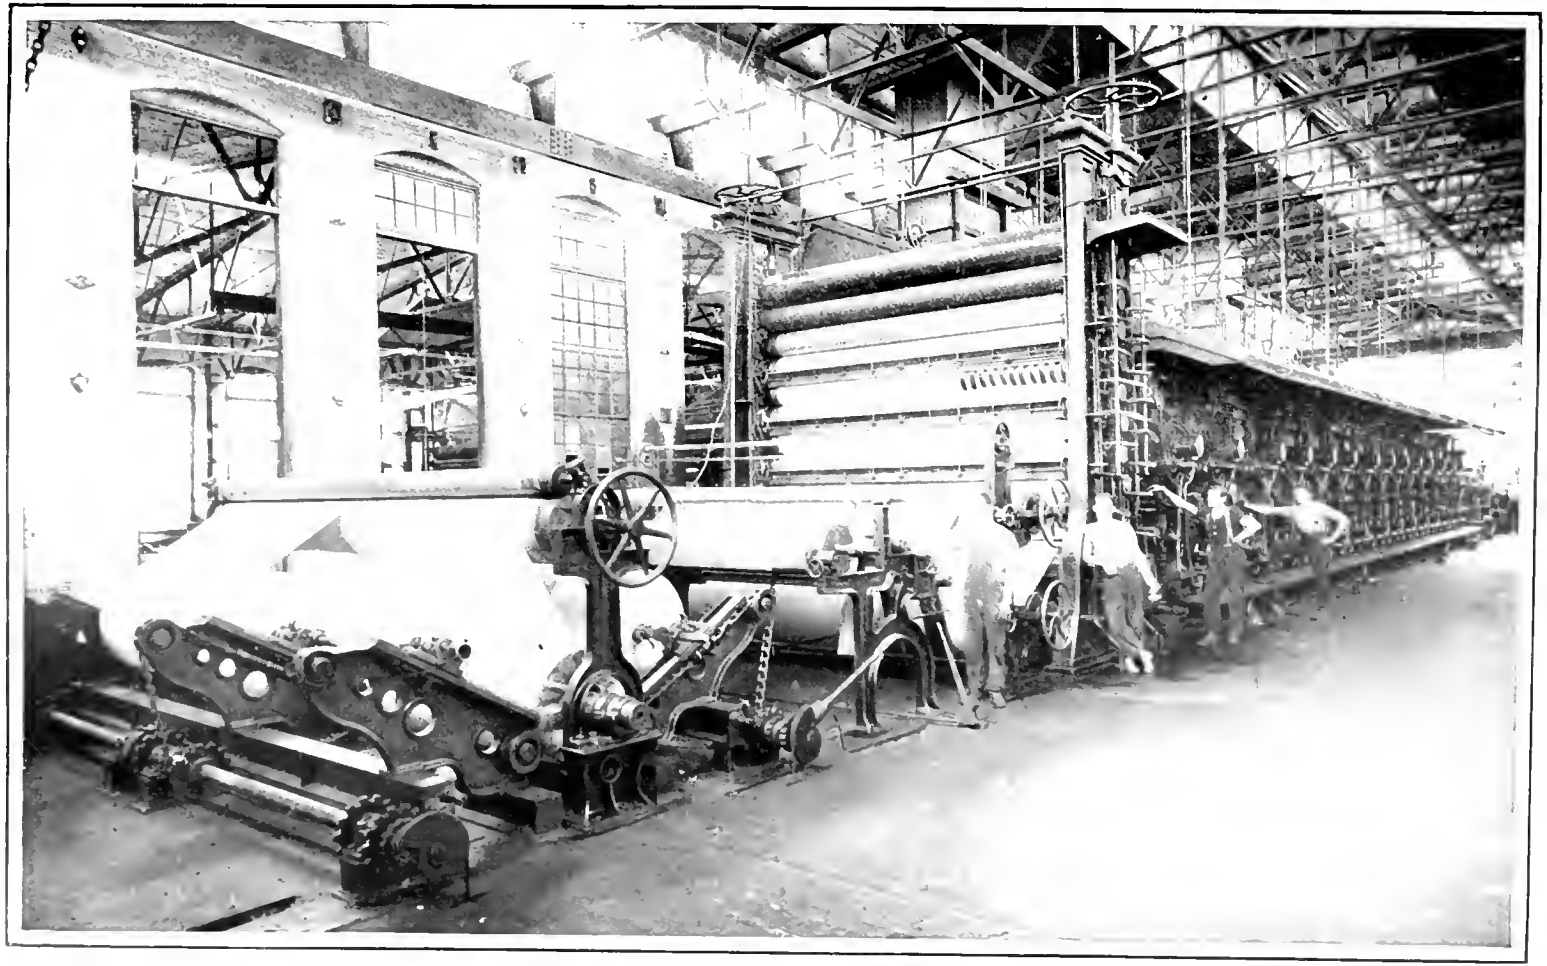
In the different processes of treating wood various forms of boilers are used, stationary, rotary, cylindrical, and spherical. They have to be lined to resist the action of the chemicals, and lead or cement is commonly used for this purpose. A large factor in the successful conduct of pulp manufacture lies in recovering the chemicals from the spent liquor. In the soda process the liquor is evaporated and finally incinerated in a furnace from which nearly all the caustic soda used is recovered. There are similar economies practiced in the other processes which not only save valuable chemicals, but prevent the pollution of streams.

The Cylinder Machine. While almost all pa-



PAPER MACHINE AT MILL OF INTERNATIONAL PAPER CO., RUMFORD FALLS, MAINE

per, ordinarily so called, is made on the Fourdrinier machine, a very large class of heavy papers, cardboards, strawboard, news board binders' board, and the like, as well as most tissue paper, is made on a different machine. Instead of the horizontal wire on which the pulp flows, the wire is fastened around a cylinder which dips in a vat of pulp, and as it revolves a film of pulp comes up with it, the water running off through the wire. As there is no lateral shake, the paper is not felted as well as on the other machine, and has less strength across the web. It is easy to arrange several vats and cylinders so that the sheets shall unite, and in this way very heavy boards are made. The rest of the machine, press rolls, driers, etc., is the same as described previously. While, as already stated, the product of the cylinder machines is not so important, there are in the United States nearly as many of these in operation as Fourdrinier machines.

Coated Papers. A large amount of paper is given a surface coating of various substances after it leaves the paper mill proper. The process of coating is as follows: The paper is fed in a continuous roll to a rotary brush which applies the coating on one side. Other brushes spread the material evenly, and it is then hung from sticks in festoons in a steam-heated room. The sticks rest on moving racks which pass the festoons slowly down the room. When dry the paper is rewound and calendered, glazed, or embossed. If it is to be coated on two sides, it is passed through the machine a second time and the other side coated. A patented process for coating both sides at once is in use, but is only suitable for a cheap product.

Coated book paper (used for illustrations of the better sort where a very smooth surface is needed to reproduce every line and shading of the picture) is coated with clays and glue or casein, and the necessary smoothness obtained by calendering in a machine similar to the supercalender described above, but having compressed cotton rolls in place of paper ones. Lithographic paper is usually coated on one side only, and is used for printing from stones. See Lithography.

Glazed papers are chiefly used for covering paper boxes. They are coated on one side only and given a very high glossy surface by the *friction calender*. This consists of a top roll of polished iron heated by steam revolving at a much higher speed than the roll below, which is made of compressed cotton. The paper as it passes between these rolls is smoothed as if a hot iron were passed over it. Colors are given to the coating, various pigments being mixed with the clay; and the high lustre is obtained by using beeswax or carnauba wax in the coating mixture. Many other fancy effects are obtained by coating and embossing paper.

Wall paper is printed in various colors and designs from paper in the roll, and is often embossed.

Manila Paper. Originally the wrapping paper called manila paper was made of manila hemp, jute, old rope, and other substances having a strong fibre. Since the introduction of sulphite fibre the ordinary manila wrapping paper of commerce is made wholly of wood, while the strong paper made of old rope and other strong materials is called rope manila.

Papers may be classified as follows: (1) Writing papers, comprising bond papers, ranging from the best bank note and stock certificate to greatly inferior grades, bond in nothing but name, ledger papers, for bookkeeping and other fine writing purposes, linen papers, usually with rough surface and laid water mark. Writing papers are known in the trade as 'flat' papers, as opposed to printing papers, which used to be folded in quires, but now are also flat and almost never folded. (2) Book papers. (3) Newspaper usually largely made of ground wood. (4) Wrapping paper, rope manila, manila, bogus manila, etc. (5) Tissue, blotting paper (unsized), cover papers, etc. (6) Boards of all sorts, strawboard, box board, news board (made from old printed newspapers), bristol board, etc. Pulp is used for a great many purposes besides making into paper. It is waterproofed and pressed into pails and many other shapes. It is used for the inside of car wheels.

Sizes. Formerly very many names were in use to designate different sizes of papers, but now they are largely obsolete, especially in America, and standard sizes are being more and more superseded by special orders of odd sizes. The names for the sizes of writing papers are largely the same in the United States and in England, but the sizes differ slightly. A few of the most common are given below, with the size of both countries:

	In United States	In England
Cap	14 x 17	
Demy	16 x 21	20 x 15½
Folio	17 x 22	
Medium	18 x 23	22 x 17½
Double cap	17 x 28	
Royal	19 x 24	24 x 19¼
Super royal	20 x 28	27 x 19¼
Imperial	23 x 31	30 x 22
Atlas	26 x 33	34 x 26
Double elephant	27 x 40	40 x 27

Statistics. The United States census of 1900 shows a very rapid growth of the paper industry since 1890. While the number of mills did not greatly increase, the value of the product, the tonnage, and the capital invested nearly doubled. The amount of spruce wood consumed each year is so great that unless regular methods of forestry are soon introduced, this source of supply will be cut off. In 1900, 76 per cent of all the wood used in the United States was spruce, and the consumption was 1,500,202 cords. Out of a reported total cost of all materials of $70,530,236, only $13,002,002 went for rags, which were the only material available fifty years ago.

PAPER-BOOK. In the English law, a book containing copies of all the pleadings and an abstract of all the facts necessary to a complete understanding of a case. A paper-book is only required to be filed with the court where the facts are agreed upon or have been determined and the question is one of law only. Where the argument is before a court of original jurisdiction the facts must have been agreed upon or admitted by the pleadings. Where a case is appealed the paper-book corresponds to what in the United States is usually called the 'case and exceptions.' See APPEAL; CASE; PLEADING; PRACTICE.

PAPER-HANGINGS, or WALL PAPER. A name applied to the webs of paper, *papiers peints* of the French, usually decorated, with which interior walls are often covered. Paper-hangings appear to have been used by the Chinese at an early period, but were not introduced into Europe, to any extent, before the eighteenth century. Hangings of canvas, painted to imitate tapestry, were extensively used during the fifteenth and sixteenth centuries. The well-known "Triumph of Julius Cæsar," by Mantegna, at Hampton Court, England, is simply a consecutive set of such hangings. During the sixteenth and seventeenth centuries a thriving business was done in Italy and Spain (particularly at Cordova) in the manufacture of hangings of leather variously stamped and embossed, and from these countries the art was carried into France and England. At first the wall papers produced were imitations of the tapestries, velvets, and leather hangings that for many centuries had been used as wall decorations. But gradually independent designs and effects have been introduced, especially in America. In Europe the costliest wall papers are still those that counterfeit most successfully some other fabric.

In the early days wall paper, like all other kinds, was made in sheets instead of webs. (See PAPER.) These, of the size called *elephant* (22 × 32 inches), were pasted together to make a length of 12 yards before the pattern was applied. In those days the patterns were put in with stencils and the background with a brush. The first improvement was the introduction of block printing. In this process the pattern was engraved on wooden blocks, a separate block for each color, and each block applied to the paper by hand as many times as the pattern is repeated. The colored background was painted in with a brush.

The next advance was the application of the Fourdrinier machine, by which wall paper, instead of being made in sheets, was produced in continuous webs. Then came the cylindrical rollers, a roller for each pattern, similar to that employed for the printing of textile fabrics. (See TEXTILE PRINTING.) Later, grounding machines, for laying on the background color; bronzing machines, which apply bronze powders (popularly called gold); embossing machines, and a number of other inventions have been applied to this art. About 1870 the continuous process was introduced, by which the paper passes automatically from one step to another, without a stop and without handling. Great improvements in design and in blending of colors have also been made in recent years. An important phase of the subject is the sanitary one, serious results having followed the use of poisonous coloring materials, like arsenic.

In the United States the manufacture of wall paper was introduced by two Frenchmen, Boulet and Charden, in 1790, and only three or four more firms undertook the business before 1844. In that year the first machine for printing paper was put up in the Howell factory at Philadelphia. About the same time continuous rolls of paper came into general use, instead of sheets. From that time the business rapidly increased in importance.

The accompanying table, taken from the chapter on "Wall Papers," in *One Hundred Years of American Commerce* (New York, 1895), shows the growth of this industry:

GROWTH OF THE WALL PAPER INDUSTRY IN THE UNITED STATES

YEAR	Number of factories	Capital employed	Number of employees	Value of product
1793	1	nominal	nominal	nominal
1810	3	$30,000	75	$25,000
1844	5	150,000	500	250,000
1880	25	3,500,000	2,500	6,500,000
1890	30	9,000,000	5,500	9,000,000
1895	35	12,000,000	7,000	12,000,000

PAPER NAUTILUS, or PAPER SAILOR. The shell of the argonaut (q.v.).

PAPER WEDDING. See WEDDING ANNIVERSARIES.

PAPH'LAGO'NIA (Lat., from Gk. Παφλαγονία). In ancient geography, a district of Northern Asia Minor, bounded on the north by the Black Sea, on the east by Pontus, from which it was separated by the river Halys, on the south by Galatia, and on the west by Bithynia. The inhabitants were akin to the Phrygians and Thracians, and seem to have preserved a large degree of independence, though recognizing the suzerainty of Lydians, Persians, and Macedonians. Later the country was joined to Pontus, and after the Roman conquest was divided between the provinces of Bithynia and Galatia. It was organized into a separate province toward the end of the third century of the Christian Era. The cavalry of the country was famous, and the mountains furnished abundant timber and some metals. The chief city was the Milesian colony of Sinope, on the Black Sea.

PAPHO, or **PA'PHOS** (Lat., from Gk. Πάφος). The ancient name of two cities on the southwest coast of the island of Cyprus (Map: Turkey in Asia, E 5). The older city, sometimes called Palaipaphos (now Kuklia), was situated about a mile and a quarter from the coast. It was probably founded by the Phœnicians, and was the centre from which the worship of Aphrodite spread over the island. Remains of the wall surround-

ing the temple of the goddess still exist. In Greek legend, the goddess was said to have risen from the sea at this point, and even in the Homeric poems it is mentioned as her favorite abode. The form of the shrine of the goddess on Roman coins is strongly reminiscent of the Mycenæan period, and points also to the early date of the sanctuary, which was a place of pilgrimage until the overthrow of paganism. The other Papho, called Neopaphos (now Baffo), was on the seacoast, about seven or eight miles northwest of the older city, and was said to have been an Arcadian colony. Under the Romans it was the capital of the island and the official residence of the Governor.

PA'PIAS (Lat., from Gk. Παπίας). Bishop of Hierapolis in Phrygia. He flourished during the first half of the second Christian century, but the dates of his birth and death are unknown. He is said to have been a companion of Polycarp, and to have known personally some of the Lord's disciples, but this is uncertain. He wrote in Greek an important work, in five books, entitled *Expositions of the Oracles of the Lord*, which unfortunately has been lost. A few fragments, preserved chiefly by Irenæus and Eusebius, indicate that the work was not itself a gospel, but a sort of running commentary on the sayings (and deeds?) of Christ. They also prove that written gospels already existed. Papias diligently gathered up the primitive Christian traditions, setting a high value upon every direct line of testimony concerning the Lord's teaching.

Eusebius credits Papias with more learning than judgment, which probably means that he disliked his crude and materialistic notions of the approaching millennium, with its alleged miraculous vintages and crops. (Cf. Irenæus, *Against Heresies*, v. 33.) These conceptions, however, were not displeasing to Irenæus and other early Christians, although they were generally discarded before the fourth century. In any event, Papias's reputation does not depend upon his millenarian views. He stands as a connecting link between the Apostolic Age and that of the Apologists, a period where our sources at best are scanty, and each one correspondingly valuable.

The fragments of the *Expositions* may be consulted in Lightfoot's *Apostolic Fathers*, ed. by Harmer (London, 1893), or in Funk, *Patres Apostolici* (Tübingen, 1901). Consult, also: Zahn, *Forschungen*, part vi. (Leipzig, 1900); Lightfoot, *Essays on Supernatural Religion* (2d ed., London, 1893); Cruttwell, *Literary History of Early Christianity* (ib., 1893); Westcott, *History of the Canon of the New Testament* (7th ed., ib., 1896).

PAPIER-MACHÉ, pā'pyā'-mā'shā' (Fr., pulped paper). A tough, plastic material, made from paper-pulp, or from paper that has been reduced to a pulp, mixed with glue, paste, oil, resin, or other sizing. It has been in use for more than a century in Europe, and it is not improbable that it was first suggested by some of the beautiful productions of Sindh and other parts of India, where it is employed in making boxes, trays, etc., as well as in China and Japan. Its first application, as far as we know, was to the manufacture of snuff-boxes, by a German named Martin, in 1740. Properly speaking, papier-maché is paper-pulp molded into shape, and it has been used, not only to make small articles, such as boxes, trays, etc., but in the interior decoration of houses for cornices, ceilings, etc. From the extension of the application of papier maché to the manufacture of a number of light and useful articles, modifications have taken place in its composition, and it is now of three kinds: first, the true kind, made of paper-pulp; second, sheets of paper pasted together after the manner of pasteboard, but submitted to far greater pressure; and third, sheets of thick millboard cast from the pulp, which are also heavily pressed. The term papier-maché is in the trade held to apply rather to the articles made of the pulp than to the pulp itself; and a vast manufacture sprang up during the last century. Some articles are coated with successive layers of asphalt varnish, which is acted upon by heat in ovens until its volatile parts are dissipated, and it becomes hard and capable of receiving a high polish. Mother-of-pearl is sometimes used in its decoration, and the fine surface which can be given to asphalt varnish also permits of burnished gilding and other decorative applications with excellent effect.

PAPIL'LA (Lat., nipple). A term applied by anatomists to one of several minute, elongated, conical processes, projecting from the surface of the true skin into the epidermis, highly vascular and nervous in their character, and taking an active part in the sense of touch. Their form and structure are described in the article SKIN. The term papilla is also used to designate the optic disk or nerve-head as observed through the ophthalmoscope. See OPHTHALMOSCOPE.

PAPIL'ION'IDÆ. A family of large butterflies. See SWALLOWTAIL.

PAPIN, pā'păN', DENIS (1647–c.1714). A French physicist. He was born at Blois, where, after studying medicine, he practiced for some time as a physician. His devotion to study and research in physical science dates from his acquaintance with Huygens, and he soon after became the pupil and assistant of this famous physicist, contributing substantial improvements to the air pump. He rapidly acquired a wide reputation and visited England, where he was received with open arms by the philosophers of that country, and became a member of the Royal Society in 1680. While in England, Papin and Robert Boyle worked together and performed many experiments, Papin inventing the double air pump and the air gun during this period. To him is also due the idea of pneumatic transmission of power, but he was not able to make a practical use of his method. In 1687 Papin was called to the chair of mathematics in the University of Marburg in Hesse-Cassel, the duties of which office he discharged with zeal and success for many years. He died in extreme poverty. To Papin belongs the high honor of having first constructed a steam engine with a piston (1690), and he also used the simple method of condensing the steam to produce a vacuum beneath the raised piston. He is also the inventor of the 'safety-valve,' which was an essential part of his 'digester' (q.v.). With the latter machine Papin showed that liquids [illegible] produced atmospheric pressure would [illegible]

to boil at a much lower temperature than when freely exposed to the air. Papin discovered the principle of action of the siphon, improved the air pump of Otto von Guericke, and took part in philosophical discussions with Leibnitz. In 1690 he constructed a paddle-wheel boat in which his pumping engine was used to raise water which turned a water wheel connected with the paddle. It was destroyed by a mob on account of its interfering with the business of the boatmen. Many of Papin's numerous writings will be found in the *Philosophical Transactions*, *Acta Eruditorum*, and the *Recueil de diverses pieces* (1695). He published an explanation of the construction and uses of his 'digester' (London, 1681), afterwards (1682) translated into French, and his experiments entitled *Nouvelles expériences du Vuide* (Paris, 1674). It was not for nearly a century after his death that the great value of Papin's experiments and researches was perceived. For Papin's work connected with the steam-engine, see Thurston, *Growth of the Steam Engine* (New York, 1878). See his *Life*, by Gerland, which includes his correspondence with Leibnitz and Huygens (Berlin, 1881).

PAPINEAU, pä'pē'nō', Louis Joseph (1789-1871). A Canadian orator and political agitator. He was born at Montreal, and received his education at the Seminary of Quebec, and then entered upon the study of law. In 1809 he was elected to represent the constituency of Kent in the Legislative Assembly of Lower Canada, and in 1811 was chosen to sit for one of the districts of Montreal. During the War of 1812 he was the commander of a company of militia, but saw little active service. In 1817, as the leader of the French-Canadian Party, he was chosen Speaker, and continued to hold that position until 1837. He had frequent conflicts with the royal Governors, and in 1827 Lord Dalhousie refused to accept him as Speaker, but the Assembly insisted and Dalhousie resigned. In an effort to force the home Government to make the Provincial Council elective instead of appointive, the Assembly under his lead refused to grant supplies to the Governor, and in 1834 transmitted to England the famous 'Ninety-two Resolutions.' Affairs now became more and more critical, and in 1835 Papineau arranged with William Lyon Mackenzie, the leader of the Revolutionary Party in Upper Canada, for coöperation between their followers. In March, 1837, the English Government finally declared that an elective Council could not be granted, and authorized the Governor, since the Assembly still refused to vote supplies, to use the money in the treasury. A proclamation was issued warning the people against agitators, and, because of Papineau's violent harangues to the people, he was deprived of his captaincy in the militia. In October, 1837, he attended a meeting which decided upon revolution, though there has been much dispute as to whether he favored this action. Certain it is, however, that when the rebellion, the way for which he had prepared, broke out, he fled to the United States, where he remained for two years. He then went to France, but in 1847 took advantage of a general amnesty and returned to Canada. He was soon afterwards elected to a seat in the Lower House of the now united Canadian Parliament, but found that his old influence had departed. He retired from the public service in 1854, and spent the remainder of his life in seclusion at his residence of Montebello on the Ottawa River. Consult: Kingsford, *History of Canada* (Toronto, 1887-98); Christie, *History of the Late Province of Lower Canada* (Quebec, 1848-55); and Read, *The Canadian Rebellion of 1837* (Toronto, 1896).

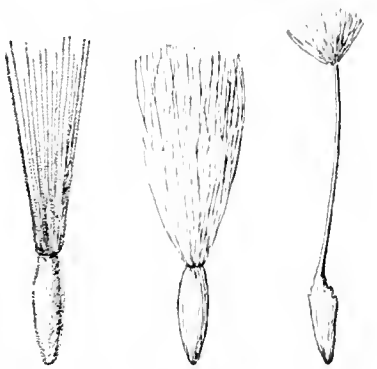
PAPINIANUS, Æmilianus. A distinguished Roman jurist, a contemporary, friend, and trusted adviser of the Emperor Septimius Severus. He was probably of Syrian-Greek origin; was born about 146 A.D.; became pretorian prefect or Chief Justice of the Empire in 203, and was put to death in 212 because (it is said) he refused to justify Caracalla's murder of Geta. He was regarded by the later Romans and is still generally regarded as the greatest of the Roman jurists. More than any other, he strove to keep law in harmony with ethics. In Valentinian's Law of Citations (426) that Emperor directed that if an equal number of authorities were produced on either side of a disputed question the opinion supported in Papinianus's writings should prevail. Both before and after Justinian's time the works of Papinianus formed an important part of the third year of legal study, and the students of that year were called Papinianistæ. His principal published works were digests of decisions: 37 books of 'questions' and 19 of 'responses.' Because he left no systematic commentaries, Justinian's codifiers drew less largely on his writings than on those of Ulpian and Paul; but excerpts from his works constitute an important part of the Digest. Outside of the Digest we have a passage from Papinianus which was included in the Breviary of Alaric (q.v.) and a few fragments of his responses found in Egypt in 1877 and 1882. These have been printed by Huschke. Consult Otto, *Papinianus* (2d ed., 1743) and the article by Bruns in Pauly, *Realencyclopädie*.

PAPIST PLOT. See Oates, Titus.

PAPPENHEIM, päp'pen-hīm, Gottfried Heinrich, Count (1594-1632). One of the leading Imperialist generals in the Thirty Years' War. He was born at Pappenheim, Bavaria, May 29, 1594, of an old and distinguished Swabian family. He studied at Altdorf and Tübingen and early identified himself with the Catholic cause. He served under the Poles against the Russians and Turks; was in the service of the Catholic League in 1620, and at the battle of the White Hill in the same year contributed greatly to the victory over the Bohemian forces. He was in 1623 made commander of the mounted regiment which became famous as Pappenheim's cuirassiers. He was a cavalry commander in the Spanish service in Lombardy in 1625-26, but rejoined the Imperialist army in the following year, suppressed a revolt of the Protestant peasants of Upper Austria, and then was engaged under Tilly in the campaigns against the Danes, Swedes, and Saxons. He took a prominent part in the storming of Magdeburg (1631), was engaged at Breitenfeld (1632) and covered the retreat of the defeated army. He served under Wallenstein in the final campaign against Gustavus Adolphus. Just before the fateful battle of Lützen he had been detached with eight regiments for an independent movement, but a recall was sent after him when the rapid ad-

vance of the Protestant leader became known to Wallenstein. His splendid charge on the left wing of the Swedish army had almost changed the result when he was mortally wounded in the last charge. He died a few hours afterwards at Leipzig, November 17, 1632. Consult Hess, *Gottfried Heinrich, Graf zu Pappenheim* (Leipzig, 1855).

PAP'PUS (Neo-Lat., from Gk. πάππος, down, from πάππος, *pappos*, grandfather, from πάππας, *pappus*, father, papa). The peculiar calyx of the Compositæ. The flowers are placed close together in the flower-head. As a consequence, the sepals are not necessary for protection, and for mechanical reasons are probably prevented from developing in a normal way. Moreover, the flowers are epigynous, so that the sepals are developed from the top of the seed-like fruit (achene, q.v.). In many cases the sepals



ACHENES.

a, Arnica; *b*, Sonchus, or sow thistle; *c*, Taraxicum, or dandelion.

(pappus) are entirely obsolete, in others they form a shallow cup or crown, in others they are arranged as teeth or scales, while in still others they constitute a tuft of bristles (*a*) or hairs (*b*). It is this last form of pappus which, as in the dandelions, thistles, etc., is a conspicuous character of the family. The hair-like pappus is exceedingly diverse in details of structure, in some cases being coarse and bristly, others soft and silky, and others beautifully plumose. In the dandelion (*c*) the achene develops a long beak at the summit of which the tuft of soft pappus hairs occurs. In case the pappus has any special development it is associated with the dispersal of the seeds. For example, the hairy pappus of thistles and dandelions enables the fruit to be carried by currents of air; while the toothed and even barbed pappus of Spanish needles serves as a grappling appendage by which the fruit may lay hold of animals brushing past.

PAPPUS, or **PAPPOS** (Lat., from Gk. Πάππος) (c.300 A.D.). An Alexandrian mathematician. He is said to have written on geography and astrology, to have composed a commentary on the *Almagest* of Ptolemy, and to have been the head of a school. His principal work, however, was a mathematical *Synagoge* (collection) in eight books, the first and half of the second of which are lost. To this work we owe much of our knowledge of Greek mathematics, and its translation by Commandin (1588) had a powerful influence on the Renaissance of geometry in the seventeenth century. In particular, the geometry of Descartes had for one of its principal objects the solution of a problem of Pappus, viz.: given 2*n* straight lines, to find the locus of points such that the product of the distances of each of these to *n* of the lines (or more generally of straight lines at given angles to the *n* lines) shall have a given ratio to the product of the distances (or lines at given angles) to the other *n*. Pappus was the last of the great Greek mathematicians, but the value of his work is largely due to the fact that it gives to us numerous extracts from the lost writings of his predecessors. The most important theorem due to him is the one often called by Guldin's name, viz.: the volume of a solid of revolution is equal to the product of the area of the revolving plane figure and the length of the path of its centre of gravity. Numerous minor propositions bear his name, such as the Pythagorean theorem as generalized for an oblique-angled triangle, in which the squares on the sides are replaced by parallelograms. The text of Pappus has been edited by Hultsch (3 vols., Berlin, 1876-78, Greek and Latin).

PAP'UA. An island north of Australia. See NEW GUINEA.

PAP'UAN or **AUSTRO-MALAYAN SUBREGION.** In zoögeography, a northern subdivision of the Australian Region, formed of the islands eastward of 'Wallace's Line' to San Cristoval, embracing Celebes, Lombok, the Giloolo group, Ceram, New Guinea, and the Solomons. All are mountainous, well forested, hot and damp, excepting the small arid group from Lombok to Timor. Considering the proximity and physical resemblance of these islands to those west of them, and their dissimilarity to the continent of Australia, it is surprising to find that their affinities are Australian rather than Oriental. The mammals are almost wholly marsupials, with one monotreme (*see* ECHIDNA) in New Guinea. A long list of peculiar genera of birds may be made, and this subregion is the special home of the birds of paradise, honeysuckers, some peculiar fly-catchers, and a host of most brilliant parrots, kingfishers, and pigeons. The extraordinary tendency toward ornamentation which characterizes the birds of these islands extends also to the insects, and has been the object of much speculation. Consult: Wallace, *Geographical Distribution of Animals*, vol. i. (New York, 1876); id., *Malay Archipelago* (ib., 1869); Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (ib., 1885).

PAP'ULE (Lat. *papula*, pimple, pustule). A medical term meaning a pimple; a small elevation of the surface of the skin containing no fluid. Papules are either of the normal skin color or red. If they become filled with fluid they are called vesicles. If pus develops in a vesicle it is called a pustule. Papules appear in the early stage of many skin diseases and form the eruption in certain other diseases, as scarlet fever, chickenpox, and smallpox. Papular skin diseases include lichen, prurigo, and pityriasis (*qqv.*).

PAPYR'OGRAPH. See COPYING MACHINES.

PAPY'RUS (Lat., from Gk. πάπυρος, *papyros*). A genus of plants of the natural order

Cyperaceæ. Egyptian Papyrus (*Cyperus Papyrus*) is a kind of sedge 3 to 10 feet high, with a very strong, woody, aromatic, creeping root, long, sharp-keeled leaves, and naked, leafless, triangular, soft, and cellular stems, as thick as a man's arm at the lower part, and at their upper extremity bearing a compound umbel of extremely numerous drooping spikelets with a general involucre of eight long filiform leaves. The plant is represented in the oldest Egyptian monuments as reaching the height of about 10 feet. The papyrus was used for many purposes. The more slender stalks were woven into baskets and boxes, while bundles of the thicker stalks formed the material of which light boats were constructed. The fibre was used for making cordage, sails, awnings, and matting. The pith was boiled and eaten by the poorer classes, and the root was dried and used as fuel. The most important use of the plant, however, was in the manufacture of a species of paper. For this purpose the pith was cut into strips which were placed side by side on a flat surface, and over the layer thus formed was laid a second layer of strips at right angles to the first. The whole was then pressed or rolled into a sheet, to which the natural gum of the plant gave a homogeneous character, and the sheet when dried was ready for use. It is possible that artificial paste was sometimes used to bind the fibres. When newly prepared the sheet was white or brownish white; but in the process of time those papyri which have reached the present day have become of a light or dark brown color, and exceedingly brittle. The papyrus or paper of the Egyptians had a great reputation in antiquity, and it appears on the earliest monuments in the shape of long rectangular sheets, which were rolled up and tied with a string. At a very late period the papyrus was no longer rolled, but was cut into square pages which were bound together as are the leaves of a modern book. The papyrus sheets and rolls are of very different heights. The tallest specimen is said to be 15½ inches high, but most literary manuscripts are from 8 to 12 inches, with a tendency toward the lower limit. The sheets are far narrower, however, rarely exceeding 9 inches, while widths of from 5 to 7 inches are common. The strips seem to have been sold in lengths of about 20 sheets, but there is no limit to the length of the rolls, though for literary purposes the Greeks seem rarely to have exceeded 30 feet. The ancient Egyptians made up huge rolls—one is said to be 144 feet long—for burial with the dead, though there is little likelihood that such unwieldy volumes were used by the living. The writing is regularly in columns, parallel to the length of the roll, and of varying width, in literary prose rarely exceeding three inches, though in verse they are often wider to accommodate the longer lines of the hexameter. Public documents and private papers are of course bound by no such rules. The use of papyrus paper, or at least of some similar manufacture from vegetable fibre, must have arisen at an early date in Egypt, and the oldest datable specimen can be but little later than B.C. 3600. (For a description of the Egyptian papyri and their contents, see the paragraph on *Literature and Science* under EGYPT.) The Greeks seem to have known a paper as early as the beginning of the fifth century B.C., though the oldest extant Greek papyrus is perhaps the *Persians* of Timotheus, belonging to the end of the fourth century. With the growth of the Alexandrian Library and the spread of Greek learning the use of papyrus largely increased, and the manufacture of the paper seems to have developed greatly under the patronage of the Ptolemies. It is only in comparatively recent years that the attention of scholars and explorers has been drawn toward the Greek papyri of Egypt, and that systematic search has been made for them. The great bulk of the enormous mass of papyri brought to light consists of non-literary documents, partly public, such as official correspondence, laws, petitions, and tax-receipts, and partly private, including wills, contracts, letters, and notes, school exercises, and accounts. These documents are of immense value as enabling us to reconstruct the life and language of the common people in the towns and villages of Egypt under Greek and Roman rule. Though the literary papyri are relatively few, they are often of great importance as restoring to us works formerly lost. Among the more important are the *Orations* of Hyperides, the *Mimes* of Herondas, the *Odes* of Bacchylides, the treatises of Aristotle on the Constitution of Athens, and the *Persians* of Timotheus. Of Christian writings the yield has not been large, nor of very striking value. There are a few fragments from the New Testament and the Septuagint, some scraps of apocryphal or heretical writings, and especially the interesting leaf from Oxyrhynchus containing some Logia or sayings attributed to Jesus. The first great discovery of papyri in Egypt was made near Arsinoë in the Fayum in 1877. Fifteen years later at Soenopæi Nesos, also in the Fayum, another rubbish heap was opened, most of whose contents went to Berlin. While the first mass was chiefly Byzantine, these were Roman and on the whole in fair preservation. An earlier period, extending well into the third century B.C., was revealed by the discovery by Flinders Petrie of a series of mummy cases made of old papyri pasted together. Patient labor separated these fragments and brought to light remnants of the lost *Antiope* of Euripides, as well as bits of the *Gorgias* and *Phædo* of Plato, and many non-literary fragments. All previous discoveries were surpassed by the work of Grenfell and Hunt at Oxyrhynchus in 1896-97, and to their continued labors at other points in the Fayum, and especially at Tebtunis, a large part of the increase since then is due. Outside of Egypt discoveries of papyri have been almost unknown. In 1753 a great mass of charred rolls were found in the Villa Suburbana at Herculaneum, and a few of these have been unrolled by means of a very delicate apparatus, but their contents have been a disappointment, as they have proved to be philosophical treatises of the Epicu-

EGYPTIAN PAPYRUS.

rean school, though the fragments of Philodemus have added somewhat to our knowledge of the history of ancient philosophy. For the handwriting on papyri, see EGYPTOLOGY; PALEOGRAPHY.

As a matter of scientific interest experiments in the manufacture of paper from the papyrus have been made in modern times by Landolina, Seyffarth, and others, and a small quantity is made at Syracuse in Sicily, though of course merely as a curiosity.

Other species of papyrus (*Cyperus Congobosus*, *Cyperus tefetum*) are much used in India for mats. *Cyperus alternifolius*, the umbrella plant or umbrella palm, is a common house plant. It grows to a height of one to three feet, with drooping involucral rays six to eight inches long and less than one-half inch broad.

BIBLIOGRAPHY. On the general subject, consult: Wilcken, *Die griechischen Papyrusurkunden* (Berlin, 1897); Kenyon, *Palæography of Greek Papyri* (Oxford, 1899); Dziatzko, *Untersuchungen über ausgewählte Kapitel des antiken Buchwesens* (Leipzig, 1900); on the results for Biblical study, Deissmann, *Bible Studies*, trans. by Grieve (Edinburgh, 1901). A periodical devoted to this subject is the *Archiv für Papyrusforschung und verwandte Gebiete* (Leipzig, 1900, et. seq.); and a brief review of the more important publications of each year may be found in the *Annual Archæological Reports* of the Egypt Exploration Fund (London, 1869 et seq.).

PARÁ, pä-rä'. An estuary indenting the northeastern coast of Brazil and forming the southern boundary of Marajo Island (q.v.), of which the true mouth of the Amazon is the northern boundary (Map: Brazil, II 4). The Rio Pará is 40 miles wide at its mouth and has, in general, a width of 5 to 10 miles for a distance of 200 miles inland. Formerly it was probably one of the principal mouths of the Amazon, but is now connected with that river only by a network of channels and backwaters, which, however, form the principal steamship routes to the Amazon, since the true mouth is obstructed by islands and strong currents. The Pará has become the almost independent estuary of the Tocantins (q.v.).

PARÁ. One of the largest and commercially most important States of Brazil, occupying the northeastern part of the Republic, and bounded by the Guianas on the north, the Atlantic Ocean on the northeast, the Brazilian States of Maranhão and Goyaz on the east, Matto Grosso on the south, and Amazonas on the west (Map: Brazil, G 4). Its area is 443,653 square miles, excluding the disputed portion of Guiana. The surface consists of plateaus rising from the here narrow Amazonian valley to a height of 2500 feet in the north and south. The Amazon River with its extensive estuary takes in a large portion of the State, and the adjoining low lands are inundated during the rainy season. Its two large tributaries, the Tapajos and the Xingu, and the system of the Tocantins, give the State a network of navigable waterways, and thus remove one of the greatest obstacles in the way of industrial development in South American countries—lack of transportation facilities. The climate is tempered by the trade winds, and is on the whole not unhealthful. Most of the low lands are covered with dense forests, which yield the most important product, as well as the chief source of revenue, of Pará—rubber. Agriculture is as yet undeveloped on account of the scarcity of population. Some foodstuffs have to be imported. Besides rubber, the annual export of which exceeds 22,000 tons, Pará exports yearly large quantities of cacao, cinchona, coumarin, glue, and hides. Most of the exports go to New York and Liverpool. The mineral deposits of Pará are believed to be extensive, but so far very little has been done toward their exploitation. Pará has no railways with the exception of a short line from the capital (Pará) to the coast. The population of Pará was only 328,455 in 1890. The Indians are mostly civilized. The capital is Pará.

PARÁ, or BELEM. The capital of the State of Pará, Brazil, situated on the southeast shore of the Pará estuary (q.v.), 85 miles from the ocean, and 1° 27′ south of the equator (Map: Brazil, II 4). Viewed from the harbor it presents a picturesque appearance with its numerous churches and white houses half hidden amid luxuriant tropical foliage. The streets are in general narrow and ill-paved, but some of them are wide and straight, and there are several spacious avenues lined with trees. The principal building is the cathedral, dating from 1720. There are a lyceum and other schools, a public library, a museum, a large botanical garden, and many scientific, literary, and charitable institutions. The Government buildings are plain structures. The harbor has 20 feet of water, and, being situated at the principal entrance for ships into the Amazon and in the northern part of the country, where it is comparatively near to the commercial countries of Europe, Pará has become an important trade centre. Its chief exports are rubber, cacao, and colonial wares. The rubber export exceeds that of any other port of the world, having in 1898 amounted to 31,882,883 pounds, with a value of about $68,850,000. The total value of the exports in the same year was about $72,000,000, which shows an increase of 100 per cent. during the preceding five years. The population has increased six-fold during the last half century, the inhabitants numbering 90,122 in 1896. Pará is the seat of a United States consul.

Pará was founded in 1615, but was an unimportant place until the middle of the nineteenth century. During the disastrous racial and social strifes of 1835-48 the population fell from 25,000 to 15,000, and it was still further reduced by the epidemic of yellow fever in 1850. Since that year, however, it has grown rapidly.

PARA (Pers. *pāra*, piece, portion). A coin of copper, silver, or mixed metal, though most generally of copper, in use in Turkey and Egypt; it is the fortieth part of a piastre, is divided into three aspers, and varies much in value, owing to the debased and complicated condition of the Turkish coinage. Pieces of five paras are also in use. Five para is equal to about one mill (American) in Turkey, and a little more in Egypt.

PARABLE (OF. *parable*, *parabole*, Fr. *parabole*, from Lat. *parabola*, *parabole*, from Gk. παραβολή, comparison, juxtaposition, parable, παραβολά, from παραβάλλειν, *paraballein*, to throw beside, to compare, from παρά, para, beside, beyond + βάλλειν, *ballein*, to throw). A short [illegible]

rative, founded upon any real event in nature or human experience, intended to convey a moral or religious meaning. The parable is best known from its use in the Bible. In the Old Testament it is not of very common occurrence. The five examples which admit of the least question are: (1) The prophet Nathan's parable of the poor man with the one ewe lamb, told to King David (II. Sam. xii. 1-4); (2) the story of the woman of Tekoa concerning her sons (II. Sam. xiv. 5-7); (3) the tale of the prophet regarding the escaped captive, told to King Ahab (I. Kings xx. 39-40); (4) Jehovah's rebuking song of the vineyard (Is. v. 1-6); and (5) the parable of planting and threshing (Is. xxviii. 24-28). Ancient Jewish writings outside the Bible abound in parables. Jesus of Nazareth was the great master in their use. In the New Testament the word parable occurs 48 times in the Synoptic Gospels, but nowhere else except twice in the Epistle to the Hebrews. It designates either a short narrative designed to convey spiritual truth, such as the parable of the sower (Matt. xiii. 8 sqq.), or, more rarely, a popular proverb, such as 'Physician, heal thyself' (Luke iv. 23). Hence many of the utterances of Jesus, which are commonly regarded as proverbs ('consider the lilies,' 'salt of the earth,' 'light under a bushel') might be classified as parables. The well-known parables of Jesus were taken from the natural scenes and events of common life with which He and His disciples were familiar. In the art with which He seized upon and illustrated the supreme point in a parable He never has been surpassed. He made both nature and history a parable of which the Kingdom of God is the spiritual interpretation. For definition of the parable and a study of those spoken by Jesus, consult: French, *Notes on the Parables of Our Lord* (New York, 1851); also Guthrie, *The Parables* (London, 1866); Bruce, *The Parabolic Teaching of Christ* (1892); Jülicher, *Die Gleichnisreden Jesu* (Freiburg, 1899).

PARABOLA (Neo-Lat., from Gk. παραβολή, *parabolē*, comparison, juxtaposition, parable, parabola). A conic section cut by a plane parallel to the element of the cone. When the plane coincides with its parallel element, the parabola assumes the limiting form of a straight line. The parabola may also be defined as the locus of a point whose distance from a fixed point (the focus) is equal to its distance from a fixed straight line (the directrix), i.e. its eccentricity (q.v.) is 1. From this definition its construction readily follows. Let DD' (Fig. 1) be the fixed straight line or directrix, and F the fixed point or focus. Draw a perpendicular to the directrix, passing through the focus, and this will be the axis of the curve. The point O on the axis, half way between F and DD', will evidently be a point on the curve. To find other points on the curve draw a series of lines parallel to the directrix and cutting the axis XX' in M_1, M_2, F, M_3, ... With F as a centre and ZM_1 as a radius, describe an arc cutting the perpendicular through M_1 in P_1 and Q_1; with F as a centre and ZM_2 as a radius, describe a circle cutting the perpendicular through M_2 in P_2 and Q_2; and so on. The points P_1, P_2..., Q_1, Q_2..., are then points on a parabola. PQ is called the latus rectum or parameter, and, as is evident from the construction, equals twice the distance between the focus and directrix. The curve may be described mechanically in the following manner: move a right-angled triangle with one perpendicular side coinciding with the directrix; a string equal in length to the other perpendicular side has one end fastened to the outer vertex of the triangle and the other to the focus; a pencil resting against the lower side of the triangle and holding the string taut will trace a parabola.

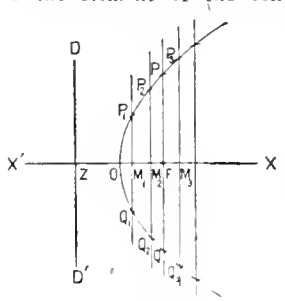


FIG. 1.

The Cartesian equation of the parabola, its axis being taken as the X-axis and its vertex as the origin, is $y^2 = 4px$, where p is the distance between the focus and the vertex. Its polar equation, the focus being the pole, is

$$r = \frac{2p}{1-\cos\theta}; \text{ or } r = \frac{4p\cos\theta}{\sin^2\theta}$$

when the vertex is taken as pole. The following are some of the most important properties of the parabola: (1) Any line RH (Fig. 2) parallel to the X-axis is a diameter, i.e. bisects a system of parallel chords, as those parallel to PQ; (2) the subnormal MN is constant and equal to the semi-latus rectum FK; (3) if the tangent through P cuts the X-axis in T, and if the normal at P cuts the X-axis in N, the focus F is equidistant from P, T, and N; (4) the angle DPT = angle XTP is equal to the angle TPF, or the tangent at any point makes equal angles with the axis of the curve and the focal radius to the point of contact (these last two properties furnish simple methods for drawing tangents to the parabola); (5) through any point in the plane, three normals can be drawn to the parabola; (6) the tangents at the extremities of any focal chord PL intersect at a point G on the directrix, and at right angles; (7) a perpendicular from the focus F upon a tangent SQ meets this tangent at a point I on the tangent through the vertex; (8) a tangent RE at the end of a diameter RH is parallel to the chords bisected by that diameter, of which PQ is one and the tangents at the extremities of PQ intersect upon the corresponding diameter SH; (9) the area of a parabolic segment ORPQ is $\frac{4}{3}$ of the triangle RPQ on the same base and

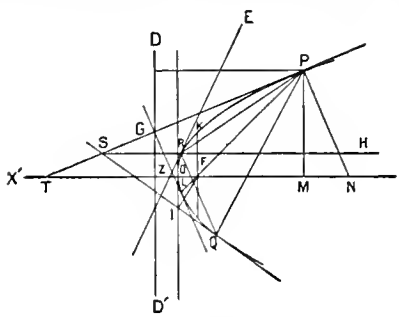

FIG. 2.

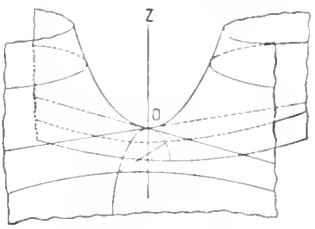
having the same height; (10) the parabola has no real finite asymptotes.

Concave reflecting mirrors are often formed so that all axial sections are equal parabolas. In such a mirror, all parallel rays of light are reflected to the focus; and, conversely, if a light be placed at the focus of such a mirror, its rays will be reflected in a parallel pencil. If a body were projected upward and obliquely to the direction of gravity, it would, if undisturbed by any other force except gravity, accurately describe a parabola whose axis is vertical and whose vertex is the highest point reached by the body. The term parabola is used in analysis, more generally, to denote that class of curves in which some power of the ordinate is proportional to a lower power of the corresponding abscissa. Thus the common parabola above given has the equation $y^2 = kx$, the cubical parabola has the equation $y = a + bx + cx^2 + dx^3$, the simplest form being $y = kx^3$ and the semi-cubical parabola, $y = kx^{\frac{3}{2}}$ or $y^2 = kx^4$. The last mentioned curve is also known as the Neilean parabola, because it was rectified by William Neil (1657).

For the various curves bearing the name parabola, consult: Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897; partie complémentaire, 1899).

PAR'ABOLA'NI (Lat. nom. pl., from Gk. *παράβολος*, *parabolos*, reckless, from *παραβάλλειν*, *paraballein*, to throw beside, to compare). A class of functionaries in the early Church by some writers reckoned as members of the clergy, and included in the minor orders, but more probably religious associations, whose chief duty was to tend the sick, whether in ordinary diseases or in times of pestilence. They received their name from the boldness with which they exposed themselves to danger of contagion. By some, the association is believed to have originated at Alexandria in the time of a great pestilence under the Bishop Dionysius in the third century. They were certainly very numerous at Alexandria, amounting to some 500 or 600, but were also enrolled in other churches. We find them at Ephesus, at the time of the council in 449, and at Constantinople under Justinian. The parabolani are made the subject of formal legislation by Theodosius the Younger. At first they were subject to the Præfectus Augustalis, but a later decree placed them directly under the authority of the bishop. They seem to have been mainly from the lower classes and with a tendency to disorder. After the time of Justinian they are not mentioned.

PARABOLOID (from Gk. *παραβολή*, *parabolē*, parabola + *εἶδος*, *eidos*, form). A solid whose surface has the equation $Ax^2 + By^2 - 2Cz = 0$, or $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2cz$. (See COÖRDINATES.) If B is positive, the surface is called an *elliptic* paraboloid; if B is negative, a *hyperbolic* paraboloid. The sections of the former made by the coördinate planes, $x = 0$, $y = 0$, are parabolas having a common axis. The section by any plane parallel to $z = 0$ on the positive side is a real ellipse; on the negative side the section is imaginary. The sections of the hyperbolic paraboloid made by the planes $x = 0$, $y = 0$ are parabolas, but the sections made by planes parallel to $z = 0$ are hyperbolas. The section made by the plane $z = 0$ is two intersecting straight lines, the limiting form of the other hyperbolas. The hyperbolic paraboloid is a special case of the hyperboloid of one sheet, and hence is a ruled surface. A paraboloid of revolution is formed by revolving a parabola about its principal axis. Its



HYPERBOLIC PARABOLOID.

equation is $x^2 + y^2 = 4pz$. Sections of such a figure perpendicular to the axis of revolution are circles. The term *paraboloidal* is applied to bodies having the general form of a paraboloid, a form commonly found in concave reflecting mirrors. See PARABOLA.

PARACATU, pä'rä-kä-tōō'. A town of the State of Minas Geraes, Brazil, near the borders of the State of Goyaz, situated 450 miles northwest of Rio de Janeiro (Map: Brazil, H 7). The town was founded near the middle of the eighteenth century, and was formerly famous for its rich gold washings. Now its chief industries are stock-raising and the cultivation of sugarcane and coffee. Its population is about 10,000.

PARACEL'SUS. The assumed name of Philippus Aureolus Paracelsus Theophrastus Bombastus von Hohenheim (1490 or 93-1541). A German physician and chemist. He was born at Einsiedeln, Switzerland, the son of a physician and chemist, Wilhelm Bombast von Hohenheim; he received his early education from his father, and at sixteen he went to Basel University, but soon abandoned it for the study of chemistry and alchemy under Withemina, Bishop of Würzburg. He traveled widely, sustaining himself by irregular practice, and collecting a vast amount of miscellaneous medical knowledge. He served some time as a military surgeon in the Low Countries, Denmark, and Italy, and learned practical metallurgy at the mines in Tyrol belonging to the Fugger family, who were celebrated for their patronage of art and science. Here he appears to have studied diligently, investigating the processes of preparing metals, and making experiments as to their medicinal virtues. His cures, real or pretended, became noised abroad, and he was called to prescribe for many of the great men of his day. Erasmus was one of his patients. At the recommendation of Œcolampadius he was, in 1526, appointed professor of physic and surgery at Basel, when he inaugurated his career as a teacher by publicly burning the works of Galen, and denouncing the Arabian masters, whose teachings were then generally followed. He also flouted tradition by lecturing in German instead of Latin. His defiance of tradition, in addition to his arrogance, vanity, and drunkenness, provoked the most bitter animosity of the regular faculty, and he was compelled to leave the university. He resumed his wanderings. Wherever he went he excited the regular faculty to a state of violent hatred, not wholly undeserved. At Salzburg he gave offense and was

thrown from a window by the servants of a physician, and had his neck broken by the fall. He was then about forty years old.

In spite of his turbulent life and charlatan methods, Paracelsus exerted a profound influence upon the medical beliefs of his time and of succeeding centuries. He struck at the weak points of the prevailing system of medicine; he destroyed the 'humoral pathology' (which was founded on the belief that diseases depended upon an excess or deficiency of bile, phlegm, or blood), and taught that diseases were actual entities, and were to be combated with specific remedies. He improved pharmacy and therapeutics, made some new chemical compounds, and strove to reduce the overdosing then practiced. A large number of medical works are attributed to him, many of which were written by his followers, and some, it is declared, by his enemies, in order to injure his reputation. Marx admits only ten as genuine, and Häser twenty-four. The earliest printed work was *Practica D. Theophrasti Paracelsus* (Augsburg, 1529). Collected editions of his writings appeared in German at Basel in 1589-91, in 1603-05, and in 1618. Latin editions in 1603-05 and 1658 (Geneva). For his life consult: M. B. Lessing (Berlin, 1839); Mook (Würzburg, 1876); Hartmann (London, 1886); Kahlbaum (Basel, 1894); and Netzhammer (Einsiedeln, 1901). Consult also Hartmann, *Grundriss der Lehren des Theophrastus Paracelsus von Hohenheim* (Leipzig, 1898), and *The Hermetics and Alchemical Writings of Paracelsus* (London, 1894).

PARACHUTE, pär'ä-shōōt' (Fr. *parachute*, from ML. *parare*, to guard against, prevent, Lat. *parare*, to prepare + Fr. *chute*, fall, OF. *cheute*, *cheoite*, It. *caduta*, fall, from Lat. *cadere*, to fall). A device for the purpose of diminishing the velocity of a falling body and used by aëronauts as a means of descending from balloons. The parachute generally takes the form of a large umbrella. Its invention is accredited to Sebastian Lenormand, and the device was used by him in 1784 in making a descent from an upper window of a house in Lyons. The first descent from a balloon was made by Garnerin in Paris in 1797, in which a parachute 23 feet in diameter, composed of a number of gores of canvas, was employed. In this parachute a wicker basket was suspended from a hoop 8 feet in diameter somewhat below the top of the umbrella-shaped surface. In its usual form, the parachute is made of canvas, being attached to the balloon so as to hang loose during the ascent, and to spread out and offer a resisting surface as soon as it is separated from the balloon and begins to fall. For a weight of 220 pounds, which includes that of the passenger as well as of the apparatus, it is necessary to have a surface about 40 feet in diameter in order to reduce the velocity to a rate of about 31½ feet per second. Under the pressure of the air such a surface would become concave and would measure about 35 feet across. The car or basket is supported by cords attached to the edge of the canvas, and sometimes there is a heavier cord or girth which passes over the top of the parachute and carries the larger part of the weight. There is generally a small opening at the top to allow some of the air to pass out, and this serves to keep the parachute steady in its proper position and prevent swinging. The concave surface has also been divided into compartments with transverse partitions for this same purpose, and each compartment has a small opening to permit of the escape of the air.

PARADE (Fr. *parade*, show, halt on horseback, from Sp., Port. *parada*, halt, parade, from *parar*, to halt, prepare, from Lat. *parare*, to prepare; connected with ἔπορον, *eporon*, I prepared). In its original sense, a prepared ground, but applied also to the courtyard of a castle or fortification, and afterwards to any inclosed and level stretch of ground. In every barracks, fort, or army post there is a parade ground upon which the regiment assembles and is formed for inspection or ceremony. Regimental parade is conducted as follows: The regiment may be formed in line, in line of platoon columns at close interval, or in line of masses. On the sounding of the assembly, companies are formed and inspected. At *adjutant's call*, battalions are formed in line; battalion adjutants, taking post in front of the centre of their respective battalions, receive the reports of the first sergeants, and present the battalions to the battalion commanders. When this is accomplished, *adjutant's call* is again sounded; the regiment is formed in line, with open ranks, each battalion at the *parade rest*. The adjutant then commands *Sound off*, and takes post six paces to the right of the colonel. The band, playing in quick time, passes in front of the adjutant and field officers, to the left of the regiment, and back to its post on the right, when it ceases. The adjutant then rides out in front of the regiment, and, bringing the regiment to *attention*, gives the commands: (1) Carry arms; (2) Present arms; after which he turns about, and reports to the colonel: "Sir, the parade is formed"; the colonel acknowledges the salute, and directs him back to his post; the staff officers and the colonel draw swords; and the latter proceeds to give such orders in the manual exercises as he may desire. After the command *order arms*, the adjutant is ordered to receive the reports, swords are returned, battalion adjutants are marched out six paces in front of company officers; commencing on the right, each adjutant salutes and reports the strength of his battalion; they are then ordered to return to their post, and the regimental adjutant reports to the colonel. After the report is acknowledged, the colonel gives the command *Publish the orders, sir*, on which the adjutant faces the regiment, and reads the orders of the day. The officers then form before the colonel, who gives whatever directions are necessary, and the ceremony is concluded. The band plays, and the various component parts are marched off to their quarters for dismissal.

Parade is also used as a term in fencing, particularly by those of the French school. It is a guard position, designed to meet or parry thrusts, the English equivalent for which is *parry*.

PARADISE (OF., Fr. *paradis*, from Lat. *paradisus*, from Gk. παράδεισος, *paradeisos*, park, Paradise, from Av. *pairidaēza*, inclosure). A word found in the Old Testament and in Greek writers from Xenophon on, as a term for the great hunting and pleasure parks of the Persian kings. It is the word translated 'forest' in Nehemiah ii. 8, and that rendered by 'orchard' in the Song of Songs iv. 13 and Ecclesiastes ii. 5;

this original sense of 'park' appears in English literature. The word was adopted by the Greek translators of the Old Testament for the 'garden' in Eden (Gen. ii. 8, and in other biblical references to Eden, q.v.). The later religious notion is bound up with the Jewish mystical thought concerning the Garden of Eden. This was supposed to be still in existence in some remote and mysteriously inaccessible place (Gen. iii. 24), to which the apocalyptic thought of Judaism, from the second century B.C., added the notion that it was reserved as the future abode of the righteous. This thought is first fully developed by the Book of Enoch (q.v.), which locates Paradise variously, in the west (like the classic Isles of the Blest), in the north (with the Mount of God), or in the east (with Genesis). According to this first stage of thought Paradise is a place of sensual delight. It was also the abode of the two saints who had been translated from this world, Enoch and Elijah. But the rapid development of eschatology grew impatient of waiting for the Day of Judgment for the decision of the fate of the dead, and in the first century B.C. Paradise became the intermediate abode of all the righteous. Yet a further step took place in the spiritualization of the idea. Just as Jerusalem was supposed to be mystically preserved in the heavens until the day of redemption (cf. Rev. xxi.-xxii.), so was Paradise caught up into the celestial spheres, and thither the spirits of the faithful were conveyed upon death. This view appears at length in the Book of the Secrets of Enoch (or Slavonic Enoch, q.v.), which locates Paradise in the third of the seven heavens, and is represented in the New Testament by Luke xxiii. 43 (cf. xvi. 23 sqq.) and II. Cor. xii. 2. At the same time there was uncertainty whether this was the final abode of the saints. Jewish theology requiring the Day of Judgment. In Revelations ii. 7 Paradise seems to be synonymous with heaven. Even in these spiritualized conceptions the imagery of the ancient Garden of Eden appears still in the Tree of Life and the Water of Life. The New Testament does not add to the idea of Paradise, but the Christian doctrine of the return of Christ to consummate His kingdom developed the notion of Paradise as the place of departed saints, where they are supposed to 'sleep in Jesus,' and at the same time to enjoy mystic fellowship with Him and with the saints on earth. In mediæval theology these distinctions are exactly drawn, whereas in most Protestant theology the doctrine of Paradise remains indistinct, and in popular Protestantism Paradise is equivalent to heaven. In Islam the crass Jewish notion of Paradise was taken over and still further sensualized: it remains a garden full of all carnal delights. (See MOHAMMEDANISM.) It is interesting to note that this idea of a garden has always appealed to the Semitic mind, which, accustomed to the desert, takes the well-watered garden as the type of heaven; but Occidental thought has stripped the theological idea of this picturesque connotation. Consult: Gunkel, *Schöpfung und Chaos* (Göttingen, 1895); Charles, *Eschatology, Hebrew, Jewish, and Christian* (London, 1899); Hagenbach, *History of Christian Doctrines* (Eng. trans., Edinburgh, 1880); Salmond, *The Christian Doctrine of Immortality* (ib., 1897). See ESCHATOLOGY; HEAVEN.

PARADISE LOST. An epic poem by John Milton, published in 1667. The idea of a great epic had filled Milton's mind for many years; at first the legend of King Arthur attracted him, but he chose at last the story of the fall of man, attempted in English by Cædmon and Fletcher. Milton may have been influenced by Andreini's drama *Adamo*, about 1640, and Joost van Vondel's drama *Lucifer*, 1654. The poem is a stately creation of life and action beyond mortal scope.

PARADISE OF FOOLS, THE. One of the four divisions of Limbo, the *Limbus Fatuorum*, reserved for fools, idiots, and lunatics; but at present the term denotes the state of mind of one who indulges in vain hopes and expectations.

PARADISE REGAINED. A poem by John Milton (1671). It supplements the *Paradise Lost*, but is written in a colder, more severe style. It is in fact a paraphrase of the narrative of the Temptation in the Gospels, a dramatic dialogue between two voices, good and evil.

PARADISO, pä'rä-dē'zō. In. (It., The Paradise). The last part of Dante's *Divina Comedia*.

PARADOXIDES, par'a-dok'si-dēz (Neo Lat. nom. pl., from Gk. παράδοξος, *paradoxos*, incredible, from παρά, *para*, beside, beyond + δόξα, *doxa*, opinion, belief, from δοκεῖν, *dokein*, to seem). An important and characteristic fossil trilobite of the Middle Cambrian rocks of North America, Europe, and Australia. The animal has a flat, long, tapering shield with large arcuate head shield and sixteen to twenty thoracic segments, and a small round tail shield or pygidium. The eyes are narrow, of crescentic outline, and not prominent, and the posterior lateral angles of the head are usually furnished with long spines. The best known species, *Paradoxides harlani*, found in the sandy shales of the Cambrian in eastern Massachusetts, sometimes attains a length of 20 inches, with a width across the head of over 10 inches. Finely preserved specimens of other species of Paradoxides are found in the limestone nodules of the Cambrian shales of New Brunswick, Canada, and Newfoundland. See TRILOBITA.

PARADOX'URE. See PALM CIVET.

PARÆSTHE'SIA. See FORMICATION.

PARAFFIN (Fr. *paraffine*, from Lat. *parum*, little + *affinis*, akin, from *ad*, to + *finis*, end). A hard, white, wax like substance largely used for the manufacture of candles, a small amount of stearin being added to render the candles translucent. Paraffin is used, besides, in making matches, in preserving meat and wood, to improve the quality of timber employed as fuel, to render fabrics waterproof, etc. It occurs naturally in the mineral ozokerite, which was formerly the chief source of the substance. The manufacture of paraffin has developed into an important industry since 1851, when it was founded by James Young, a Scotch chemist. At present, considerable quantities of paraffin are made in Germany, by distilling certain varieties of brown coal. In Scotland, the chief seat of the industry, it is made from boghead coal and certain bituminous shales. When the shale is subjected to a process of destructive distillation, a green, oily liquid passes over, which contains a large amount of paraffin in solution. This crude oil is washed with sulphuric acid and with caustic soda, and is divided into more and less vola-

tile fractions by further distillation. Most of the paraffin is contained in the heavy, non-volatile fractions; and when the latter are let stand for some time, at a sufficiently low temperature, the paraffin separates out in the form of a crystalline mass. The crude product is purified by washing with benzine and decolorized by heating with waste coal. Chemically, paraffin is a mixture of the higher aliphatic hydrocarbons (see HYDROCARBONS); the relative composition of the mixture is not always the same, and the melting temperature varies with the product, being anywhere between 45° and 90° C. Paraffin has neither taste nor odor; it is insoluble in and lighter than water.

Among the useful by-products obtained in the manufacture of paraffin are: Benzine (not benzene), asphalt, and *paraffin oil*. Paraffin oil yields oil-gas, which has a very high illuminating power and is used to enrich ordinary coal-gas; it is largely used also for lighting ships, railroad cars, etc.

PARAFFINS. See HYDROCARBONS.

PAR'AGLOB'ULIN. See GLOBULINS.

PARAGUA, pä-rä'gwä. The old Spanish name of the island of Palawan, Philippines, and the present name of the province forming the northern half of the island (Map: Philippine Islands, D 9). See PALAWAN.

PARAGUARÍ, pä'rä-gwä-rē'. A town of the department of the same name, Paraguay, 30 miles southeast of Asunción, on the railway leading from that place to Encarnación. It is the centre of traffic for the surrounding region, which is chiefly engaged in tobacco culture. Paraguarí was founded in 1775. Its population has doubled since the introduction of the railroad, and now amounts to about 7000.

PARAGUAY, păr'ä-gwā *or* pä'rä-gwī'. An inland republic of South America, bounded on the north by Bolivia and Brazil, on the west and south by Argentina, and on the east by Argentina and Brazil. It is bisected by the Tropic of Capricorn. It has an area of 98,000 square miles, being about as large as Italy excluding Sicily. The Paraná River forms a large part of the eastern boundary. The country is divided by the Paraguay River into two sections: (1) Eastern Paraguay (Paraguay proper), between the Paraguay and Paraná rivers, which has attained considerable development; (2) west of the Paraguay, that part of the Gran Chaco belonging to the Republic. Few enterprises of the white race have yet been carried into the latter region.

TOPOGRAPHY. Eastern Paraguay is a plateau of no great elevation surmounted by low ridges and hills and subsiding in the west and southwest to grassy tracts, morasses, and lagoons, which scarcely rise above the fluvial level. The plateau has an average altitude of less than 300 feet above sea level, and the hills and ridges rarely exceed 1600 feet in height. The name of mountains can hardly be assigned to these hills. Slightly undulating plains skirt the east bank of the Paraguay, but away from the river the hills soon become numerous and higher. Chains of low heights extend north and south through the country, and are hyperbolically called Sierras and Cordilleras, though hunters and maté-gatherers easily pass from one slope to the other. The fact that much of the interior is still little known is due not to these low ridges, but to the dense tangle of vegetation covering their slopes. The Gran Chaco west of the Paraguay River is mainly an immense level plain with a very slight slope toward the river, and with large areas subject to frequent inundations.

HYDROGRAPHY. Between the low ranges flow innumerable rivulets and streams. The whole country is divided into two fluvial basins, the Paraná system to the east and the Paraguay system to the west. While the Paraná is one of the largest rivers of the world and the Paraguay is its tributary, the Paraná is of minor importance in the country's development. The Paraguay River, on the other hand, has a far greater importance in the industrial advancement of the Republic. Life, energy, and progress are chiefly centred in its valley and especially on its eastern shore. Of great depth, unvarying in current and velocity, and containing an immense volume of water, it can at all times be navigated by the largest vessels, so that it forms a highway of trade into the heart of the continent. The Pilcomayo is the chief affluent of the Paraguay, but though it is navigable on the Bolivian frontier as well as in its lower reaches, the current is too feeble in its middle course across the level plain to excavate a deep channel, and the middle river is therefore too shallow for navigation.

CLIMATE. The country is hot, but the heat is tempered by many refreshing breezes from the south. The temperature of the summer months (December, January, and February) ranges from about 55° F. to 100°. From May to August (winter) it occasionally falls to about 40°, but during the day is frequently 86°. Nine of the twelve months may be said to be perpetual spring, the other three months being very hot. The annual rainfall amounts to 46 inches, distributed over about one-fourth of the days of the year. The rainy season is chiefly confined to the period between August and October, and, as the amount of precipitation shows, it cannot be compared with what is usually called the rainy season in tropical countries. The climate is not unhealthful, and white immigrants, by observing ordinary hygienic rules, maintain a high degree of vigor.

FLORA. The Paraguay River divides the country into well-defined botanical regions. In Eastern Paraguay the prevailing feature of hill and valley is virgin forests with majestic trees, tangled lianas, and brilliant flowers; among the forests are interspersed wide tracts of pasturage covered with tall grass, and pindo and mbocaya palms crowning many hills. There are also groves of orange trees whose fruitage never fails, clumps of bananas, and the large bush of the timbo, a leguminous plant. The Chaco, west of the river, on the other hand, presents the bare aspect of a heath occasionally marshy or dotted over with yatais palms; on rising ground thrive dense quebracho forests. The excellence of Paraguayan timber, both for building and cabinet-making, is far-famed. The density of many of these woods is so great that they will not float; but lighter woods, such as are needed for ordinary carpenter work, are not lacking. The forests also supply dyestuffs and many medicinal plants. Perhaps the most characteristic vegetable product is maté, which grows in the forests, is cultivated on plantations, and is the leading article of export.

FAUNA. Among the wild animals are the jaguar, the most formidable of the carnivora, the American lion or puma (which, however, is far more common in Argentina), the tiger cat, the marten, polecat, tapir, peccary, and deer. Saurians swarm throughout the country. The alligator of the Paraná is strong and large, but not so fierce as that of the Amazon. Though the venomous snakes include the rattlesnake, viper, and cobra, few cases of snake-bite occur, largely because of the great caution of the Paraguayans. The boas are enormous, but singularly inoffensive. Paraguay can boast of some of the most beautiful birds in the world. No family is unrepresented, from the enormous wading birds to the tiniest of humming-birds. In the wilderness flies, gnats, and other pests are very annoying, but, strange to say, they give little trouble in the cultivated districts.

GEOLOGY. Broadly speaking, limestones predominate in Northern Paraguay as far south as latitude 22° S., while sandstones prevail in most of the hilly regions of the south, the plains being formed of argillaceous beds and sandy stones belonging to the Tertiary epoch. In some districts volcano cones are seen. The hills and ridges are due to great dislocation of the rocks occurring long before the mighty upheaval of the Andean Cordilleras; but the present elevations are only the ruins of former lofty summits which have been degraded by long denudation. Little use is yet made of the mineral resources, though iron ore is widely distributed, marble is abundant in the north, and copper and other valuable minerals are found.

AGRICULTURE. The soil in Paraguay is generally good. Farming is the chief pursuit, but is in a very backward condition. Only about 300,000 acres are under cultivation, chiefly along the rivers, where transportation is easy. Owing to the fact that the State owns the public lands and for a long period sold large areas to capitalists and syndicates, the price of the lands most favorably situated for farming or stock-raising was high, and this helped to retard the development of agriculture. Large tracts of country also have been assigned to the holders of Paraguayan bonds as security for the national debt, and many a peasant pays rent to foreign owners of land. The most important crop is maté, whose withered leaves are used as tea, the beverage being very popular in Paraguay, Brazil, Argentina, and some other South American countries. The decoction appears to act both as a stimulant and also, by retarding digestion, as a substitute for food. Half of the crop is consumed at home. The crop is gathered from the wild shrub in the forests or from the cultivated plant, and though the adjacent districts of Brazil also produce it, that of Paraguay is superior in quality. The native orange trees yield an enormous crop. Almost every house has its orange grove. Hogs are fattened on oranges, and immense quantities are exported. Maize, the great cereal crop, is the staple food. Wheat, rice, and other cereals are raised, but not in sufficient quantities to supply the home demand. Tobacco is a large crop, and is consumed in enormous quantities, but has been so poorly cured that it is only just beginning to be important in exports. Among other vegetable products are sugar-cane, coffee, cotton, and ramie. Stock-breeding has not yet attained its proper development. The grasses are of superior quality. The number of cattle is now rapidly increasing. Good grazing lands are abundant in Eastern Paraguay, and branches are being opened by cattle men on the plains of the Gran Chaco. In 1900 it was estimated that the cattle numbered 2,743,665; horses, 182,790; mules and asses, 7626; sheep, 214,060; goats, 32,334; and hogs, 23,900. The cattle are used chiefly for meat (including jerked beef), and for hides, which are a large export. As in all Spanish countries, butter is scarcely known, but butter and cheese are now produced by foreign immigrants for their own consumption. Among the numerous forest products the *quebracho colorado*, now found only on the Chaco, is most important. It contains nearly 30 per cent. of tannin and is used chiefly for tanning, but also for railroad ties and other purposes. Large quantities of the wood are exported to Germany, and the tannin is also locally extracted. The export of forest products for Europe and other parts of the world is increasing, though the difficulty of carrying them to the Paraguay and Paraná rivers for shipment is still great. Paraguayan woods for piles in the harbor works of Argentina and Uruguay and for railroad ties are in large demand.

MANUFACTURES. The country has made little advance in general industries. In 1899 308 distilleries were making spirits from sugar-cane juice, 3 sugar factories were producing an inferior grade of sugar for home consumption, and 73 kilns were turning out brick and other clay products. Other manufacturing industries are tanning, and furniture and cigar making. There were in 1899 35 wood yards, 36 bakeries, 26 blacksmith shops, soap works, etc. Many of the Indians, under the tuition of the Jesuits, have become skilled in various trades.

COMMERCE. The following table shows the value of the imports and exports in gold dollars at Asuncion, the capital and chief town:

	1898	1899	1900	1901
Imports	$2,608,487	$2,147,858	$1,858,710	$3,003,658
Exports	2,463,294	2,021,023	2,064,290	2,529,307

As all the people dress in cotton fabrics, these textiles are the principal foreign purchases, being followed by wine and rice. About half the imports come from Great Britain and 85 per cent. of the foreign purchases are textiles. The chief exports in 1901 (gold value) were: maté, $774,090; hides, $755,348; tobacco, $193,845; timber, oranges, and hair. Other exports include leather, manioc, and ostrich feathers.

TRANSPORTATION AND COMMUNICATIONS. Four fairly good roads lead from Asuncion to various parts of the country. With these exceptions there are scarcely any roads, and land transportation is difficult and costly. A number of the tributaries of the Paraná and Paraguay are important in the transportation of forest products to those rivers, but the stage of water in them is often too low for navigation. Thus it is very difficult at times to deliver a part of the maté crop at the large rivers for shipment. In 1896 the Great Southern Railroad of Argentina purchased ties in Australia because Paraguay, with its enormous quantities of timber adapted for that purpose, could not ship the supply needed in the stipulated time. The traffic of the country

is centred on its two great rivers, the Paraguay carrying the larger part of it. In 1901 2157 steamers and sailing vessels entered and cleared at the port of Asuncion. Some of the largest and finest river steamers in the world ply between that port and Buenos Ayres. A railroad is in operation between Asuncion and Pirapo, 156 miles.

GOVERNMENT. The present Constitution was adopted by a popularly elected convention of 60 delegates which met at Asuncion on August 15, 1870. The government is that of a centralized republic. The legislative power is vested in a Congress consisting of a Senate and a Chamber of Deputies. Both Senators and Deputies are elected by universal suffrage in the proportion of one Senator for each 12,000 inhabitants, and one Deputy for each 6000. The Senators are chosen for a term of six years, one-third retiring every second year. The Deputies serve for four years, one-half of the membership of the chamber retiring biennially. The executive power is vested in a President chosen for a term of four years by an electoral college very similar to the method followed in the United States. He is eligible to reëlection only after an interval of eight consecutive years. He is aided in the exercise of his functions by a Cabinet of five ministers who are responsible to the Legislature. In case of death or inability of the President he is succeeded by a Vice-President, who is *ex-officio* President of the Senate. The judicial power is vested in a Supreme Court consisting of two associate justices and one chief justice; five inferior courts; and a series of magistrates' courts, of which there is one in each town of importance. The Supreme Court is a tribunal of last resort and possesses the right to pass upon the constitutionality of acts of Congress. The justices are appointed by the President with the consent of the Senate for a term of four years. The powers of the executive and of Congress, the guarantees in behalf of civil liberty, the provision for amending the Constitution, etc., are quite similar to those in the Constitution of the United States. For purposes of local government Paraguay is divided into 83 circumscriptions called 'departments,' which are in turn subdivided into cantons. The capital is Asuncion (q.v.).

FINANCE. The revenue is almost wholly obtained from customs dues. Stamp duties, patents, harbor duties, postal charges, and the like are so moderate that they are no appreciable burden upon the people. The revenues and expenditures are small when compared with those of most other countries. The figures for four years are as follows, the value being expressed in paper dollars, which are worth only about one-tenth of the gold dollar:

	1896-97	1897-98	1899-1900	1900-01
Revenue	$4,200,009	$8,977,209	$9,866,000	$11,412,747
Expenditure	6,852,384	8,441,275	8,122,139	.....

Paraguay incurred a large foreign debt chiefly on account of prolonged civil wars. As a result of the country's failure at times to meet its obligations, it has been necessary to make arrangements for scaling the debt and reducing the interest. The debt in 1874 amounted to $7,527,000 (gold), but it was agreed in 1885 that in exchange for this debt new bonds to the amount of $4,250,000 should be issued. An arrangement was also made for the future payment of interest, and land was assigned to creditors in payment of arrears of interest up to July, 1886. The holders of these unpaid interest coupons received land warrants, and the Paraguay Land Company, later known as the Anglo-Paraguayan Land Company, was formed to deal with these warrants. Another arrangement was made with the bondholders in 1895 for the reduction of interest, refunding of interest coupons in arrears, the creation of a sinking fund, and the assignment of securities. The outstanding debt in 1902 was $4,688,750 (gold), and the guarantee debt which the Government owed to the Paraguayan Central Railroad amounted to $5,130,305.

There are five banks: the Agricultural Bank, with a capital of 3,025,723 pesos (for value see below), the Territorial Bank, the Mercantile Bank, the Bank of Los Rios, and the Caja de Crédito Commercial. Paper money is chiefly in circulation, the amount on December 31, 1901, being 10,566,171 pesos.

The nominal value of the peso is $1, but as compared with the paper peso gold is at a premium of about 1000 per cent. The legal value of the gold peso is one American gold dollar. The silver peso varies in value according to the gold price of silver. The metrical system of weights and measures has nominally been obligatory since 1886, but practically the old Spanish weights and measures have remained in use.

The Paraguayan standing army has 1500 men.

POPULATION. The census of 1899 showed a population of about 630,000, of whom nearly 100,000 were Indians. The foreign population in 1895 numbered 5000 Argentines, 2500 Italians, 1500 Spaniards, 1250 Germans, 800 French, 600 Brazilians, and 1000 Swiss, Austrians, English, and other nationalities. The Paraguayans are a hospitable, well-meaning people, whose prosperity was long retarded by terrible misrule, but whose position is improving under the present favorable conditions of government.

EDUCATION AND RELIGION. The schools are supported by the State, but though education is nominally compulsory, only about one-fifth of the adult Paraguayans can read and write. In 1897 there were 390 public and private elementary schools, with 25,000 pupils and 700 teachers. A number of Protestant schools are maintained and private schools are partly supported out of the public funds. An agricultural school near Asuncion, with a model farm, is having a favorable influence upon farming. The national college, with 15 professors and 205 students, is situated at Asuncion. This city has a public library and five newspapers. The Roman Catholic is the State religion, but everyone is protected in the exercise of his own religion.

IMMIGRATION. The Government encourages immigration, yet, owing to the troubled history of the country until quite recently and the nearer opportunities presented by Argentina, the incomers from foreign countries have been comparatively few. In 1897 there were seven agricultural colonies, embracing 2148 inhabitants, Italians, Germans, French, Spaniards, Swiss, and English. They cultivated 10,000 acres and possessed 235,246 fruit trees, 62,620 coffee plants, 1444 horses, and 14,615 cattle. A con-

siderable number of foreigners, also, scattered through the towns, are leaders in business affairs and a helpful, progressive element.

History. The native inhabitants of the region above the junction of the Paraná and the Paraguay rivers belong to the warlike race of the Guaraní (q.v.). The country was first explored in 1527-28 by Sebastian Cabot, who made his way for several hundred miles up the course of these two streams. In 1529-30 Diego Garcia entered the same region, and in 1536 or 1537 Juan de Ayolas laid the foundation of a town at Asuncion. He was murdered by the natives, but Martinez Yeala, who succeeded him, soon put the colony in a prosperous condition and it promised to become one of the most important in South America. His power was largely personal, however, and after his death a period of anarchy ensued, which effectually destroyed Spanish influence over the natives. The country was considered as a dependency of the Viceroyalty of Peru, which exercised, however, little more than nominal oversight. The history of Paraguay is chiefly remarkable for the long civil and religious domination of the Jesuits, extending from 1609 to 1768. The missions, or Reductions as they were called, were not only centres of education and civilization, skillfully directed to appeal to the habits and imagination of the natives, but they were refuges from the rapacity and oppression of the Spanish conquerors, and as such acquired an influence and moral ascendency in many ways analogous to that exercised by the monasteries of Europe in the early Middle Ages. The disciplinary rule of the Jesuits was thorough. They instituted a penal code with carefully graduated penalties, and established large schools for the education of the children. The economic character of the Reductions was largely communal, in keeping with native customs and traditions. After the expulsion of the Jesuits the missions soon became deserted. At that time (1768) there were in the various Jesuit stations some 400,000 natives. In 1776 Paraguay was included in the Viceroyalty of Rio de la Plata. The Spanish Government was overthrown in 1811. The last Governor quietly resigned his office, and his place was taken by a triumvirate, one of whose members was José Gaspar Francia (q.v.), who soon made himself Dictator, upon the occasion of a war with the Argentines, and held that position until his death, in 1840. His rule was based on a policy of national isolation. He attempted to cut off all intercourse with other States, and actually closed the Paraguay River to navigation. His policy was followed by his successors—Vidal, who ruled the country from 1840 to 1844; Francia's nephew, Carlos Antonio Lopez (1844-62); and from 1862 to 1870 the latter's son, Francisco Solano Lopez (q.v.). The last named, an ambitious despot, plunged Paraguay into a five years' war with Brazil, Argentina, and Uruguay, which utterly exhausted the country. The struggle terminated with the death of Lopez at Aquidaban in 1870. The establishment of peace was followed by the adoption of a more liberal Constitution.

PARAGUAY RIVER. A river of South America, the largest tributary of the Paraná (q.v.). It rises on the plateau of Matto Grosso and flows in a general southward direction, at first wholly in Brazil, then on the boundary between Brazil and Bolivia, then through the centre of Paraguay, and finally, below Asuncion, on the boundary between Paraguay and Argentina until it joins the Paraná near Corrientes (Map: South America, D 5). Its total length is about 1500 miles. Its sources are a series of lakes called As Sete Lagoas, which are believed to be also the source of a headstream of the Tapajoz, which flows into the Amazon. After leaving the plateau in a series of rapids the river flows for the rest of its course with a tranquil current over an almost level bed through the great plains known as the Gran Chaco and the Pampas. The upper part of this plain, above the Bolivian frontier, forms the marshes called the Laguna de los Charayes (Xarayes). This tract is converted during the annual floods into a vast lake over 100 miles wide and several hundred miles long, leaving exposed only a few islands and the rows of trees which line the banks of the permanent streams. Below the Charayes the river is again confined to its banks by spurs of the plateau, and farther south its bed is so deeply cut into the plain that the latter generally escapes inundation. Below Asuncion, however, the banks again become marshy. From the escarpment of the plateau to the confluence with the Paraná, a distance of 900 miles, the river is entirely free from obstructions, and is navigable at all seasons for small vessels, which can also ascend the São Lourenco to Cuyabá in Brazil. Steamers drawing nine feet can at all seasons reach Corumba at the southern end of the Charayes, and the river is the only commercial outlet for Matto Grosso and Paraguay. Two lines of steamers ply regularly between Asuncion and Buenos Ayres, each running one steamer weekly, and in 1898 nearly 500 ocean vessels entered the former port. The longest tributaries of the Paraguay are the Pilcomayo and the Berbejo. The river was discovered by Sebas-

[illegible] in 1526, ascended the Paraná as [illegible]

PARAGUAY TEA. A South American [illegible] See MATÉ.

PARAHELIOTROPISM from Gk. παρά, *para*, beside — ἥλιος, *hēlios*, sun — τροπή, *tropē*, a turning, from τρέπειν, *trepein*, to turn. A sensitiveness of plants, especially of leaves, to the rays of light, by which they take the position of least illumination when exposed to intense light. Parahelioptropic leaves may turn their tips either toward or away from the source of light. In either case the response brings the plane of the leaf parallel to the direction of the incident light rays. Thus the leaf is much less strongly illuminated than in the diaheliotropic position, at right angles to this direction. Many plants of the pea family show this response on bright days in summer. See HELIOTROPISM.

PARAHYBA, or PARAHIBA, pä'rä-ē'bä. One of the smaller states of Brazil, lying in the easternmost part of the country, and bounded by the state of Rio Grande do Norte on the north, the Atlantic Ocean on the east, Pernambuco on the south, and Ceará on the west (Map: Brazil, K 5). Area, 28,850 square miles. The surface is low and marshy on the coast, but the greater part consists of an elevated plateau whose slopes are heavily forested. The climate is dry and healthful, but the soil in the interior supports only a scanty vegetation. In the coast region are raised sugar, cacao, rice, and tobacco, and some coffee is cultivated in the more elevated regions. The population in 1890 was 457,232, consisting largely of Indians and Negroes. The capital is Parahyba (q.v.).

PARAHYBA, or PARAHIBA. The capital of the State of Parahyba, Brazil, situated on the river of the same name, about 10 miles from the sea, and 50 miles north of Pernambuco (Map: Brazil, I 5). The town lies partly on hills and partly in a plain; the former section is the old city and has dwindled away, while the newer portion, along the river, forms, with its port of Cabadello, the business quarter. The most notable structures are the cathedral and a former Jesuit college, which contains the state offices. The harbor of Cabadello is deep enough for vessels of 15 feet draught, and from it sugar and cotton are exported. Population, in 1890, 15,000. Parahyba was founded by the Portuguese in 1579, being one of the oldest settlements of Brazil.

PARAL'DEHYDE from Gk. παρά, *para*, beside — Eng. *aldehyde*, clipped form of Neo-Lat. *alcohol dehydrogenatum*, alcohol deprived of hydrogen. A polymeric form of aldehyde with the symbol $(C_2H_4O)_3$, occurring as a colorless or pale yellow oily liquid, soluble in about nine parts of water and miscible with the oils, ether, and alcohol. It is obtained by treating aldehyde with dilute sulphuric acid or dilute nitric acid. In medicine, it is used as a hypnotic (q.v.) principally, rarely as a diuretic and antispasmodic. Excitement follows its administration, which is succeeded by sound and refreshing sleep, without digestive or cerebral disturbance. It does not weaken the heart's action. See ALDEHYDE.

PARALLAX (from Gk. παράλλαξις, *parallaxis*, alternation, from παραλλάσσειν, *parallassein*, to make alternate, from παρά, *para*, beside — ἀλλάσσειν, *allassein*, to alter, from ἄλλος, *allos*, other). The apparent displacement of an object caused by a change of place of the observer. When an object at M (Fig. 1) is looked at from

FIG. 1.

P, it appears in line with some other object, S; but after the observer has moved to E, M has apparently retrograded to a position in line with S'; this apparent retrogression is called *parallax*. The angle PME is called the *angle of parallax*, and is the measure of the amount of parallax. To astronomers the determination of the parallax of the heavenly bodies is of the greatest importance, for two reasons—first, from the necessity of referring all observations to the earth's centre, i.e. so modifying them as to make it appear as if they had been actually made at the earth's centre; and secondly, because parallax is our only means of determining the magnitude and distance of the heavenly bodies. The *geocentric* parallax, the apparent displacement of a heavenly body due to its being observed from a point on the surface of the earth instead of from its centre, may be determined as follows: Let P and P' be two stations on the surface of the earth (Fig. 2), E its centre, M the object to be ob-

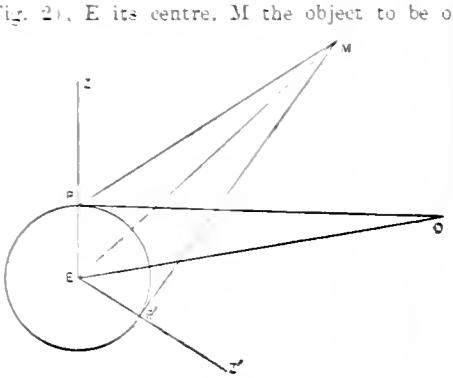

FIG. 2.

served, and Z and Z' the zeniths respectively of the observers at P and P', then at P and P' let the zenith distances, ZPM and Z'P'M, be observed simultaneously, and since the latitudes of P and P', and consequently the angle PEP', is known, from these three the angle PMP' (the sum of the parallaxes at P and P') is at once found; and then by trigonometry the separate angles or parallaxes PME and P'ME. When the parallax of M, as observed from P, is known, its distance from E, the centre of the earth, can be at once found in terms of the earth's radius as a unit. When the heavenly body is on the horizon, as at O, its geocentric parallax is a maximum, and is known as the *horizontal* parallax.

In the case of the fixed stars, which are so far away that to them the earth's radius subtends only an infinitesimal angle, it becomes necessary to make use of a much larger base-line than the earth's radius, and, as the largest we can employ is the radius of the earth's orbit, it

accordingly is made use of, and the displacement of a star, when observed from a point in the earth's orbit instead of from its centre, the sun, is called the *annual* or *heliocentric* parallax. Here the base-line, instead, as in the former case, of being 4000 miles, is about 92,800,000 miles, and the two observations necessary to determine the parallactic angle are made from two points on opposite sides of the earth's orbit, at an interval as nearly as possible of half a year. Yet, notwithstanding the enormous length of the base-line, it bears so small a proportion to the distances of the stars that only in a few cases have they been found to exhibit any parallactic motion whatever, and in no case does the angle of parallax amount to 1". See STAR.

SOLAR PARALLAX. The extremely precise determination of this quantity is very important, since the solar parallax is our only means of determining the distance of the sun from the earth. This is the fundamental unit of distances in astronomy. Upon it depend directly all our notions as to the magnitude and distance of the other members of the solar system, and of the universe in general. The solar parallax problem is not only the most important one in fundamental astronomy, but it is also, perhaps, the one offering the greatest difficulty in solution. Astronomical instruments enable us to submit to actual measurement only the directions in space of the heavenly bodies, never their distances. These latter must be obtained by computation from measured directions or angles, and for this purpose some base-line is indispensable. The largest possible terrestrial base-line is of course a diameter of the earth. Yet so small is even this compared with the distance of the sun, that it would subtend an angle of only about eighteen seconds of arc to an imaginary observer at the sun's centre. When we reflect that an angle of one second corresponds to only three-tenths of an inch at a distance of one mile, we get some idea of the extreme minuteness of the earth's diameter as seen from the sun.

It is never possible, of course, to get a complete diameter of the earth for a base-line; but extraordinary efforts have been made to come as near as possible to this ideal condition. For many years observations of transits of Venus were considered the most favorable means of measuring the small angular differences of direction of the sun's centre as seen from opposite sides of the earth. No expense was spared, especially for the transits of 1874 and 1882, to secure very complete observations. Yet, although the various civilized governments of the world sent out numerous and most elaborately equipped observing expeditions, the whole operation turned out practically a failure. It was simply impossible by this method to secure observations of the requisite precision. Of late years, two other methods have been pretty generally accepted as the best. The first is based on the so-called constant of the aberration of light. (See ABERRATION OF LIGHT.) It is known that the directions in which we see the stars are apparently thrown forward toward that part of the sky to which the orbital motion of the earth is carrying the observer. It is a phenomenon analogous to the well-known fact that if a man be running in a rain-storm the falling drops seem to slant toward him though they are really falling vertically. So their directions seem to be thrown forward in the direction of the observer's motion. In the case of the earth's orbital motion around the sun, the observer will be moving in opposite directions in space at intervals of half a year. Consequently the effect of aberration is reversed, and the so-called 'constant' or amount of aberration admits of determination from the differences of observations made six months apart. The solar parallax can be computed from the aberration constant, since we know, with quite sufficient precision, the velocity of the transmission of light in space.

The other accredited method of determining the parallax is by observations of the planetoids. The method is extremely simple in practice, and also very accurate. It is necessary merely to wait for a time when one of these little bodies is favorably situated for observation, and then to fix its position telescopically with respect to the neighboring stars. Let this be done simultaneously at two observatories situated very far apart on the earth, and using, of course, the same stars in both places. Then it is clear that the position determined for the planet will not be quite the same at the two observatories. The base-line is the straight line joining the two observatories. As a result we obtain directly the distance of the planet from the earth, in terms of this base-line as a unit. But this is known in miles from existing geodetic surveys of the earth. Thus we arrive at a knowledge, in miles, of the planetoid's distance. But from the ordinary processes of astronomical observation, we know the so-called elements of the planetoid's orbit. (See ELEMENTS.) We can find from these, by a simple computation based on Kepler's laws, the distance of the planetoid from the earth in terms of the latter's distance from the sun. Knowing then the distance between the earth and planetoid in miles from the special parallax observations, and in terms of the distance 'earth-sun' from theory, we can at once deduce the value of 'earth-sun' in miles. This, combined with our knowledge from geodesy of the terrestrial radius in miles, enables us to compute the angle subtended by that radius to an observer in the sun — in other words, the solar parallax.

The planetoid method was put in operation by no less than twenty-five observatories, acting in co-operation. By thus increasing the number of observation stations the precision of the final result could not fail to be greatly enhanced. The entire campaign was planned and managed by Gill, of the Cape of Good Hope Observatory. The observatories taking a principal part in the work, in addition to that at the Cape of Good Hope, were those at Bamberg, Leipzig, Göttingen, and, in this country, Yale University. All these observatories are provided with the modern heliometer, probably the most precise apparatus for measurement on the sky at present known to science.

The parallax determinations through the constant of aberration have been made principally in connection with the study of latitude variation.

It may be of interest here to show the relative precision or 'weight' of the various parallax methods. The general work of highest authority on this subject is the *Fundamental Constants of* [illegible] by Simon Newcomb (Washington [illegible]). Newcomb assigned the following 'weights' or relative degrees of precision:

From the aberration constant.. .... weight 68
From the planetoid method .... weight 20
Six other methods combined. .. .. weight 35

Newcomb was already at that time in possession of preliminary results of Gill's researches, communicated to him in advance of publication. But after his writing several important series of aberration determinations were made public, and the results exhibited certain small discordances among themselves, which discredited somewhat the aberration method, and consequently enhanced the relative weight of the planetoid method. The latter method gained also from the discovery in 1898 of a new planetoid, much more favorably situated for parallax determinations than any previously known. See EROS.

The final result for the solar parallax at present accepted by astronomers in general is 8″.80, corresponding to a distance of 92,789,000 miles between the earth and the sun.

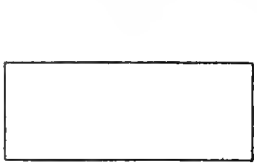
PAR'ALLEL'EPI'PED (ML. *parallelepipedum*, from Gk. παραλληλεπίπεδον, *parallēlepipedon*, from παράλληλος, *parallēlos*, parallel, from παρά, *para*, beside, beyond + ἀλλήλων, *allēlōn*, of each other, from ἄλλος, *allos*, other + ἄλλος, *allos*, other, + ἐπίπεδον, *epipedon*, plane surface, from ἐπί, *epi*, upon + πέδον, *pedon*, ground), or PARALLELOPIPED. A solid figure having six parallelograms for faces. Therefore any two opposite faces are equal and parallel. If the faces are all squares the parallelepiped is a cube. The volume of a parallelepiped is found by multiplying its base by the altitude.

PARALLEL FORCES. See MECHANICS.

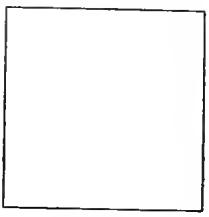
PARALLELISM. A term used in philosophy to denote an hypothetical relation of matter and consciousness. In the history of philosophy Spinoza is the most thorough-going parallelist, holding that matter and ideas are both attributes of one divine subject, and that every material object, or instance of the material attribute, has its ideal counterpart. In modern times the term parallelism is used more particularly in psychology and in epistemology to denote the specific parallelism of the human (or animal) body with the concrete consciousness of man (or lower animal). In this usage, parallelism means the concomitance of brain process and mental process. It is distinguished from interactionism, which holds that mental processes may cause and precede brain processes and *vice versa*. Psychologists, however, do not accept parallelism as an explanatory theory, but only as an hypothetical statement of a relation of body and mind which may be used as a basis for formulation of psycho-physical facts. The solution of the problem is by them held in abeyance or referred to the epistemologist. See BODY AND MIND: DUALISM: KNOWLEDGE, THEORY OF; MIND-STUFF THEORY; OCCASIONALISM.

PARALLEL MOTION. See MECHANICS.

PAR'ALLEL'OGRAM (Lat. *parallelogrammum*, from Gk. παραλληλόγραμμον, parallelogram, neu. sg. of παραλληλόγραμμος, *parallēlogrammos*, bounded by parallel lines, from παράλληλος, *parallēlos*, parallel + γράμμα, *gramma*, line, letter, from γράφειν, *graphein*, to write). A quadrilateral whose opposite sides are parallel. From this it follows that the opposite sides and angles must be equal. Therefore, if one angle of a parallelogram is a right angle, all of them are, and the figure is then called a *rectangle;* and if at the same time all the sides are equal, the figure is a *square*. If the sides are equal, but not the angles, it is a *rhombus*. If only the opposite sides are equal, it is a *rhomboid*. The diagonals of a

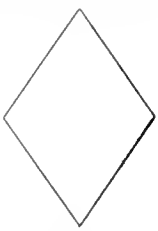


RECTANGLE.



SQUARE.

parallelogram bisect each other, and each bisects the parallelogram: the sum of their squares is equal to the sum of the squares of the sides of



RHOMBUS.

RHOMBOID.

a parallelogram. All parallelograms which have equal bases and equal altitudes are equal in area, and this is found by multiplying the base by the altitude.

PARALLELOGRAM OF FORCES. See MECHANICS, section *Two Non-Parallel Coplanar Forces.*

PARALLELS (OF. *parallele*, Fr. *parallèle*, from Lat. *parallelus*, *parallelos*, parallel). In military fortifications, trenches cut in the ground, parallel to the position under siege, and designed to protect the men and guns of the besiegers from the fire of the besieged. See SIEGE AND SIEGE WORKS: FORTIFICATION.

PARALLELS, or CIRCLES OF LATITUDE. Circles drawn round the surface of the earth parallel to the equator. They are the intersections with the earth's surface of planes which cut the earth at right angles to its axis. The greatest of these circles is the equator, which has the centre of the earth for its centre, the radius of the earth for its radius, and is equally distant at all points from each pole. It is evident that of the others, those next the equator are greater than those more remote, and that they become less and less till at the poles they vanish altogether. The radius of any one circle is equal to the earth's radius multiplied by the cosine of the latitude, if we regard the earth as a sphere. The rotary velocity of the earth's surface, which is about 17¼ miles per minute at the equator, is therefore about 8⅝ miles in latitude 60°; and in latitude 89½° (within 35 miles of the pole) is not more than 267 yards per minute. The most important parallels of latitude are the *tropics of Cancer* (latitude 23° 28′ N.) and *Capricorn* (latitude 23° 28′ S.), and the *Arctic* (latitude 66° 32′ N.) and *Antarctic circles* (latitude 66° 32′ S.).

PARALLEL SAILING. See SAILINGS.

PARALYSIS (Lat., from Gk. παραλυσις, palsy, paralysis, from παραλύειν, *paralyein*, to disable the side, from παρά, *para*, beside, beyond + λύειν, *lyein*, to loose), sometimes called PALSY. A loss, more or less complete, of the power of motion. By some writers the term is made to include loss of sensation. When the upper and lower extremities on both sides and more or less of the trunk is involved, the affection is termed general paralysis. Frequently only one-half of the body laterally is affected, the other side remaining sound. To this condition the term hemiplegia is applied. When the paralysis is confined to all the parts below an imaginary transverse line drawn through the body, or to the two lower extremities, the condition is known as paraplegia. When one part of the body, e.g. a limb or one side of the face, is exclusively affected, the condition is known as a local palsy or local paralysis. In some cases the loss of sensation and of motion in the paralyzed part is complete, while in others there is only some loss of power. In the former case the paralysis is said to be complete, in the latter partial. In most cases, but not invariably, sensation and motion are simultaneously lost or impaired. When motion is lost but sensation remains unaffected, the condition is known as akinesia. More rarely there is a loss of sensibility while the power of motion is retained. To such a condition the term anæsthesia is applied. This latter affection occurs most frequently in the organs of special sense, as, for example, in the tongue, where the sense of taste may be lost without any impairment of motion.

Paralysis is not a disease in itself, but merely a symptom of disease usually located in some part of the body other than that affected by the paralysis. Rarely are disturbances of sensation or of motion due to changes which are primarily in the skin area or muscles affected by the paralysis. This does, however, sometimes occur, as in the paralysis of progressive muscular dystrophy, where the primary lesion is in the muscles affected. The proper appreciation of external stimulation, i.e. sensation, and the proper carrying out of voluntary movements of the muscles, are dependent upon the integrity of the parts of the nervous system which govern such sensations and movements. The nerve terminations in muscle, skin, etc., serve as means for the reception and distribution of nervous impulses. The nerves themselves carry impulses between the nerve centres in the brain, spinal cord, and ganglia, and the peripheral nerve terminations. The brain, spinal cord, and ganglia serve as centres in which nervous impulses originate, are transformed, and associated. It thus follows that paralysis is a symptom which is usually indicative of pathological changes in (1) the peripheral nerves, or (2) the nerve trunks, or (3) the nerve centres in the brain, cord, or ganglia, and it is in these organs that the lesions of paralysis must usually be sought, and not in the paralyzed parts themselves. Thus disease of the peripheral nerves may cause paralysis, e.g. the paralyses occurring in peripheral neuritis. More frequently disease of or injury to nerve trunks, or tumors, or displaced bone pressing upon nerve trunks, causes paralysis in the parts supplied by the nerve or nerves affected. The completeness of the paralysis is determined by the extent of the injury to the nerve fibres and by the completeness of the interruption of nerve impulses. The spinal cord (see NERVOUS SYSTEM AND BRAIN) acts by means of its gray matter as a centre for automatic, reflex, and trophic impulses, also through its fibre tracts (white matter) as a pathway by means of which impulses are transmitted to and from the higher centres in the brain. After injury to the cord, such as results from dislocation or fracture of the vertebræ, with the consequent pressure upon or tearing of the tissues of the cord itself, a paralysis supervenes in the parts of the body below the seat of injury. If the paralysis results from pressure alone without an actual injury to the cord, it may be only temporary, recovery taking place when the pressure is removed. More often there is some crushing of the cord, in which case the paralysis is permanent, its extent depending upon the extent of the injury. When the cord is crushed completely across there is a complete paralysis, both motor and sensory, of all parts below the seat of injury, with the exception of such internal organs as are supplied by nerves which arise above the injury. Tumors, benign or malignant, diseased conditions extending from neighboring tissues and organs, hemorrhages into the spinal canal or into the substance of the cord, etc., determine, by the pressure upon the cord which they cause, paralyses similar to those resulting from injury. The main difference between the two is a clinical one, the paralysis from injury coming on suddenly and immediately after the injury, while the paralysis from disease has a gradual onset. Again, certain diseases of the spinal cord itself cause paralysis. Thus acute anterior poliomyelitis, often called (because of its most prominent symptom and because of its most frequent occurrence in children) acute infantile spinal paralysis, is a disease of the gray matter of the anterior horns and causes paralysis of those muscles governed by the affected cells. In the early stages of this disease the number of cells affected is large, and the paralysis is consequently extensive. Some of the cells are so severely injured that they die, and the paralysis in the muscles which these cells govern is permanent. The majority of the cells first affected usually recover, and this recovery in the cells is marked by a disappearance of the paralysis in the muscles which these cells govern. Among the other diseases of the spinal cord in which paralysis occurs or may occur may be mentioned Landry's paralysis, spastic paraplegia, or spastic spinal paralysis, amyotrophic lateral sclerosis, tabes dorsalis, ataxic paraplegia, and myelitis.

The brain serves as a centre for voluntary motion and for the perception of sensory impulses. It follows that injury to or disease of the brain is frequently followed by paralysis of greater or less extent. Thus concussion of the brain; fracture of the skull with resulting compression due to displaced bone or to hemorrhage in the cranium; hemorrhage into the substance of the brain or into its membranes independent of external injury; compression of the brain from tumors benign or malignant, from syphilitic gummata, etc.; destruction of brain tissue by extension of disease from surrounding parts, as from bone necrosis, middle ear disease, abscesses, etc.; brain softening from cutting off blood supply, as in thrombosis or embolism—all these and other widely different lesions cause paralysis as

a symptom by interfering with the proper working of the nervous mechanism.

There remain to be described somewhat more in detail certain conditions to which the term paralysis is popularly applied.

Hemiplegia is that form of paralysis popularly known as a 'paralytic stroke' or 'stroke of apoplexy.' The paralysis affects only one lateral half of the body. The parts generally affected are the upper and lower extremities, the muscles of mastication, and the muscles of the tongue on one side. In a well-marked case the patient when seized falls to the ground, all power of motion in the affected arm and leg being lost. The paralysis of the face which accompanies hemiplegia is usually quite distinct from the affection known as facial paralysis, which is an affection of the facial nerve or portio dura. (See Nervous System and Brain.) The motor branches of the fifth or trifacial nerve going to the muscles of mastication are generally involved in hemiplegia, and consequently the cheek is flaccid and hangs down, and the angle of the mouth is depressed on the affected side. The tongue when protruded points toward the paralyzed side, and there is often imperfect articulation, in consequence of the lesion commonly affecting the hypoglossal nerve. While paralysis of one side of the body or hemiplegia may be due to a large number of different conditions in the brain or cord, some of which have been already mentioned, it is most commonly due to one of three cerebral accidents. These, mentioned in the order of frequency of their occurrence, are (1) cerebral hemorrhage, (2) cerebral embolism (q.v.), (3) cerebral thrombosis (q.v.). Hemorrhage may occur into any portion of the brain tissue proper or between the skull and brain, i.e. into the meninges. These hemorrhages may be due to injury to the vessels or to disease of the vessel walls such as atheroma or aneurism. The most common seat of hemorrhage is in the optic thalamus and corpus striatum, from the branches of the middle cerebral artery. With the escape of blood there is usually more or less tearing and destruction of brain tissue, and this broken down brain tissue mixed with the extravasated blood constitutes what is known as the apoplectic clot.

Facial Paralysis, although locally affecting but a small part of the body, is of such frequent occurrence as to require separate description. In this affection there is more or less perfect loss of power over all the muscles supplied by the portio dura or facial nerve. This interference with the functions of the nerve may be due to lesions in the cortex affecting facial fibres of the corona radiata or internal capsule, to lesions in the nucleus of the nerve, or to lesions of the nerve trunk. Facial paralysis due to lesions in the cortex is commonly associated with hemiplegia. This paralysis is on the same side as that of the body, the nucleus from which the facial fibres originate being connected with the opposite side of the cortex in a manner quite similar to that by which the anterior horns are associated with the opposite hemisphere. Facial paralysis due to lesions of the facial nucleus in the medulla is uncommon. Tumors, hemorrhages, softening, the toxins of diphtheria, and the extension of an anterior poliomyelitis are the most frequent causes. Lesions of the trunk of the nerve may occur in any part of its course, due to tumors, injury, inflammation, etc. When the lesion affects the nerve fibres as they pass through the lower portion of the pons, and involves also the pyramidal or main motor tracts, there results the so-called 'cross paralysis,' i.e. a paralysis of the face on the same side as the lesion and of the trunk upon the opposite side. The following graphic account of the appearance of a patient suffering from facial paralysis is condensed from Watson, *Lectures on the Practice of Physic*. From one-half of the countenance all power of expression is gone: the features are blank, still, and unmeaning; the eyelids apart and motionless. The other half retains its natural cast, except that in some cases the angle of the mouth on that side seems drawn a little awry, in consequence of want of counterpoise from the corresponding muscular fibres of the paralyzed side. The patient cannot laugh, weep, frown, or express any feeling or emotion with one side of the face, while the features of the other side may be in full play. He cannot spit or whistle properly. One half the aspect, with its unwinking eye, its fixed and solemn stare, might be that of a dead person; the other half is alive and mobile.

If the cause of the paralysis is due to conditions in the nerve external to the cranial cavity, there is little danger to life and good chances for recovery from the paralysis. If, however, the paralysis is dependent upon intra-cranial conditions, there is not only less chance of recovery from the paralysis, but great danger to life.

There yet remain to be considered certain conditions which are popularly called paralyses or palsies, but which are essentially different from those already described. Among these may be mentioned the so-called 'shaking palsy,' or paralysis agitans (q.v.), and the palsies induced by various poisons. The poisons which are the most common causes of paralysis or of tremors are alcohol, lead, tobacco, and mercury. Arsenic and opium are rare causes. It is upon the peripheral nerves that these poisons seem to have their most pronounced effect, setting up a toxic peripheral neuritis.

A specific form of paralysis of the lower extremities, consequent on the use of flour from the beans of the Lathyrus sativus, is common in certain parts of India and Tibet. The ripe bean is an ordinary article of food when made into flour, but it is generally used with wheat or barley flour. It is said to be injurious only when it exceeds one-twelfth part of the mixture and to cause paralysis only when it constitutes more than one-third. Other species of Lathyrus have been known occasionally to cause similar symptoms in European countries.

PARALYSIS AGITANS (Lat., shaking palsy), Parkinson's Disease, Shaking Palsy. A chronic progressive nerve disease, in which the principal symptoms are tremor, muscular rigidity, restlessness, weakness, and altered sensations. It occurs more frequently in males, and generally between the ages of fifty and seventy. It is caused by exposure, hard labor, and great fatigue. Fright or injury may immediately precede an attack. The earlier symptoms are pains in one arm, with tremor of one hand, the fingers working together as if the patient were pulling or picking at something. Stiffness in the arm follows, and the process invades the leg of the same side. The neck becomes stiff and the body

bent forward. The disease lasts from three or four to twelve years. The pathological changes found consist of hypertrophy of the nerve cells of the pons, induration of the pons medulla and cord, thickening of the blood-vessel walls and of the pia, and increase of connective tissue in the motor tracts, nerves, and muscles. (Dana.)

The most successful treatment consists of rest, freedom from mental anxiety, outdoor air, warm baths, and massage. Among drugs, hyoscine, codein, quinine, arsenic, cannabis, veratrum, salicin, nitrate of silver, conium, atropia, and phosphorus have been used to relieve various conditions and with varying results. The mental condition, which may be hysterical or emotional, sometimes delusional, is improved by strong mental influences, routine and control, and employment. Consult Dana, *Text-Book of Nervous Diseases* (New York, 1892).

PARAMARIBO, pär'ä-mär'ī-bō. The capital of Dutch Guiana, South America, situated on the left bank of the Surinam River, about 17 miles above its mouth, in latitude 5° 50′ N. and longitude 55° 10′ W. (Map: Guiana, Dutch, F 2). Its climate is very hot, the average annual temperature being over 80°. Paramaribo has the neat appearance of a Dutch town with its wide streets shaded with trees and lined with bright-colored modern houses. The Government buildings are situated near the river, forming the so-called 'Government plain.' There are a number of churches and synagogues. The harbor is safe and commodious, and fortified by the two forts of Zeelandia and New Amsterdam. A number of wharves are situated along the river. Paramaribo receives the entire trade of Dutch Guiana and is the seat of a number of foreign consuls. Population, in 1900, 31,817, or nearly 50 per cent. of the entire population of Dutch Guiana.

PARAMATTA, pär'ä-mät'ä. A town of New South Wales. See PARRAMATTA.

PARAM'ETER (from Gk. παρά, *para*, beside, beyond + μέτρον, *metron*, measure). As commonly used in mathematics, any constant quantity, that is, a quantity fixed in value, entering into an equation. In analytic geometry it is used either as a constant or as a variable. Thus, the line in a conic section called by the ancient geometers latus erectum, and later latus rectum, and now the parameter, is a constant for any given curve, but a variable quantity for a family of curves of that type. E.g. in the equation of a parabola (q.v.) $y^2 = 2px$, where p is the parameter, p remains constant, while x and y vary so as to generate the curve. But if p be given a new value, while x and y pass again through the same cycle of values, a new parabola will be formed; and by repeating the process any number of curves may be generated which are said to belong to the same family. The method of variation of parameters is an important one in the treatment of differential equations. The name parameter is due to Mydorge (1585-1647).

PARAMUSHIR, pä'rä-mōō'shēr', or **PARAMUSHIRI**. The largest of the Kurile Islands (q.v.).

PARANÁ, pä'rä-nä'. The largest river of South America after the Amazon, and one of the great rivers of the world. It is formed by the confluence of the Paranahyba and the Rio Grande in Southern Brazil at the common boundary point of the States of Matto Grosso, Minas Geraes, and São Paulo (Map: South America, D 5). The Paranahyba rises on the Serra dos Vertentes and flows southwestward on the boundary between Minas Geraes and Goyaz. The Rio Grande, which is the longer of the headstreams, and may be regarded as the true upper course of the Paraná, rises on the Serra da Mantiqueira in the Coast Range, 60 miles from the Atlantic Ocean near Rio de Janeiro. It flows northwest and westward to the confluence, whence the Paraná proper takes a southwest course through Brazil, then south on the boundary between Brazil and Paraguay, whence it curves westward between Paraguay and Argentina until it receives its largest tributary, the Paraguay River (q.v.). From this point the lower Paraná flows southwest through Argentina as far as Rosario, where it finally turns to the southeast, and enters the Atlantic Ocean through the Plata estuary, at the head of which it is joined by the Uruguay River (q.v.). The total length of the Paraná River from the ocean to the source of the Rio Grande is 2950 miles, and excluding the Plata 2720 miles. The length of the lower Paraná from the Paraguay confluence is 850 miles, and with the Plata 1080 miles. The Paraná is thus longer than the Mississippi proper, and the drainage area of the system is nearly equal to that of the Mississippi.

In its upper course the Paraná flows over the great Brazilian plateau, and most of its upper tributaries, including the two headstreams, are obstructed by falls and rapids as they descend over the successive escarpments of the higher plateaus. The main river itself has the fall of Urupupanga a short distance below the confluence of the headstreams. Below this point, however, it is navigable for 600 miles over the level surface of the plateau as far as the boundary of Paraguay. Here it descends over the final great escarpment in the Falls of Guayrá, in which the river plunges through numerous rocky clefts with a total fall of 70 feet. From this point to within 150 miles of the Paraguay confluence the stream rushes through a deep gorge over a series of rocky shallows and rapids. Here the banks are heavily forested, and most of the tributaries fall into the river by cataracts, of which the Victoria Falls of the Iguassú are said to rival Niagara in height and grandeur. Below the gorge and the Paraguay confluence the river flows unobstructed through the Pampas plains, and for the last 1000 miles of its course, including the Plata, is navigable at all seasons by large vessels, while trans-atlantic steamers go directly to Rosario, 400 miles from the ocean. It is 3000 yards wide at Corrientes, near the Paraguay confluence, and 7000 yards wide at Diamante. It reaches its greatest volume at Corrientes, and loses considerably by evaporation in its lower course, since it here receives scarcely any permanent tributaries except the Salado (q.v.). Several hundred miles above the estuary it begins to divide into parallel channels, inclosing a long island, and has a total width of 25 to 30 miles, while some of the channels are two miles wide. The delta proper begins 100 miles from the estuary, and consists of a vast network of channels and backwaters, emptying by 14 mouths into the Plata estuary. The main channel is accessible to the largest vessels even at low water, but all the channels are constantly and

rapids, shifting, calling for great caution in their navigation. For the description of the river below the delta, see PLATA, RIO DE LA. The Paraná was first ascended as far as the Paraguay confluence in 1526 by Sebastian Cabot.

PARANÁ. A southeastern State of Brazil, bounded by the Atlantic Ocean on the east, the State of São Paulo on the north, Paraguay and Matto Grosso on the west, and Argentina and Santa Catharina on the south (Map: Brazil, G 8). Area 85,430 square miles. The low strip of coastland is followed by a mountain range reaching an altitude of nearly 5000 feet and passing into an elevated plateau lying about 3000 feet above the sea. The portion along the western frontier slopes toward the Paraná River, whose tributaries are the chief rivers of the State. Most of them, however, are unfit for navigation, owing to rapids. The climate is generally healthful in the elevated portions, but very hot and humid on the coast. Forests cover a large part of the State, especially in the western half, which is almost unknown, and inhabited by roving Indians. On the coast are cultivated cotton, coffee, and manioc, and in the more elevated regions grain and fruits are raised, but the maté industry is the most important, and maté is almost the only export. The population of the State in 1890 was 249,491, consisting to a great extent of German and Polish immigrants. Capital, Curitiba (q.v.). Consult Lange, *Südbrasilien* (2d ed., Berlin, 1885).

PARANÁ (formerly *Bajada del Paraná*). The capital of the Province of Entre Rios, Argentina, situated on a high bluff on the Paraná River, 370 miles from its mouth and opposite the city of Santa Fé (Map: Argentina, E 10). It is a well-built town with straight streets, good public buildings, a normal school, and a national college. It has an important inter-provincial trade, has daily steamship connection with Santa Fé, and is a station for all steamers ascending the Paraná River. Population, in 1898, estimated at 24,000. From 1852 to 1861 Paraná was the capital of the Argentine Republic.

PARANAGUÁ, pä'rä-nä-gwä'. The chief seaport of the State of Paraná, Brazil, situated on the Bay of Paranaguá, 400 miles southwest of Rio de Janeiro. A regular steamship line connects the port directly with Hamburg, and it exports woods, maté, sugar, and cereals. Population about 6000.

PARANAHYBA, pä'rä-nä-ē'bä, or **PARNAHYBA**, pär'nä-ē'bä. One of the headstreams of the Paraná (q.v.).

PARANAHYBA, or **PARNAHYBA**. A river of Northeastern Brazil. It rises in the Serra das Mangabeiras on the northern boundary of the State of Goyaz, flows northeast for 800 miles between the States of Piauhy and Maranhão, and empties into the Atlantic Ocean at the town of Paranahyba (Map: Brazil, J 4). It is navigable for small steamers through nearly half its length.

PARANAHYBA, or **PARNAHYBA**. A seaport in the State of Piauhy, Northeastern Brazil, near the mouth of the river of the same name (Map: Brazil, J 4). It is the commercial centre of Piauhy, being the only harbor in the State, and the outlet for its agricultural and cattle products. Population, in 1898, about 11,000.

PAR'ANOI'A (Neo-Lat., from Gk. *παράνοια*, madness, from *παρανοεῖν, paranoein*, to be deranged, from *παρα, para*, beside, beyond + *νοεῖν, noein*, to think). A chronic form of insanity in which for many years the intellect of the patient remains unimpaired, though dominated by a systematized delusion. There is almost invariably present an acquired or transmitted neuro-degenerative taint, though an attack may be based on a sudden or severe injury to the nervous system. It may follow a severe fever or an injury to the head. It may equally well be caused by great emotional strain or a constantly harassing thought.

Paranoiacs usually present somatic evidences of degeneration, such as a deformed or asymmetrical skull, badly developed teeth, strabismus, atrophy of one side of the body, and differences in size of hands or feet. In several cases examined by Spitzka anomalies of the cerebrum were found.

Mild forms of paranoia are presented by persons who exhibit perverse acts, morbid ideas, persistence in absurd notions, and who are commonly called 'cranks.' These persons become imbued with an idea and are dominated by it, and talk constantly of it. They are suspicious, consider themselves slighted or the subject of remark. They think they are neglected or martyred, fancy there is a combination against them, and are frequently melancholic. These patients are able to carry on a business or practice a profession.

The variety of paranoia demanding more attention is the ordinary type of chronic delusional lunatic who was eccentric in childhood and hypochondriac in his youth, and is excessively egotistical, whose failures are considered to be due to conspiracy, who betrays delusions of persecution and hallucinations of sight and hearing. The usual delusion of persecution may be replaced by systematized delusions of erotic, religious, or patriotic nature. The paranoiac is usually homicidal, either because of mandatory hallucinations or of persecutory delusions. Early moral control may do much for mild cases, even aborting the psychosis. The regularity of life in asylums, with their discipline, recreations, and employment, is often beneficial. Consult: Séglas, "Paranoia," translated by Noyes, in *Journal of Nervous and Mental Diseases* (New York, 1888); Ferris, "Clinical Notes on a Case of Paranoia," in *Philadelphia Medical Journal* (Philadelphia, May 26, 1900).

PARAPET. See FORTIFICATION.

PARAPH (OF., Fr. *paraphe, paragraphe*, It. *parafo, paragrafo*, from ML. *paragraphus*, from Gk. *παράγραφος*, marginal line, from *παραγράφειν, paragraphein*, to write beside, from *παρά, para*, beside, beyond + *γράφειν, graphein*, to write). An addition to the signature formed by a flourish of the pen, which, during the Middle Ages, constituted some sort of provision against a forgery. Its use is not altogether extinct in diplomacy, and in Spain the paraph is still a usual part of a signature.

PARAPHERNALIA (ML. nom. pl., from Lat. *parapherna*, from Gk. *παράφερνα*, property of a bride above her dower, from *παρά, para*, beside, beyond + *φέρνη, phernē*, dower, from *φερειν*,

pherein, to bear). Articles of wearing apparel and ornament suitable to a wife's station in life, which were given to or acquired by her either before or during marriage. Both the Roman and civil law recognized a special property in the wife, as to her necessary articles of clothing and ornament, and the name and idea were adopted from the above systems into the English law. By the common law the wife's paraphernalia, except articles of absolutely necessary clothing, belonged to the husband during his lifetime and he could dispose of them at his discretion, but on his death the wife could hold them against the heirs and legatees, although not as against creditors.. The husband, however, could not dispose of her paraphernalia by will.

No exact list of articles which may be included under the term paraphernalia can be given, as the rules vary in different jurisdictions. In general, it may be said that the clothing and ornaments must be such as would ordinarily be possessed by a woman in her station in life, and that jewels, etc., given by the husband in excess of his means will not be included. See HUSBAND AND WIFE; SEPARATE ESTATE. Consult the authorities referred to under HUSBAND AND WIFE.

PARAPHRASE (Lat. *paraphrasis*, from Gk. *πάραφρασις*, from *παραφράζειν*, *paraphrazein*, to repeat a statement in different words, from *παρά*, *para*, beside, beyond + *φράζειν*, *phrazein*, to say). In music, a free arrangement of a composition for some other instrument or instruments. Bülow's arrangement of *Tristan und Isolde* is merely a *transcription*, because he puts nothing into the piano score that Wagner has not written in the orchestral score. Liszt's arrangement of the Love-Death is more a paraphrase, because he uses rhythmic figures of his own invention. Also he begins with the motive of the Curse, which in Wagner's score does *not* precede the opening of the Death song. Liszt's transcriptions of the songs of Schubert, Schumann, and others are excellent examples of paraphrases.

PARAPHYSES, păr-ăf'ĭ-sēz (from Gk. *παράφυσις*, *paraphysis*, offshoot, from *παραφύειν*, *paraphyein*, to produce offshoots, from *παρά*, *para*, beside + *φύειν*, *phyein*, to grow). Outgrowths, usually filamentous in form, which are associated with reproductive organs, either sexual or asexual. Among the fungi paraphyses occur in connection with the spore-bearing organs in the formation of hymenial layers, as in Ascobolus, black knot (*Sphæria morbosa*), etc. The best known use of the term, however, is in connection with the mosses, in which the groups of sex-organs, especially the antheridia, are often intermingled with hair-like paraphyses. See MUSCI.

PAR'APLE'GIA. See PARALYSIS.

PARASOL FUNGUS. See MUSHROOM.

PAR'ASANG (Lat. *parasanga*, from Gk. *παρασάγγης*, *parasangēs*, from Pers. *farsang*, parasang). A lineal measure still used by the Persians, and often alluded to by the Greeks. The estimate of its length given by Herodotus, Suidas, Hesychius, and Xenophon, and concurred in by modern travelers, is equivalent to about 30 Greek *stadia*, or $3^{3}/_{4}$ English miles. The word is thought to be derived from *sang* (Persian, 'a stone'), and *para* (Sanskrit, 'end'), in allusion to milestones. Byzantine writers reckoned it at 21 *stadia*; Strabo reckoned it at 30, 40, and even 60 *stadia*. Persian authorities are divided.

PARĀŚARA, pā-rā'shā-rā. A Hindu sage, reputed to be the author of some of the hymns of the Rig Veda, where he is once mentioned (vii, 18, 21) as a friend of Indra. He is said to have been the son of Vasishtha, or, according to the more usual account, of Vasishtha's son, Śakti. The story runs that King Kalmashapada once met Śakti in a narrow path in a thicket, and ordered him out of the way. The sage refused, whereat the King lashed him with his whip, and Śakti cursed him to become a rakshasa, or demon. In this transformation Kalmashapada killed and ate Śakti, together with the other sons of Vasishtha. Śakti, however, had left his wife, Adrishyanti, pregnant, and she gave birth to Parāśara, who was brought up by his grandfather. When he grew up, and was informed how his father died, he instituted a sacrifice for the destruction of all the rakshasas, but was dissuaded from its completion by Vasishtha and other sages. This legend is later expanded, so that, as a reward for his forbearance, Parāśara is said to have been the compiler of the *Visnu purāna*. (See PURĀNA.) There is also attributed to him a law-code, the *Parāsara smrti*, and a subpurana, the *Parāśara-purāna*, which, like some late works ascribed to Parāśara, may have been composed by historical personages bearing this name. The legendary Parāśara is said to have been the father of Vyasa (q.v.) by an intrigue with the Princess Satyavati.

PARASELENÆ. See HALO.

PARASITE (Lat. *parasitus*, from Gk. *παράσιτος*, one who eats at another's table, guest, parasite, from *παρά*, *para*, beside, beyond + *σῖτος*, *sitos*, food). ANIMAL. Animals that feed on the fluids of other living animals that the latter have elaborated for their own use; also on the juices and even solid matters that they get while feeding in the interior of living plants. It is essential to the idea of parasitism that an injury is done to some other living organism within which, or fastened on to which, the parasite lives; and the organism that supports the parasite is called the 'host.'

Parasites are either 'temporary' or 'stationary.' Temporary parasites are those that seek their host only occasionally or for a short time; they may have different individuals as hosts at different times, as is the case with the leech and bed-bug. Stationary parasites are those whose parasitic life continues for a long time, perhaps as long as life, e.g. the tapeworm. Parasites may also be classified as 'ectoparasitic' or 'endoparasitic.' Ectoparasites live chiefly on the skin and are either temporary, as in the case of the mosquito, or stationary, as in the case of the itch mite. Endoparasites live chiefly in the alimentary tract or some other intestinal organ, and are stationary.

ORIGIN OF PARASITIC LIFE. A knowledge of this subject can best be gained by a study of certain groups where all gradations occur from free living to parasitic forms. The first example may be taken from the group Copepoda. Many of these small crustacea swim free in the sea and in ponds. They feed on all sorts of organic débris. One species, Argulus, travels

TABLE OF PRINCIPAL PARASITIC ANIMALS

GROUP	Species	Host	Remarks
PROTOZOA			
Rhizopoda	Some Amœbæ are parasitic.	Alimentary tract of man, mammals, insects.	
Sporozoa	All are parasitic.		Behavior in the body like pathogenic bacteria.
Infusoria	Numerous parasitic forms, e.g.: Balantidium coli.	Colon of man.	
	Trichodinæ.	On gills and gill-cavity of frog.	
	Opalina.	Bladder and gut of frog.	
	Holophyra multifiliis.	Surface of fish.	
	Ancistrum.	Mantle cavity of mussels.	
	Anoplophrya.	Intestine of various marine invertebrates.	
PORIFERA (Sponges)	No true parasites.		Cliona bores in shells of lamellibranchs.
CŒLENTERATA	A very few species: Polypodium hydriforme parasitic at one stage.	Immature ova of sturgeon (Ussow).	
	Cunina, a medusa.	In other medusæ.	
	Edwardsia, an actinian.	In Ctenophora.	
	Pemmatodiscus socialis.	On Rhizostoma (Monticelli, 1898).	
	Gastrodes, a ctenophore.	In Salpa.	
SCOLECIDA			
Turbellaria	A few Rhabdocœla: Graffilla muricicola.	In kidney of the gastropod Murex.	
	Fecampia erythrocephala.	In gut of crab (Carcinus mænas).	
Trematoda (Liver flukes)	All parasitic: Two cases.		
	1. Only one host; young like adult, ectoparasites.	On or in gut and bladder of aquatic animals.	Called 'monogenetic.'
	2. Two hosts; endoparasites.	The asexual generation in Mollusca; the sexual, usually in gut of some vertebrate.	Called 'digenetic.'
Cestoda (Tapeworms)	All parasitic, with or without alternation of generation.	Adults in various vertebrates; young stages also in invertebrates.	Two hosts required for complete development.
Nematoda (Roundworms)	Mostly parasitic.	Plants and animals, chiefly vertebrates.	Complicated life history, frequently with alternation of generations.
Acanthocephela	Four genera, all parasites.	Rarely in man; the young live chiefly in arthropods; the adults in vertebrates, especially fish intestines.	
Nemertinea	Rarely parasitic. Malacobdella.	In lamellibranchs.	
Rotifera	Various species; order Ploïma.	On or in fresh-water Oligochæta.	
	Order Seisonaceæ.	On the crustacean Nebalia.	Marine, form much modified.
POLYZOA	None parasitic.		
MOLLUSCA	Enlima, Stylifer, Thyca.	Holothuria, star-fishes, echinoids.	Imbedded in skin, often forming tumors.
Gastropoda			
	Entoconcha mirabilis.	Inside of Synaptidæ (Holothuroidea).	Attached to blood-vessels or muscles.
	Entocholax, Entovalva.		
	Sistrum.	Certain corals.	
ECHINODERMATA	No parasitic species.		
ANNELIDA.			
Chætopoda (Sand-worms)	Labrorostratus and Hæmatocleptes (Ennicidæ).	In the body cavity of other chætopods.	
	Some species of Polynoë.	In other invertebrates, as crinoids, on which galls are formed.	
	Species of Mysostomidæ.		
Hirudinea (Leeches)	Most species are ectoparasites.	Mollusca, vertebrates.	Temporary parasites, some leeches are carnivorous.
CRUSTACEA	Many Copepoda, e.g.:		
	Argulus.	Surface of fishes.	
	Caligus.	On gills of fishes.	
	Lernæonema.	In flesh of fishes.	
	Some Cirripedia, especially Sacculina.	Crabs; beneath abdomen.	Reduced to mere sacs.
	A few Amphipoda, e.g.:		
	Cyamus.	Skin of whales.	
	Hyperia.	In the jelly of large medusæ.	
	Many Isopoda, e.g.:		
	Ancens.	On the fish Cottus.	
	Bopyridæ	On the gills of Crustacea.	
	Cymothoidæ.	On fishes.	
INSECTA (Insects)	Many plant parasites.		
	Certain groups of animal parasites, e.g.:		
	Mallophaga (bird-lice)	Birds and mammals.	Ectoparasites, on feathers and hairs.
	Pediculidæ (lice).		
	Membranacei (bed-bugs).	Warm-blooded vertebrates.	Temporary ectoparasites.
	Strepsiptera.	Bees and wasps.	
	Aphaniptera (fleas).	Birds and mammals.	Ectoparasites.
	Pupipara (sheep-lice).	Birds, mammals, and bees.	Stationary ectoparasites.
	Culicidæ (mosquitoes) and many other Diptera. Chalcididæ.	Warm-blooded vertebrates.	Ectoparasites.
	Ichneumon flies.	Other insects.	Active in the larval stage.

GROUP	Species	Host	Remarks
ARACHNIDA (Spiders)	Many parasites among Acarina (mites)	Mamm[illegible]ods, and insects.	
	Demodex folliculorum; Pentastomum.	Deb[illegible]ite of man, of young hare, cat, ox, or adult dog, wolf, horse.	A greatly modified arthropod.
VERTEBRATA	Myxinidæ (hag-fishes).	Bore into the body cavity of fishes.	The only parasitic vertebrates.

about on the surface of the body of fish and feeds on their slime. Another genus, Caligus, has taken a further step; it has migrated under the gill-cover of a fish and has attached itself to the gills, receiving food from the blood flowing through them. It is doubtless harmful; it is a true external parasite. Finally other Copepoda, e.g. Lernæonema, have penetrated between the scales and are found imbedded deep in the muscles of menhaden and other marine fishes living entirely on the juices elaborated by them, and typifying a complete internal parasite. We see in this case how living or waste organic matter is by easy gradations to live on and in living organisms.

The nematode worms are chiefly parasitic. Some of the Anguillulidæ, or vinegar eels, however, live in organic fluids. The Ascaridæ, or stomach worms, live for the most part in the organic fluid contents of the intestine, which they still have to digest somewhat, so that they are on the line between messmates (see COMMENSALISM) and true parasites. They are, however, in great danger of being indubitable parasites, and this is the fate that befalls some of their kindred; e.g. *Trichina spiralis*. (See TRICHINA.) Anguillula, Ascaris, and Trachina show how parasitism has arisen in a group that originally had come to live on organic fluids, and especially how those animals that live on the surface of other animals, devouring their excretions (or waste fluids), will easily come to penetrate into the flesh, devouring the vital secretions (or functional fluids). They will pass from scavengers to parasites.

The question why animals which are in a position to become parasites often do become parasites is not difficult to answer. Parasitic life brings great advantages to the parasite. First, it affords an abundant food supply; second, it diminishes the chance of direct attack from other organisms. The great disadvantage of abject parasitism is this, that the parasite is restricted in its environment, and since the body that it inhabits is mortal, it must make special provision for the continuation of the species. In mammals the capacity of infecting the embryo while attached to the mother, would be of great service in insuring this continuity, and a certain threadworm of the dog (*Filura immitis*) has been found to be transmissible from parent to fœtus, as seems to occur in few species. Most parasites depend either upon the flesh of the host being eaten by a second host, or else the young are discharged, encapsuled (to protect them from desiccation or other untoward conditions), and take their chances of being picked up by a suitable host. To increase the chances of the continuity of life from one individual to the next, the fertility of parasites has become extraordinary. Indeed, in the group of copepods, where the embryos are carried in external pouches, one may see how the parasitism becomes more complete as the embryo pouches become larger. Van Beneden states that a single nematode produces 60,000,000 ova. The rich food supply of the parent makes this great fertility possible. In extreme cases the parasite becomes little but an egg-sac. To increase the fertility still more, fission, in the case of cestodes at least, has been added; so that the number of fertile individuals is increased. Since a species is little likely to devour the flesh of its own kind, many parasites may pass successively into two hosts, e.g. the pig and the rat. This has given rise in some cases to an *obligatory* alternation of hosts.

The adaptations in structures of parasites are striking. First, temporary parasites must move over the body of their hosts or go from one host to another. Hence (1) sense organs are developed to direct them in their migrations, and they are provided with locomotor apparatus, e.g. the springing legs of the flea; (2) stationary parasites gain apparatus for holding on, as suckers in cestodes and nematodes, and hooks in mites and copepods. Certain cestodes have both suckers and hooks; in still other cases, as in the degenerate cirriped Saculina, roots or holdfasts are developed, which also serve as imbibitory tubes; (3) endoparasites lose their locomotor organs, for large legs would be a disadvantage to burrowing parasites, such as Demodex, among mites, or unnecessary, as in the copepod Caligus; (4) endoparasites lose also their sense organs, because no longer useful, as is the case in parasitic Copepoda; (5) the alimentary tract becomes degenerate in extreme forms, because food is gained by osmosis through the body wall (e.g. cestodes). In less extreme cases the alimentary tract is simplified on account of the absence of necessity for digestive apparatus.

ECONOMICAL CONSIDERATIONS. The number of animal parasites harbored by one host may be enormous. Thus, in a young horse Krause found 500 Ascaris, 190 Oxyuris, several millions of Strongylus, 214 Sclerostomum, 287 Filaria, 69 Tænia adult and 9 immature. The destruction wrought by these parasites is sometimes very great. It is estimated that half a million pullets die yearly in England from "gapes," caused by a threadworm (*Syngamus trachealis*). England in 1880 was estimated to be losing about 1,000,000 sheep annually from liver-flukes. Fortunately, the United States has been visited by no such scourges, but scores of cattle regularly die of the liver-fluke in this country. The United States Bureau of Animal Industry makes official investigations into epidemics of parasites among the higher animals.

Leuckart, *The Parasites of Man and the Diseases Induced by Them* (trans. by Hoyle, Edinburgh, 1896); Ghenmann, *Treatise on the Parasites and Parasitic Diseases of the Domesticated Animals* (trans. by Fleming, London, 1892); Van Beneden, *Animal Parasites and Messmates* (ib., 1876); Maniez, *Les parasites du [illegible]* Paris, 1888).

PARASITE. Plant. The plant kingdom presents abundant illustrations of parasitism, from the lowly bacteria to such complicated flowering plants as the mistletoe and dodder. A number of the immense group of fungi must also be either a saprophyte (q.v.) or a parasite, and some entire groups have adopted the latter habit, the most disastrous of the plant diseases being due to fungous parasites. The potato rot and grapevine mildew are caused by members of the Peronosporales. (See Phycomycetes.) The Ustilaginales (q.v.) are responsible for smut, and the Uredinales (q.v.) for rusts. Some of the leaf-curls are caused by an Ascomycete, and certain important blights and wilts by bacteria. Some very characteristic diseases of insects are the result of fungous parasites from among the Phycomycetes (q.v.) and Ascomycetes (q.v.). The adaptations developed by many of these parasites to adjust themselves to their hosts are remarkable, and lead to some very complex life histories. A life of parasitism appears to result in sexual degeneration (see Fungi), so that, associated with remarkable specialization of vegetative regions, there is in a number of groups the entire loss of sexuality. There are also some remarkable parasites among the flowering plants, the dodder (Fig. 1) being an extreme example of complete dependence upon its host, the root disappearing, the leaves being mere scales, and the flowers much reduced. Other plants have well-developed green leaves, and yet always grow with their roots or other parts connected with some host which supplies certain of their wants. Among these may be mentioned the mistletoe (Viscum), Euphrasia, and Pedicularis, the first-named probably depending upon its host for almost all the water that comes to it. Parasites establish relations with their hosts generally by sucker-like structures, called haustoria (q.v.), or, as in the fungi, through delicate processes which pierce the cell walls (Fig. 2). See also Symbiosis.

Fig. 1. Dodder (*Cuscuta*) parasitic on a hop stem.

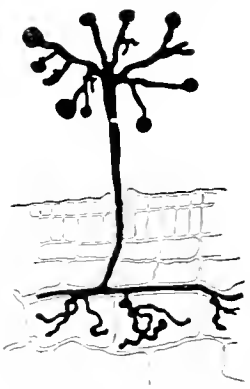


Fig 2. Diagram of fungus parasitic in the tissue of the host plant and forming spores above the surface.

PARASITIC DISEASES. An important subdivision in the classification of diseases. (See Nosology.) In these diseases certain morbid conditions are induced by the presence and vital activities of various low forms of animal or vegetable life, which have found lodgment and subsistence in some tissue or organ, or upon some surface of the body of man or animals. Even plants are not exempt from disorders of this nature. See Parasite, Plant.

The vegetable microörganisms which cause disease are far more numerous and important than the animal, but are as yet less perfectly understood. They may be divided into three classes: (1) the *Blastomycetes* or yeast fungi; (2) the *Hyphomycetes*, or molds; and (3) the *Schizomycetes* or bacteria.

(1) The yeasts are important only as causes of fermentation. One member of the family, however, is pathogenic, and grows upon the mucous membrane of the mouth and throat. This is the *Oidium albicans*, and the disease it gives rise to is called thrush (q.v.). Yeasts are common in the stomach, being introduced with the food, and are found in diabetic urine.

(2) The pathogenic molds are found upon the surface of the body, since they require free oxygen for their growth. They are responsible for many skin diseases. Favus (q.v.) is caused by the *Anchorion Schönleinii*. *Pityriasis versicolor*, also called chloasma, is caused by the *Microsporon furfur*. *Actinomycosis* (q.v.) is due to infection by the ray fungus (actinomyces). *Madura foot* is a serious disease, occurring in the feet of natives of India, and was shown in 1861 by Carter to be due to a fungus—*Chionyphe Carteri*.

(3) The Schizomycetes or bacteria are by far the most important and interesting of the vegetable parasites. They penetrate every tissue of the body and are known to be the cause of most of the specific febrile diseases, and are suspected to be the cause of others. The study of these organisms has almost reached the dignity of a separate science. See Bacteria.

PARATOLOID. See Tuberculin.

PARAY-LE-MONIAL, pä'rā'-le-mō'nyāl'. A town in the Department of Saône-et-Loire, France, on the Bourbince, 32 miles northwest of Macon (Map: France, L 5). Its Benedictine abbey, founded in 973, contains the tomb of Marguerite Marie Alacoque (q.v.). The revelations said to have been made to her here greatly stimulated the devotion to the Sacred Heart of Jesus (see Sacred Heart of Jesus, Feast of the), which has been so marked a feature of Roman Catholicism in the last two centuries. Paray-le-Monial has consequently become a popular pilgrimage centre, and large numbers, even from America, visit it annually. Population, in 1901, 4362. For an account of the apparitions, consult Bougaud, *Histoire de la bienheureuse Marguerite Marie* (Paris, 1894).

PAR'CÆ (Lat., fates; connected with *parere*, to bring forth, hence originally *Parca*, a goddess of childbirth; later associated by popular etymology with *pars*, part, identified with the Gk. Μοῖρα, *Moira*, and then tripled into three *Parcæ* to correspond to the three *Μοῖραι*, or Fates). The name given by the Roman poets to the Greek Moiræ, or goddesses of fate. They have no place in Roman worship, though the name appears in Gallic territory applied to Celtic divinities, who are also called Fati (masculine) or Fatæ (feminine). In the poets they

PARASITIC FLOWERING PLANTS

play an important part as spinners of the thread of life. Among the Greeks the conception of the Moiræ is somewhat different. The name in the singular denotes the portion of life allotted to each man at his birth, with the inevitable death at the appointed moment. In Homer Moira is the goddess who allots this portion to man, though it is often hard to tell whether the word is a proper name or a common noun, destiny. Here we find, however, Moira or Aisa as a spinner of a thread of destiny for every man at his birth, or in one place associated with the *Klothes*, or spinners, who work under her direction. From this idea of the spinner of the thread of life developed the conception of two or three goddesses who begin, control, and end this thread, but the *Moirai* are only once named in Homer, and their development in the cult is of a later date. In Hesiod they appear as the three daughters of Zeus and Themis—Clotho, the spinner; Lachesis, the assigner of the lot; Atropos, the inflexible, who cuts the thread. They were worshiped in Athens, Corinth, Sicyon, Sparta, Thebes, and elsewhere. They are gloomy, invisible goddesses, who know the future and at times reveal it. Their cult was in some places without images, and their offerings those appropriate to chthonic divinities. To them honors were paid not only in connection with birth and death, but at any important epoch in human life. To a later period belongs the close division of functions between the three sisters, which does not appear in art till Roman times. In the earlier art they are not distinguished as individuals, but are only represented as fully draped female figures of youthful dignity. The so-called Fates of the Parthenon pediment are not certainly identified. Later Clotho is regularly indicated by the spindle, Lachesis with a globe on which she traces the fate or little rods from which she draws the lot of man, and Atropos by a roll or tablet in which she records man's fate, or the sun-dial to which she points. The relation of the Moiræ to the gods is not always clearly defined. In Homer the decree of Moira is in accord with the will of Zeus, and once determined cannot be altered. Later writers, while keeping the connection with Zeus, seem at times to regard the Moiræ as binding even the gods. Later philosophical speculation naturally gave much attention to the Fates, and even in popular belief they held a high place among the gods.

PARCELS. See Baggage; Carrier, Common.

PARCENARY (OF. *parcenerie*, from *parcener*, partner, from ML. *partionarius*, having a share, from Lat. *partitio*, share, from *pars*, portion). In law, the state or estate of two or more persons, called *parceners*, who hold title to lands that have descended to them as equal heirs, so that though the estate is undivided each has a right to a separate share of it, and, therefore, with no benefit of survivorship. See Coparcenary.

PARCHÉ, pär'shā'. One of the small, beautiful coral-fishes or butterfly-fishes (*Chætodon capistratus*) common in West Indian waters. The name 'parché' is sometimes applied to all the butterfly-fishes. See Plate of Coral-Fish.

PARCHIM, pärk'im. A town in the Grand Duchy of Mecklenburg-Schwerin, Germany, situated on the Elde, about 20 miles southeast of Schwerin (Map: Germany, D 2). It has a monument to Field-Marshal Von Moltke, a native of the town, a gymnasium, and manufactures of cloth, chicory, cellulold, etc. Parchim is one of the richest cities of Mecklenburg, owning a good deal of the surrounding land. Population, in 1900, 10,242, chiefly Protestants.

PARCHMENT (OF., Fr. *parchemin*, from Lat. *pergamina, pergamena*, from Gk. παργαμηνή, parchment, from Πέργαμος, *Pergamos*, relating to Pergamus, from Πέργαμος, *Pergamos*, Πέργαμον, *Pergamon*, a city of Mysia in Asia Minor, whence parchment was originally brought, and Vellum (from OF. *velin*, Fr. *vélin*, *vélum*, from ML. *vellanus*, relating to a calf, from Lat. *vitulus*, calf; connected with Gk. ἰταλός, *italos*, Skt. *vatsa*, calf, from *vatsa*, Gk. ἔτος, *etos*, year). Parchment is one of the oldest of writing materials, known at least as early as B.C. 500. Herodotus speaks of books written upon skins in his time. Pliny, without good grounds, places the invention as late as B.C. 190, stating that it was made at Pergamum in the reign of Eumenes II., in consequence of Ptolemy of Egypt having prohibited the exportation of papyrus. Possibly the Pergamian invention was an improvement in the preparation of skins, which had certainly been used centuries before. The manufacture rose to great importance in Rome about the first century B.C., and its use spread over all Europe, and retained its preëminence until the invention of paper from rags.

Parchment is prepared from the skins of sheep and goats; vellum, from that of calves, kids, and dead-born lambs; the thick, common kinds, for drums, tamborines, battledores, etc., from those of old goats and in Northern Europe from wolves; and a peculiar kind is made from asses' skins, the surface of which is enameled. It is used for tablets, as black-lead writing can be readily removed from it by moisture. The method of making parchment is at first the same as in dressing skins for leather. The skins are limed in the lime pit until the hair is easily removed. They are then stretched tightly and equally upon a square wooden frame called a horse. The flesh side is dressed as in currying, until a perfectly smooth surface is obtained. It is next ground by rubbing over it a flat piece of pumice stone, previously dressing the flesh side only with powdered chalk, and slaked lime sprinkled over it. It is next allowed to dry, still tightly stretched on the frame. The drying process is an important one and must be rather slowly carried on, for which purpose it must be in the shade. Sometimes these processes have to be repeated several times, in order to insure an excellent quality, and much depends upon the skill with which the pumice stone is used, and also upon the fineness of the pumice itself. Vellum is prepared with the finest pumice. When quite dried the lime and chalk are removed by rubbing with a soft lambskin with the wool on.

PARCHMENT, Vegetable, or Parchment Paper. When pure unsized paper is dipped into a mixture of one part of water and six parts of sulphuric acid, and then washed carefully until every trace of acid is removed, a product is obtained in which the cellulose of the paper has changed into amyloid or hydrocellulose, which forms a gelatinous coating over the fibers, and acts as a sizing. The parchment-like

paper produced is translucent, and its strength is increased threefold. A long-fibred unfilled paper is preferred for the manufacture of this parchment. A similar product is obtained by treating unsized paper with a solution of ammoniacal cuprous oxide, or zinc chloride. After dipping the paper into the bath it is passed over hot rollers and then cooled and washed in pure water to remove all excess of the solution, after which it is dried in a heated room, given a coat of paraffin oil, and calendered. Such parchments are extensively used for covering the corks of bottles and for similar purposes.

PARDESSUS, pär'de-sy'. JEAN MARIE (1772-1853). A distinguished French jurist and publicist, born at Blois, August 11, 1772. He was educated to the law and early became distinguished for learning and eloquence. He was made associate judge in his native city at thirty, and mayor of Blois in 1805. His *Traité des servitudes*, published in 1806, established his reputation as a jurist, and a writer of force and eloquence. It quickly reached eight editions. In 1809 he published *Traité du contrat et des lettres de change*, subsequently published under the title of *Cours de droit commercial*, which was considered the masterpiece of its time. His works on maritime law, *Collection des lois maritimes antérieures au XVIIIème siècle* (6 vols., 1828-45), *Us et coutumes de la mer* (1847), and his *Collection des ordonnances des rois de France*, were equally esteemed. In 1810 a professorship of commercial law was created for him in the law department of the Collège de France, where his lectures were notable. In 1815-16 and again in 1824-27 he was a member of the Chamber of Deputies. After the Revolution of 1830 he retired from public life. He died at Blois, May 26, 1853.

PARDO, pär'dō. MANUEL (1834-78). A Peruvian statesman, born in Lima. He was educated in Santiago de Chile and in Europe, studied law and political economy, and received a Government position in the Lima Bureau of Statistics in 1853. Five years afterwards he was elected to the board of charities, and, forgetful of self, did much to check the yellow fever epidemic of 1867. In 1862 he founded the first bank in Lima. He entered the Cabinet of President Mariano Prado in 1865, was president of the Tribunal of Commerce in 1868, Mayor of Lima (1869), and President of Peru in 1872-76. He was the first civilian to hold that position, and his decrees in the interests of science, literature, and the public peace caused the people to remember him as a good ruler. He was afterwards president of the Senate. Probably at the instigation of officers who bore Prado ill-will for having reduced the army, he was assassinated in front of the Hall of Congress by a sergeant.

PARDO BAZAN, bä-thän'. EMILIA (1851—). A naturalistic Spanish novelist and critic. She was born at Coruña, September 16, 1851. After her marriage in 1868, she went to Madrid, where she witnessed the revolutionary outbreak of that year. In 1876 she won a prize offered by the municipality of Oviedo for an essay on the Benedictine monk Benito Jerónimo Feijóo, well known in eighteenth-century Spanish literature. Essays published soon afterwards in the *Ciencia Cristiana* showed her an Ultramontane, perhaps a Carlist, but ere long Señora Pardo Bazán underwent a change, inevitable to a follower of naturalism or of nature. A journey through France, England, and Italy followed. Later she settled at Madrid, where she started her critical review, the *Nuevo Teatro Crítico*. She gained great repute as a leading representative of the naturalistic school of novelists, and as one of the most capable of modern literary critics. To some extent she is a disciple of Zola, whose determinism, however, she condemns, although in her two strongest novels, *Los pazos de Ulloa* and *La madre naturaleza*, in which she describes the decay of an aristocratic family, she is close to those very pornographic methods of Zola that she has stigmatized. But she is no mere imitator, for her realism is Spanish rather than French, and she does not limit her pictures of man and nature to the evil side only, but seeks rather a broad outlook on life. In *El cisne de Vilamorta* the ending is so romantic as to set at naught her naturalistic theories. Her descriptions of the life in her native Galicia are successful. Of her novels there may be mentioned, besides the three noted above, *Pascual López; Un viaje de novios; La tribuna; La dama joven; Insolación; Morriña; Una cristiana; La prueba; La piedra angular;* and of her essays and critical treatises, *San Francisco de Asís; De mi tierra* (1888); *El Padre Luis Coloma; Pedro Antonio de Alareón; La revolución y la novela en Rusia* (1887); *La cuestión palpitante* (4th ed. 1891), rhetorical essays dealing with realism and naturalism in the modern novel; *Polémicas y estudios literarios*, a supplement to the matter contained in the *Cuestión palpitante*, embracing also the account of her quarrel with the novelist, Pereda, and a review of some of the works of Galdós, etc. As a critic, Emilia Pardo Bazán is fairly keen in her analysis, tolerably sure in her judgment, and forceful in her language. Consult her *Obras completas* (1891, ff.), and her *Nuevo Teatro Crítico* (1891-93).

PARDOE, pär'dō. JULIA (1806-62). An English author born at Beverley, Yorkshire. Her father was Major Thomas Pardoe. She traveled in Portugal, was with her father for a time at Constantinople, and visited Hungary. Since Lady Mary Montagu, no woman had ever acquired so close a knowledge of Turkish life and manners. In 1859 she was granted a civil list pension of £100. She died in London, November 26, 1862. In her fourteenth year Miss Pardoe published a volume of verse, which went into a second edition. Afterwards she became a popular novelist, writing *Lord Morcar of Hereward* (1829), *The Hungarian Castle* (1842), etc. Her miscellaneous works are descriptions of the lands and peoples she had visited and graceful essays on French history. Among them are: *Traits and Traditions of Portugal* (1833); *Louis XIV. and the Court of France* (1847); *The Court and Reign of Francis I.* (1849; reprinted with memoir 1887); *Life and Memoirs of Marie de Medici* (1852); *The Romance of the Harem* (1839); *The Beauties of the Bosphorus* (1839); *The City of the Magyar* (1840); and *Episodes of French History During the Consulate and t[illegible] First Empire* (1859).

PARDON (OF., Fr. *pardon*, from ML. *perdonum*, pardon, from *perdonare*, to grant, from Lat. *per*, through + *donare*, to give, from *donum*, gift). An act of grace, exercised by a com-

petent authority, remitting the penalty imposed by law upon a person who is either guilty or accused of a crime or offense against the Government. The earliest records of governments contain instances of the exercise of such a pardoning power by the sovereign authority, relieving an offender from the consequences of a violation of a tribal rule, or later of a national law. The main reasons for vesting the chief executives of modern nations, with the wide discretion which they exercise in this regard are to prevent injustice because of the fallibility of human laws, which sometimes work hardship in individual cases, although they may be salutary on the whole; the possibility that a person may be unjustly accused and convicted, which may not be discovered until long afterwards; to make it possible for the supreme authority to release persons convicted and sentenced under laws which are later considered harsh and oppressive, especially political offenders convicted in a time of great public excitement and discord, as during or at the close of a civil war; and to enable the chief executive to reward in this manner repentance and good conduct in prison, where he is satisfied that a thorough reform has been effected, and justice satisfied.

In England this power has always been vested in the King, and in early times seems to have been shared to a certain extent by the Lords of the Marches. In 1536 a statute was enacted (27 Hen. VIII., ch. 24) restricting the right to the King, and prohibiting him from delegating it to any subject within the realm. At present the Crown exercises its prerogative upon the advice of the Secretary of State. Parliament has imposed certain restrictions on the power to pardon from time to time. A pardon cannot be pleaded as a defense to an impeachment by the House of Commons. By the 'Habeas Corpus Act' of 1679, the Crown cannot pardon the offense of sending a person to prison without the realm. Where the pardon of an offense will work an injury against an innocent person, it will only be operative as far as the culprit's liability to punishment by the Crown is concerned, and will not affect his civil liability to a person injured by his crime.

In the United States the power to pardon offenses against the national Government is vested, by the Constitution, in the President. His power is absolute, except as to impeachments of public officers, and rests entirely in his discretion, not being subject to legislative control. Perhaps the greatest number of pardons are granted to soldiers guilty of a breach of the military regulations, especially to volunteers who are unused to rigid military discipline. In most of the States the pardoning power is vested in the Governor alone. Several of the States require the concurrence of one branch of the Legislature, and in a few boards of pardon have been established, of which the Governor is a member *ex officio*. Applications for a pardon are usually presented in the form of petitions, affidavits of responsible people as to the extenuating circumstances of the case, and the previous good character of the convicted person; and formal rings on such applications are often held. The necessity for the exercise of this power is greatly lessened in some States by statutes allowing a graduated commutation of a term of imprisonment as a reward for repentance and good conduct in prison. Many penal statutes also allow wide discretion to the trial judge as to sentence to be imposed, in the exercise of which he considers extenuating circumstances, etc., just as a Governor would do on an application for a pardon. The system of releasing prisoners on probation, and suspending sentence of convicted persons, is also a development of the idea of pardon.

Conditional pardons are sometimes granted. For example, a prisoner may be released on condition that he leaves the State forever. On violation of the condition, the ex-prisoner is again remanded to serve out his original term. A general pardon extended to political offenders, such as rebels, is usually called an act of amnesty (q.v.). A pardon is more sweeping in its effect than a reprieve, which only operates as a suspension of sentence. A full pardon effects a remission of the punishment and removes the legal disabilities which follow conviction, so that a person who is pardoned is, in law, as innocent as if he had never committed the crime, except that it does not restore forfeited property or fines. In New York, where a final conviction of murder and sentence of death operate as an absolute divorce of husband and wife, if the convicted spouse is pardoned, the marital relation is not thereby restored. A pardon obtained by deception or fraud is void, and on discovery of this fact the convicted person may be again committed to serve out his term. Consult the authorities referred to under CONSTITUTIONAL LAW; CRIMINAL LAW.

PARDONER'S TALE, THE. In Chaucer's *Canterbury Tales*, the story of three rioters who pledge themselves to find and destroy Death, who, they are informed, is under a certain tree. There they find a treasure. One is sent for food, and poisons the wine, while the others conspire to murder him when he returns. All three are killed.

PARDUBITZ, pär'dy-bits. A town of Bohemia, Austria, situated at the confluence of the Chrudimka with the Elbe, 12 miles south of Königgrätz (Map: Austria, D 1). It has an old palace, a large Rathaus, and a higher *Realschule*. Its manufactures comprise spirits, agricultural machinery, iron products, musical instruments, etc. Population, in 1890, 12,367; in 1900, 17,029, chiefly Roman Catholic Czechs.

PARÉ, pä'rä', AMBROISE (1517-90). A French surgeon, born at Laval, Department of Mayenne. He was apprenticed to a barber in Paris, studied anatomy and surgery, and in 1536 entered the army as a surgeon. During the military operations in Italy he acquired a great reputation as a skillful surgeon. He introduced the practice of ligating arteries in bleeding wounds, in place of the fashion which then prevailed of cauterizing them with boiling oil. Although he made many other improvements in the art, it is on the ligating arteries that his fame as 'the father of modern surgery' chiefly rests. On his return to Paris in 1539 he was received with distinction by the Royal College of Surgery, and was subsequently made its president. War being renewed, he again entered active service. At this time also he substituted ligatures of the arteries after amputations for cauterization, and many other important improvements in surgery were introduced by him. Returning to Paris, he ors

were showered upon him, and though he was ignorant of Latin, the *conditio sine qua non* of a liberal education at that time, learned titles and degrees were conferred upon him.

Paré's writings have exercised a profound influence on the practice of surgery, and particularly in the treatment of gunshot wounds. The first complete edition of Paré's works appeared at Lyons in 1562; the last, edited by Malgaigne, at Paris in 1840-41. Besides these are eight Latin editions, and more than fifteen translations. His principal work was *Cinq livres de chirurgie* (1562). Consult: Stephen Paget, *Ambroise Paré and His Times* (1897), and the *Life* by Paulmier (Paris, 1884). See SURGERY, MILITARY; and MEDICINE, HISTORY OF.

PAR'EGOR'IC (Lat. *paregoricus*, from Gk. *παρηγορικος, parēgorikos*, soothing, from *παρηγορος, parēgoros*, consoling, from *παρα, para*, beside + *ἀγορεύειν, agoreuein*, to talk in assembly, from *ἀγορά, agora*, assembly). The *camphorated tincture of opium* of the United States pharmacopœia. An alcoholic solution of opium, benzoic acid, camphor, and oil of anise, every fluid ounce containing two grains each of opium, benzoic acid, and camphor, and two minims of oil of anise. This preparation is much used both by the profession and the public. It is an excellent remedy for the chronic winter cough of old people, the opium diminishing the bronchial secretion and the sensibility of the pulmonary mucous membrane, while the benzoic acid and oil of anise act as stimulating expectorants. The volatile oil and camphor render paregoric particularly useful in diarrhœa. The preparation is often improperly given to children by careless or ignorant parents to quiet them and relieve pains in the bowels. Children are peculiarly susceptible to opium, and much harm is done by its regular administration.

PAREIRA BRAVA, pá-rā'rá brä'vá (Port., from Brazilian *parcira*, the native name, and Port. *brava*, brave, strong). The root of Chondodendron tomentosum, used to some extent medicinally as a diuretic, which for a century was supposed to be the root of Cissampelos Pareira, but was identified by Hanbury in 1873. The plant is a tall, woody climber, a native of Brazil and Peru, belonging to the order Menispermaceæ. It has large, ovate-cordate, fine-nerved leaves, very small unisexual flowers, and purplish-black, ovoid one-seeded drupaceous fruits, resembling grapes. As it comes to market the root is in short, thick, dark-brown pieces externally ridged and fissured transversely and irregularly furrowed longitudinally. It is nearly inodorous and has a bitter taste. The stem is sometimes found mixed with the root, which it much resembles, but may be distinguished by the pith. The roots of several other menispermaceous plants have been sold for pareira brava, among which is a yellow pareira brava exported from Brazil, in the form of flat, twisted stems which have been thought to be obtained from Aristolochia glaucescens. It may be detected by the eccentric arrangement of its woody zones, which in the genuine are symmetrically concentric. See CISSAMPELOS.

PAREJA, pá-rā'hä, JUAN DE (1606-70), called El Esclavo (the slave). A Spanish religious and portrait painter. He was born at Seville, the son of Moorish parents, and was the slave of Velazquez. He assisted his master in the studio, all the while secretly studying his art. By an artifice he succeeded in bringing one of his pictures to the attention of Philip IV., while he was visiting Velazquez's studio, who immediately set him free. After his emancipation he continued to serve Velazquez, though enrolled among his pupils, and after the latter's death he served his daughter. His paintings, which include portraits and religious subjects, are quite in the manner of his master. The most notable are: "The Calling of Saint Matthew," in the Prado Museum, Madrid; "Baptism of Christ," Santa Trinidad, Toledo; "Madonna de Guadalupe," in the Recollet Monastery at Madrid; "Capuchin Monk," Saint Petersburg; "Portrait of a Boy," Dulwich.

PARENCHYMA, pär-ĕn'kĭ-mâ (Neo-Lat., from Gk. *παρέγχυμα*, tissues of the lungs, liver, kidneys, and spleen). A plant tissue composed of living (usually thin-walled) cells whose three dimensions are approximately equal. Sometimes the term is applied to elongate cells. See HISTOLOGY.

PARENT AND CHILD. Under this head are usually treated the legal relations which exist between father or mother and children. The legal is to be distinguished from the natural relation, for two persons may be by the law of nature parent and child, while they are not legally or legitimately so. Conversely, the legal relation may exist although there is no natural relation. Hence a radical distinction exists between natural or illegitimate and legitimate children, and their respective legal rights with relation to their parents are very different.

EARLY LAW. While the legal relationship between mother and child has always been based on the fact of maternity, that between father and child was originally based, not on the fact of paternity, but on the husband's power over the child's mother. Marriage (q.v.), as we find it at the dawn of European history, was the appropriation of the woman by the man; and as the husband's power was originally not differentiated from other property rights, so the power of the father over children born of the wife was originally indistinguishable from ownership. Wife, children, slaves, and things were equally in the 'hand' (Latin manus, German *Mund*) of the head of the house. The father had the power of life and death over the child; he had also the right to sell the child. The marriage of a daughter, which put her in the 'hand' of her husband, and which usually took the form of a sale to the husband, of course carried her out of the father's power, and paternal authority over the son ended, among most of the Indo-European peoples, when the son established a household of his own. The life-long *patria potestas* (q.v.) of the Roman father seems to have been exceptional; it was connected with the Roman custom by which the son brought his wife into his father's house.

Of maternal authority over children, even when illegitimate, there is little trace in early law, because the woman was regularly herself in the 'hand' of father or husband or kinsman during her whole life. In early Frisian law, however, the mother had the same right as the father to kill her new-born child.

The earliest restraints upon the power of the

head of the house were exercised by his kinsmen, and to some extent by those of his wife, and, when the family was recognized as a religious institution, by the priests. These restraints, which at an early period began to lift the wife out of the position of a mere chattel, affected but slightly the position of the child. (For that of the Roman child, see PATRIA POTESTAS.) In the old German law (heathen period) the infant was not to be exposed after it had been sprinkled with water and had received its name; nor was a child to be put to death subsequently without cause; nor was a child to be sold except when the parents were in dire need. With the acceptance of Christianity by the Germans, the right of exposure disappeared, but the paternal power of punishment for crime and of sale in case of necessity were not at first affected. As regarded personal property, all that the unmarried daughter or the son living in the paternal house acquired was acquired for the father. As regards property, however, the children's eventual rights were protected; inherited realty of the parents was 'tied up' (*verfangen*) in the interest of the children, and a sale by the father conveyed no perfect title to the purchaser.

MEDIÆVAL LAW. In the course of the Middle Ages the authority of the father assumed more and more the aspect of a natural guardianship. The mother, also, with the disappearance of the rule that women were themselves always under guardianship, acquired a subordinate authority. After the death of the father, or when he was incapable of exercising control over the children, the mother became the natural guardian (at least of the persons) of her children.

The canon law introduced in the mediæval law of parent and child but one important modification, viz. legitimation of children born out of wedlock by subsequent marriage between the parents. This rule was borrowed from the Roman law, but was extended by the Church: at Roman law it applied only to children of a concubine, at canon law it applied to all illegitimate children. When it came, however, to recognizing such children as heritors, the Church encountered obstinate resistance. In many parts of Europe German law held its own, especially as regards the inheritance of entailed estates. The reception of the law-books of Justinian (see CIVIL LAW) had little influence upon the European law of parent and child, for the patria potestas of the Roman law was not generally received.

MODERN EUROPEAN LAW. In modern European law maternity is purely a question of fact; paternity is based on the presumption that the child born or conceived in wedlock is the husband's child, but proof of the contrary is permitted. The child born out of wedlock, if 'recognized' by the father, or if the fact of paternity be established by judicial inquiry, is entitled to support up to a certain age, and has rights of succession (q.v.) in the paternal estate, but not the same rights which belong to legitimate children. In the French law, however, inquiry into the paternity of the illegitimate child is prohibited, and such a child has no rights against the father unless it has been recognized. The legal relation of the parent and child is regularly established by birth in wedlock, by legitimation, and by adoption. A child born out of wedlock is legitimized by the subsequent marriage of the parents accompanied by recognition of the child; and in some countries (e.g. in Spain and in Germany) the child may be legitimized by administrative decree issued at the father's request. Adoption (q.v.) is usually permitted only when the adopting parent is childless. Legitimation and adoption generally give parent and child the same rights which pertain to the parent and to the child born in wedlock, but this is not always the case.

The authority of the parent over the person of the child is that of a guardian; i.e. the element of duty is more emphasized than that of power. In the exercise of parental authority the voice of the father is decisive, so that the parental rights of the mother become legally effective only when the father is dead, or when he is unable to exercise his rights or has been deprived of them by a decree of court. The administration of the property of children belongs to the parents (to the father as of right; to the mother, usually, only with the authorization of the family council or the court), and in most of the codes the parents are not obliged to account for the income, their rights being those of usufructuaries; but where property is given or bequeathed to a child, the donor or testator may exclude this parental usufruct and even the parental administration. The parental usufruct is also excluded as regards money and property acquired by the child's separate labor and industry. In case of divorce or annulment of marriage, the control of the persons and the property of the children is regulated by order of the court. The authority of the widow or divorced wife over her children and her usufructuary rights are, in all civil legislations, impaired by her remarriage; and the German law makes provision for safeguarding the interests of children of the first marriage when the father marries again. Parental authority is extinguished when the child reaches full age or is emancipated. In many legislations, however, parental consent is necessary for the marriage of a child even after the child has reached full age. See MARRIAGE.

In all European legislations parents, like other guardians, are subject to the control of the State, exercised through the courts; and they are usually incompetent to alienate real estate belonging to the children without the authorization of the proper court.

The chief duties of parents are the suitable support and education of their children. In many of the civil codes they are also bound to provide daughters with dowries (so at Spanish and German law); but this is not the case at French law, the Code Napoléon following the old maxim, 'ne dote qui ne veut.' Parents are responsible for debts contracted by their children without their authorization only as a result of the duty of support and education (i.e. they are liable only for necessaries). In most legislations they are liable for all torts committed by children; at German law, however, the parent is responsible only when the tort could and should have been prevented by him, i.e. when he has failed to exercise proper surveillance and control.

THE COMMON LAW.

LEGITIMATE CHILDREN. The parents are the legal as well as the natural guardians and protectors of the child. They have the legal right

to raise the child and are entitled to his custody. As such custodians, they or persons *in loco parentis* may reasonably chastise the child, but for excessive punishment, amounting to willful or malicious cruelty, the parent may be civilly liable in an action of tort (although in some States this liability has been denied on grounds of policy), or criminally liable for assault, or homicide in case death ensues. At common law the parents could not be deprived of the custody and control of the child by third parties, but by modern legislation officers having supervision over public charities, and in some States private charitable corporations, are authorized to acquire custody of the child, if subjected to cruel or improper treatment by the parents, by means of a properly instituted legal proceeding. At common law, as between the father and mother, in case they were living apart or divorced, the father was deemed to be entitled to the custody of the child, but by the Statute 36 and 37 Vict., c. 12, the mother was entitled to apply to the Court of Chancery for custody of the child, which the court in its discretion might award to her if it appeared to be for the best interests of the child. It is now the practice of courts generally in the United States, even in the absence of statute, to award the custody of the child to the parent best qualified and able to care for and educate the child.

In case of divorce or judicial separation of the parents, even in the absence of statute, courts having jurisdiction over divorce generally have jurisdiction to award custody of the children of the marriage. The right to custody may also be determined in a proper case by habeas corpus (q.v.), or in some States upon application to courts of probate or similar courts having statutory jurisdiction over the subject matter. If the parents separate by agreement, no stipulation entered into by them as to the custody of the child will be enforced by the courts if prejudicial to the child.

A parent or one *in loco parentis* is entitled to the services of his child until he comes of age, and if the services are rendered to others, the parent is legally entitled to recover the reasonable value of the child's services unless payment for the services is made to the child with the consent of the parent. As between the father and the mother, the father is entitled to the child's services, but upon the death of the father or upon custody of the child being awarded to the mother, she becomes entitled to the child's services. The right of the parent to take the child's earnings may be waived by his voluntary emancipation of the child. See EMANCIPATION.

When a child having regularly rendered services to his parents continues to do so after coming of age, there is a presumption of fact that the services are rendered as a gift, and he will not be allowed to recover for the services thus rendered in the absence of some agreement to that effect.

Parents have no interest in or control over the property of their children, such control being exercised by guardians appointed by courts of chancery or probate, having jurisdiction over the property of infants. (See GUARDIAN and WARD.) Wearing apparel and personal effects, however, purchased by the parent for an infant child remain the property of the parent and subject to his control. Choses in action belonging to the infant might be enforced at common law by an action brought in the name of the infant by the parent as next friend (*prochein ami*) of the infant; and now by statute generally such actions are prosecuted in the name of the infant by a guardian *ad litem* appointed by the court, who may be but is not necessarily a parent of the litigant.

As the parent is legally entitled to the services of the child, any wrongful act of third persons interfering with this right is a tort, for which such third persons must respond in damages to the parent. Thus a parent may recover all damages suffered by him by reason of loss of services of his child because of personal injuries inflicted upon the child by the negligent conduct of third persons. And in most jurisdictions he may recover also for the medical attendance supplied to the child, although, as will appear, the parent was not bound by the common law to supply the child with necessaries.

Upon similar principles the parent may recover damages for the seduction of an infant daughter. Indeed, by the early law, as well as in some States at the present time, the parent's right to recover for the seduction was based solely upon his right to recover for the loss of his daughter's services. The courts of some States, however, have departed from this rule and permit a recovery, even though the parent has emancipated his daughter and is, therefore, not entitled to her services. See SEDUCTION.

As regards the maintenance of the child, it is somewhat singular that according to the common law the parent is under no civil legal duty whatever to support the child. This defect in the law was remedied somewhat when what is known as the 'Poor Law' was enacted by Parliament in the reign of Elizabeth by which some legal duty was imposed upon parents and children to support each other when financially able to do so, or rather to assist the parish authorities in contributing to their support.

This act authorized the parish authorities to enforce the law by appropriate proceedings, and even authorized them to procure a judicial seizure of the parents' property for the use of their children in case of abandonment of the children by the parents. But it did not create obligations such that one who supplies a destitute child with food and clothing has any legal claim against the parent. Similar statutes have been enacted in most of the United States, and in a few States the courts have indicated that the duty of a parent to maintain his child thus created may also be enforced by third persons by an action in the nature of *quasi* contract.

While the parent is not civilly liable to maintain his child, he is criminally responsible if, having undertaken to care for his child, he neglects it and, by exposure or failure to provide it with food or clothing, causes the child's injury or death. Parents have been held guilty of manslaughter and even murder when death resulted from negligent or improper care of their children. The English courts have held that a parent who in good faith neglects to provide medical attendance for his child because he did not believe in the use of medicine was not criminally responsible for his neglect. The rule of this decision was promptly corrected by an act of Parliament, and it is probably generally the law in the United States that a parent guilty of gross neglect in

not providing proper medical attendance for his child is criminally responsible.

At common law a parent is not liable for the torts of his child unless their commission is incited or authorized by the parent, in which case the rules for determining his liability are the same as in the law of agency or master and servant.

At common law the child is an heir of the parent (see DESCENT) and is also entitled to a share of the parent's estate under the various statutes of distribution (q.v.). This interest of the child in the parent's property may, however, be defeated by the parent's will, which may dispose of all his property to strangers. In several States it is provided by statute that children of a testator born after the execution of his will and of whom no mention is made in the will shall take the same share in the parent's property which he would have secured had the parent died intestate.

ILLEGITIMATE CHILDREN. In strictness of law an illegitimate child, that is, one born out of wedlock, has no parent, and consequently he has no rights as against his natural parents, and they owe him no corresponding obligation. Natural parents at common law were, therefore, not bound to support their illegitimate child, and in case of their death intestate he acquired no interest in their property as heir or next of kin. The English Poor Law or Bastardy Act, which has been substantially reënacted in most of the United States, has qualified the common-law rule as to the duty of parents to maintain their illegitimate children.

As between the father and mother of the child the English statute makes the following requirements: The father is not bound even by the poor laws to maintain the child, and the parish officers cannot institute any proceedings whatever against him for this purpose; but the mother or the guardian of the child may, to a certain extent, compel him to contribute toward the child's maintenance and education. The first step is to go before a justice of the peace and obtain a summons of affiliation. The father is then cited before the magistrate, and if the mother swears that he is the father of the child, and some material part of her statement is corroborated by a third party, the magistrate may make an order directing the father to pay the expenses of lying in and a weekly sum until the child attains the age of sixteen. The mother may make this application either a few months before the birth, or within twelve months after the birth; and even after that time, provided that she can prove that the putative father paid her some money on account of the child within the twelve months. The putative father in these cases is a competent and compellable witness. The poor laws make the mother liable to maintain the child until it attains the age of sixteen; and not only is she so bound, but any man who marries her is also by statute bound to support all her illegitimate children until they attain that age. As regards the custody of illegitimate children, the mother is the party exclusively entitled, for the father is deemed in point of law not to be related to such child. Yet, if the father has in point of fact obtained the custody of such child, and the child is taken away by fraud, the courts will restore the child to his custody, so as to put him in the same position as before.

The bastardy statutes in the United States in general differ only in minor particulars from the English statute. One important difference, however, is a provision generally adopted authorizing the poor officers or other designated officials to bring bastardy proceedings directly against the putative father without the intervention of the mother. Although the father of an illegitimate child is under no direct positive obligation to support his child, the natural relationship has been held in some States to be a sufficient consideration to support and render enforceable the father's promise or agreement with third persons to pay for the support of the child even if made after the support has been given.

In some States also illegitimate children are by statute made heirs at law of the mother. Such is the law in New York, provided the mother leave no legitimate children. The mother may also inherit from her illegitimate child.

Consult: Field, *Legal Relations of Infants, Parent and Child*, etc. (Rochester, 1888); Ewell, *Cases on Domestic Relations* (Boston, 1891); Fraser, *Treatise on the Law of Scotland Relative to Parent and Child*, etc. (2d ed., Edinburgh, 1886); Eversley, *Law of the Domestic Relations* (London, 1885); Arndts, *Juristische Encyclopädie* (9th ed., Stuttgart, 1895); and the authorities referred to under such titles as DOMESTIC RELATIONS; HUSBAND AND WIFE; MARRIAGE; CONTRACT; DIVORCE; etc.

PARENZO, pä-rĕn'dzō (Lat. *Parentium*). A town on the west coast of the Crownland of Istria, Austria, situated on a rocky peninsula, connected with the mainland by a narrow strip of land, 35 miles south by west of Trieste (Map: Austria, C 4). It is the seat of the Provincial Assembly and of a Roman Catholic bishopric, and has a good harbor. Its principal building is the cathedral, a basilica of the sixth century containing fine mosaics. There are also ruins of Roman buildings. The inhabitants are engaged principally in fishing, shipbuilding, and trade. Population, in 1900, 9962, mostly Italians. Parenzo was a Roman colony. Parentium; became a part of the Venetian Republic in 1267 and remained so until its dissolution. The bishopric of Parenzo was founded about 524 and united with that of Pola in 1827.

PARE'PA-RO'SA, EUPHROSYNE (1836-74). An English soprano. She was born at Edinburgh and was the daughter of Georgiades de Boyesen, a Wallachian nobleman, and Elizabeth Seguin. She studied under Crescentini, Panseron, and Bordogni, and made her first appearance as a singer at Malta under the name of Parepa. She made her début in London in 1857, and in 1863 married Captain Carvell, who died two years later. She then went to America, and appeared at Irving Hall, New York, in 1865. In 1867 she married Carl Rosa, the violinist and operatic manager and conductor, with whom in 1869 she organized an English opera company. She sang at the Boston Peace Jubilee in 1869, and was a member of the Italian opera company at the Khedive's Theatre in Cairo during the winter of 1872-73. Her voice was remarkable for its purity and flexibility, and had a compass of two and one-half octaves. She died in London.

PAR'ESIS (Neo-Lat., from Gk. παρεσις, letting go, paralysis, from παριέναι, *pariénai*, to relax, from παρά, *para*, beside, beyond + ἵεναι,

hiemi, to let go, send). General Paresis, Paralytic Dementia, Dementia Paralytica, General Paralysis of the Insane, popularly but improperly called 'Softening of the Brain.' "A chronic diffuse encephalitis, presenting mental, motor, vaso-motor, and sensory symptoms, with progressive course and fatal termination" (Starr).

Etiology. The disease is much more common in males than in females, and occurs especially between the ages of thirty and fifty-five. In but few cases has any hereditary tendency been noted. While in general the disease is said to be more frequent among the lower classes, in this country it is most common among the middle and upper classes. About 80 per cent. of cases give a syphilitic history, and the relation between syphilis and paresis is so intimate that Fournier classes the latter as among 'les affections parasyphilitiques.' Alcoholic and sexual excesses and severe mental or emotional strains may also be mentioned as etiological factors.

Pathology. The earlier changes consist of congestion of the vessels of the brain and pia mater, exudation of serum into the peri-vascular lymph spaces, and an increase in the nuclei and cellular elements of the walls of the vessels. Following these vascular changes, and probably in a measure dependent upon them, is an increase in the neuroglia or connective tissue of the brain. This neuroglia increase often goes on quite rapidly and determines a corresponding shrinkage and atrophy of the nervous tissue proper. As the process continues there are degenerative changes in the nerve cells and fibres, with pigmentation and the formation of cyst-like cavities. There are usually an increase of fluid in the ventricles and thickening of the ependyma. With the full development of the lesion the brain atrophies, becomes shrunken, weighs less than the normal brain, the convolutions are smaller and the sulci more widely open. These changes affect the whole brain, but are most marked in the frontal and parietal lobes. Accompanying the brain lesions there are often a chronic meningitis and sclerosis of the posterior columns of the cord. Sclerosis of the lateral columns may also occur.

Symptoms. The onset is gradual. It is first noticed by friends that the patient does not seem in his usual frame of mind. He is irritable, either depressed or excitable, is growing inattentive to business, is laying unusual plans and schemes. These are often of great magnitude and involve expense entirely out of proportion to the man's means. The patient feels well, often saying that he never felt better in his life. A marked egotism usually develops. He boasts of his wealth, power, and abilities. Soon he becomes forgetful, careless, inattentive, unable to concentrate his mind upon any definite train of thoughts or to carry on a logical argument. This becomes noticeable in his conversation, which is disconnected. Headache and sleeplessness are common and there is a marked loss in weight and in strength. Even though previously a man of exemplary habits, the patient becomes neglectful of the ordinary proprieties of life, uses bad language, ignores family obligations, loses his temper, and indulges in sexual and alcoholic excesses. This condition lasts from one to three years and passes over gradually into a fully developed dementia. This condition is marked by an increase in the symptoms above described. Egotism is usually a marked feature and delusions of grandeur are the rule. Instead of exaltation there may be depression and melancholia, or melancholia and elation may alternate. Illusions, delusions, and hallucinations are common, but there are no fixed systematic delusions as is the case in paranoia. The emotions are in a state of unstable equilibrium. The patient is easily moved to laughter or tears. Slight causes produce intense excitement, which may take the form of rage or frenzy, rendering the patient dangerous to his fellows. There is rarely any suicidal tendency. Self-control is weakened, and consequently voluntary actions are weak, irresponsible, and impulsive. Self-consciousness is impaired, the patient failing to appreciate his changed mental condition. He is contented wherever he is, is not concerned about the anxiety of his friends, loss of money or business, or even asylum confinement. Of motor symptoms tremor of the tongue and face muscles appears first. Later almost any motion is attended with trembling. This results in thickness of speech and in clumsiness in the finer coördinate movements, such as writing. These motor symptoms gradually pass over into a paralysis, which becomes increasingly widespread and increasingly complete. There is also marked increase or marked decrease in the reflexes, with less retention of urine and of control of the rectum. Sensory symptoms, anæsthesia and analgesia, are late manifestations. Bed-sores and cystitis are very common. The average duration of the disease is from three to four years. In the early stage of the disease there may be transient paralysis of one arm or one leg. There may be convulsions occurring at intervals of a few days, which may be mistaken for epilepsy. In the last stages convulsions are usual and severe. Death results from exhaustion, frequently from convulsions, or from some intercurrent complication, such as pneumonia, cystitis, or obstruction of the bowels.

Treatment. Antisyphilitic treatment may be tried in the early stages. Later the treatment is entirely symptomatic, tonic, sedative in conditions of excitement, while in the later stages confinement in an institution or constant home care is necessary. See Insanity.

PAR'ET, William (1826—). A bishop of the Protestant Episcopal Church. He was born in New York, graduated from Hobart College in 1849, and pursued his theological studies under Bishop De Lancey, by whom he was ordained priest at Grace Church, Rochester, June 28, 1853. He had charges at Clyde, N. Y.; Pierrepont Manor, N. Y.; East Saginaw, Mich., Elmira, N. Y.; Williamsport, Pa.; and Washington, D. C. He was consecrated sixth bishop of Maryland on January 8, 1885. He is the author of canonical digests, and *Saint Peter and the Primacy*, a lecture before the Church Club of New York.

PARGA, pär'gà. A town in the Vilayet of Janina, European Turkey, situated on the shore of the Ionian Sea, opposite the island of Paxos (Map: Balkan Peninsula, C 5). It is built on a steep cliff, surmounted by an almost impregnable citadel, and has a harbor defended by a small island. Parga, founded in the last days of the

Roman Empire, was independent and under the protection of Venice from 1401 to 1797, when it was for a short time governed by the French. In 1814 Ali Pasha, Governor of Albania, besieged it, and the people applied to the English for aid. England took possession of the fortress, but in 1819 handed it over to Ali Pasha, whereupon most of the inhabitants emigrated to the Ionian Islands. The present population is about 5000.

PAR'GASITE (named from *Pargas*, Sweden, where it is found). A name applied to the green and bluish-green varieties of hornblende. Pargasite is usually found in the form of stout lustrous crystals, although sometimes occurring in the granular form. It is distinguished from the common hornblende, which is usually dark-green or black in color.

PAR'GO. A fish—a snapper of the genus Neomænis. The familiar red snapper is 'pargo colorado,' called in Havana markets 'pargo guachinango,' or Mexican snapper, because brought from the Mexican coast. The silk snapper is 'pargo de lo alto.'

PARHELIA. See HALO.

PARIA, pä'rē-ä, GULF OF. An inlet of the Atlantic Ocean on the coast of Venezuela (Map: Venezuela, E 1). It is 40 miles wide and 100 miles long, and almost completely land-locked, being cut off from the Caribbean Sea by the narrow and rocky Paria Peninsula, while across its mouth lies the island of Trinidad. The gulf communicates with the ocean on either side of the island by the straits known as the Dragon's Mouth in the north and the Serpent's Mouth in the south, each about 10 miles wide. They were thus named by Columbus, who discovered them in 1498, because of the difficulties he found in navigating the strong currents which race through them. The gulf receives the northern arms of the Orinoco delta.

PARIAH, pä'rĭ-à (from Tamil *pariah*, *pariar*, drummer, from *parai*, drum; so called because they are hereditary drum-beaters). The name applied to aboriginal individuals of low class throughout Southern India, who do not belong to any of the castes of the Brahmanical system. They are shunned even by the lowest Hindus who profess Brahmanism, since the touch of a pariah renders a Brahman impure. Pariahs were formerly compelled to wear a bell to warn Brahmans of their proximity. The pariahs are of Negrito origin, as shown by their short woolly hair, flat nose, thick lips, and short stature. They, like the Hindus, are divided into distinct grades, and imitate their superiors in that the lowest pariah is as careful to preserve his status as the proudest Brahman. In the Tamil country they form a large part of the population, and are employed as agricultural laborers or as servants to Europeans. In station, however, they are superior to other aborigines.

PARIAH DOG. The native cur of Egypt, Persia, and all Oriental countries, regarded merely as an outcast and scavenger. According to Youatt, there are several varieties, viz.: (1) a wild form bred in the jungles and lower ranges of the Himalayas, of a reddish-brown color, with sharp pointed ears; (2) a form in inhabited districts among which turn-spits are often found; (3) the Sumatran form, which has the countenance of a fox, eyes oblique, ears rounded, hairy, muzzle foxy brown, tail bushy and pendulous; (4) the Javanese indigenous dog. Stonehenge describes the pariah dog as a cross between a dhole and any domesticated dog of the neighborhood, and Fitzinger calls it a variant of the sheep-dog. The pariah dogs of Egypt appear to belong to a single race, and, according to Lydekker, are about the size of a sheep-dog, but of a stouter build, with a broader head, the tail being long, generally bushy, and carried close to the ground. The general color of their coarse rough hair is reddish brown, tending in some individuals more decidedly to gray, and in others to yellow. Occasionally black or tawny individuals may be observed. Their ears are short, pointed, and usually erect.

PARIAN CHRONICLE. A marble slab containing the most important inscription among the Arundel Marbles (q.v.).

PA RIASAU'RUS (Neo-Lat., from Gk. παρεία, *pareia*, cheek + σαῦρος, *sauros*, lizard). A remarkable fossil anomodont reptile, of which a few quite complete skeletons have been found in the Permo-Triassic Karoo formation of South Africa. The animal was large, about 10 feet in length, of massive build, with very short stout limbs and a short tail. The skeleton presents a most peculiar squat appearance and in some respects suggests that of the turtles, for which reason this creature has been thought to afford a clue to the origin of the chelonians. There were a few rows of small dermal scales on the back, but no nearer approximation to the carapace of the turtles.

PARI'ETAL BONES. See SKULL.

PARIEU, pä'ryē', MARIE LOUIS PIERRE FÉLIX ESQUIROU DE (1815-93). A French politician and economist, born at Aurillac. He studied at Paris and Strassburg and practiced law at Rouen. In 1848 he was elected to the Constituent Assembly, where he voted with the Moderate Left. From 1849 till 1851 he was Minister of Public Instruction. He joined the Bonapartist Party, and became a member of the Council of State in 1852. In the Ministry of Ollivier he was president of the Council of State. He served as Senator from Cantal in 1876, but was defeated in the election of 1885. He was one of the most earnest advocates of a single gold standard in France. His chief works are: *Traité des impôts* (1862-64); *Principes de la science politique* (1870); *La politique monétaire en France et en Allemagne* (1872); and *Histoire de Gustave-Adolphe* (1875).

PARIMA, pä-rē'mä, SIERRA DE. An isolated mountain system running along the southern boundary of Venezuela and Guiana, and forming part of the divide between the Orinoco and the Amazon (Map: Brazil, E 3). Though the name Parima is commonly extended to the whole system, the eastern range is also known as the Sierra Pacaraima. It forms a vast turtle-back plateau consisting of a granite core underlying Old Sandstone strata. This plateau is crossed in various directions by short ridges, and falls, especially toward the Amazon valley, by several steep escarpments. The higher ridges are generally barren rocks, but the plains intervening between the successive escarpments are covered with grass or forests. The system is neither as high nor as sharply defined as the northern mountains of Venezuela. The highest points are Mount Maraguaca, 8230 feet, and Mount Duida,

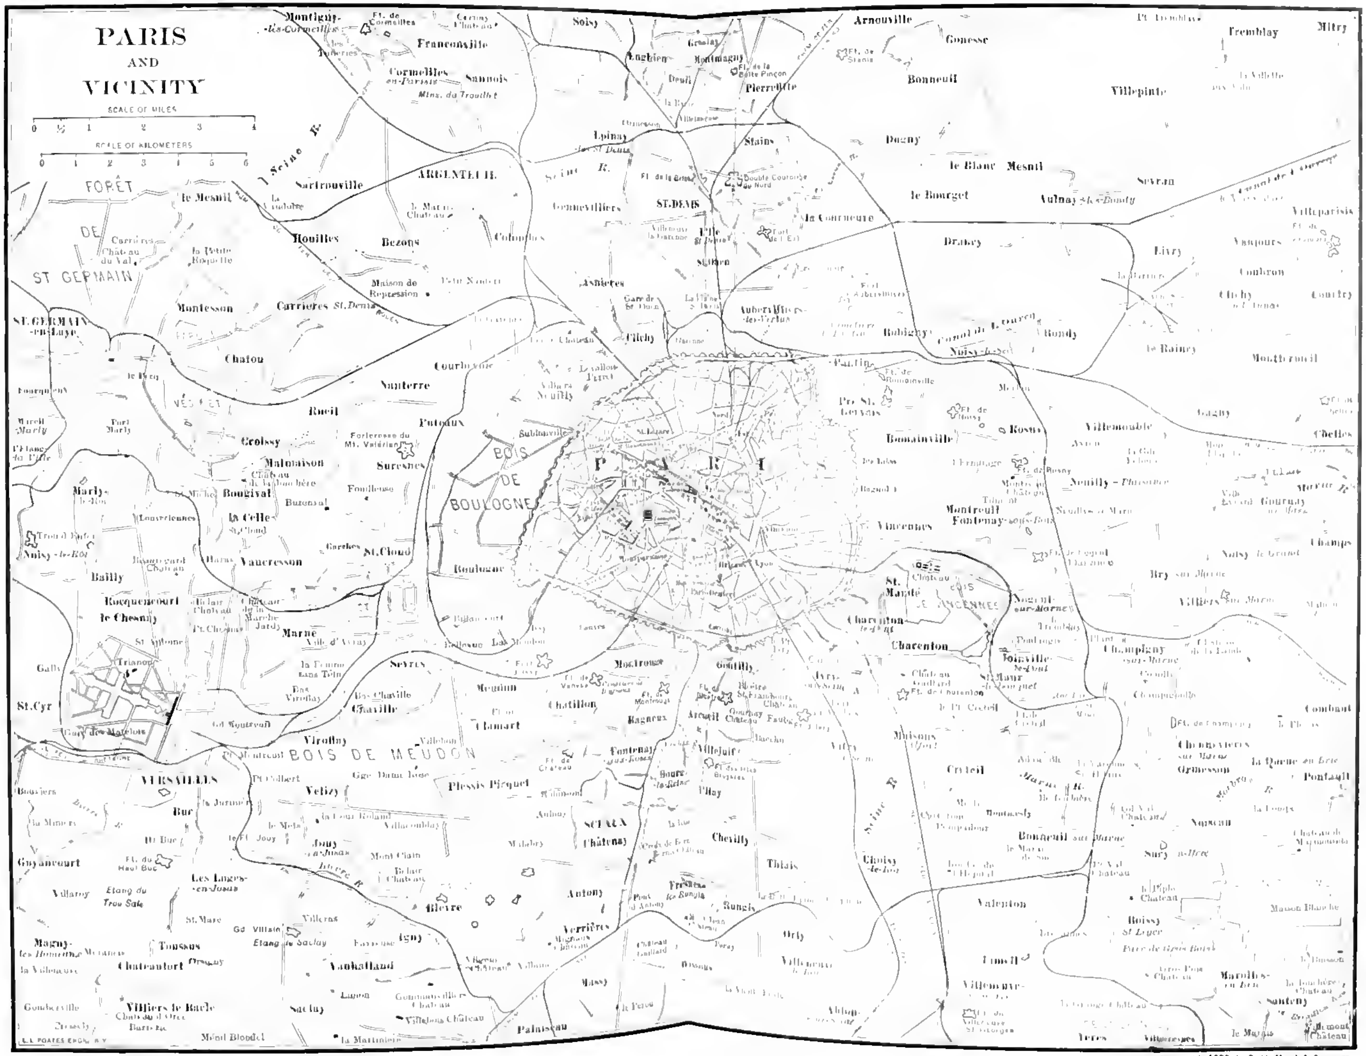
8120 feet. The latter is a conspicuous landmark, situated near the point of bifurcation of the Orinoco and the Cassiquaire.

PARINI, pä-rē'nē, Giuseppe (1729-99). An Italian poet, born at Bosio, May 23, 1729. After the appearance of his first verses he was made a member of the Accademia dei Trasformati, and he was admitted into a branch of the Arcadia. He became a priest in 1754. From 1773 on he taught the principles of fine arts at the Brera in Milan. To Bonaparte he owed a temporary office in the government of Milan. He died at Milan, August 15, 1799. His more important works are the descriptive poem *Il Giorno* and the *Odi* or Odes. The *Odi*, some twenty-one in number, were composed between 1757 and 1795, and, like most of his earlier poetry, show that he had a deal of the Arcadian spirit, although he intentionally avoided the excessive refinement and mellifluousness of the Arcadian measures. The *Giorno*, written after 1760, is not only Parini's masterpiece, but is also one of the most important literary productions of Italy in the eighteenth century. It is composed of four parts: the *Mattino* (morning), the *Meriggio* (noon), the *Vespro* (evening), and the *Notte* (night). Under the form of counsels given to a young noble as to the way in which he should spend his day, the author has here satirized the fashionable youth of his time, who were given up to effeminate and corrupt practices. Consult Reini's edition of the *Opere di Giuseppe Parini* (Milan, 1801-04), which is still the most nearly complete collection of his works, and contains his prose productions (mainly academic discourses) as well as his verse. Of the *Odi* the best edition is that of Salveraglio (Bologna, 1882). Consult also Cerquetti, *Il testo più sicuro delle Odi di Giuseppe Parini* (Osimo, 1892).

PARIS, *Fr. pron.* pà'rē'. The metropolis of France, and the capital of the Department of Seine, situated on the River Seine, 110 miles in a direct line from its mouth, latitude 48° 50′ N., longitude 2° 20′ E. With its suburbs, comprised in the arrondissements of Saint-Denis and Sceaux, Paris forms the Department of Seine (q.v.). The city lies in a hollow, about 200 feet above the level of the sea, and is surrounded by low hills, which to the north, at Belleville and Montmartre, reach a maximum altitude respectively of 330 feet and 420 feet. These hills, separated by narrow valleys or plateaus, as those of Saint-Denis to the north, Ivry to the southeast, Montrouge to the south, and Grenelle to the southwest, are encircled at a distance of from two to five miles by an outer range of heights, mostly fortified, which include Mont Valérien, 450 feet above the Seine, the highest point in the immediate vicinity of the city, Villejuif, Meudon, and Saint-Cloud. The hollow is a small level plain of Tertiary formation, known as the Paris Basin, composed at varying depths of different strata of gypsum and marls abounding in fossil remains, siliceous limestones, and a vast chalk bed. The strata provide in part the city's building material, stone, gravel, etc. The climate is fairly uniform and mild, pleasant and healthful, the mean annual temperature being 51° F., the mean January temperature 36°, July 66°. The river seldom freezes. Rain falls on an average during 143 days in a year, the average quantity during that period being 19.68 inches.

Paris is encircled by a wall 21 miles long, fortified by 94 bastions, pierced by 57 gates, and having a glacis and moat 48 feet wide. In addition there are 17 detached forts within a distance of two miles, and 19 outlying fortresses encircling an area of 400 square miles. The modern enceinte was constructed by Louis Philippe in 1841-44, but the outlying fortresses were added after the war of 1870. The city is now practically impregnable. Steam and electric railroads give access to the numerous suburbs famous alike for their picturesque situations and historical associations. These include the more immediate suburbs of Boulogne, with the famous Bois de Boulogne (bordering Paris on the west), adjoining which is the race-course of Longchamps, Neuilly, Levallois-Perret, Clichy-la-Garenne, Suresnes, Puteaux, Courbevoie, Asnières, Aubervilliers, Bobigny, Pantin, Pré-Saint-Gervais, Vincennes, with its wood, fort, château, and race-course, Charenton, Ivry, Gentilly, Arcueil, Bagneux, Châtillon, Montrouge, Vanves, Issy, Meudon, and the more distant Versailles, with its palace, gardens, fountains, art collections, and the Grand and Petit Trianon; Rambouillet, with its castle, parks, and gardens; Saint-Cloud, with its palace and park; Saint-Germain-en-Laye, with its two castles; Sèvres, famous for its porcelain factories; Saint-Denis, with its abbey cathedral, where the kings of France are buried; Enghien, noted for its sulphur springs, on a wooded lake near the forest of Montmorency; Argenteuil, a favorite boating resort; Mériel, which derives its celebrity from the neighboring Abbaye du Val, a twelfth-century monastic edifice of great archæological interest; Dampierre, with the splendid ducal château of the Luynes family; Fontainebleau, with its palace, fine art collections, and its extensive forest with Barbison, the resort of artists on the western border; Malmaison, with the former château residence of the Empress Josephine; and Marly-le-Roi, with its forest and aqueduct.

Communications and Bridges. The wall-girt city covers an area of about 30 square miles. It is entered by six lines of railroads; the palatial stations in the metropolis include the Gare du Nord on the Place Roubaix, the Gare Saint-Lazare, facing the Rue Saint-Lazare, the Gare de l'Est or de Strasbourg on the Place de Strasbourg, the Gare d'Orléans on the Quai d'Austerlitz, and the Gare de Lyon on the Boulevard Diderot. The Seine, which enters Paris in the southeast at Bercy, about a mile below its junction with the Marne, is spanned by 32 bridges. It leaves the city at Point du Jour in the southwest, having divided it in two parts, and having formed the two islands of La Cité and Saint-Louis, which are both covered with buildings. The river at Paris is from 300 to 500 feet wide. The most celebrated and ancient of the bridges are the Pont Notre Dame, dating from 1500, and the Pont Neuf, begun in 1578, completed by Henry IV. in 1604, and thoroughly restored in 1852. The latter, which crosses the Seine at the lower end of the Ile-de-la-Cité, is 1080 feet long, and abuts near the middle on a small peninsula planted with trees which form a background to the equestrian statue of Henry IV., which stands in the central open space on the bridge. Among the other bridges, the handsomest are the Pont de la Concorde, 160 yards long, built in 1781-90; the Pont d'Austerlitz, and Pont



d'Iéna, both of the time of the First Empire; the Pont du Carrousel, built under Louis Philippe; and the Pont des Invalides, Pont de l'Alma, and Pont de Solférino—all fine structures, adorned with military and naval trophies commemorative of events and victories connected with the Second Empire. Among the most recent, and one of the most striking, is the Pont Alexandre III., named in honor of the Czar, and the Pont Mirabeau, connecting Auteuil and Grenelle. These bridges all communicate directly with the spacious quays, planted with trees, which line both banks of the Seine, and which, together with the boulevards, give characteristic beauty to the city. Although the most ancient quays—as the Quai des Augustins and the Quai de la Mégisserie—date from the fourteenth century, the greatest part of these magnificent embankments, measuring 12 miles in extent, is due to Napoleon I. and Napoleon III.

STREETS, BUILDINGS, MONUMENTS, ETC. The private houses, most of which are of the apartment or flat-house order, rising to six or seven stories, as well as the public buildings, are built of a light-colored limestone, easily wrought and carved ornamentally. Among the finest of the wide and straight streets are the Rue de Rivoli, two miles in length, the Rue de la Paix, the Rue du Faubourg Saint-Honoré, and the Rue Royale. The boulevards, which extend in an irregularly circular line on both sides of the Seine, generally on the site of the ancient ramparts, between the nucleus of the city and its surrounding quarters, present the most striking feature of Parisian life. In all the better parts of the city they are lined with trees, seats, and little towers called Vespasiennes, covered with advertisements. Restaurants, cafés, shops, and various places of amusement succeed one another for miles, their character varying from the height of luxury and elegance in the Boulevard des Italiens and the Boulevard Haussmann, to the domestic simplicity of the Boulevards Beaumarchais and Saint-Denis. Among the public squares or places, of which there are over 130, mostly owned by the municipality, the most noteworthy is the Place de la Concorde, which connects the gardens of the Tuileries (q.v.) with the Champs Elysées (q.v.), and embraces a magnificent view of some of the finest buildings and gardens of Paris. In the centre is the famous obelisk of Luxor, brought from Egypt to France in 1836, and covered over its entire height of 76 feet with hieroglyphics. On the site of this obelisk stood the Revolutionary guillotine, at which perished Louis XVI., Marie Antoinette, Philippe Egalité, Danton, Robespierre, and a host of other victims. Of the other squares, the following are some of the handsomest: the Place du Carrousel, west of the Louvre, with the Arc de Triomphe du Carrousel, erected by Napoleon I. in commemoration of his victories in the campaigns of 1805-06; the Place de la République, with a fine bronze statue of the Republic; the Place de l'Opéra; the Place Vendôme, with Napoleon's column of victory; the Place de la Bastille, where once stood that famous prison and fortress (see BASTILLE); the Place de la Nation, formerly Place du Trône (with its fine fountain and monumental group, the Triumph of the Republic); the Place de l'Hôtel de Ville, formerly Place de la Grève, for many ages the scene of public executions, and the spot at which some of the bloodiest deeds of the Revolution were perpetrated. The Porte Saint-Martin and Porte Saint-Denis, which were erected by Louis XIV. to commemorate his victories in the Low Countries, and are adorned with bas-reliefs representing events of these campaigns, mark the ancient limits of the most turbulent quarters of the Paris of the past; the Arc de Triomphe de l'Etoile, 160 feet high and 146 feet wide, begun by Napoleon I. in 1806, and completed in 1836 at a cost of more than $2,000,000, may be said to form the extreme west end boundary of the aristocratic quarters. It is profusely adorned with bas-reliefs and alto-reliefs, representing victories of Napoleon. The great streets which radiate from the Arc de Triomphe de l'Etoile are among the most magnificent of Paris, and form the finest quarter. The Place de l'Etoile is connected with the Champs Elysées by the Avenue des Champs Elysées, with the celebrated Bois de Boulogne (q.v.) by the Avenues Grande Armée, Bois de Boulogne, and Victor Hugo, and the Portes Neuilly, Dauphiné, and Maillot; and it communicates by the Avenues Kléber and d'Iéna with the Place, the Parc, and the Palais du Trocadéro.

The Palais du Trocadéro, named after a Cadiz fort taken in 1823 by the French, dates from the exhibition of 1878; it is a mammoth building of Oriental architecture and crescent form, on an elevation surmounting a huge cascade of ornamental water. It has valuable museums of comparative sculpture and of ethnography, and its fine salle des Fêtes, containing a huge organ, can accommodate 6000 persons. In the well-kept park is a subterranean aquarium. The Pont d'Iéna leads from the Parc across the Seine to the historic Champ de Mars (q.v.), the site of the universal expositions since 1867, and of the Eiffel Tower (q.v.), 984 feet high, built for the Exposition of 1889. On the southeast is the Ecole Militaire, founded in 1752 and formerly used as barracks for infantry and cavalry, but now occupied by the Ecole Supérieure de Guerre. Near by is the Hôtel des Invalides (q.v.), founded in 1670 for disabled soldiers. The crypt of the church contains the sarcophagus, hewn from a huge block of Russian granite, in which lie the remains of Napoleon I., deposited there in 1840. The Musée d'Artillerie in the west wing comprises an historical collection of 10,000 war implements. The fine Esplanade des Invalides, fronting the building and bordered by the Quai d'Orsay, connects by the Pont Alexandre III. with the Champs Elysées on the north bank. Here are situated the Palais de l'Elysée, the official residence of the President of the Republic, the Grand and Petit Palais des Beaux Arts, where the Salons are held, and the Palais de Glace, the three latter built for the Exposition of 1900, having replaced the Palais de l'Industrie built for the first Great Exposition in 1855, and until 1897 housing a permanent exhibition. Thence through the Place de la Concorde the Jardin des Tuileries is reached, to the east of which is the Louvre (q.v.), forming a square of 576 by 538 feet, remarkable especially the eastern façade, for its architectural beauty.

The Louvre, formerly a royal residence, was connected with the celebrated palace of the Tuileries (q.v.) by a great picture gallery, and between the two palaces lay the Place du Carrousel. Napoleon III. further connected the Tuileries and Louvre on the northern side, throw-

ing them into one vast building, which formed the most palatial structure in the world. The Tuileries continued to be occupied as the residence of the Imperial family; but the Louvre proper, with its series of great galleries, formed a vast museum of pictures, sculptures, and collections of Egyptian, Greek, and Roman antiquities. The Communists of 1871 attempted to burn the whole pile and succeeded in destroying the Tuileries and a corner of the Louvre. The library of the Louvre, with its contents, was burned, but the rest of the building and its priceless treasures were saved. North of the Louvre is the Palais Royal (q.v.), and north of the Palais Royal is the Bourse or Exchange, a beautiful structure in Graeco-Roman style, surrounded by sixty-six Corinthian columns; to the east, on the north bank of the Seine, opposite the Ile de la Cité, is the Hôtel de Ville. Since 1871, when it was burned by the Communists, it has been carefully rebuilt in the style of its predecessor, and is one of the most magnificent buildings in Paris. It is the residence of the prefect of the Seine, and includes all the offices for the transaction of the municipal business of Paris. Not far from the Hôtel de Ville is the Tour Saint Jacques, a square Gothic tower 175 feet high, dating from 1504-22, and until recently utilized as an atmospherical observatory; it affords one of the finest views in Paris. Almost opposite, on the northern bank of the Cité, stands the vast Palais de Justice, originally the residence of the kings of France; some parts of it date from the fourteenth century, others are modern. It is the seat of some of the courts of law, as the Court of Cassation, the tribunals of the first appeal, and of police. Within the precincts of this palace are the Sainte Chapelle, and the noted old prison of the Conciergerie, in which Marie Antoinette, Danton, and Robespierre were successively confined. The Conciergerie, in which prisoners are lodged pending their trial, constituted one of the eight prisons of Paris, of which the principal were La Force, Saint Pélagie, Saint Lazare, Mazas, and La Roquette. The latter have been replaced by the modern prison of Fresnes-les-Rungis, which covers fifty acres, the Conciergerie alone being retained.

Among other notable features on the north of the river are the mammoth Halles Centrales or Central Markets, the Marché du Temple, and the Parc des Buttes Chaumont. The palace of the Luxembourg (q.v.), on the south side of the Seine, was built in the Florentine style by Jacques Debrosse for Marie de' Medici. It contains many magnificent rooms and the celebrated museum devoted to the exhibition of the works of modern artists and other notable features. Also on the south side of the river are the Sorbonne (q.v.), the centre of the famous Latin Quarter, the Panthéon (q.v.), the Jardin des Plantes, the large Halle aux Vins, the Hospice de la Salpêtrière, the Observatory, and the Cemetery of Mont Parnasse.

Paris has many theatres and places of amusement, suited to the tastes and means of every class. The leading houses, as the Opéra, Théâtre Français—chiefly devoted to classical French drama—Odéon, Théâtre Italien, etc., receive a subvention from the Government, and all are under strict police supervision. The new opera house, completed in 1875, is a magnificent building, costing, exclusive of the site, $5,600,000. It is at present the largest theatre in the world, occupying an area of nearly three acres; its most striking features are the magnificent Grand Staircase and the Foyer with admirable decorations. Cheap concerts, equestrian performances, and public balls, held in the open air in summer, supply a constant round of gayety to the burgher and working classes at a moderate cost, and form a characteristic feature of Parisian life.

Among the large number of churches, the grandest and most interesting from an historic point of view is the Cathedral of Notre Dame (q.v.), which stands on a site on the Ile de la Cité, successively occupied by a Pagan temple and a Christian basilica of the time of the Merovingian kings. The present building was constructed between 1163 and the end of the thirteenth century; since then it has been frequently altered, and in its present state of restored magnificence ranks as one of the noblest specimens of Gothic architecture. Saint Germain-des-Près, which is probably the most ancient church in Paris, was completed in 1163; Saint Etienne du Mont and Saint Germain l'Auxerrois, both ancient, are interesting—the former for its picturesque and quaint decorations, and for containing the tomb of Saint Geneviève, the patron saint of Paris; and the latter for its rich decorations and the frescoed portal, restored at the wish of Margaret of Valois, and for the fact that from its little bell-tower the signal was given for the massacre of the Huguenots on Saint Bartholomew's night. The Sainte Chapelle, built by Saint Louis in 1245-48 for the reception of the various relics which he had brought from the Holy Land, is one of the most remarkable buildings in Paris, profusely decorated in all parts with brilliantly colored materials. In Saint Eustache, erected 1532-1637, the Feast of Reason was celebrated in 1793; here is performed probably the finest religious music in Paris. Saint Sulpice, finished in 1749, is noticeable for its size, measuring 462 feet in length, 183 feet in width, and 108 feet in height. Among modern churches are: the Madeleine (q.v.), built in imitation of a Greek temple, and surrounded by a colonnade of fifty-four massive Corinthian columns; the building having no windows, the light enters through the ceiling of the three cupolas surmounting it; the interior is gorgeous with gildings, frescoes, carvings, marbles, and statues; the Panthéon (q.v.), which was begun as a church, but converted by the Constituent Assembly at the time of the Revolution into a temple dedicated to the great men of the nation, was restored to the Church by Napoleon III, and rededicated to Saint Geneviève, but was definitely secularized in 1885, when Victor Hugo was buried there; Notre Dame de Lorette, erected in 1823, a flagrant specimen of the meretricious taste of the day; Saint Vincent de Paul, completed in 1844, somewhat more imposing in style; and, crowning the height of Montmartre, the national votive church of the Sacré Cœur, begun in 1875, a Romanesque edifice with a Byzantine dome and campanile respectively 197 feet and 263 feet high. Among the Protestant churches, L'Oratoire is the largest and the best known.

Paris has a number of cemeteries, of which the principal one is Père Lachaise, extending over 110 acres, and filled in every part with monuments erected to the memory of the multi-

tude of celebrated persons who have been buried here. The Morgue, on the Ile de la Cité, behind the Cathedral of Notre Dame, is a building in which the bodies of unknown persons who have met with a violent death are placed. These, if not claimed within three days, are buried at the public expense. The southern parts of the city are built over beds of limestone, rich in fossils, which have been so extensively quarried as to have become a mere network of vast caverns, which in some cases scarcely afford sufficient support to the houses above. These quarries were converted into catacombs in 1784, and there are deposited the bones of the dead collected from the ancient cemeteries of Paris.

EDUCATIONAL INSTITUTIONS. The chief institutions connected with the University of France are situated in the Quartier Latin. The old Sorbonne (q.v.), a large building erected by Cardinal Richelieu for the faculties of the old University of Paris, has been replaced by a magnificent modern building, with fine lecture halls and class-rooms, and an extensive library open to the public. Near the Sorbonne is the Collège de France, where gratuitous public lectures are also delivered by eminent scholars and men of letters. The Ecole Polytechnique, the School of Medicine and the School of Law, the Observatory, and the Jardin des Plantes, with its great museum of natural history, lecture-rooms, and botanical and zoölogical gardens, are situated in the same quarter of Paris.

The principal of the public libraries is that of the Rue Richelieu, now called the Bibliothèque Nationale, which contains more than 2,600,000 volumes, 100,000 manuscripts, many portfolios or engravings, and a collection of 400,000 coins and medals, which originated in a small collection of books placed by Louis XI. in the Louvre. In addition, the municipality maintains many branch libraries. No city is richer than Paris in fine-art collections, and among these the museums at the Louvre stand preëminent. The Palais or Ecole des Beaux-Arts, one of the finest educational institutions in the world, dating from 1648, is a place for exhibiting art, manufactures, and architectural models. The Hôtel Cluny, connected underground with the Roman Palais des Thermes, besides being in itself a most interesting monument of mediæval art, contains curious relics of the arts and usages of the French people from the earlier ages of their history to the Renaissance period. The mint deserves notice for the perfection of its machinery. The Gobelins, or tapestry manufactory, may be included under the fine arts, as the productions of its looms are all manual and demand great artistic skill. The Conservatoire des Arts et Métiers, in the Rue Saint Martin, contains a great collection of models of machinery and class-rooms for the instruction of workmen in all departments of applied science. The spacious building in which the exposition of 1878 took place was named the Palace of the Trocadéro, and now forms a permanent exhibition. Among the numerous learned societies, associations, and institutions the chief are the Académie de Médecine and the Institute of France (q.v.), the latter housed in the Palais de l'Institut on the Seine at the end of the Pont des Arts, and comprising five academies devoted respectively to the supervision of the French language and the publication of official dictionaries of the French language (the French Academy), to archæology and ancient languages; to mathematics and natural science; to painting, architecture, sculpture, and music; and to philosophy, history, and political economy.

ADMINISTRATION. Paris is divided into twenty arrondissements for purposes of administration. The Prefect of the Seine is the chief of the municipal government, and is appointed by the national Government. There is a municipal council, composed of eighty members, four from each arrondissement, chosen by popular election. Each arrondissement has a mayor and two assistant councilors. The arrondissement is the unit of municipal organization for all administrative purposes. It registers all the births and deaths within its boundaries; keeps the registration lists of voters and jurors; attends to the assessment and collection of all taxes; receives application for licenses and privileges; serves as an agency in floating municipal or State loans; administers the schools and libraries; and forms the local centre for all modes of charity work. The whole work of the municipal administrative machine is greatly facilitated by the admirable system of civil service regulating all the appointments and promotions of city officials. The prefect of police is at the head of the civic guard or gendarmes, the fire brigade, and the gardiens de la paix, or city police, who are armed with swords. The number of policemen has been constantly increasing. At the close of the last century there were nearly 9000 men on the police force, or 35 to 10,000 population.

Paris is abundantly supplied with water, the chief sources being the Seine, the Canal d'Ourcq, the Marne, the Dhuis, and a vast natural reservoir, underlying the Paris Basin; the latter is tapped by artesian wells, the most famous of which is the well of Grenelle, 1800 feet deep, and surmounted by a tower 108 feet high. The cleaning, sewerage, and water supplies are under the charge of the prefect. The sewerage system is admirable; the total length of the underground channels is over 615 miles, and they are kept so clean and well ventilated that an hour's excursion through the sewers or *égouts* is one of the ordinary experiences of visitors to Paris, the journey being made partly in boats and partly by electric trolleys. Paris has a sewage farm, five miles from the city limits (in the Saint Germain forest), which has proved a success from an agricultural point of view, without in the least injuring the health of the community in that region. The paving of the city leaves nothing to be desired, and the street lighting is admirably carried out by means of electric and gas lights furnished by private companies, as explained below.

The administrative tendency in Paris is for municipal ownership of all works supplying public wants and directly affecting public health.

The Conseil d'Hygiène et de Salubrité, or Board of Health, is composed of men known for their high attainments in science, and includes physicians, city engineers, and men whose technical training enables them best to deal with sanitary problems. Within the scope of its work come not only cases of disease and epidemics, but the sanitary regulation of workshops, schools, and dwellings; prevention of adulteration of food; sanitary aspects of the water-supply, drainage, and cemetery management. In addition to that

central body there are twenty 'commissions d'hygiène,' one for each arrondissement, and a 'commission des logements insalubres,' composed of physicians, architects, and engineers, whose duty it is to pass upon the sanitary conditions of dwellings; they can recommend sanitary improvements or condemnation of houses, and their recommendations are as a rule favorably acted upon by the municipal council. There is a special service of sanitary police which enforces all the health laws.

In addition to the activities enumerated above, the municipality owns all markets, cattle-yards, and slaughter-houses, from which it derives a considerable income. The municipal markets and abattoirs facilitate the inspection of the meat supply, and the municipal laboratory has done a great deal in checking adulteration of milk, bread, wine, and other food of common use, and has served greatly to reduce the death rate.

The poor relief is organized in Paris on a large scale and centralized in the hands of a special department called 'L'Assistance Publique à Paris.' This has charge of the hospitals, of the homes and asylums for aged poor, as well as for friendless children, and of outdoor relief. The department is under the authority of the Prefect and is governed by a director and a board, composed of leading men from various Government departments. The work is carried out in detail by the 'Bureaux de bienfaisance,' one in each arrondissement, and composed of persons familiar with the people in their respective districts. The city comes to the aid of the poor in several other ways. There are a number of municipal lodging-houses open to unemployed workmen free of charge, and furnishing a meal to each guest. A similar home exists for working women. From 15,000 to 20,000 families are helped each year by advance of rent-money in cases of threatened eviction. An agricultural colony has been established not far from the city for those unable to make a living. A free employment office is maintained by the city in each arrondissement, and a central labor exchange known as the 'Bourse du Travail' was erected by the municipality in 1892 at a cost of 2,000,000 francs. In addition, the municipal council votes 50,000 francs annually for the maintenance of the institution, which serves as the headquarters of all the trade-unions in the city. A public pawn-shop, known as the Mont-de-Piété, has been in existence for more than a century. It advances loans in any amount at 6 per cent., which is a great accommodation for the poor. The largest of the numerous hospitals or almshouses is La Salpétrière (for women), probably the largest asylum in the world, extending over 78 acres of land; 1300 of its 4500 inmates are insane. Bicêtre, with nearly 3600 beds, receives only men. The Hospice des Enfants Trouvés, or foundling hospital, provides for the infants brought to it till they reach the age of maturity, and only demands payment in the event of a child being reclaimed. The crèches, or public nurseries, first established in 1844, of which there are now 18, receive the infants of poor women for the day at the cost of 20 centimes. Besides institutions for the blind, deaf and dumb, convalescents, sick children, etc., Paris has 17 general and special hospitals. Of these the oldest and most noted are the Hôtel Dieu, rebuilt at a cost of $9,000,000, which covered also the cost of the new site, La Charité, and La Pitié.

Education. The educational facilities of Paris are very complete. A system of kindergartens called Ecoles Maternelles is provided for children between the ages of three and six, and although attendance there is not compulsory, they are all patronized, as they are a great help to the poor. The attendance is from 50,000 to 60,000. Next follow the Ecoles Enfantiles, which are a transition from the kindergarten to the primary school, and are open to children between six and eight. The primary schools for children below the age of fourteen employ nearly 3000 teachers, half men and half women, and are attended by 156,000 pupils. The school system is under the joint supervision of the municipal council, the prefectoral administration, and the national Ministry of Education. The children are supplied with text-books, etc., and those unable to pay (60 per cent. of the total number) are given gratis one meal each day. A new feature of the school system is the boarding-school for children of widowers or guardians unable to give proper care to their children. The cost of boarding and clothing a child has been fixed at 600 francs a year, but since 1892 the payment has been reduced to 120 francs for those unable to pay more, the city paying the rest. Upon the completion of the primary school a child is free to enter a high school or professional school, according to the profession he or she chooses.

Finance. The maintenance of so many institutions involves, naturally, a great annual expense, and their municipalization has required the contraction of large loans. The budget of Paris for 1901 amounted to 314,000,000 francs, of which more than a third, 113,000,000, went for payments on the public debt. It should be observed that only about 30,000,000 francs out of these 113,000,000 go to pay off the principal, the rest being interest charges. The next heaviest item is 35,000,000 francs for the police, to which the national Government adds another 10,000,000. The other items of importance are charity, 28,000,000 francs; education, 27,000,000; streets, 24,000,000. The relative expense for the various departments is about the same from year to year. The total debt of the city is about 2,000,000,000 francs ($400,000,000). To offset these items of expense there are a number of sources of income which the city derives from the various companies holding franchises. Paris does not own its water works, nor the gas and electric plants, and has no municipal transit system. The gas company, in addition to furnishing gas for the illumination of the streets and public buildings at cost price, pays 200,000 francs a year for the right to lay its pipes and a tax of 2 francs for every 100 cubic meters of gas it sells, and divides with the city all its profits above 13½ per cent. on its capital stock, which it is not allowed to increase. This makes the total income of the city from the gas company alone equal to 20,000,000 francs. A similar arrangement with the electric lighting and water companies brings several more millions a year into the city treasury. Likewise the markets, abattoirs, and cemeteries make their contributions.

Transportation. The main means of intramural communication is supplied by the omni-

buses and electric tramways, which latter are in a great measure supplanting the former, and so satisfactorily that it seems hardly possible that until the last decade of the nineteenth century the intramural transportation was extremely inefficient. Of the comprehensive system of underground electric railways authorized by the national Government in 1898, to be built by the city and worked on lease by a private company, seven miles were in operation in 1900. One of the lines supplements the old surface steam belt railway that passes around the city just inside the fortifications. The cab service in Paris is unexcelled. The steamboats on the Seine are well patronized in pleasant weather, and it will probably be long before the ancient and familiar omnibuses are entirely put out of commission.

Industry and Trade. Paris is the largest industrial centre of France. It has a world-wide renown for the elegance and taste of its products. There are comparatively few large industrial undertakings, Paris being more of a centre of small workshops employing highly skilled laborers. Of late, however, a tendency has been noticed toward large establishments. Large factories are found in such industries as the manufacture of machinery, railroad supplies, chemical products, soap, dyes, brewing and liquor establishments, china, porcelain, leather, printing, etc. Small workshops, however, predominate in the production of clothing, gold and silver articles, furniture, optical and surgical instruments, toys, paper boxes, steel and aluminum articles, artificial flowers, perfumes, articles of luxury, gloves, etc. In all these products Paris excels the world. The book-publishing business of France is almost wholly concentrated in Paris. As a trading centre Paris stands at the head of the list of French cities. The products of its industry are valued at more than 3,000,000,000 francs annually, most of which is exported. It was among the first cities of the world to introduce large department stores such as the Louvre, the Bon Marché, and Printemps. The most important financial institutions are the Banque de France, the Crédit Foncier, the Crédit Lyonnais with 22 branches in the city, and the Clearing House, called 'Chambre de Compensation de Banquiers.' Then there is the Bourse de Commerce in addition to the Bourse de Travail.

Population. The population of Paris varied little from the thirteenth to the sixteenth century, ranging during that period from 216,000 to 260,000. In 1718 it had increased to 509,000; in 1817 to 714,000; in 1851 to 1,053,000; in 1881 to 2,269,000; while in 1891 it was 2,448,000, and in 1901, 2,714,068. The most densely populated quarters are the Eighteenth Arrondissement, formerly the Butte Montmartre, the Eleventh Arrondissement, formerly Popincourt, and the Seventeenth Arrondissement, formerly the Batignolles Monceaux. The average density of population in Paris exceeds 83,000 people to the square mile, or nearly two and one half times that of London. About 10 per cent. of the population is composed of foreigners. The great bulk of the population is Roman Catholic; there are about 60,000 Protestants and 25,000 Jews.

History. The earliest notice of Paris occurs in Julius Cæsar's *Commentaries*, in which it is described, under the name of Lutetia, as a collection of mud huts, composing the chief settlement of the Parisii, a Gallic tribe conquered by the Romans. The ruins of the Palatium Thermarum (Palais des Thermes), and of ancient altars, aqueducts, and other buildings, show that in Roman times the town extended to both banks of the Seine. Christianity was introduced about A.D. 250 by Saint Denis. In the fourth century Lutetia began to be known as Parisia, or Paris. In the sixth century Paris was chosen by Clovis as the seat of government; and after having fallen into decay under the Carlovingian kings, in whose time it suffered severely from frequent invasions of the Northmen, it finally became in the tenth century the residence of Hugh Capet, the founder of the Capetian dynasty, and the capital of the French monarchy. From this period Paris continued rapidly to increase, and in two centuries it had doubled in size and population. In the Middle Ages Paris was divided into three distinct parts—La Cité, on the islands; the Ville, on the right bank; and the Quartier Latin, or University, on the left bank of the river. Louis VI. did much to enlarge Paris, and to efface the disastrous results of its hostile occupation by the English during the wars under Henry V. and Henry VI. of England. Its progress was again checked during the wars of the last of the Valois, when the city sustained several sieges. On the accession of Henry of Navarre in 1589, a new era was opened for Paris. The improvements commenced under his reign were continued during the minority of his son, Louis XIII. Louis XIV. converted the old ramparts into public walks or boulevards, organized a regular system of police, established drainage and sewerage works, founded hospitals, almshouses, public schools, scientific societies, and a library, and thus gave to Paris a claim to be regarded as the focus of European civilization. The terrible days of the Revolution (see French Revolution) caused a temporary reaction. The improvement of Paris was commenced on a new and grander scale under the first Napoleon, when new quays, bridges, markets, streets, squares, and public gardens were created. All the treasures of art and science which conquest placed in his power were applied to the embellishment of Paris, in the restoration of which he spent more than $10,000,000 in twelve years. His downfall again arrested progress, and in many respects Paris fell behind other European cities.

Renovation of various sorts was recommenced under Louis Philippe, under whom fortifications on a colossal scale were constructed, but it was reserved for Napoleon III. to render Paris the most commodious, splendid, and beautiful of modern cities. When he commenced his improvements Paris still consisted, in the main, of a labyrinth of narrow, dark, and ill-ventilated streets. With the assistance of Baron Haussmann, the Prefect of the Seine, his schemes were carried out with rare energy and good taste. Two straight and wide thoroughfares, parallel to and near each other, were made to traverse the whole width of Paris from north to south crossing the City; a still greater thoroughfare was made to run the whole length of the town, north of the Seine, from east to west. The old boulevards were completed so as to form outer and inner circles of spacious streets, the former chiefly lying along the outskirts of the old city, the latter passing through and connecting a long line of distant suburbs. In the year 1867, when the international exhibition was opened, Paris and

becoming in all respects the most splendid city in Europe, and in that year it was visited by upward of 1,500,000 foreigners. Many further improvements were contemplated, but financial and political difficulties supervened (see FRANCE), and these great schemes had to be postponed. The siege of Paris by the Germans, which lasted from September 19, 1870, to January 28, 1871, caused much less injury to the city than the vandalism of the Red Republicans, who rose against the Government in March, 1871, took possession of Paris, and proclaimed the Commune (q.v.) the only lawful Government. Acts of pillage and wanton destruction followed. The column erected to the memory of Napoleon and the Great Army, in the Place Vendôme, one of the principal squares of Paris, was pulled down as 'a monument of tyranny.' When the Government troops under Marshal MacMahon pressed forward into the city, in the latter part of May, the Communists began systematically to set fire with petroleum to a great number of the chief buildings of Paris, public and private. The fire for a time threatened to destroy the whole city. It was not checked until property had been lost to the value of many millions of dollars and historical monuments were destroyed which never can be replaced. Two years later, however, all the private houses burned had been rebuilt, the monuments only partially injured had been restored, and the streets and public places were as splendid and gay as in the best days of the Empire. The Universal Expositions of 1878, 1889, and 1900 are among the chief events of the subsequent history of Paris.

PAR'IS. A city and the county-seat of Edgar County, Ill., 20 miles northwest of Terre Haute, Ind.; on the Cleveland, Cincinnati, Chicago and Saint Louis and the Vandalia Line railroads (Map: Illinois, E 4). It is mainly a residential place, and has a public park of 100 acres, 70 of which are now submerged, forming an artificial lake. The city is in a farming district, the products of which form the staples of a considerable trade. There are extensive manufactures of brooms. Paris was laid out in 1825 and incorporated first in 1849. The government is administered under a general law of 1872, which provides for a mayor, chosen biennially, and a council. The municipality owns and operates the water-works and electric light plant. Population, in 1890, 4996; in 1900, 6105.

PARIS. A city and the county-seat of Bourbon County, Ky., 90 miles east of Louisville; on Stoner Fork of the Licking River, and at the junction of divisions of the Louisville and Nashville Railroad (Map: Kentucky, G 2). A handsome court-house, to cost more than $150,000, is in course of construction (1903), and a new library (Carnegie) is projected. Situated in the famous 'blue-grass region' of Kentucky, Paris is engaged extensively in breeding fine horses. It has also a large trade in whisky, tobacco, hemp, grass seed, etc. The gas-works are owned by the municipality. Paris was settled in 1784 and was chartered as a city in 1862. Population, in 1890, 4218; in 1900, 4603.

PARIS. A city and the county-seat of Henry County, Tenn., 110 miles west of Nashville; on a fork of the West Sandy River, and on the Louisville and Nashville and the Nashville, Chattanooga and Saint Louis railroads (Map: Tennessee, C 4). It is the centre of a fertile region, producing cereals, cotton, and tobacco, and has several tobacco and medicine manufactories, planing mills, flouring mills, and repair shops of the Louisville and Nashville Railroad. Population in 1890, 1917; in 1900, 2018.

PARIS. A city and the county-seat of Lamar County, Texas, 100 miles northeast of Dallas; on the Texas and Pacific, the Texas Midland, the Saint Louis and San Francisco, and the Gulf, Colorado and Santa Fe railroads (Map: Texas, G 3). It has a fine United States court and post-office building, and a county court-house of granite. The city is the centre of a productive cotton-growing section, and controls extensive wholesale and shipping interests. Its industrial establishments include large cottonseed-oil mills, a large compress, cotton gins, a flouring mill, canning factory, brick plants, etc. Paris, settled in 1841, is governed under a charter of 1889,

which provides for a mayor, elected every two years, and a council. The water-works are owned and operated by the municipality. Population, in 1890, 8254; in 1900, 9358.

PARIS, Congress of. See Crimean War; Declaration of Paris; Paris, Treaties of.

PARIS, Treaties of. The name given to important treaties of peace concluded at Paris in 1763, 1783, 1814, 1815, 1856, and 1898.

The treaty of February 10, 1763, was concluded between France and Spain on the one hand, and Great Britain and Portugal on the other, at the end of the Seven Years' War (q.v.). It provided for a cession to Great Britain of Canada, Prince Edward Island, Cape Breton, and the region east of the Mississippi River, possessed or claimed by France, except New Orleans and the isle on which it stood. Great Britain was confirmed in the possession of Nova Scotia. France retained a share in the fisheries of Newfoundland and the Saint Lawrence, under certain restrictions, together with the isles of Saint-Pierre and Miquelon. In the West Indies, Great Britain restored Martinique and Guadeloupe, and ceded Saint Lucia to France, while France ceded to Great Britain Dominica, Saint Vincent, Grenada, and Tobago (the last previously neutral territory). France ceded Senegal to Great Britain. She recovered possession of Pondicherry, but had to agree not to maintain military settlements in Bengal. In Europe, France relinquished her conquests in Germany, restored Minorca, and engaged to maintain the status quo. By way of compensation for the loss of Florida, which Spain ceded to Great Britain, which had fallen into the hands of that Power, France ceded to Spain the bulk of Louisiana, including New Orleans. The effect of the treaty was to establish the supremacy of Great Britain in America, in India, and on the seas.

The Treaty of Paris of September 3, 1783, between Great Britain and the United States, marked the close of the American Revolution and recognized the independence of the colonies. Simultaneously with its conclusion Great Britain made peace with France and Spain at Versailles. The four difficult questions upon which the British and American negotiators labored at great length before reaching a settlement related to (1) the boundaries of the United States; (2) fishing rights on the coast of Newfoundland; (3) payment of private debts due from Americans to British creditors; and (4) compensation of the loyalists. As finally concluded, the treaty recognized the Mississippi River as the western boundary from a point west of the Lake of the Woods to the thirty-first parallel of north latitude; thence the boundary was to run due east to the Appalachicola (Chattahoochee) River, thence down the middle of that stream to the Flint River, thence to the head of the Saint Mary's River, and thence along the middle of that river to the Atlantic Ocean. The Great Lakes and the Saint Lawrence River were recognized as the northern boundary to the forty-fifth parallel. Thence to the Atlantic Ocean the boundary was described as following the highlands which divide those rivers that empty themselves into the Saint Lawrence from those which empty into the Atlantic; thence from the highlands to the source of the Saint Croix River; and thence down that stream to its mouth. (See Northeast Boundary Dispute; also Northwest Boundary Dispute.) With regard to the fisheries, it was provided that the Americans were to continue to enjoy the same rights of fishery at Newfoundland and vicinity which they had enjoyed as English colonists, and while they were to be permitted to dry their fish on other unsettled shores, they were not allowed to do so on the island of Newfoundland. At the same time they were to have the exclusive right of fishing on their own coasts. On the third point it was provided that creditors on either side should meet with no lawful impediment to the recovery of the full value in sterling money of all bona fide debts contracted before the war. With regard to the loyalists, the American negotiators consented that Congress should be asked to recommend to the State legislatures to provide for the restitution of confiscated estates, and to abandon all future confiscations and to cease all prosecutions commenced against persons known as loyalists. The navigation of the Mississippi was declared to be free to the subjects of both nations. By the terms of the Treaty of Versailles, signed on the same day as that of Paris, Great Britain restored Florida and Minorca to Spain and ceded Tobago to France. Senegal was relinquished to France.

The Treaty of Paris of May 30, 1814 (First Peace of Paris), was concluded between France on the one hand and the representatives of all the great Powers of Europe on the other. It provided that France should surrender all her conquests except slight territories on the northern and eastern boundaries, leaving her with the boundaries of 1792. She was to pay no indemnity, and was to retain all works of art taken from conquered countries with a few exceptions. Most of the colonies taken from her by Great Britain were restored; Holland was restored to the House of Orange; of the colonial possessions wrested from Holland, Great Britain retained Ceylon, the Cape of Good Hope, and part of Surinam (Guiana); Switzerland was declared independent; Italy, except the Austrian provinces, was to consist of independent States; a similar arrangement was made for Germany; the navigation of the Rhine was to be open; and the settlement of all other questions of European concern was to be intrusted to a European congress to be convened at Vienna. (See Vienna Congress.) By secret provisions it was agreed that the Allies should control the distributions of territory at the congress; that Austria should receive Northern Italy; that the King of Sardinia should receive Genoa; and that Belgium and Holland should be united as a defensive territory against France.

The Treaty of Paris of November 20, 1815 (Second Peace of Paris), was concluded between France on the one hand and the Allies on the other, and essentially modified the treaty of 1814. By this treaty France was deprived of certain small territories to the north and east which she had been allowed to retain by the treaty of 1814. She was also compelled to pay [illegible] Allied Powers for the expenses of the war, amounting to some 700,000,000 francs, the occupation of her frontier provinces for a period of five years by an allied army of 150,000 men, and to defray the cost of this occupation out of her own revenues. Indemnities

to a large amount were allowed several of the allies for the spoliations committed on them by the French armies, the total amount of the entire indemnity exceeding £60,000,000.

The Treaty of Paris of March 30, 1856, was concluded among the Powers at the close of the Crimean War (q.v.), and settled a number of questions of European public law of great importance. It provided that the Black Sea should be neutralized, and that it should be thrown open to the merchant marine of every nation. All war vessels of every nation, including Russia and Turkey, were forever prohibited from entering that sea. The Czar and the Sultan agreed not to establish upon its coasts any military fort or arsenal. A portion of Bessarabia was surrendered by Russia, and the River Danube was declared to be open to free navigation. For the purpose of insuring free navigation, and for policing and improving the river, it was placed under the supervision of an international commission. This provision was declared to be a part of the public law of Europe. The Sublime Porte was formally admitted to the European concert, and the Powers engaged to respect the independence and integrity of the Ottoman Empire. The Danubian principalities of Moldavia and Wallachia were to continue under the suzerainty of the Porte, Russia renouncing her protectorate over them and the Powers guaranteeing all the privileges and immunities of which they were then in possession. Several important principles of international law were agreed upon at the same time, and were embodied in the Declaration of Paris (q.v.).

The Treaty of Paris of December 10, 1898, terminated the Spanish-American War. Spain relinquished her sovereignty in Cuba, and ceded Porto Rico, the Philippine Islands, and the island of Guam to the United States, from which she received the sum of $20,000,000.

PARIS, University of. One of the oldest and largest universities in the world. It had its inception in the schools of Notre-Dame, Sainte Geneviève, and Saint Victor, and first comes into prominence about 1170. In the early part of the twelfth century Paris was already the noted seat of a number of great masters, among whom were William of Champeaux and his pupil Abélard (q.v.). Thousands of scholars from all over Europe flocked to Paris. Hence arose the necessity for common protection against the impositions of citizens and particularly against the chancellor of Notre Dame, who possessed the right to grant the 'license to teach' and thus constituted the quasi head of the university, and from a mere association of masters there gradually developed a corporation with special rights and privileges. In 1200 Philip Augustus granted a charter conceding among other privileges the right of students to be tried in an ecclesiastical court. In 1207 there is mention made of 'Communitas Scholarium' and 'Universitas Magistrorum,' indicating a fully organized Studium Generale. The chancellor's power to grant licenses was somewhat neutralized by the custom of Inception, which obliged a candidate to deliver an inaugural address before being permitted to associate with the masters. In 1229 a bloody fight between students and citizens caused an emigration which greatly benefited Oxford. Two years later, however, Pope Gregory IX. came to the assistance of the university, and masters and scholars returned in large numbers. Popes Honorius III. and Gregory IX., by siding with the masters in these disputes, acquired an enormous influence over the affairs of the university. The corporation, which at first was nothing more than an association of masters, now consisted of masters and scholars, although the right to vote was vested in the masters only. The university was divided into the superior faculties, viz. theology, medicine, and law, and the inferior faculty of arts ever, on account of the predominance of their number the rector of the faculty of arts became practically the head of the university in the fourteenth century. The arts faculty was divided into four nations: French, Picards, English, and Normans. In the Congregations of the university there were seven voices, the nations controlling four and the other faculties three. In the middle of the thirteenth century the university entered into a series of litigations with the aggressive Mendicants, who included among their teachers such men as Thomas Aquinas, Alexander of Hales, and Saint Bonaventura. They established three chairs in theology without taking the oath of obedience to the university statutes. After a struggle of seven years the Pope decided against the masters and the Mendicant scholars were placed on a basis of equality with the seculars. The contest with the Mendicants, however, was fortunate in that a series of 'colleges' or foundations modeled after those of the Orders where laymen could get lodging, care, and instruction were established. The most famous of these were the Sorbonne (q.v.), founded by Robert de Sorbon about 1257, and the College of Navarre.

In the fourteenth and fifteenth centuries the university attained its highest stage of development. Princes and popes courted its favor, and followed the teachings of its famous theologians and jurists. It became the centre of the educated world. However, its conservative attitude toward the humanism of the fifteenth century; the civil wars; the constantly increasing centralization of the French Government, which crippled free university life—all contributed toward the gradual decline of its fame. The theological faculties, owing to the establishment of the bishop seminaries, lost their prestige as educational institutions, and degenerated into mere degree-conferring bodies. The famous jurists also forsook Paris for the practical business of administration in the provinces. The faculties of arts and the colleges came to serve the purposes of secondary education, while most of the higher education fell into the hands of the Jesuits, who established a number of colleges in France. The university never flourished again as during the mediæval period. Henceforth the great scholars of France were connected with the Academy. During the Revolution the university went down with the rest of the French universities. In 1808 Napoleon reorganized it as part of the University of France, and until 1896 it was known as the Facultés de Paris. In 1902 it consisted of the following faculties, school, and administrative body: (1) The Conseil de l'université; (2) the Protestant theological faculty; (3) the medical faculty, including the Musée Dupuytren, established in 1835; (4) the law faculty; (5-6) faculties of science and letters at the Sorbonne; (7) the school of pharmacy.

The total attendance is over 12,000. The library contained, in 1902, 477,590 volumes, including 1590 manuscripts. Consult: Jourdain, *Histoire de l'université de Paris au XVIIme et au XVIIIme siècle* (Paris, 1862-66); Budinszky, *Die Universität in Paris und die Fremden an derselben im Mittelalter* (Berlin, 1876); and Denifle and Chatelain, *Chartularium Universitatis Parisiensis* (Paris, 1889 et seq.). See article UNIVERSITY.

PAR'IS (Lat., from Gk. Πάρις, of unknown etymology), also known as ALEXANDER. In Greek legend, the second son of Priam, King of Troy and Hecuba, and cause of the Trojan War. His mother dreamed that she gave birth to a firebrand, which set the whole city on fire, a dream interpreted by Helenus or Cassandra to signify that the child would bring the city to destruction. To prevent this, Priam caused the infant to be exposed upon Mount Ida, where he was found and brought up by shepherds, among whom he distinguished himself. After a time he accidentally discovered his origin, and was received by Priam as his son, but continued to live on Mount Ida, where he had won the love of the nymph Œnone, daughter of the river-god Cebren. While on Ida he was appealed to as umpire in a strife which had arisen among the three goddesses, Hera, Athene, and Aphrodite, as to which of them was the most beautiful, the goddess Eris (strife) having revengefully flung among them at the marriage of Peleus, to which she had not been invited, a golden apple (of discord) inscribed *To the Most Beautiful*. Each of the three endeavored to bribe him. Hera promised him dominion over Asia; Athene, military renown; Aphrodite, the fairest of women for his wife, Helen, the wife of Menelaus. Paris decided in favor of Aphrodite, hence the animosity which the other two goddesses displayed against the Trojans in the war that followed. Paris now equipped a ship and sailed to Sparta, where, with the aid of Aphrodite, he persuaded Helen to elope with him to Troy. Upon this followed the Trojan War, in which the princes of Greece joined Menelaus in his endeavor to recover his wife. In the *Iliad* Paris is at times represented as a cowardly boaster, disliked by his countrymen, while in other portions of the poem he is valiant and skillful in battle, especially with his bow, and is welcomed on his appearance by the Trojans. His manly beauty is more than once praised. In the epic he was said to have killed Achilles, while endeavoring to force his way through the Scæan gate into Troy, but the later writers elaborated the story of Achilles's love for Polyxena, and represented the Greek hero as enticed to the temple of Apollo and there murdered by Paris and Deiphobus. The *Little Iliad* told of the death of Paris by the arrow of Philoctetes, who owned the bow and arrows of Heracles. The Alexandrian writers, to whom the Œnone episode is due, added the version that when Paris was wounded by the poisoned arrow he turned for healing to his old love on Mount Ida. She, however, refused to employ her magic skill, and the hero died, whereupon, in remorse, she destroyed herself. Representations of Paris are common in ancient art. On the earlier vases he appears at the judgment of the goddesses as a shepherd, often with the lyre, and amid his flocks. Later he is usually distinguished by the Phrygian cap, and sometimes by the close-fitting trousers and jacket worn by the Asiatics.

PARIS, pä'rē', GASTON (1839-1903). A French philologist, born at Avenay, son of Paulin Paris. He studied Romance philology for two years at Göttingen and Bonn, where he was for a while associated with the illustrious founder of modern Romance philology, Friedrich Diez. Having gone back to France, he worked at the Parisian École des Chartes and became director of the École des Hautes Études. He gave to his department of it such fame that students came to him from all parts of the world. He was also soon associated with the work in the Collège de France, and succeeded to the chair of his father when the latter retired in 1872. He was one of the staff of the *Revue Critique* from 1866 to his death, and in 1872 with his life-long fellow-worker, Paul Meyer, he founded the *Romania*, one of the most important of the Romance journals. In 1895 Professor Paris was made director of the Collège de France, and in 1896 he was elected to the French Academy. He had long been a member of the Institute. Since Sainte-Beuve, who gave little attention to the linguistic side, the French nation had had no critic so great as Gaston Paris. In him the philologist and the lover of beauty were at one. Paris was revered among literary men. Toward the end of his life he was at the head of scientific literary criticism in France. He had no showy theories, but his discoveries were many, and his knowledge was so wide that other great scholars were loath to assail his views. Yet his influence, which had been won by his steadfastly scientific attitude, and by the moderation, clearness, and charm of his thought, created no doctrinary school. He had rare personal dignity, a keen but sober wit, an extraordinary memory, and a wide acquaintance with men. Paris devoted himself mainly to the language and literature of France. He excelled not only in textual criticism, but in teaching and in arousing a sound love of old literature. In 1902 Paris became head editor of the *Journal des Savants*, and had other great work on hand when he died in Cannes, March 5, 1903, the most famous of Romance scholars, with disciples in all civilized countries. Some of the more important of his productions, besides the manifold articles to be found in the *Romania* and other reviews, are: *Étude sur le rôle de l'accent latin dans la langue française* (1862; new ed. 1896); *De Pseudo-Turpino* (1865); *Histoire poétique de Charlemagne* (1865); *Les contes orientaux dans la littérature française du moyen âge* (1875); *Le petit Poucet et la grande Ourse* (1875); *La poésie au moyen âge* (1885); *La littérature française au moyen âge* (Paris, 1888); *Poèmes et légendes du moyen âge* (1900); *Poètes et penseurs* (1896). Perhaps his most fascinating work is his biography and literary estimate of François Villon (1901). Among the notable texts edited by him are the *Vie de Saint Alexis*, with L. Pannier (1872; new ed. 1887), a remarkable work, and the *Extraits de la chanson de Roland*; also *Merlin*, and *Les miracles de Notre Dame*. Consult: Todd, "Gaston Paris, Romance Philologist and Member of the French Academy," in *Publications of the Modern Language Association*, vol. xii. (Baltimore, 1897), and *Romania* for April (Paris, 1903).

PAR'IS, JOHN AYRTON (1785-1856). An English physician and author. He was born and was educated at Cambridge, where, after pursuing courses of study at Edinburgh, he took his medical degree in 1808. He began the practice of his profession in London, was made physician to Westminster Hospital, and later settled in Cornwall. There he obtained a large practice, studied natural history, and founded the Royal Geological Society of Cornwall. Returning to London, he lectured on materia medica and the philosophy of medicine at the Royal College of Physicians. He became a censor of the Royal College of Physicians in 1817; delivered the Harveian oration before it in 1843, and the next year succeeded Sir Henry Halford in its presidency, retaining that office until his death. Among his works are a *Pharmacologia* (1812), long the standard treatise on the subject; a *Treatise on Diet* (1827); *Philosophy in Sport Made Science in Earnest* (1827), a popular treatise on physical science; and a *Life of Sir Humphry Davy* (1831).

PARIS, pȧ'rē', LOUIS PHILIPPE D'ORLÉANS, Count of (1838-94). Pretender to the crown of France. He was born in Paris, August 24, 1838, being the eldest son of Ferdinand, Duke of Orleans, and grandson of Louis Philippe. On the death of his father in 1842 the Count of Paris became the French heir apparent. He was carefully educated in Germany and later in England, whither his mother had removed after the events of 1848. A journey to Syria with his brother, the Duke of Chartres, in 1859, resulted in the publication of a journal of the voyage, entitled *Damas et le Liban*. Early in 1861 the Count of Paris became interested in the Civil War in the United States, offered his services with his brother's to the Federal Government, and with their uncle, the Prince de Joinville, the two were attached to the staff of General McClellan, with the rank of captain. They remained in active and efficient service in all the disastrous battles of that campaign, and only retired when the attitude of France toward Mexico gave cause of offense to the United States. The Count of Paris returned to England in the summer of 1862, and shortly afterwards began to appear as a contributor to the *Revue des Deux Mondes*, though under a nom de plume. In 1864 he married his cousin Isabella, the daughter of the Duke of Montpensier. In 1871 he was chosen to the National Assembly, which voted that his property in France, confiscated by Napoleon, should be restored. In 1873 the Count of Paris made a formal resignation of the claims of his family to the throne of France by a visit to the Count of Chambord at Frohsdorff, but after the latter's death in 1883 he was generally regarded as the Count of Chambord's successor and as the chief of the Legitimist Party. By the Expulsion Act of 1886 the Count of Paris and his family were compelled to leave France. He settled in England and devoted himself to literary pursuits, though occasionally issuing a royal manifesto to the people of France. Of his eight children, the most noteworthy is the eldest, Philippe, Duke of Orleans. The Count of Paris revisited the United States, where he was well received, in 1890. He died at Stowe House, Buckinghamshire, England, September 8, 1894. Of his writings, the most important are: *De la situation des ouvriers en Angleterre* (1869), which has been translated into English and German, and *Histoire de la guerre civile en Amérique* (1874-75), an able military history, which has been translated.

PAR'IS, MATTHEW (c.1200-59). The greatest English historian of the Middle Ages. In 1217 he entered the Monastery of Saint Albans, where Roger of Wendover (q.v.) was historiographer. When Roger died in 1236 Paris took up the work of continuing the *Chronica Majora*, which had been brought to the year 1235. Paris evidently enjoyed a wide renown even in his own day, for about 1246 he was specially invited by King Haakon IV. of Norway to reorganize the Abbey of Saint Benet Holm, and was ordered by Pope Innocent IV. to investigate its spiritual condition also. He returned to England in 1249 laden with presents. With the year 1250 Paris intended to end his chronicle, but new events aroused his interest, and the great work ended only nine years later. An abridgment which he prepared is known as *Historia Minor*, and extends from 1067 to 1253, and contains a few incidents not noted in the *Chronica Majora*. In addition, Paris wrote the *Vitæ Abbatum S. Albani*, and the *Addinotimenta*; the latter contains charters, etc., supplementing both the *Chronica Majora* and the *Vitæ*. He died probably about May, 1259. In his own day Paris was considered a universal scholar, and was indeed versed in most of the learning of his time. There is a continuation of his works ascribed to Rishanger (q.v.). All of the works of Paris are published in the *Rolls* series. For other editions and works connected with Paris, consult: Gross, *Sources and Literature of English History* (London, 1900); Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii. (Berlin, 1896).

PARIS, pȧ'rēs', PAULIN (1800-81). A French historian and philologist, born at Avenay, Marne. His appointment in the manuscript department of the National Library gave him opportunity to study the old French writers. He was made a member of the Academy of Inscriptions (1837), wrote memoirs for its publications, and for those of other learned societies to which he belonged, and was professor of mediæval history in the Collège de France (1853-72). His most notable achievement was his catalogue, *Manuscrits français de la bibliothèque du roi* (1836-48). Besides other translations, he made a French edition of Byron (1830-32-36). He edited the *Grandes chroniques de France* (1836-40) and other works. His own *Etudes sur François I.* (1885) were published posthumously.

PARIS BASIN. A geologic basin eroded in the Cretaceous rocks of the vicinity of Paris and subsequently filled with Tertiary marls and sands. The basin occupies an oblong area of about 20,000 square miles, which is divided by the Seine into a northern and a southern half. The underlying strata are chiefly remarkable for the rich harvest of organic remains which they supplied to Cuvier, and which led to the foundation of the modern science of paleontology.

PARISH (OF. *parosse, paroiche*, Fr. *paroisse*, from Lat. *parœcia, parœcia*, from Gk. *παροικία, paroikia*, ecclesiastical district, from *πάροικος, paroikos*, neighboring, from *παρά, para*, beside, beyond + *οἶκος, oikos*, house). A division either of territory or population, originally ecclesias-

tical, but in some places also civil. The word in its Greek form was applied in its earliest ecclesiastical use to a body of Christians living in a city and its neighborhood to distinguish them from the other inhabitants. Gradually it came to mean the district under the care of a bishop. The subdivision of the dioceses of the kingdoms of England into what are now known as parishes is not supposed to have taken place much earlier than the time of King Edgar (970), the boundaries of the parishes being fixed by those of manors. In this later ecclesiastical sense, the parish came to be the territory committed to the charge of one priest. But since the modern development of the English poor laws the term parish in the statutes defines a district for which a separate poor rate is or may be made and a separate overseer appointed. On the temporal side the administration is in the hands of the vestry, and especially of the church wardens, one of whom is usually nominated by the incumbent, the other elected by the ratepayers. Their duties are to have a care for the fabric of the Church and other property, preserve order during divine service, and provide whatever is necessary for its due celebration. There has for many centuries been an apparent confusion in the use of the term, arising from the fact that as a rule the same body of individuals represented both the civil and the religious organizations. From an early period, however, the ecclesiastical side of the parish has predominated over the civil side, and this was the condition of affairs at the time of the first English settlements in America. It was in Virginia that the parish as it existed in England was developed, although, on account of the peculiar circumstances of the colony, it came later than the military and civil divisions, and therefore never possessed civil powers equal to the parishes of the mother country. The word parish was used in the New England colonies to denote the township from the ecclesiastical point of view, as well as a portion of a township not possessing town rights. In the United States at the present time the word parish as an ecclesiastical district is used loosely by the Episcopal and Reformed Episcopal churches, and often with a more definite territorial limitation by the Roman Catholic Church. In the Episcopal Church the parish is the local unit of organization, and, as a rule, possesses a corporation composed of the rector, wardens, and vestrymen. In Louisiana the term parish is given to the civil territorial divisions called counties in other States.

PARISH CLERK. A secular officer in the parishes of the Church of England and in some of the colonial churches of the Anglican communion. It is the duty of a parish clerk to represent the congregation in public worship. A person in holy orders may be appointed, but such a clerk is usually a layman, who by the canon law is required to be at least twenty years of age and of competent skill in singing.

PARISH SCHOOL. A term applied to institutions located in the district called the parish.

In the capitulary of 789 Charles the Great directed every monastery to have its school where boys might be taught the Psalms, the system of musical notation, singing, arithmetic, and grammar. Such schools would, of course, reach only a very little beyond those designed for the Church, but in 796 Theodulphus, Bishop of Orléans, issued a similar capitulary to the clergy of his diocese, requiring them to give gratuitous instruction to the children of the laity in every town and village. From time to time other decrees by both Church and State attempted to render more effective the popular instruction that the clergy of France were supposed to give. After the revocation of the Edict of Nantes (1685), Louis XIV. decreed that there should be in every parish a school to teach the Roman Catholic religion, reading, and even writing. The 'Brethren of the Christian Schools,' founded in 1679 by La Salle, a canon of the cathedral church at Rheims, afforded a most effective means of education for the common people.

The early Protestant reformers, Luther, Melanchthon, Zwingli, Knox, and others, were anxious that the common people should have proper religious instruction, and to this end they deemed the rudiments of reading and writing of the greatest importance. They urged upon the pastors the duty of attending to this matter, and the early Protestant parish schools either were taught by the pastors or their assistants or were at least under their supervision. As the schools were taken in hand by the State, ecclesiastical supervision was retained, and it has been done away with very slowly, vestiges of it remaining in Prussia even to-day.

Consult: M. Arnold, *Popular Education of France* (London, 1861), and Balfour, *Educational Systems of Great Britain and Ireland* (Oxford, 1898).

PARISIUS, pä-rē'zē-us, Ludolf (1827–1900). A German politician and author. He was born at Gardelegen, studied law at Halle, and practised in his native town. In Berlin he became prominent in the politics of the Progressist Party as an editor of the *Parlamentarische Korrespondenz aus der Fortschrittspartei*, and a member of the Prussian House of Deputies. Afterwards he joined the National Liberal Party, and sat in the Reichstag in 1874–77 and 1881–87. In 1874 he was made conspicuous by his attacks on Von Mühler, Minister of Education. He wrote various legal commentaries; a valuable history, *Deutschlands politische Parteien und das Ministerium Bismarcks* (1877); and several novels.

PARIS SKETCH-BOOK, The. A collection of sketches and stories by W. M. Thackeray (1840).

PARJANYA, pär-jän'yà. In the Veda (q.v.), the rain-god. He is mentioned about thirty times in the Rig-Veda, where he is celebrated in three hymns. His action, however, is not wholly independent, as he, like the Maruts, is subject to Mitra and Varuna (q.v.). Parjanya, as being a rain-deity, is frequently associated with thunder, and occasionally also with lightning. It naturally follows from his functions that he is in a special degree the god who promotes and fosters vegetation. His wife is by implication the earth, although one passage of the Atharva-Veda expressly calls her name Vasa. Parjanya is mentioned in connection with several other deities, especially with Vata, the wind, and less often with the Maruts, the storm-gods, and with Agni, the fire. He has likewise many points of resemblance with Indra (q.v.), with whom in the epic he is regularly identified.

Parjanya is often thought to be identical with the Lithuanian thunder-god Perkúnas, but this view must be regarded as more inviting than probable. Consult Macdonell, *Vedic Mythology* (Strassburg, 1897).

PARK. See Parks and Playgrounds.

PARK (MEng. *park*, *parrok*, from OF., Fr. *parc*, and from AS. *pearroc*, OHG. *pfarrih*, Ger. *Pferch*, park, of uncertain etymology, possibly connected with provincial Eng. *par*, inclosure for domestic animals, and with OHG. *sparro*, Ger. *Sparren*, Eng. *spar*). Military. Any inclosed space, in which are stored either guns, wagons, or supplies. Specifically, an artillery park is one consisting of guns and their equipment; and similarly an engineers' park would consist of wagons, pontoons, animals, etc. Wagons or other train vehicles, brought together for purposes of storage, camping, or for defense against attack, are said to be parked.

PARK, Edwards Amasa (1808-1900). An American theologian. He was born in Providence, R. I., December 29, 1808. He graduated at Brown University in 1826, Andover Seminary in 1831, and was ordained as colleague pastor with Rev. Richard Salter Storrs of Braintree, Mass., in the latter year. In 1835 he became professor of intellectual philosophy at Amherst College, and the following year was called to Andover Theological Seminary as professor of sacred rhetoric. Nine years later he was transferred to the chair of systematic theology, succeeding the first incumbent, Rev. Dr. Leonard Woods. In this position Professor Park remained till he retired from active labor in 1881. He died June 4, 1900. Dr. Park was a famous preacher, but he was before all things else a teacher, and his influence from his lecture room was second to that of no man of his generation. In a sense he was the last of the 'New England' theologians. (See New England Theology.) His system may be defined in a phrase as that of the Westminster Confession, grounded upon a new philosophy and purged of its artificial and realistic details. His literary labors appeared chiefly in the *Bibliotheca Sacra*, which he founded in 1844 and continued to edit till 1884. He also published memoirs of Samuel Hopkins (Boston, 1854), Nathaniel Emmons (ib., 1861), and others; and a volume of *Discourses on Some Theological Doctrines as Related to the Religious Character* (Andover, 1885). Consult the memorial address by R. S. Storrs (New York, 1900) and the volume in celebration of his ninetieth birthday (Boston, 1898).

PARK, Mungo (1771-1806). An eminent African explorer. He was born near Selkirk, in Scotland, was educated in Edinburgh University, and devoted his attention particularly to the study of surgery. In 1792 he went to the East Indies as a surgeon in the sea service of the East India Company. Returning from his first voyage, he offered his services to the African Association, which for half a century was the chief promoter of the exploration of Africa. Under its auspices, in 1795, at the age of twenty-four, he went to the Gambia River with instructions to reach the Niger River and to ascertain its source, its course, and, if possible, its termination. After acquiring some knowledge of the Mandingo language, he set out for the interior in December, 1795, crossed the Senegal, and finally reached the Niger at Sego in July, 1796. He went down the river until he was within fifteen days' travel of Timbuktu, which he could not reach on account of the tropical rains and because he had entered the country of merciless and fanatical Mohammedans. After having been in the interior for nineteen months he returned home and wrote *Travels in the Interior of Africa* (1799; frequently reprinted).

The achievements of this solitary white man in inner Africa excited the widest interest. He had brought to light more important facts respecting the geography of Western Africa than had any former traveler. By pointing out the positions of the sources of the Senegal and Gambia, he showed where to look for the elevated parts of the country, and for the water-partings between the Gambia and Niger, and between the fertile country and the desert. The success of his first journey induced the British Government to employ him to complete the discovery of the course of the Niger. He received a captain's commission, and was accompanied by his brother-in-law, Anderson, and forty-five English soldiers, besides natives. He started into the interior in April, 1805. The employment of white soldiers soon proved a fatal mistake. Many died, and, when the party embarked in canoes on the Niger to float down to its mouth, it had dwindled to seven men. Anderson died in October. Undaunted by his misfortunes, Park was resolved to find the mouth of the Niger. He sailed more than 1000 miles, but, entering a stretch of rapids below Yuri on the lower river, while both shores were lined with hostile natives, the boat was wrecked, and Park and his three surviving comrades were downed. The journal he sent home and information obtained by later explorers give all the facts known about his last expedition. An "Account of the Life of Mungo Park," by Wishaw, was published in Park's *Journal of a Mission to the Interior of Africa* (1815).

PARK, Roswell (1852—). An American physician, born at Pomfret, Conn. He studied at Racine College and at Harvard, and in 1876 graduated in medicine at Northwestern University. During the following years he was interne at several hospitals and a member of the faculties of the Woman's Medical College (Chicago), Northwestern University, and Rush Medical College. In 1883 he was elected professor of surgery at the University of Buffalo, and afterwards became surgeon to the Buffalo General Hospital and director of the State Pathological Laboratory at Buffalo. His writings include *Text Book of Surgery* (1896) and *History of Medicine* (1897).

PARK CITY. A city in Summit County, Utah, 31 miles east-southeast of Salt Lake City; on branches of the Union Pacific and the Rio Grande Western railroads (Map: Utah, B 1). It is in a rich silver-mining district, and its chief mechanical industries are metallurgical. Population, in 1890, 2850; in 1900, 3759.

PARKE, John Grubb (1827-1900). An American soldier, born in Chester County, Pa. He graduated at West Point in 1849, and was assigned to the topographical engineers. From 1857 until the outbreak of the Civil War he was engaged in surveying the northwest boundary. In 1861 he was commissioned brigadier-general of volunteers, and was placed in command of one of the three brigades in Burnside's North

Carolina expedition, during which he assisted at the capture of Roanoke Island (February 8, 1862) and Newbern (March 14, 1862), and commanded at the capture of Fort Macon (April 26, 1862). For these services he was promoted major-general of volunteers in 1862, and was made chief of staff of the Ninth Corps, with which he served at South Mountain (September 14, 1862) and Antietam (September 16-17, 1862). When his superior, General Burnside, was appointed commander of the Army of the Potomac, Parke remained his chief of staff until after the battle of Fredericksburg (December 13, 1862). He accompanied the Ninth Corps into Kentucky the following March, and commanded it before Vicksburg. At Jackson, Miss. (July 16, 1863), he commanded Sherman's left wing; his corps was ordered north, and he took part in the siege of Knoxville (November 15-December 5, 1863) and the pursuit of Longstreet into Virginia. He participated in the battles of the Wilderness and Spottsylvania. During the latter part of the Richmond campaign he again commanded the Ninth Corps, which he led at the capture of Petersburg and in the pursuit to Appomattox. He was mustered out of the volunteer service on January 15, 1866, and returned to the boundary survey. Subsequently he had charge of various military works, and was superintendent of West Point from 1887 to 1889, when he retired from active service with the rank of colonel of engineers and the brevet of major-general in the Regular Army. He published *Compilations of Laws of the United States Relating to Public Works for the Improvement of Rivers and Harbors* (1877; rev. ed. 1887) and *Laws Relating to the Construction of Bridges Over Navigable Waters* (1882; rev. ed. 1887).

PARKER, Alton Brooks (1852—). An American jurist. He was born at Cortland, N. Y., and graduated at the Albany Law School in 1872. It was his early intention to fit himself for a teacher, and by much sacrifice and perseverance he succeeded in working his way through the Cortland Normal School. Teaching, however, proved distasteful to him, and he entered the law office of Schoonmaker and Hardenburgh at Kingston, N. Y., and eventually completed the course at the Albany Law School. In 1877 Parker was elected Surrogate of Ulster County, and he held that position until 1885. He was a delegate to the Democratic National Convention in 1884, and in 1885 successfully managed the Democratic gubernatorial campaign. In 1886 Parker was appointed by Governor Hill to a vacancy in the Supreme Court, and in the autumn of the same year he was elected as the candidate of both parties for a full term. He was transferred to the Appellate Division of the Supreme Court in 1889, and in 1897 reached the culmination of his judicial career when he was chosen Chief Judge of the Court of Appeals. Judge Parker had many opportunities for political preferment, notably the Democratic nomination for Governor in 1902, but refused to take advantage of them.

PARKER, Edward Harper (1849—). An English Chinese scholar. From 1869 to 1871, in the character of student interpreter, he traveled in Mongolia, and afterwards he served in British consulates at Wenchow, Fusan, and Shanghai, and traveled in Oceanica, Eastern Asia, and North America. He retired from the consular service in 1895, became reader in Chinese at University College, Liverpool, in 1896, and in 1901 was appointed to a chair in Chinese at Owens College, Manchester. His works include: *Comparative Chinese Family Law* (1879); *Up the Yangtsze* (1892); *Burma* (1893); *A Thousand Years of the Tartars* (1895); and *China* (1901).

PARKER, Foxhall Alexander (1821-79). An American naval officer, born in New York City. He graduated at the Naval School in Philadelphia in 1843, served against the Florida Indians, and in 1850 became a lieutenant. In the Civil War he first commanded the gunboats *Wabash* and *Wabash*, and after 1863 the Potomac flotilla. In 1866 he was promoted captain, and in 1872 commander. In 1873 he was chief signal officer of the navy, and from 1878 until his death was superintendent of the Naval Academy at Annapolis. He published: *Fleet Tactics Under Steam* (1863); *Squadron Tactics Under Steam* (1863); *The Naval Howitzer Afloat* (1865); *The Naval Howitzer Ashore* (1865); *The Fleets of the World: The Gatling Vessel* (1876); and *The Battle of Mobile Bay* (1878).

PARKER, Francis Wayland (1837-1902). An American educator, born in Bedford, N. H. He was principal of a school in Manchester, N. H. (1865-68), and of one in Dayton, Ohio, from 1868 until 1872, when he went to Germany for a course at the Berlin University. Afterwards he was school superintendent in Quincy, Mass. (1875-80), supervisor in Boston (1880-83), principal of Cook County, Ill., Normal School (1883-90), and of the Chicago Normal School (1896-99). He was appointed president of the Chicago Institute in 1899. His publications include: *Talks on Teaching* (1883); *The Practical Teacher* (1884); *Course in Arithmetic* (1884); and *How to Study Geography* (1889).

PARKER, Sir (Horatio) Gilbert (1862—). A Canadian novelist, born at Camden East, Addington, Ontario. He studied pedagogy in Ottawa and taught in Frankford and Seaforth. He studied for the ministry at Trinity University, Toronto, held a curacy at Trenton for a short time, and taught in the Belleville Deaf and Dumb Institute, but in 1886 went for his health to Australia. There he took up journalistic work and the writing or adapting of plays, but after his return to Canada was principally known as a writer of romances and short stories, such as *Pierre and His People* (1892); *Mrs. Falchion* (1893); *The Translation of a Savage* (1894); *When Valmond Came to Pontiac* (1895); *The Seats of the Mighty* (1896); *The Battle of the Strong* (1898); *The Lane that Had No Turning* (1900); *The Right of Way* (1901); and *Donovan Pasha* (1902). He made his home in England, was elected Conservative member of Parliament for Gravesend in 1900, and was knighted in 1902. The dramatic quality of his later books won for them considerable popularity, despite their disregard of truth in local color.

PARKER, Horatio William (1863—). An American composer and teacher. He was born at Auburndale, Mass., and was a pupil first of his mother, then of George W. Chadwick and Stephen A. Emery, and subsequently of the Munich Conservatory. After returning to America he became organist of the Garden City Cathedral, Long Island, and professor of music at the Cathedral School. In 1886

he was organist and choirmaster at Saint Andrew's, New York, and two years later went to the Church of the Holy Trinity, Boston. He became professor of music at Yale University in 1894. His oratorio, *Hora Novissima* (1893), has been called by European critics one of the finest of American compositions. Other compositions are: *The Holy Child* (1890); *The Kobold* (1891); *The Dream King* (1893); *Saint Christopher* (1896); *A Northern Ballad*, for orchestra (1899); and choruses, anthems, organ pieces, transcriptions, and some chamber music.

PARKER, Sir Hyde (1739-1807). A British admiral, son of the vice-admiral of the same name, under whom he first served. He was knighted in 1779 for his success three years before in occupying the North River, which was strongly fortified by the colonial forces. He served through the Revolutionary War, was appointed commander-in-chief at Jamaica in 1796, and in January, 1801, was sent into the Baltic to terrorize Denmark. His lieutenant, Lord Nelson, urged bolder action than seemed good to Parker, and in the battle off Copenhagen took command in the lighter vessels because of the shallow channel, and refused to obey the order to retreat issued by Parker, who was loath to infringe the customary rules of naval warfare. Parker was soon replaced by Nelson, and saw no further service.

PARKER, Joel (1795-1875). An American jurist, born at Jaffrey, N. H. He graduated at Dartmouth College in 1811 and, after studying law, practiced at Keene. He was appointed an associate justice of the Supreme Court of New Hampshire in 1833 and became chief justice in 1838. In 1840 he was chairman of the committee on the revision of the State statutes, and in 1847 was called to a chair in the Harvard Law School. Conservative in politics, he opposed during the Civil War the exercise by the President of what he deemed unconstitutional powers. He published: *Non-Extension of Slavery* (1856); *Personal Liberty Laws* (1861); *The Right of Secession* (1861); *Constitutional Law* (1862); *The War Powers of Congress and of the President* (1863); *Revolution and Reconstruction* (1866); *Conflict of Decisions* (1875).

PARKER, Joel (1816-88). An American politician, born near Freehold, N. J. He graduated at Princeton in 1839 and in 1842 was admitted to the bar. In 1847 he was elected to the Legislature by the Democrats, and in 1852 was appointed prosecutor of the Pleas. At the outbreak of the Civil War he was appointed a major-general of militia, and devoted himself to the work of enlisting volunteers. The next year, 1862, he was elected Governor by an unprecedented majority; for, though a Democrat and opposed to the Abolitionists, he was a strong Union man. So energetic and successful was he in raising troops that the draft was never applied in New Jersey; and during Lee's invasion of Pennsylvania in 1863 he induced several recently returned regiments to go again to the front, thereby earning the thanks of the neighboring State. Equally successful was his financial policy, for during his administration the State bonds never sold below par, and the adoption of his plan for wiping out the war debt resulted in its being paid off without special taxation. At the end of his term as Governor, in 1866, he retired to private life, but in 1871 was reëlected. In 1875 he was appointed Attorney-General, and in 1880 and in 1887 an associate justice of the State Supreme Court.

PARKER, Joseph (1830-1902). An English Congregational clergyman. He was born at Hexham, Northumberland. He had little training in the schools, but read much. In 1852 he attended classes at University College, London. In 1853 he became pastor of the Congregational Chapel at Banbury, and remained five years, when he was called to the Cavendish Street Chapel, Manchester. He at first declined on account of a debt contracted in building a new church at Banbury; but the Manchester people assumed the debt, and the transfer was effected. In 1869 he left Manchester and went to London to preach at the Old Poultry Chapel, Cheapside. Here his success was so great that the chapel became inadequate for the congregations, and in 1874 the City Temple on Holborn Viaduct was opened. He continued pastor of the church until his death at his home in Hampstead. His eccentricities did not always secure public approbation, but he was surrounded by enthusiastic admirers who turned the edge of public criticism. He was twice chairman of the London Congregational Board, and twice of the Congregational Union of London and Wales. In 1887 he visited America, and delivered a eulogy on his friend, Henry Ward Beecher. His published works include: *Ecce Deus: Essays on the Life and Doctrine of Jesus Christ* (1868), a reply to *Ecce Homo: The Paraclete* (1874); *The People's Bible* (25 vols., 1885 sqq.); *People's Prayer Book* (1898); *Paterson's Parish* (1898). Works of an autobiographical nature are: *Springdale Abbey, Extracts from the Letters and Diaries of an English Preacher* (1869); *Tyne Chylde, My Life and Ministry, Partly in the Daylight of Fact, Partly in the Limelight of Fancy* (1883); *A Preacher's Life: An Autobiography and an Album* (1899). For his life, consult Adamson (New York, 1903).

PARKER, Louis Napoleon (1852—). An English composer and dramatist, born in Calvados, France, and educated at Freiburg im Breisgau, and at the Royal Academy of Music. From 1877 to 1896 he was director of music in Sherborne School. To this period belong his songs, cantatas, and instrumental music. He was made a fellow of the Royal Academy of Music in 1898. He was connected as author, collaborator, or translator with many successful plays. Among those which he translated are *Magda*, *Cyrano de Bergerac*, and *L'Aiglon*.

PARKER, Matthew (1504-75). The second Protestant Archbishop of Canterbury. He was born at Norwich, August 6, 1504, studied at Corpus Christi College, Cambridge, and was ordained a priest in 1527. At the university he was a distinguished student, and was from an early period favorably disposed toward the doctrines of the Reformation, and lived in close intimacy with some of the more ardent reformers. In 1535 he was appointed chaplain to Queen Anne Boleyn. With this appointment he obtained the deanery of the monastic college of Stoke-by-Clare in Suffolk. Here he appears to have first definitely sided with the reforming party in the Church and State, the sermons which he preached containing bold attacks on different Catholic tenets and practices. In 1538 Parker took the degree of D.D.; and in 1544, after some minor changes, became master

of Corpus Christi College, Cambridge, which he ruled admirably. Three years later he married and probably about this time drew up his defense of the marriage of priests, entitled *De Conjugio Sacerdotum*. In 1552 he was presented by King Edward VI. to the rich deanery of Lincoln. On the accession of Queen Mary he refused to conform to the reëstablished order of things, and was deprived of his preferments, and even obliged to conceal himself. It does not appear, however, that he was eagerly sought after by the emissaries of Mary; for he was very unwilling to disturb the framework of the Church. On the death of Mary and the accession of Elizabeth (1558) he was appointed by the Queen Archbishop of Canterbury. The consecration took place in Lambeth Chapel, December 17, 1559.

The subsequent history of Archbishop Parker is that of the Church of England. The difficulties that beset him were very great. Elizabeth herself was addicted to various 'popish' practices, such as the use of images, and was strongly in favor of the celibacy of the clergy. But his greatest anxiety was in regard to the spirit of sectarian dissension within the bosom of the Church itself. Already the germs of Puritanism were beginning to spring up, and there can be no doubt that their growth was fostered by the despotic caprices of the Queen. Parker himself was manifestly convinced that if ever Protestantism was to be firmly established in the land at all, some definite ecclesiastical forms and methods must be sanctioned to secure the triumph of order over anarchy, and he vigorously set about the repression of what he thought a mutinous individualism incompatible with a catholic spirit. That he always acted wisely or well cannot be affirmed; he was forced into intolerant and inquisitorial courses, and as he grew older he grew harsher, the conservative spirit increasing with his years. He gave the English people the "Bishops' Bible," which was undertaken at his request, prepared under his supervision, and published at his expense in 1572. Much of his time and labor from 1563 to 1568 was given to this work. He had also the principal share in drawing up the *Book of Common Prayer*, for which his skill in ancient liturgies peculiarly fitted him, and it was under his presidency that the *Thirty-nine Articles* were finally reviewed and subscribed by the clergy (1562). Parker died in the palace at Lambeth, London, May 17, 1575.

Among other literary performances, Parker published in 1567 an old *Saxon Homily on the Sacrament*, by Ælfric of Saint Albans, *A Testimonie of Antiquitie Showing the Auncient Fayth in the Church of England Touching the Sacrament of the Body and Blonde of the Lord*, to prove that transubstantiation was not the doctrine of the ancient English Church; edited (1571) the histories of Matthew of Westminster and Matthew Paris; and superintended the publication of a most valuable work, *De Antiquitate Britannicæ Ecclesiæ*, probably printed at Lambeth in 1572, where the Archbishop, we are told, had an establishment of printers, engravers, and illuminators. He also founded the 'Society of Antiquaries,' and was its first president; endowed the University of Cambridge, and particularly his own college, with many fellowships and scholarships, and with a magnificent collection of manuscripts relating to the civil and ecclesiastical condition of England, and belonging to nine different centuries (from the eighth to the sixteenth). His correspondence from 1535 on was published by the Parker Society (Cambridge, 1853). Consult his *Life* by Strype (best ed., 3 vols., Oxford, 1821), and in Hook's *Archbishops of Canterbury*, new series, vol. iv. (London, 1872). In his honor the Parker Society was formed, which published 53 volumes of Elizabethan ecclesiastical literature (Cambridge, 1841-54).

PARKER, Peter (1721-1811). A British naval officer, born probably in Ireland. He entered the navy and became lieutenant in 1743, and captain in 1747. He served in the West Indies, and took part in the capture of Belle-Isle in 1761. For ten years he was out of the service on account of the reduction of the navy. He was knighted and restored in 1772, and in October, 1775, with a small squadron, was sent to coöperate with Sir Henry Clinton in the reduction of the Southern colonies of America. The attempt of Josiah Martin to arouse the Tories of North Carolina failed, and Parker proceeded to Charleston and made the unsuccessful attack on Fort Moultrie June 28, 1776. He aided Lord Howe in the capture of New York in September, and commanded the squadron which afterwards took possession of Rhode Island. In April, 1777, he was promoted to rear-admiral and placed in charge of Jamaica, in 1778. He became vice-admiral in 1779, was made a baronet when he returned to England in 1782, and became admiral in 1787. From 1793 to 1799 he was commander-in-chief at Portsmouth and succeeded Lord Howe as admiral of the fleet. He is perhaps best remembered as the friend and patron of Nelson.

PARKER, Peter (1804-88). A medical missionary and diplomat, born in Massachusetts; graduated at Yale College in 1831; studied theology and medicine at New Haven; was ordained and went to China as a missionary in 1834. He established a hospital at Canton, principally for eye diseases, but soon for other diseases. Dr. Parker possessed great surgical skill, and his fame spread rapidly. War breaking out in 1840 between England and China, the hospital was closed, and Dr. Parker returned to the United States. In 1842 he went back to China and reopened the hospital, which was soon crowded. In 1845 he resigned his connection with the American Board, and became secretary to the United States legation and interpreter of the new embassy, still having charge of the hospital. In the absence of the minister he acted as chargé d'affaires. In 1855, his health having failed, he again visited the United States, but by request of the Government he returned the same year to China as commissioner with full power to revise the treaty of 1844. This position he held until a change of administration in 1857, when, his health again failing, he returned to the United States, and settled in Washington. He published *Reports of the Ophthalmic Hospital at Canton* (Canton, 1836-52); *Statements Respecting Hospitals in China* (London, 1841); *Notes of Surgical Practice Among the Chinese* (Edinburgh, 1846).

PARKER, Theodore (1810-60). An American preacher, scholar, and reformer. He was born in Lexington, Mass., August 24, 1810. His father was farmer and mechanic, and the son

shared actively in his occupations in the intervals of study at the district school and Lexington Academy. He entered Harvard College in 1830 and took the full course of study privately, passing all the examinations, but getting no A.B. degree because he had paid no tuition fees. In 1840 the degree of M.A. was given him. By that time he had mastered several languages which the college did not teach. In 1833 he entered the Harvard divinity school, from which he graduated in 1836. He was ordained June 21, 1837, and the same day installed pastor of the West Roxbury Unitarian Church. May 19, 1841, he preached in South Boston an ordination sermon, "The Transient and Permanent in Christianity," which attracted much attention and elicited violent opposition. With Channing's "Baltimore Sermon" of 1819 and Emerson's Divinity School Address of 1838, it is accounted one of the three epoch-making sermons of the Unitarian development. It was virtually a rejoinder to Andrew Norton's "Latest Form of Infidelity," which, replying to Emerson's address, contended that no man can be a Christian who accepts the teachings of Jesus for any other reason than that of their miraculous attestation. The sermon did not deny the miraculous in Christianity, but men's present need of it. Invited to preach in Boston, his first important sermons were gathered into a book, *A Discourse on Matters Pertaining to Religion* (1842), which increased the controversial heat. There were Unitarians who wished formally to expel him from their fellowship, and did achieve his virtual exclusion. In 1846 the Twenty-eighth Congregational Society was formed in Boston and he became its minister, preaching in the Melodeon until 1852, and for the next seven years to a congregation of several thousands in Music Hall. To much controversial preaching, he added more of the kind represented by his *Lessons from the World of Matter and the World of Man* (1865). He had inherited a tendency to consumption, and in January, 1859, was attacked with severe illness. He was taken to Santa Cruz and there wrote his *Experience as a Minister* (1859). From Santa Cruz he went to England and thence to Italy, and died, May 10, 1860, at Florence, where he is buried in the Protestant cemetery. Theodore Parker's Christianity was anti-supernatural; his philosophy intuitional, transcendental; his theology theistic, affirming God, the moral law, and immortality as certainties of consciousness. His conception of Jesus was purely humanitarian and his criticism of the Bible anticipated the results of more recent orthodox scholarship. He was one of the most conspicuous leaders of the New England abolitionists, uniting a great personal admiration for Garrison with some differences from his views and aims. His works have been published collectively (edited by Frances Power Cobbe, 14 vols., London, 1863-70; 10 vols., Boston, 1870). Consult also his *Historic Americans* (Boston, 1870); *Discourse on Matters Pertaining to Religion*, with introduction by Hannah E. Stevenson (New York, 1871); *Prayers*, with memoir by F. B. Sanborn (Boston, 1882); *Views of Religion*, with introduction by James Freeman Clark (ib., 1885); *West Roxbury Sermons* (ib., 1892). For his life, consult Weiss (New York, 1864), Frothingham (Boston, 1874), and Chadwick (with full bibliography, ib., 1901).

PARKER, Thomas Jeffery (1850-98). A zoölogist, born in London. He received his education in the Royal School of Mines and in the University of London. From 1872 to 1880 he was demonstrator under Huxley at South Kensington and lecturer in biology in Bedford College, London. In 1880 he became professor of biology in the University of Otago, Dunedin, New Zealand. He published a number of memoirs on New Zealand animals, important of which are: *On the Structure and Development of Apteryx* and *On the Cranial Osteology, Classification, and Phylogeny of the Dinornithidæ*. He also wrote the following text-books, in which great literary and artistic ability are joined with extensive knowledge and pedagogical skill: *Zoötomy* (1884); *Lessons in Elementary Biology* (1890); *A Text-book of Zoölogy* (with W. A. Haswell, 1897). The last named is the guide followed in the classification of animals in this Encyclopædia. Professor Parker died at Warrington, New Zealand, November 7, 1898.

PARKER, Willard (1800-84). An American surgeon, born at Lyndeborough, N. H. He graduated from Harvard in 1826, and from its medical school in 1830, when he was made professor of anatomy in Vermont Medical College, and in the same year professor of anatomy in the Berkshire Medical College, in which latter institution he became professor of surgery in 1833. The following year was spent in the hospitals of London and Paris; and upon his return he was appointed professor of surgery at the College of Physicians and Surgeons in New York City, a post he occupied for thirty years. He then became professor of clinical surgery. In 1854 he first described and reported cases of what is now known as malignant pustule. In 1865 he was made president of the New York State Inebriate Asylum at Binghamton, and in 1867 a member of the Metropolitan Board of Health. He was the first to point out the phenomenon of concussion of the nerves, as distinguished from that of the nerve centres, a condition which had previously been confounded with congestion or inflammation. Dr. Parker made several important discoveries in practical surgery, among which were the operation of cystotomy for the relief of certain cases of chronic cystitis, and that for the cure of abscess near the vermiform appendix, called at that time perityphlitis. He was also a successful operator in many important cases of ligature of the larger arteries. Consult his biography in *Medical Record*, xxv. 492 (New York, 1884).

PARKER, Sir William (1781-1866). An English admiral, born at Almington Hall, Staffordshire. He went to sea when twelve years old on the *Orion*, which shared in Lord Howe's victorious engagement with the French fleet in 1794. As commander of the *Amazon* he was engaged in arduous service on the Portuguese and Spanish coasts and made a notable capture of the French frigate *Belle Poule* (1806). He was made a rear-admiral in 1830, and was knighted in 1834 for his services aboard the flagship *Asia* during the three preceding years. He remained in England as an Admiralty lord until 1841, when he was made vice-admiral in command in the East Indies, and his prompt action in capturing the ports and blockading the mouth of the Grand Canal brought the Chinese war to an end.

In 1845-52 he was commander-in-chief in the Mediterranean, and in 1857 he retired. He was created admiral of the fleet in 1863.

PARKER, William Kitchen (1823-90). An English naturalist and morphologist, born at Dogsthorpe, near Peterborough. He studied medicine at King's College, London, and began to practice in 1849. In 1873 he was appointed Hunterian professor in the Royal College of Surgeons, conjointly with Prof. W. H. Flower. His chief and most suggestive work was on the comparative osteology of the higher vertebrates, from amphibian to mammal. He constantly dwelt on the developmental side and on the phylogeny of the vertebrates, making many improvements in the classification of the types he studied. His larger monographs were: *Monograph on the Structure and Development of the Shoulder-Girdle and Sternum in the Vertebrata* (1868), and memoirs on the skull of the Batrachia (1878 and 1880), the urodelous Amphibia (1877), the common snake (1878), sturgeon (1882), Lepidosteus (1882), Edentata (1886), Insectivora (1886), and an elaborate paper on the development of the wing of the common fowl (1869). His general works were *Morphology of the Skull* (1877) and *On Mammalian Descent* (1885).

PAR'KERSBURG. A city and the county-seat of Wood County, W. Va., 98 miles southwest of Wheeling, on the Ohio River, at the mouth of the Little Kanawha, and on the Baltimore and Ohio, the Baltimore and Ohio Southwestern, and the Ohio River railroads (Map: West Virginia, C 2). It is regularly laid out with a gradual rise from the water's edge, the limits of the city extending for some distance on both rivers. A railroad bridge spans the Ohio at this point, one and one-third miles long, and another spans the Kanawha, both being imposing examples of engineering. The city has a fine public park, public library, Washington High School, Academy of the Visitation, Federal building, court house, and city hall. Blennerhasset Island, of historic interest, is in sight of the city. There are regular steamboat lines to important river ports. The city is favorably located in the centre of a fertile agricultural region, and has an active trade. There are several noted medicinal springs near the city, petroleum and gas wells, and coal and clay deposits of great value. The industrial interests are extensive. There are lumber mills, iron foundries, machine shops, furniture and chair factories, oil refineries, veneer and panel works, breweries, oil-well supply works, flouring mills, etc. Settled in 1773, Parkersburg was first incorporated in 1820, and in 1863 was chartered as a city. Under a charter of 1893, the government is vested in a mayor, chosen biennially, and a council which elects the majority of administrative officials. The waterworks are owned and operated by the municipality. Population, in 1890, 8408; in 1900, 11,703.

PARKES, pärks, Sir Harry Smith (1828-85). A British diplomatist, born in the Parish of Bloxwich, near Walsall, in Staffordshire, England. Left an orphan in tender years, he was educated at King Edward's Grammar School, Birmingham. In 1841 he went to Macao, China. By his energy and diligence he rose to be British Consul at Canton. On October 8, 1856, the Chinese seized the British ship *Arrow*, taking therefrom twelve Chinese sailors. Parkes's vigorous protest and Mandarin Yeh's defiant refusal to make amends led, in December, 1857, to the bombardment and occupation of Canton by the British forces, who were aided by French. In July, 1860, Parkes joined Lord Elgin in the Anglo-French punitive expedition to North China. After the capture of Tientsin, August 24th, Parkes, with twenty-five men, proceeding to Tung Chow under a flag of truce, was captured and imprisoned. Though suffering torture, he sent word to his chief to make no delay or compromise, and to take no account of him. The Allies arrived in Peking October 6th, and half of the prisoners—those not already murdered or starved—were delivered up October 20th; but, in punishment of the Government's treachery, the Emperor's summer palace was pillaged and destroyed. Parkes was knighted in 1862, became Consul at Shanghai, and in 1865 was appointed British Minister to Japan. For eighteen years in this office, he enjoyed extraordinary popularity with his countrymen, and was always a stalwart upholder of British interests. He was a powerful element in the modern history of Japan, fearless, truthful, and a despiser of the shams and hypocrisies which marked the old school of Japanese statesmanship. In 1882 he was made G. C. M. G. He was appointed Minister to China in 1883 to succeed Sir Thomas F. Wade, and in the following year he also became Minister to Korea. He visited Seoul and negotiated a treaty there; but after the Tongking question and diplomacy, in which "he tired out the Tsung li Yamen" (q.v.), he died of overwork, March 22, 1885. He was buried at Whitechurch in England. A marble bust of Parkes was unveiled in 1887 by Sir Rutherford Alcock in Saint Paul's Cathedral in London, and in April, 1890, his was the first public statue unveiled in Shanghai. See his *Life*, by Stanley Lane Poole (London, 1894), and the *Dictionary of National Biography*.

PARKES, Sir Henry (1815-96). An Australian statesman. He was born at Stoneleigh, in Warwickshire, England; was compelled by his father's poverty to earn his own living from the time he was eight years old, and was entirely self-educated. When twenty-four years old, he emigrated to Australia, and opened a little store in Sydney, New South Wales. He attracted some attention as a writer of verses, and gained considerable influence by his writings on economic subjects. In 1840 he founded the *Empire*, a liberal newspaper. Parkes became a zealous advocate of responsible government in New South Wales and of the larger question of an Australian federation. This last was the great work of his life. Upon the establishment of responsible government in 1858, he was elected to the New South Wales Parliament, and was re-elected in 1863. In 1866-68 he was a member of Sir James Martin's Ministry as Colonial Secretary; in 1872 he became Prime Minister, an office which he held again four times during the following years, and in 1891 he presided over the convention which made Australian federation a surety. The most important of his books are: *Australian Views of England* (1869); *Federal Government for Australia* (1890); *Fifty Years in the Making of Australian History* (his autobiography, 1892); and *An Emigrant's Home Letters* (1896). Consult Lyne, *Life of Sir Henry Parkes* (1896).

PARK'HURST, Charles Henry (1842—). An American clergyman. He was born at Framingham, Mass., and graduated from Amherst College in 1866. In 1872 he went to Europe and devoted two years to study at Leipzig, Halle, and Bonn. In 1874 he became pastor of the Congregational Church at Lenox, Mass., and in 1880 was called to the Madison Square Presbyterian Church, New York City. As a preacher he is rapid, nervous, and effective, dealing much in epigram, intensely practical, and fearless in utterance. In 1891 he was made president of the Society for the Prevention of Crime, and the investigations made by the society into the conditions of vice existing under police protection resulted in the appointment by the Senate, on January 30, 1894, of the Lexow Committee to investigate the police department; the work of this committee sustained the accusations brought by Dr. Parkhurst and his society. He has been a frequent contributor to the periodical press, and has published: *Forms of the Latin Verb Illustrated by the Sanskrit* (1870); *The Blind Man's Creed, and Other Sermons* (1883); *Pattern in the Mount and Other Sermons* (1885); *The Question of the Hour* (1896); *The Fellowship of Suffering* (1891); *Our Fight with Tammany* (1895); *Talks to Young Men* (1897); *Talks to Young Women* (1897); *Guarding the Cross with Krupp Guns* (1900).

PARKHURST, John (1728-97). An English Bible scholar. He was educated at Rugby and Clare Hall, Cambridge, and took orders, but received no preferment, spending his life in retirement and study. He published a *Hebrew and English Lexicon* (1762), to which he added in later editions a Hebrew grammar and a Chaldee grammar; a *Greek and English Lexicon to the New Testament*, with a Greek grammar (1769); and treatises against Wesley's doctrine of assurance (1753), and Priestley's views concerning the divinity and preëxistence of Jesus Christ (1787). Parkhurst's lexicons had much merit, but were marred by fantastic theories which he adopted from John Hutchinson. The edition of his Hebrew lexicon published in 1823 contains his life.

PAR'KIN, George Robert (1846—). A Canadian educator and author. He was born in New Brunswick, and was educated at the University of New Brunswick, and later at Oxford University, England. He was principal of the College School at Fredericton for several years, and began to take an active interest in the 'Imperial federation' question, upon which subject he spoke in various parts of the Empire. In 1895 he was appointed principal of Upper Canada College, Toronto. Afterwards he was made one of the trustees to arrange for the scholarships at Oxford provided for by the will of Cecil Rhodes. His publications include: *Imperial Federation* (1892); *Round the Empire* (1892); and *The Great Dominion* (1895).

PARK'INSO'NIA (Neo-Lat., named in honor of John Parkinson, an English botanist of the seventeenth century). A genus of plants of the natural order Leguminosæ. *Parkinsonia aculeata* is a West Indian, Texas, and California shrub or small spiny tree with pinnated leaves, and large yellow flowers spotted with red. When in flower it is one of the most splendid objects in the vegetable kingdom. It is often used for hedges, hence its name Barbadoes flower fence. The bark yields a beautiful, white, short but rather weak fibre, which might be used for paper-making. *Parkinsonia microphylla* and *Parkinsonia Torreyana*, both commonly known as Palo Verde tree or green-barked acacias, are small trees from western Texas to California and south to Mexico.

PARKINSON'S DISEASE. See Paralysis Agitans.

PARK'MAN, Francis (1823-93). A distinguished American historian, born in Boston, September 16, 1823. He graduated at Harvard in 1844, and then studied law for two years in the Harvard Law School, but never practiced. Having become interested in American history, he selected, as his life work, the writing of the story of the rise, decline, and fall of the French power in America. With this thought in mind, he at once began to prepare himself for his great task. In his vacations he visited historic scenes connected with the struggle between the French and the English, and made a study of several Indian tribes yet remaining in New England, New York, and Southern Canada. In 1846, feeling the need of seeing Indians who were still in an entirely primitive state, he traveled westward with a friend, and in company with a tribe of Dakotas spent several months in the Black Hills, in the Platte River country, and on the eastern slopes of the Rocky Mountains. An account of this expedition appeared the next year in *The Knickerbocker Magazine*, under title of "The Oregon Trail," and was republished two years later in book form as *California and the Oregon Trail*.

The hardships he endured while in the West resulted in the breaking down of his health, and he remained a semi-invalid all the rest of his life. Despite this misfortune, he continued in his work, and succeeded, in 1851, in bringing out the first of his historical works, *The Conspiracy of Pontiac* (2 vols.). Fourteen years elapsed before he was able to complete a second. A part of this period he devoted to collecting material, both in America and in Europe, and to writing a novel, *Vassall Morton*, which appeared in 1856, but which met with little success. During much of the time, however, his health was so bad that he was forced to abstain almost entirely from literary work. To occupy his time, he interested himself in horticulture, and acquired such a knowledge of the subject that in 1886 he published *The Book of Roses*, and in 1871 was made professor of horticulture in the Harvard Agricultural School. This position, however, he resigned in the following year. In 1865 the second of his historical works, *Pioneers of France in the New World*, appeared. It was followed in 1867 by *The Jesuits in North America*; in 1869 by *La Salle and the Discovery of the Great West*; in 1874 by *The Old Régime in Canada*; in 1877 by *Count Frontenac and New France Under Louis XIV.*; in 1884 by *Montcalm and Wolfe* (2 vols.); and in 1892 by *A Half-Century of Conflict* (2 vols.), which completed the series. Besides these works, he published also an *Historic Handbook of the Northern Tour* (1885), and numerous articles, many of them advance chapters from his histories, in magazines and other periodicals. During all this time his health continued to be precarious, and his eyes were so weak that his material, collected for him

by hired copyists, had to be read to him, and he was forced to rely almost entirely upon dictation instead of the pen. The story of his struggle against such odds is one of the most heroic in the history of literature. He died at his home at Jamaica Plain, Mass., November 8, 1893, the year following the completion of his great work.

Authorities are unanimously agreed that to Parkman belongs a place with such historians as Bancroft, Prescott, and Motley, and many are of the opinion that his work will live longer than any other yet done in the field of history on this side of the Atlantic. In him, in fact, existed a combination rare among historians: for while he was a scholarly and indefatigable investigator, he was at the same time a consummate literary artist. His search for material was one of the most exhaustive that any historian has ever made. He seven times visited Europe, and while there sought out the documents bearing upon the period about which he intended to write. He visited also all the important localities mentioned in his story, and his knowledge of the Indians and of the wild life of the woods was invaluable in giving him insight into the events he narrated. Consult Farnham, *A Life of Francis Parkman* (Boston, 1901).

PARKS AND PLAYGROUNDS. The term park is here used to denote a tract of ground set apart for public use and enjoyment. A grassy expanse, large or small, stocked with shade trees, and used for rest and recreation, is a park, whether it be as formal as at Versailles, as wild and picturesque as Fontainebleau, or as trim as an old Dutch garden. Even grass may be omitted and yet the park remains, as in the park of the Tuileries in Paris, where the entire surface among its trees not occupied by pavements, groups of shrubs, or parterres of flowers, is covered with loose gravel, through which water percolates to the tree roots, and over which there is no restraint of popular use. The distinction between a park and a pleasure garden is this: the decorated garden where no crop is grown is cultivated to exhibit a growth of grass, trees, shrubs, or flowers with reference to the special beauty of each, as well as the beauty of harmonious arrangements. The perfectness of development of each part of a pleasure garden is the object aimed at. (See LANDSCAPE GARDENING.) The garden becomes a park whenever freely used for recreation by persons not interested in its special growth. Frederick Law Olmsted, the highest American authority on parks, suggests that small open spaces in cities, designed for public use, should be called places when not large enough to have grass and trees, and place-parks when barely large enough to have grass-plats and a few trees; that thoroughfares planted with trees for special adaptation to promenades, or as avenues to parks, should be called parkways; and public forests without roads simply woods.

The practice of reserving public parks for the use and delight of the people seems to be as old as civilization. The Egyptians had parks from the earliest times. These were small and formal, ornamented with colonnades and other architectural features, and with sculpture. Very different were the parks of the Assyrians and later Persians, who reserved and lavishly decorated vast areas of mountain land. Little is known of the parks of the Greeks, but they were probably limited and formal, like those of the Egyptians. In Rome, however, in the time of the Cæsars there were, according to Lanciani, eight camps or commons and thirty parks belonging to the city. Of these the most extensive was the Campus Martius. During the Middle Ages public parks were little thought of, but the Renaissance is notable for the beautiful public gardens and parks which were then laid out and which are still the ornament of many European cities.

Another condition has favored the existence of accessible parks in European cities: Nearly every town formerly had its wall and surrounding ditches and reserve of open ground outside kept clear for military defense, all belonging to the State. These walls and adjacent grounds, before as well as after the fortifications were razed, were the promenades of the people, and in modern times have been converted into parks and boulevards. Towns which have grown greatly have had several successive circles of inclosing fortifications, thus providing, as in Paris and Vienna, several successive circles of public promenades, boulevards, and commons.

The area of parks in London is proportioned to the immensity of the city. Only a small part of them is broken by carriage roads, nearly their whole extent being dedicated to the exclusive use of pedestrians. Its seven great parks are: Hyde, containing about 400 acres, intersected by walks and carriage roads (including the famous saddle-horse road called Rotten Row), clothed with old forests, and graced by the lake called Serpentine; Kensington Gardens, an adjoining royal park of about the same size, farther from the city; Green, a smaller pedestrian park, by which Hyde Park may be approached; Regent's, nearly circular, with 450 acres, and having zoological and botanic gardens; Victoria Park, with 290 acres; Battersea Park, 320 acres; Kensington Park, 20 acres. These are almost exclusively for pedestrians, as well as the great Botanic Gardens of Kew outside of London. Paris is more noted for the elegance and great number of its place-parks and avenues for promenades than for real parks. The latter have become numerous of late years, and are even more recent than the Central Park of New York. The Bois de Boulogne, an ancient wood belonging to the Crown, was given to the public about 1852. It contains 2,250 acres, not particularly interesting by nature, with no noble trees, but treated with all the graces of art possible to cover its natural deficiencies. Carriage drives and promenades traverse it in every part, and four artificial lakes are its most interesting feature. The most striking new park in the city is the Buttes Chaumont, in the quarter occupying the site of extensive old stone quarries. The Park Monceau is a smaller example of similar transformation. The old gardens of the Tuileries, already alluded to, and the gardens of the Luxembourg, though more like gardens than parks in their treatment, are so completely used by the public that they fulfill all the uses of parks. Paris is provided with park resorts outside of the city to a greater extent than any other city. All the old château forests and hunting grounds of successive kings of France are now the property of the State and furnish attractions in every direction from the city. Saint Cloud, Versailles, Vincennes, and Fontainebleau, the last named one of the most picturesque and extensive of old royal hunting forests,

are the most noted. Smaller cities in France and throughout Europe abound in beautiful small parks contiguous to their population, most of which have been improvements of the last thirty years, made possible by the possession by municipalities of suitable ground previously used by the public, but not specially improved for their enjoyment.

Public parks in the United States on a small scale are as old as the cities. A seaside walk was originally the most common. The Battery in New York, and the Bay Side in Charleston, S. C., are familiar examples. The City Hall Park in New York was originally a playground or common. Boston Common was specifically dedicated to public use by the founders of the city, and has more perfectly fulfilled its use than any other equal area in the country. Public squares in nearly all the cities, notably around Yale College in New Haven, have shown the noble expression that may be given to a very limited park by avenues of full-grown native trees. The period of land speculation from 1830 to 1837, when great numbers of Western cities were planted, was peculiarly unfortunate in the failure to dedicate ground liberally either in park-places, public squares, or larger grounds. Many of the so-called 'boom' cities which have since been planted farther west have provided for parks and other public grounds in a most liberal manner. The beginning of the era of public parks for large cities, commensurate with their size, was made when the city of New York secured special legislation to create the Central Park. Though inferior in many respects to older parks, especially if its comparatively recent growth of trees be compared with noble old park forests, and its limited ranges of lawn with the great expanse of the finest English parks, yet it has this merit in a remarkable degree that, in proportion to the ground which it covers, the loss of space by the great reservoir being considered as well as its proportions and topography, it has developed more beauties and interest for public use than any other. The property was secured in 1857, and the plans for its laying out submitted by Frederick Law Olmsted and Calvert Vaux were adopted and put in their charge to be executed. The ground occupied is two and a half miles long north and south, and a half-mile wide east and west. The city reservoirs within it occupy 142 acres, forming a lake, the elevation of which does not permit it to be given the air of a natural piece of water, but which nevertheless is a pleasing feature. Besides this water there are several artificial lakes. Exclusive of the reservoirs and building sites, the park contains 683 acres. About 110 acres are in lawn, little broken by rocks and only bordered by trees, and the remainder mostly broken ground, in glades and young forests, or covered with copses and shrubbery, but nearly all in a condition to have a surface lawn. The grand terrace by Mr. Vaux—the first great work of park architecture executed in the United States—is an admirable study. Prospect Park, in the Borough of Brooklyn, is an outgrowth of the enthusiasm developed by the creation of the Central Park. It contains 550 acres, all of which is available for park use. Well-grown trees already on a part of it, and larger stretches of grassy ground, gave a nobler immediate effect in sylvan features than was possible in Central Park. Its architectural features, though on a grand scale, are not so interesting as those of Central Park, except at the entrance, which is finer. The heights command a fine view of New York Bay and the ocean, and there are picturesque artificial lakes.

Philadelphia, in addition to her generous original squares for park use, followed and outdid New York in the purchase and improvement of Fairmount Park. Its extent, varied surface, fine old trees, broad expanses of turf, the Schuylkill River at its side, and the stream of the Wissahickon, flowing through a picturesque rocky valley clothed with the trees, shrubs, and wild vines of virgin nature, through dark dells, broken by numerous waterfalls, altogether give it a different character from that of most other parks of the United States. Baltimore has the honor of the noblest forest park of the United States, Druid Hill—an old forest of 700 acres acquired in 1860, previously the private park of an old estate. Most of the larger and many of the smaller American cities have followed the example of New York and Philadelphia in providing liberal park areas.

Playgrounds. Recently there has been an effort to secure public playgrounds for city children. When children have no playgrounds but the streets they will necessarily be interfered with in their games by the police, and thus a most unfortunate spirit of antagonism toward the guardians of the peace is engendered. Not only the moral and physical value of playgrounds, but also their educational value, is beginning to be understood by those who have the welfare of the children at heart. The forerunner of the playground was the New England 'common,' where the boys met to play that peculiarly American game, baseball. It is not surprising, therefore, that the New England city of Boston leads in the provision of children's playgrounds. At the close of 1901 Boston had 14 grounds ranging in size from 0.4 acre to 77 acres, and making a total area of 182 acres. Brooklyn has maintained for years a fine though inaccessible playground. In 1898 Milwaukee established an open-air gymnasium in one of its parks. In the city of New York, portions of Central Park have for years been set apart as children's playgrounds. A general movement for the establishment of municipal playgrounds throughout the city, and especially in the congested tenement-house district, was inaugurated in 1887. In that year an act was passed by the State Legislature permitting an annual expenditure of $1,000,000 for the establishment of small parks. The City Park Department, however, has steadily opposed the use of any portion of this sum for the foundation and equipment of children's playgrounds. In May, 1888, the New York Society for Parks and Playgrounds for Children was incorporated under a special law giving the society unusual powers, including the appointment of special police. In 1894 the Tenement-House Commission secured the adoption of a law which provides for at least two parks on the lower East Side "to be furnished in part as public playgrounds." The first of these plots was opened to the children in 1900. It was merely a bare piece of ground with no apparatus for children's games and no directors. Under such management it has done little good. The management of the second of these plots, known as Seward Park, was assumed by the Recreation League, an organiza-

tion devoted to work of this character; apparatus was obtained and directors secured to help the children in their games, the entire cost of equipping and operating the playground being paid by the League. The playground was opened to the public on June 3, 1899, in the presence of from 15,000 to 30,000 people. From the start it has been immensely popular with the children, and is an effectual proof of the feasibility and usefulness of such undertakings. In 1903 various other parks were opened as playgrounds.

Another branch of the work of furnishing playgrounds for the children of New York was undertaken in 1898. In that year the school boards of Manhattan and the Bronx appointed a committee for the management of summer playgrounds and appropriated $15,000 for the work. On July 6th twenty playgrounds attached to public schools were opened. Apparatus for games and gymnastics were supplied the children and a director was appointed to take charge of each playground. The daily attendance in the playgrounds averaged from 300 to 1000 children, and many had to be turned away.

The work of securing playgrounds for the children is not confined to the few large cities mentioned. According to Baker, *Municipal Year-Book* (New York, 1902), 187 cities and towns in the United States reported municipal playgrounds in 1901. Of these, 51 were in New England, 39 in the Middle Atlantic States, 11 in the South Atlantic, 13 in the South Central, 41 in the North Central, 16 in the Northwestern, 9 in the Southwestern, and 7 in the Pacific States. According to the same authority 747 cities and towns of the United States reported the possession of municipal parks.

Recreation Piers. Another form of [illegible] enjoyment has been provided by several American cities in the [illegible] recreation [illegible]. These are simply second stories to the ordinary shipping piers, fitted up with canopy roofs; [illegible] open day and evening; music is furnished at certain hours, and dancing allowed.

With the advent of the trolley and the bicycle, the outskirts of cities have become more accessible to the inhabitants, so that parks many miles distant may be reached in a comparatively short time and for a trifling sum. Many of the trolley companies have themselves taken advantage of this fact and have fitted up parks on their lines for the sake of the traffic which they attract. At the close of the last century the description of more than one hundred such parks could be found in recent numbers of the street railway journals. The movement for park sys-

*Regardless [illegible]

tems on an extensive scale is progressing in the United States, and two such systems are being developed at public expense with considerable success, one in the region about Boston, and the other in Essex County, N. J. At the beginning of 1902 the Metropolitan Park System for Boston and vicinity included 9248 acres of parks and 23.6 miles of parkways, and an immense ocean-bathing establishment. Besides this large area in parks and public reservation, the city of Boston alone had 2389 acres in parks and playgrounds, and hundreds of acres of parks were owned by the other cities and towns in the park district. In 1902 the Essex County Park System included 3548 acres of land, with a comparatively short length of parkways built, but many miles projected. Much of this land lies along the ridge of the Orange Mountain, commanding a view of New York City and Harbor and the intervening country. A feature of these two park systems is the providing of large reservations, to be left as nearly as possible in their natural state.

The preceding table gives the population, area devoted to parks, and the percentage of the total area which is in parks, for the 50 largest cities in America. The table was compiled from the *Bulletin* of the United States Department of Labor for September, 1900, and the column of percentages has been added. It will be seen that Columbus, Ohio, has the largest percentage of its area devoted to parks. It must be remembered, however, that two factors enter into this proportion, and that where a city has a great area in proportion to its population, like Saint Paul, the need for public parks is not so great as in a densely crowded city like Jersey City. The latter city, crowded as it is, is one of the most poorly provided with parks of the cities of the United States.

PARLEMENT. The name borne in France, before the Revolution, by a number of local tribunals which exercised a great influence on the government in fields other than the judicial. The Parlement of Paris, the most influential and celebrated of the French parlements, is generally supposed to have had its origin in the *curia regis* of the Frankish kings, an assembly consisting of the lay and ecclesiastical dignitaries of the court which met under the presidency of the king or his representative and exercised a wide though undefined jurisdiction, equitable in nature. Broadly speaking, its powers extended to all cases involving the royal interest, but it also heard appeals from inferior courts where delay or denial of justice was concerned. Under the Carolingian monarchs it became the court for the trial of cases involving the high nobility, and its jurisdiction was also extended over all persons living under the royal protection. In the course of time the *curia regis* fell apart into three separate bodies: the *conseil du roi*, the *chambre des comptes*, and the Parlement proper, which name first prominently appears under St. Louis. Under Philip the Fair the légistes or members of the learned bourgeoisie began to enter the Parlement which up till then had been composed exclusively of the lay and ecclesiastical nobility. These came to constitute a very important element in the body, as is indicated by an ordinance of 1296, which ordered that 18 laics and 16 clerks should always be in session for the doing of judicial business. The Parlement at this time comprised three chambers: the *grand' chambre* or full Parlement, meeting for the rendering of decrees; the *chambre des enquêtes*, to which was referred the greater mass of detailed work, such as preliminary investigation and the sitting of testimony, and the *chambre des requêtes*, which received the petitions of those desiring to come within the jurisdiction of the Parlement. From 1417 to 1436, while Paris was in the hands of the English, the Parlement was in session at Poitiers. In 1467 the irremovability of members of Parlement was established. The method of admission at this time was by royal appointment from a list submitted by the Parlement, but frequently the kings exercised the power of direct appointment. Under Francis I. the principle of purchase became general; nominations henceforth ceased and membership, as a rule, passed from father to son, resulting in the establishment of a so-called nobility of the robe, fully as class-conscious, as jealous of its prerogatives, and as careful of furthering its interests, as was the feudal nobility. The salary was slight, and the chief income of the magistrates was derived from fees which were very high. The kings at various times sought to increase their revenue from the sale of offices by increasing the number of members of Parlement, or even the number of chambers, there being at one time no less than nine of these in the Parlement of Paris. In 1604 the so-called Paulette was introduced in accordance with which members of Parlement paid an annual fee of 1-60 of their income in return for which their office, on death, passed to their heirs.

The provincial parlements had their rise after the Hundred Years' War. As the great feuds were reunited with the crown, parlements were established in the local capitals to perform the same judicial functions as the Parlement of Paris did within its jurisdiction. The Parlement of Toulouse had been established in 1302, but was dissolved after some time, and was not reëstablished till 1443. The other local parlements, with the date of their foundation, were as follows: Grenoble, 1461; Bordeaux, 1462; Dijon, 1477; Aix, 1501; Rouen, 1515; Rennes, 1553; Pau, 1620; Metz, 1633; Besançon, 1676; Douai, 1686; Trévoux, 1762; Nancy, 1775. The early theory was that all the parlements constituted but one body, and that the members of one parlement were entitled to sit in any other. This, however, was not maintained for a long time. The parlements were all on a basis of equality in that each was supreme within its jurisdiction, but a certain predominance was enjoyed by the Parlement of Paris, whose decrees, after 1474, were binding in any part of the kingdom without the *visa* or confirmation of the local parlement. For the facilitation of business the Parlement frequently sent out a number of its members to hold court in different places. These were known as Grand Jours and constituted, practically, courts of assize.

The political importance of the Parlement of Paris dates from the reign of Charles VI. Under Louis XI. it began definitely to put itself into opposition to the royal will in matters of legislation and administration by attempting to modify the text of the royal edicts submitted to it for registration (*enregistrement*) or by rejecting them altogether. The process of registration, which

in the beginning was merely formal and largely in the nature of an act of record, had come in time to be regarded by the Parlement as essential for the validity of all royal decrees. The kings met the opposition by letters of "jussion" commanding the Parlement to register, frequently, too, by imprisonment and exile. After 1563 the common form was by means of a royal bed of justice (q.v.), where the king appeared in solemn state and ordered the Parlement to register the obnoxious decree. The Parlements exercised great influence during the period of the civil wars when they were the strongholds of catholicism. They submitted, however, to Henry IV. The Parlement of Paris sought to assert its authority during the reign of Louis XIII., but failed before the masterful will of Richelieu. Under Louis XIV. Parlement, after playing a leading part in the troubles of the Fronde (q.v.), was restricted entirely to its judicial functions. After that monarch's death, however, the Parlement declared his will invalid, and vested the regency in the Duke of Orleans. Thereafter it was engaged in continuous struggles against the crown in the hope of regaining its former power. It was conspicuous in the Jansenist controversy in connection with the Bull Unigenitus (see JANSENISM), and was the bitter enemy of the Jesuits, whose expulsion it brought about with the aid of Madame de Pompadour. The conflict between the Parlement and the crown culminated in the coup d'état of 1771, when the Chancelor Maupeou declared all the offices of the Parlement vacant and organized a new body whose authority was greatly curtailed by the establishment of six superior courts in the territory formerly under the jurisdiction of the Parlement. Purchase and fees were abolished, but the principle of irremovability was retained. In spite of the fact that the change was on the whole for good, the new Parlement—the Parlement Maupeou, as it was called—was extremely unpopular, and when Louis XVI. succeeded to the throne he restored the old magistrates. The quarrels with the crown nevertheless continued, the Parlement making itself the mouthpiece of the new ideas of popular rights, national sovereignty, and thorough-going reform. Its protestations, however, were not sincere, as was evidenced at the summoning of the States-General, in 1787, when it showed itself no less jealous of its prerogatives than the nobility or the clergy. It lost thereby the popularity which it had enjoyed for some time, and in 1790 the Parlement of Paris, with the provincial parlements, was abolished by the National Assembly. As judicial tribunals the French parlements take a very high position among such institutions in history. Though narrow in spirit as far as concerned their privileges as a caste, they nevertheless dispensed justice in an admirable manner, and were largely instrumental in unifying the customary law of France. Consult Voltaire, *Histoire du parlement de Paris* (Paris, 1769); Dufey, *Histoire, actes et remontrances des parlements* (vol. ii., Paris, 1826); Flammermont, *Le chancelier Maupeou et les parlements* (Paris, 1883).

PARLER, pär'lēr, PETER (*c.*1333-*c.*1307). The most famous and successful of a family of German architects. He was born in Gmünd and his name seems to have been corrupted in Bohemia from Arler to Parler, possibly under the influence of *Parlierer* or *Polier*, a word used in the architecture of the Middle Ages, signifying 'foreman.' Like his father, Heinrich, he got his early training in Cologne. In 1356 he was architect on the Prague Cathedral, of which he built the choir. His brother, JOHANNES, became master architect of the Cathedral of Freiburg in 1359. Some members of the family were known by the name of Von Gmünd. All are classified by Klemm in the *Allgemeine deutsche Biographie*. Consult Neu with, *Peter Parler von Gmünd und seine Familie* (Prague, 1891).

PARLEY (OF. *parler*, turn of speech, from *parler*, to speak, from ML. *parabolare*, to discourse, from Lat. *parabola*, comparison, speech, parable). In military affairs, this term is used to describe the conversation between antagonists, which may be introductory to an exchange of prisoners, burial of dead, or care of wounded soldiers. Hostilities are temporarily suspended in the vicinity near where the parley takes place. A parley is usually preceded by a flag of truce, although it may be preceded by a roll of drums, known as *beating a parley*.

PARLEY, pär'li, PETER. The pseudonym of the American author, Samuel Griswold Goodrich (q.v.).

PARLIAMENT (OF., Fr. *parlement*, discourse, conference, legislature, from *parler*, to speak). The name of the legislative assembly of Great Britain and Ireland. The legislative assemblies of Scotland and of Ireland previous to the union with England (1707) and Great Britain (1801) respectively bore the name of Parliament. This is also the designation of the legislatures of the Dominion of Canada and of the Commonwealth of Australia. The Parliaments (Parlements) which existed in France before the Revolution of 1789 were not legislative, but judicial bodies. The word was first used by Matthew Paris in 1246, but only gradually replaced the terms by which the councils of the English King had previously been known. Moreover, even when so called, Parliament had not at first the privileges and functions which it exercises to-day. Modern Parliament has developed by slow and painful degrees from the Witenagemot of Anglo-Saxon times. This body was composed of princes, prelates, aldermen, and a varying number of royal nominees. It met thrice yearly, had the power of electing and deposing kings, gave consent and assent in all matters of legislation, and was the supreme court of justice for the kingdom. It was in no sense a representative and legislative body, but, as the name indicates, a council of *witan* or wise men, assembled to advise the King. After the Norman Conquest the Witenagemot gradually lost its old significance together with its name, and was merged in the Great Council, an assembly to which in theory every tenant in chief of the King belonged. This was generally attended only by royal officials, the great prelates, earls, and those barons who were individually summoned. The powers of the body were three: it held a somewhat loose control over taxes, it gave consent to laws proposed by the King, and it acted as a court of justice. The first function became of some importance by the end of the twelfth century, when the idea that taxation and representation go hand in hand first germinated

the second was exercised to good purpose in great crises like the conflict between Henry II. and Thomas à Becket; but the third developed earliest and gave the Council its peculiar character.

With the granting of the Great Charter on June 15, 1215, by King John, the national assembly entered upon its chief period of transition. (See MAGNA CHARTA.) The commons, especially the citizens of London, had given important aid to the barons in their struggle, and the latter obtained certain privileges, personal and commercial, for them. More important was the fact that for the first time the nobles and commons were thus united against the Crown. The Great Charter provided that scutage, a form of feudal taxation hitherto exacted at the pleasure of the King, should no longer be levied without the consent of the Great Council, which was to be summoned forty days before the appointed date for meeting, so that all might have time to attend. The document took no notice of the representative principle, however, and the minor barons subsequently regarded themselves as exempt from attendance at the Great Council because they were no longer entitled to summons by special writ. But, curiously enough, John had already recognized the principle of representation in 1213 when he summoned to the Council of Saint Albans the reeve and four men from each vill on the royal demesne. This is the first occasion where all three estates, nobles, clergy, and commons, sat together. Recognition had thus been gained for the ideas of representation, election, and concentration in a central assembly, but until 1254 the experiment seemed abortive. In that year Queen Eleanor and Earl Richard of Cornwall, regents during the absence of Henry III. in Gascony, called a council to meet at Westminster, at which were present two knights chosen from each shire. This element was to be of great importance in the development of Parliament, since the knights of the shire henceforth furnished leaders for the commons, and, many of them being nearly related to the nobles, they enabled the two estates to unite in opposition to the Crown. This was a most important effect of the rule of primogeniture which, contrary to the custom on the Continent, was in strict force in England. The younger sons of the nobility were usually country gentlemen and thus served as a connecting link between the nobles and the commons.

In spite of the part played by the commonalty in these early attempts at constitutional reform, the tendency of the time was oligarchical. This is clearly shown by the struggle between Henry III. and Simon de Montfort (qq.v.). Though in the course of it distinction was first made between the representatives of shires and of boroughs, Simon called upon the commons only to further his ambitious plans, and even then gave them no voice in the formation of his governmental scheme. In 1258 a form of provisional government was ratified, embodied in the Provisions of Oxford (q.v.), which was distinctly oligarchical and altogether unsatisfactory. In 1261 the barons under the leadership of Simon summoned three knights from each shire south of the Trent to the autumn Parliament at Saint Albans to consider the Provisions. The King, not to be outdone, summoned the same knights to Windsor, with the result that neither council was held. Three years later, after the battle of Lewes, Simon gathered his first Parliament, to which somewhat extended powers were granted. It is with the Parliament of Westminster, however, which met in January, 1265, that Simon's name is especially connected. To this assembly were summoned not only two knights from each shire, but also two burgesses or citizens from twenty-one boroughs or cities mentioned by name in the writ. Thus for the first time the third estate, made up of county freeholders and burgesses, was fully represented in a national assembly. Nevertheless, the importance of Montfort's act has been somewhat exaggerated. In the first place, the Parliament was not truly representative. Of the lords, who as a whole were unfavorable to his cause, only five earls and eighteen barons were summoned, while of the clergy, who were his supporters, there was a very disproportionate number. Furthermore, it is doubtful whether the Parliamentary representation of the third estate was intended to be permanent. Yet Simon cleverly adapted existing materials to his own ends and showed the lines on which a real Parliament was to be formed. Meanwhile there was developing on the part of the commons a tendency toward organized opposition to excessive taxation and a somewhat indefinite theory that a grant of supply should receive the consent of Parliament. It was a step in advance that Henry III. recognized the necessity of support from the barons and that both parties no longer ignored the rights of the towns.

To Edward I. belongs the honor of completing the work of founding Parliament. During the first twenty years of his reign, though there was no important advance, he summoned representative assemblies occasionally. Whether consciously or not, he seems to have been experimenting in order to determine the proper representation of the various classes which had crystallized during the struggle of the last reign. In 1294 the right of the clergy to give consent to taxation was formally acknowledged. In the following year Edward was beset with difficulties on account of his wars with Wales and France. He needed money, and accordingly summoned representatives of the three estates, the consent of which had become essential in the matter of taxation. This assembly, which met in November, 1295, is known as the Model Parliament. To it came, aside from the bishops and the abbots, the earls and the barons, two knights from each of 37 shires and representatives of 110 cities and boroughs. The Parliament was held at Westminster, which became from this time the regular meeting place of the assembly. That Parliament was not formed into three chambers rather than into two was due to the attitude of the lower clergy, who soon withdrew and voted grants of money in their own assembly or Convocation. It was not till the reign of Edward III. that the definite separation into two Houses took place. The knights at first vacillated between the lords and the commons, but in 1332 is found the first clear reference to the arrangement which after 1339 was permanent, the lords forming the Upper House, the knights and burgesses the Lower.

If the thirteenth century marks the formation, the fourteenth century is especially notable for the development of the privileges of Parliament.

In 1322 Edward II. definitely acknowledged that "the matters which are to be established for the estate of our lord the King and of his heirs, and for the estate of the realm and of the people, shall be treated, accorded, and established in parliaments by our lord the King, and by the assent of the prelates, earls, and barons, and the commonalty of the realm." Though the position of the lords and commons was thereby recognized, the latter had yet to struggle for actual power. Laws were still made by means of petitions to the King, and only the King could proclaim them. A purely formal survival of this condition explains the phraseology of the laws in our own time, which, according to the stereotyped preamble, always emanate from the Crown, Parliament merely consenting. The Hundred Years' War (q.v.) still further increased the power of Parliament, because of the necessity of appealing to the people to meet the enormous expenses which it entailed upon the Government. The advance in privilege during the period from the accession of Edward II. to the death of Henry V. may be summarized as follows: (1) By the ordinance of 1311, succeeded by the acts of 1330 and 1362, it became the rule to summon Parliaments every year. This provision was often evaded; but regular and frequent assemblies were nevertheless held throughout the fourteenth and fifteenth centuries. (2) From 1340 taxation without the consent of both Houses was illegal. (3) After 1407 the Commons possessed the preponderating voice in making money grants. (4) Parliament began to exercise the right of supervising expenditure, which involved not only the audit of accounts, but also the impeachment of royal officials. This was first done by the Good Parliament (q.v.) in 1376, and constituted an early but important step toward ministerial responsibility.

The Wars of the Roses proved in a manner detrimental to the development of Parliament, since the destruction of the powerful nobles left the commons unaided in their struggles against the Crown. Yet the introduction of legislation by means of bills instead of petitions in the reign of Henry VI. really laid the foundations for the subsequent power of Parliament. During the earlier part of the Tudor period Parliament was denied even the semblance of power, but Thomas Cromwell showed Henry VIII. the way to use it for his own ends while observing the letter of the law. Subsequently the Tudors ruled [illegible] by means of their control over Parliament. The course they followed was this: (1) Occasionally they employed the old device of dispensing with Parliament altogether; but (2) they found a safer method in creating a number of small boroughs, later called [illegible] [illegible] narrowing the right of [illegible] [illegible] cured the nomination of the [illegible] Commons and made the [illegible] member of that body; (4) [illegible] fell back upon the royal [illegible] ment by proclamation. The [illegible] worked toward the same end [illegible] the 27 abbots and priors [illegible] the temporal peers in [illegible] Crown the opportunity of [illegible] by means of new creations [illegible] first temporal peers had been [illegible] in-chief; from the time of J[illegible] barons who received person[illegible]

Great Council; under Edward I. such barons were confirmed in their hereditary rights; but not till the device of creation by letters patent was established did the hereditary peerage in the modern sense appear. Instances of such creations are found as early as the reign of Stephen, but they were rare till the time of Richard II. Since the Reformation the spiritual lords have been [illegible] the [illegible] House of Lords [illegible] to note the peculiar function of the King as a court of last resort, a right which it has kept since the separation of the Privy Council from Parliament in the reign of Richard II.

With the accession of James I. [illegible] in 1603 began the last great struggle between Parliament and the Crown. The Tudors had been able to retain their personal popularity and to rule somewhat despotically because they held to a definite [illegible] power. The Stuarts, in defiance of this, obstinately asserted the principle of divine right, which was peculiarly obnoxious to the Puritan Party that was fast becoming strong. Moreover, James was a foreigner and understood the needs of Scotland better than those of England. The struggle with Parliament continued [illegible] Charles I. (q.v.), resulting in the Great Civil War and the rule of Oliver Cromwell (q.v.). The struggle centred about the right of taxation and the right to impeach royal officials. In both of these contests the House of Commons ultimately won [illegible] also in the [illegible] question of the inviolability of its own members. Though the army was all-powerful during the Protectorate itself, the Restoration found Parliament in possession of the rights for which it had long struggled. The reign of Charles II. was strictly Parliamentary, at least as far as outward forms went, and freedom of speech in Parliament was definitely established. In this reign, moreover, the influence of the Lower House was vastly increased by the provision that bills for the grant of supplies must [illegible] the Lords. With Charles II. also arose the Cabinet [illegible] of ministers [illegible] Parliament [illegible]

the confidence of the nation. The limit was extended to seven years by the Septennial Act of 1716, which is still in force. The eighteenth century is notable for the complete development of the party system, though the Whigs and Tories had existed under these names since 1679. In connection with the rise of parties appeared the completely developed Cabinet government, whereby the Crown is compelled to select its ministers from the dominant party in the House of Commons. The fact that George I. was a foreigner and unable to speak English had much to do with this change in government. George III. (q.v.), indeed, tried to create a party of his own, but failed. Henceforth the maxim that 'the King reigns but does not govern' represents the spirit of the English Constitution. In 1707, by the union of Scotland with England and Wales to form the Kingdom of Great Britain, certain changes were made in the composition of Parliament. Scotland received 45 members in the House of Commons, while its peers were to elect for every Parliament 16 representatives from their number to sit in the Upper House. As the Crown was restrained from creating new peers for Scotland, the Scottish peerage is gradually becoming extinct. In 1800 the Irish Parliament also ceased to have a separate existence, and Ireland was to be represented in the Parliament of Great Britain and Ireland by one of the four archbishops and three of the eighteen bishops sitting by rotation of sessions, by 28 temporal lords elected for life by the Irish peerage, and by 100 members of the House of Commons. The spiritual lords lost their seats in 1870, however, in consequence of the disestablishment of the Irish Church.

In the latter part of the eighteenth century Parliamentary corruption became notoriously prevalent. In 1793 the Duke of Norfolk had eleven seats for rotten boroughs in his gift, and many other wealthy men were answerable for a lesser number. Moreover, many great towns had no representatives whatever in the House of Commons. After various abortive attempts at the reform of Parliamentary representation by the younger William Pitt and others, the question became acute at the close of the Napoleonic wars and did not cease to agitate the kingdom during the greater part of the nineteenth century. Legislative measures began with the great Reform Bill of 1832, which was passed after the opposition of the peers had been overcome by the threat of numerous creations. This act completely remodeled Parliament. In England 143 votes were taken from boroughs and redistributed among the counties and large towns. The county franchise was given to freeholders or copyholders to the value of £10 a year, to leaseholders for twenty years whose annual rent was £50, and to tenants at will who paid £50 a year. The borough franchise was given to all holders of houses to the annual value of £10. For Scotland the number of members was increased from 45 to 53, of whom 30 were to sit for the counties and 23 for the cities and boroughs. The county franchise was given to all holders of property to the annual value of £10, while the borough franchise was made the same as that of England. For Ireland the number of members was raised from 100 to 105. Both the borough franchise and the county franchise were given as in England, except that the occupation franchise in the counties was limited to holders of land to the value of £20 per annum. This provision was designed to prevent the control of the priests, who were much feared after the Catholic Emancipation Act of 1829. With the Reform Bill the parties took new names, the Tories being succeeded by the Conservatives, the Whigs by the Liberals. Since then Parliament has undergone little change in its essential features, though several reform acts have been passed. In 1867 household suffrage was established in boroughs, with a lodger franchise at a value of £10; in the counties existing qualifications were reduced by one-half and an occupation franchise at £12 was created. There was also a slight redistribution of seats. In 1872 voting by secret ballot was established. In 1884 there was a thorough redistribution of seats, with an attempt to make equal electoral districts, and an assimilation of the county and borough franchises. In 1885 the franchise was again somewhat extended so that at present there is nearly universal suffrage in Great Britain and Ireland. Meanwhile the House of Commons has become by far the most important branch of the Government. It rules the country absolutely and is quickly responsive to popular demands. The following table illustrates the composition of the House of Commons in 1903:

	Counties	Boroughs	Universities	Total members
England	234	226	5	465
Wales	19	11	0	30
Scotland	39	31	2	72
Ireland	85	16	2	103
	377	284	9	670

Details concerning the existing system of parliamentary government will be found in the section *Government* under GREAT BRITAIN, but something remains to be said of certain customs of Parliament. The Houses of Parliament or New Palace of Westminster, in which Parliament sits, were opened in 1852, though the assembly has had its abode on that site for six centuries. The former building was destroyed by fire in 1834. The Commons' Chamber is in the north side of the building, the Lords' in the south. About them are the retiring rooms of their respective members, and the residences and bureaus of their officials, aside from a great number of other apartments. Unless sooner dissolved, a Parliament lasts for seven years. It meets about the middle of January or early in February, and when it has completed its work it is prorogued, though either House may adjourn for a short time on its own initiative. Business is now rarely completed before August or September. A new Parliament is opened with imposing ceremonies, the hour fixed being usually two o'clock. In the morning the vaults are searched for possible bombs and the like, in memory of the plot of Guy Fawkes (q.v.). By one o'clock every seat in the House of Commons is occupied, since there are many more members than seats. The members of the Government party occupy the benches—there are no desks—to the right of the Speaker; the members of the Opposition those to the left. A member secures a seat by placing upon it his hat, or since 1895 a card marked with his name. The House is opened by the clerk, who is chair-

man till the Speaker is elected. The first incident of the session is the summoning of the Commons to the Peers' Chamber by the Black Rod, the messenger of the Upper House, to hear the royal message. When the King does not open Parliament in person, this is read by the Lord Chancellor. Before the actual reading of the King's speech, the Commons return to their own chamber to elect a Speaker. The Speaker is not a party leader, as in the United States, but is supposed to be strictly impartial, and is usually reëlected regardless of the party in power. He receives an annual salary of £5000, and has some perquisites, such as an official residence. He ranks as first commoner, and when he retires he is usually rewarded with a peerage and a yearly pension of £4000. The chairman of the House of Lords is the Lord Chancellor, whose official seat is the celebrated Woolsack. He is ordinarily a member of the Cabinet. Most of the measures introduced into Parliament are Government bills, and a vote is taken by the members passing out of different doors into the lobby and being counted in the process. Each party has designated members, known as 'whips,' who gather the party forces for important divisions in the House of Commons.

(4th ed., London, 1895); Smith, *History of the English Parliament* (ib., 1892); Skottowe, *A Short History of Parliament* (ib., 1886); Dickinson, *The Development of Parliament During the Nineteenth Century* (ib., 1895). For the many interesting customs of Parliament and its method of work, consult MacDonagh, *The Book of Parliament* (ib., 1897).

PARLIAMENT, HOUSES OF, or NEW PALACE OF WESTMINSTER. The seat of the British legislature, a great mass of buildings on the Thames in London, built at a cost of $15,000,000 after plans by Sir Charles Barry on the site of the previous building, which was destroyed by fire in 1834. The edifice covers an area of eight acres, and contains 1100 apartments, 100 staircases, and 11 courts. The exterior, in rich late-Gothic style, is made impressive by three massive towers: Victoria Tower, 340 feet high; Middle Tower, 300 feet high; and Saint Stephen's or the Clock Tower, 318 feet high. The latter contains a clock with dials 23 feet in diameter, and a great bell, 'Big Ben,' weighing 13 tons. The interior is fitted up with much magnificence. In it are the sumptuous House of Peers and the simpler House of Commons, an octagonal central hall, Saint Stephen's Hall on the site of Saint Stephen's Chapel, the former meeting place of the Commons, the residence of the Speaker and other officials, the libraries, committee rooms, and lobbies connected with the two Houses, and offices. With the edifice is connected Westminster Hall (q.v.). An unsuccessful attempt to destroy the palace by explosions of dynamite was made in 1885. For illustration, see Plate accompanying the article LONDON.

PARLIAMENTARY LAW. The body of rules and precedents regulating the procedure of deliberative assemblies. Certain rules of parliamentary procedure have always been found necessary for the accomplishment of the purposes for which deliberative assemblies are called. Experience has shown that restrictions must be placed on individual members in the general interest of the whole body; that mere customary rules are insufficient, and hence regular parliamentary codes must be prepared for the government of deliberative assemblies. In the United States this has become almost a distinct branch of the law, and its mastery is highly essential to the success of the legislator. The necessary officers of a deliberative assembly are a chairman, usually called Speaker, president, or moderator, and a secretary or clerk. It is the duty of the presiding officer to call the meeting to order; to state clearly all questions brought before the assembly; to put motions properly made and in their proper order; to preserve order and enforce the rules of procedure; and decide questions of order subject to the right of appeal to the whole assembly. These are his primary duties, but he may in addition participate in debate as any other member, and vote in case of a tie. It is the duty of the secretary to keep a record of the proceedings of the meeting, including a correct statement of every motion made and the manner in which it was disposed of; the names of members of all committees appointed; a true copy of every resolution passed with the affirmative and negative votes cast thereon, etc.

Business is or should be brought before an assembly by motion of a member or in the form of a resolution which is presented by a member who at once moves its adoption. If it is a mass meeting called for a particular purpose, a motion is made for the appointment of a chairman, who, upon taking the chair, asks for a statement of the purpose for which the meeting is called. A proposition which is presented to an assembly is usually called a *motion* if it relates to a matter of secondary importance; and a *resolution*, if of greater importance. The difference is of no practical consequence, however, since a resolution may be offered as a motion and a motion may be presented in the form of a resolution. The member upon whose motion the subject under discussion was brought before the assembly, or upon whose report the conclusion of a committee is presented, is entitled to be recognized as having the floor, although another member may have already risen and addressed the chair. No member who has once had the floor is again entitled to it while the same question is before the assembly so long as any member who has not spoken claims the privilege of the floor. From the decision of the chairman as to the claim of two members for the floor an appeal may be taken, or, in first instance, the chairman may refer the question directly to the assembly for decision. It is the custom, except in the United States Congress, to require important motions to be seconded as a means of assurance that the measure has the support of more than one member. The motion is often seconded as a matter of courtesy, though the person seconding it may not favor it. After the motion has been made and seconded, the chairman clearly states it to the assembly and then recognizes the author of the motion, who is entitled to the floor if he wishes to claim it, or else the first member who rises and addresses the chair. The question is now before the assembly and cannot be withdrawn or modified by the mover, if any member objects, except by obtaining leave from the assembly or

by moving an amendment. Before the chair has put the question, however, the mover may withdraw it without the consent of the assembly.

The question on the adoption of a motion or resolution is usually known as the main question, and during the consideration of it the introduction of any other question is not permissible, but it is allowable to make subsidiary motions that may aid in disposing of the main question, or such as arise incidentally in the course of the consideration of the main question, or such as relate to the rules of procedure, the privileges of members, or the termination of the meeting. Among the subsidiary motions for disposing of the main question, all of which must be decided before the main question can be acted upon, are: First in precedence, the motion to lay on the table. The purpose of this motion is to postpone further consideration of the question until some future time, when it may again be taken up, which would not be allowable had the question been disposed of by a motion to postpone either definitely or indefinitely. This is a common method of suppressing a question, and is successful whenever a majority cannot be found to take it from the table during the session. A motion to lay on the table is not open to debate, cannot be amended, nor can another subsidiary motion be applied to it. The effect of the motion is usually to place on the table everything pertaining to the subject; thus, if an amendment be ordered to lie on the table the subject which it is proposed to amend is also laid on the table. A second means of disposing of the main question by means of a subsidiary motion is the demand for the previous question. This takes precedence of every debatable question, but is itself open to neither debate nor amendment. It applies to questions of privilege as well as to any other debatable question. Its effect is to stop immediately all debate and bring the assembly to a vote on the question pending. When a demand is made for the previous question and seconded, the presiding officer immediately puts the question, "Shall the main question now be put?" If the question is lost, the discussion continues as if the motion had not been made. The previous question requires a two-thirds vote for its adoption, may be demanded on a pending amendment, and if carried, debate on the amendment only is closed, the main question being still open to debate and amendment. It may also be used on an amendment to an amendment. (See PREVIOUS QUESTION.) A third method of disposing of the main question is by means of the motion to postpone to a certain day. Debate on this motion is limited, and must not go into the merits of the subject matter any further than may be necessary to enable the assembly to judge of the propriety of the postponement. The effect of this motion is to postpone further consideration of the subject until a certain time, during which period it cannot be taken up except by a two-thirds vote. When that time arrives the question is entitled to be taken up in preference to everything except privileged questions. In the fourth place, the main question may be disposed of by a motion to commit or recommit. The purpose of this motion is to refer the subject to a committee. If different committees are proposed, they should be voted on in the following order: (1) Committee of the whole; (2) a standing committee; (3) a special committee. The committee, if a select one, may be appointed by the Chair or nominated by a member or members and elected by the assembly. The motion to commit is debatable, and the merits of the question may be gone into. In the next place, the main question may be disposed of by a motion to amend, which may take either of the following forms: (1) to *'add'* or *'insert'* certain words or sentences; (2) to *'strike out'*; (3) to *'strike out certain words and insert others'*; (4) to *'substitute'*; and (5) to *'divide the question.'* A paragraph once inserted cannot be struck out or amended except by adding to it. Similarly, words inserted cannot be struck out except by a motion to strike out the paragraph or a portion thereof. Certain motions are never open to amendment; among these are the motions to adjourn, to lay on the table, to postpone indefinitely, to reconsider, an amendment of an amendment, a demand for the previous question, for the orders of the day, and all incidental questions. An amendment may itself be amended, but not so as to alter its form. While an amendment is pending it is not in order to make another motion to amend until the first amendment is disposed of. Lastly, the main question may be disposed of by a motion to postpone indefinitely. This motion opens to debate the whole question which it is proposed to amend, but, as already observed, it cannot itself be amended. Its effect is to withdraw the question from the further consideration of the assembly for the remainder of the session. The previous question applies to this motion without affecting the main question.

What are called incidental questions are those which often arise in the course of the consideration of the main question, and consequently take precedence of the questions out of which they arise. Such questions are unamendable, and, with a single exception, are undebatable. The incidental questions are those of appeal, objection to the consideration of a question, the reading of papers, leave to withdraw a motion, and suspension of the rules. The appeal arises out of objection raised to a decision of the chair on a question of order. The decision of the presiding officer is made without debate, and if a member objects to the result of the decision, he may say "I appeal from the decision of the Chair." If the appeal is seconded, the chairman puts the question as follows: "Shall the decision of the Chair stand as the judgment of the assembly?" If there is a tie vote the decision of the Chair is sustained. The appeal is the only incidental question which is open to debate, and there are a few cases when it cannot be debated. When debatable, no member is allowed to speak more than once. If the presiding officer neglects to enforce the rules of procedure, any member may call his attention to the breach of order by rising and saying, "Mr. Chairman, I rise to a point of order," whereupon the chairman will request the member to state his objection, which he does, and then resumes his seat. If the chairman decides that the point of order is not well taken, and no appeal is made against the decision, the first member is permitted to resume his speech. If the decision sustains the point of order, and objection is made, he cannot continue without a vote of the assembly. It is in order for any member to object to the consideration of the main question before debate has begun on it. The objection does not require a second, and may

be made while another member has the floor. It cannot be debated, amended, or have any other subsidiary motion applied to it. Whenever objection is raised to the consideration of a motion the chairman states the question, "Shall the question be considered?" Unless an affirmative vote of a two-thirds majority is secured, further consideration for the remainder of the session is ended, otherwise the discussion continues as though objection had never been raised. The purpose of this motion is not to cut off debate, but to avoid the discussion of any question which may seem irrelevant or inexpedient. Any member has the right to ask for the reading of papers for the information of the assembly, but if an objection is raised, the decision is rendered by the Chair subject to appeal to the assembly. It is in order for the mover of a question which is before the assembly to withdraw it or substitute another in its place, if no one objects. If objection is made, it is necessary to obtain leave to withdraw or substitute, which may be done by motion. Such a motion is neither debatable nor amendable. A motion to suspend the rules is one of the important incidental motions. Like the others of its kind, it cannot be debated or amended. It cannot be renewed at the same meeting for the same purpose, nor is it allowable except for a definite purpose, and then only by a two-thirds vote.

Another class of motions are those which are commonly known as privileged questions. They take precedence of all other questions, and are not open to debate except when they relate to the rights of the assembly or of its members. Privileged questions include motions to fix a time for adjournment, to adjourn, motions relative to rights and privileges of the assembly or of its members, and the call for the orders of the day. The motion to fix a day for adjournment takes precedence of all other privileged motions, and is in order even after the assembly has voted to adjourn, provided the chairman has not announced the result of the vote. Next in precedence is the motion to adjourn. This motion is neither debatable, amendable, nor open to reconsideration after a vote has been taken. If the adjournment does not close the session, all unfinished business has precedence over new business at the next meeting, and is treated as if there had been no adjournment. If the adjournment closes the session, and the next session is that of a new assembly, an end is put to all business unfinished at the close of the session, and it can be brought before the assembly only by being reintroduced. Questions of privilege are decided by the presiding officer, subject to the right of any two members to appeal from the decision. The assignment of one or more subjects to a particular day constitutes the orders of the day, and they are not open to consideration before that time except by a two-thirds vote. The orders of the day are classified as special and general, the former always taking precedence of the latter. A special order involves suspension of all rules that interfere with its consideration at the time specified, and it therefore requires a two-thirds vote to make any question a special order. The effect of an affirmative vote is to withdraw the question then under consideration as though an adjournment had happened. It is in order at any time, even though the floor is already occupied, to move a reconsideration of a previous vote on any measure, unless another question is before the assembly at the time. Unless the vote is by ballot, the motion to reconsider must be made by a member of the prevailing side, and only on the day the vote was taken which it is proposed to consider. No question can be twice reconsidered, and a motion to reconsider cannot be amended, although it is debatable, nor even debated if upon up for discussion the question subject to be reconsidered. If the motion to reconsider is carried, the original question is in the condition it was in before the last vote was taken, and must be disposed of as if it had not been voted on. No one can debate the question reconsidered who had previously exhausted his right of debate on the question, although it is allowable to discuss it while the motion to reconsider is before the assembly.

The preliminary work of deliberative bodies is usually prepared by means of committees. These may be standing committees appointed for a definite time, select committees appointed for a special purpose, and committees of the whole consisting of the entire assembly. The first person named on a committee is usually the chairman, whose duty it is to call the committee together. A committee may facilitate its labors by the appointment of a subcommittee of its own membership. A committee report is usually made by the chairman, is signed by the members and delivered to the clerk. In case of disagreement among the members, there may be a majority and a minority report. The report of the majority is the report of the committee, and it may be adopted by the assembly, rejected, or recommitted. After the report has been adopted, the question is open to amendment as if there had been no committee report. An assembly may go into "committee of the whole" for the consideration of a subject which it does not wish to refer to a committee, but which it is desired to consider with the freedom and informality which characterizes the procedure of committees. When this is done, the presiding officer calls another member to the chair and takes his place as a member of the committee. During the consideration by committee of the whole no motions are in order except to amend and adopt, or that the committee 'rise and report.' Debate may be without limit unless the assembly votes that debate in committee shall cease at a certain time, and until then any member may speak as often as he can get the floor if no one else who has not had an opportunity to speak on the question claims it. When the debate is concluded, a motion is made that 'the committee rise and report.' This motion is always in order and is undebatable. When it is adopted, the presiding officer of the assembly resumes the chair, while the chairman of the committee, having resumed his place in the assembly, reports to the Chair the decision of the committee. Like other committees, the committee of the whole has no power to alter the text of any resolution referred to it. It is the practice of many deliberative assemblies to consider certain questions 'informally' without going into committee of the whole, a procedure which is not very different from that of committee of the whole. This is the practice of the United States Senate in the consideration of measures on their second reading.

Debate upon a motion begins after it has been

stated by the chairman and is closed by the chairman rising to put the question. If the presiding officer thinks the debate has ended, he inquires if the assembly is ready for the question, and if no one claims the floor, he puts the question to a vote. The rule of the United States House of Representatives requires that those favoring the motion shall indicate their preference by saying *Aye*, and those opposing it say *No*. If when the presiding officer announces the result any member rises and expresses doubt as to the correctness of the result, or calls for a division, the presiding officer requests those who favor the motion to rise. After counting these and announcing the result, those opposed are requested to rise. These are counted and the final result is then declared. Or he may appoint tellers to make the count and report to him. Whenever there is a tie vote, the motion is lost unless the presiding officer gives his vote for the affirmative. If his vote will cause a tie, he may cast it and thus defeat the measure. Still another form of ascertaining the wish of members is the ballot. The following motions require a two-thirds vote for their adoption: Amendment or suspension of the rules, making of special orders, objections to the consideration of a question, the demand for the previous question, and the closing or limiting of debate.

The most convenient and in some respects the most authoritative manual of parliamentary law is Robert, *Rules of Order* (Chicago, 1883 and 1901). Consult, also, Stevens, *Law of Assemblies* (Minneapolis, 1901); Hackett, *The Gavel and the Mace* (New York, 1900); Thomas Brackett Reed, *Rules of Order;* Cushing, *Manual of Parliamentary Practice* (Boston); *Rules and Practices of the Senate and House of Representatives of the United States* (Washington).

PARLIAMENT OF DUNCES, The. The Parliament of 1404, under Henry IV., to which, because no lawyers were admitted, the name *Unlearned* or *Lawless* (Parliamentum Indoctum) was given by Sir Edward Coke.

PARLIAMENT OF FOWLS, The, or The Assembly of Fowls. One of Chaucer's minor poems, written in his favorite form of a vision. A student reading the "Dream of Scipio" in Cicero's *Republic* falls asleep, and is led by Scipio into a garden where nature assembles the birds on Saint Valentine's Day, and holds a court of love. The poem is taken partly from Boccaccio's *Teseide* and alludes to other Italian sources, but is based mainly on Macrobius's *Commentary on Scipio's Dream*, a favorite book in the Middle Ages.

PARLOA, pär'lō-ä', Maria (1843—). An American domestic economist, born in Massachusetts. She appeared in Boston as a lecturer on cooking in 1877, was special instructor, or lecturer, at various seminaries in Massachusetts and New Hampshire, and gave courses of lessons in sick-room cookery to Harvard medical students. In 1878 she visited Paris for study; in 1881 lectured in Western cities, and in 1882 opened a cooking-school in New York City. Her publications include: *Miss Parloa's New Cook Book and Marketing Guide* (1882); *The Young Housekeeper; Home Economics;* and other books of a similar nature.

PARMA, pär'mä. Before 1860 a duchy in Northern Italy, lying between Sardinia, Lombardy, Modena, and Tuscany. The city of Parma was one of the colonies established along the Æmilian Road by the Romans after the conquest of Cisalpine Gaul in B.C. 222. It was included in the Ostrogothic, Lombard, and Frankish kingdoms, and ultimately in the new German Roman Empire. In the eleventh century it was an appanage of Tuscany, and as such passed to the Countess Matilda, and may have been included in her donation to the Papacy (1102). Lucchino Visconti, ruler of Milan, bought it from Obizzo d'Este about 1346. It passed, together with Milan, to the Sforza, and in 1499 was included in the conquests of Louis XII. of France. In 1511 Pope Julius II. retook it from the French. In 1515, when Francis I. reconquered the Milanese, he reannexed to it Parma and Piacenza, with the Papal consent; but in 1521 it was retaken by the Papal and Imperial troops. In 1545 Pope Paul III., one of the Roman House of Farnese, separated Parma and Piacenza from the Papal domains and erected them into duchies for his natural son, Pietro Luigi Farnese, whose son, Ottavio, married Margaret, natural daughter of the Emperor Charles V. Pietro Luigi, after two years of tyranny, was assassinated by his exasperated subjects, and Parma and Piacenza were seized for the Emperor. Thereupon Paul III. retracted his grant and resumed the Papal claim. His successor, Julius III., who owed his election to the Farnese support, restored Parma to Ottavio Farnese. The Emperor retained Piacenza, and in 1551 sought to take Parma, whereupon Ottavio sought the protection of France. Philip II., to secure his alliance against France in 1556, when Italy was menaced by a new French invasion, restored to him Piacenza, though a Spanish garrison remained there. Alessandro Farnese, son of Ottavio, entered the Spanish service and rose high in Philip's favor, and in 1585 the Spanish troops were withdrawn. Duke Ottavio was succeeded in 1586 by Alessandro, who died in the Netherlands in 1592. The latter's son, Ranuccio, succeeded to the duchies under the guaranty of Spain and the Pope. Elizabeth Farnese, Queen of Philip V. of Spain, in 1725 secured the reversion of Parma and Piacenza to her son, Don Carlos, who received them upon the death of the reigning Duke, Antonio, without issue, in 1731. Carlos exchanged them in 1735 with Austria for the Two Sicilies. In 1748 Parma and Piacenza, together with Guastalla, were handed over by Austria to the Spanish Bourbons in the persons of the Infante Don Philip, with a reversion to Austria in case of failure to him of male descendants, or in case any of his descendants should ascend the Spanish or Neapolitan throne. In 1765 Philip was succeeded by his son, Ferdinand, who expelled the Jesuits in 1768. In 1801 Bonaparte concluded the Treaty of Madrid with Spain, by the terms of which Parma, Piacenza, and Guastalla were to be given to France on the death of Ferdinand, in exchange for which Don Luis, the son of Ferdinand, was made King of Etruria. France came into possession by the death of Ferdinand in the following year. The Treaty of Paris (1814) gave Parma, Piacenza, and Guastalla as a duchy to Maria Louisa, Napoleon's wife, and this was carried out, notwithstanding the protest of the King of Spain in behalf of the widow of the

King of Etruria. On the death of Maria Louisa in 1847 the duchy reverted to Charles, Duke of Lucca, son of the King of Etruria, who succeeded as Charles II. Guastalla was given to Modena, and some small districts were added to Parma. The rule of Charles was tyrannical and illiberal. On the outbreak of the Revolution in 1848 he was forced to grant the popular demands, but he soon afterwards left the country. Parma joined Sardinia against Austria, and was involved in the defeat of its ally. In March, 1849, Austria imposed upon Parma the rule of Charles III., son of Charles II., who had abdicated. The arbitrary rule of Charles III. was closed by his assassination in 1854, when his widow, Louise Marie Thérèse de Bourbon, assumed the government in behalf of her son, Robert I. She made some attempt at reform, but left the country with her son on the outbreak of the war of 1859. On March 18, 1860, Parma was annexed to Sardinia and became a part of the new Kingdom of Italy by the will of its people. It now forms the two provinces of Parma and Piacenza.

PARMA. The capital of the Province of Parma, Italy, situated on both sides of the river Parma, 12 miles south of the Po and 75 miles southeast of Milan (Map: Italy, E 3). The town is circular in form, and is surrounded by walls and ditches flanked by bastions. The site of the former fortifications is now nearly a complete circle of promenades. The streets are straight and wide, and meet at right angles. The Roman Via Emilia, here called the Corso Vittorio Emanuele, crosses the city from east to west, dividing it into two nearly equal parts. It traverses the Piazza Grande, where the official palaces and the statues of Correggio and Garibaldi stand. The northwest corner of the town is laid out in a fine public park. Here is situated the Del Giardino Palace, now a military school, constructed by the Farnese, and containing frescoes by Carracci. Along the opposite side of the city extends the Stradone promenade.

Parma has notable churches. The cruciform cathedral (consecrated 1106 A.D.) is built in the Lombard-Romanesque style. In the octagonal dome is Correggio's "Assumption." The Baptistery is a splendid edifice of Veronese marble, completed in 1270. It is surmounted by several turrets, and the exterior is richly ornamented with tablets representing symbolic scenes. In the interior is a series of good reliefs. The Madonna della Steccata, a Renaissance church in the form of a Greek cross, contains mural paintings by Parmigiano. The San Giovanni Evangelista is a fine Renaissance creation of eminent architects. It dates from 1510. The dome has noteworthy frescoes by Correggio, who has also here a valued "Saint John the Evangelist."

The large but incomplete Palazzo della Pilotta owes its origin to the Farnese. In it are Parma's valuable art collections. In the museum of antiquities here are meritorious bronze statuettes. Its picture gallery contains good paintings by Giulio Romano, Canova's statue of Marie Louise, Holbein the Younger's "Erasmus," paintings and drawings by Parmigiano, and also famous examples of Correggio. Of these last the "Madonna della Scodella" is the most prominent. Other excellent works by Correggio are a "Descent from the Cross," a "Martyrdom of Saints Placidus and Flavia," and two Madonnas. The public library (Palatina) in the same edifice contains over 300,000 volumes and about 5000 manuscripts, some of the latter of great interest and value. The Teatro Farnese is also here, dating from 1618, and latterly restored. In the Convent of San Paolo, now used for a school, are found masterful frescoes by Correggio. The university was founded in 1542. There are faculties of jurisprudence, mathematics and science, and medicine and surgery. In 1902 it had 42 instructors and 621 auditors. Its paleontological collection and its African fauna from the Italian colonies are noteworthy. Connected with the university are a botanic garden, an observatory, and a pharmaceutical school. Among the other educational institutions of Parma are an Episcopal seminary, a lyceum, an agricultural institute, an academy of fine arts, and a school of music. The city is notable in art history as the place of residence of Correggio and the birthplace of Parmigiano.

Parma has manufactures of musical instruments, silks, woolens, linens, felt hats, leather, glass, and ironware. There is also a royal tobacco factory. The printing establishment, founded by Bodoni in 1766 is famous in Italy. The trade is chiefly in wine, grain, cattle, and cheese. In June is held a silk fair. Population (commune), in 1881, 45,217; in 1901, 49,340.

PARMA, Alessandro Farnese, Duke of, Spanish governor of the Netherlands. See Farnese.

PARMA, Jean Jacques Régis Cambacérès, Duke of. See Cambacérès.

PARMEN'IDES (Lat., from Gk. Παρμενίδης). A Greek philosopher of the fifth century B.C., and the most famous member of the Eleatic School (q.v.). Little is known of his life, but he was greatly revered in antiquity for his intellectual powers and noble character. He is said, when sixty-five years old, to have visited Athens, where Socrates, then a young man, heard him. Like his master Xenophanes, Parmenides set forth his philosophical doctrine in verse—his work being entitled *On Nature* (Περὶ Φύσεως). Considerable fragments of it are still extant. The leading design of this poem is to demonstrate the reality of actual being, the non-existence of which Parmenides declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. As for the phenomena of nature, they are only apparent and due to man's error; they only seem to exist, but have no real existence. Apparently Parmenides made no attempt to grapple with the inevitable contradiction between the doctrine of being and that of seeming. The fragments are published by Karsten, *Philosophorum Graecorum Veterum Reliquiae*, vol. i. (Amsterdam, 1835); Stein, in *Scholia Philologorum Bonnensium* (Bonn, 1867); Ritter and Preller, *Historia Philosophiae Graecae* (7th ed., Gotha, 1888); Diels, *Parmenides' Lehrgedicht, griechisch und deutsch* (Berlin, 1897). Consult Zeller, *Philosophie der Griechen*, vol. i. (5th ed., Leipzig, 1892).

PARME'NION (Lat., from Gk. Παρμενίων) (c.399–329 B.C.). A Macedonian general, who served under Philip and Alexander the Great. In 356 he defeated the Illyrians; in 342 carried

out a successful campaign in Eubœa; and in 337 was sent into Asia Minor to pave the way for the conquest of Persia. While he was there Philip was assassinated. Parmenion, his most trusted servant, remained faithful to Alexander and acted as his military adviser and as commander of the infantry. In 330, when Parmenion was in Media guarding the booty, his son, Philotas, was accused of treason against Alexander and was executed, after having implicated his father. Alexander may have believed the charge or feared vengeance from Parmenion; at any rate he had him put to death.

PARMIGIANO, pär'mē-jä'nō, or **PARMEGIANINO** (1503-40). An Italian painter, whose real name was Mazzuoli, or Mazzola, and who was called Parmigiano from his birth-place, Parma. He was the most talented of a group of mannerists, who attempted to amalgamate the schools of Rome and Parma. He early came under the influence of Correggio and became a successful imitator of his style. In 1523 he went to Rome, where his first manner underwent great modification, due to his study of the masterpieces of Michelangelo and Raphael. His Roman career was interrupted by the sack of the city in 1527 by the soldiers of Charles V. The picture of Saint Jerome, National Gallery, London, was painted at this time. Taking refuge in Bologna, after a residence there of three years, he returned to Parma in 1531. During this year he contracted to execute a series of frescoes in the Church of Madonna della Steccata. Receiving half payment in advance and failing to fulfill the terms of the agreement, he was imprisoned by the church authorities in 1537. Upon promising to complete the work, he was released from prison, but fled to Casalmaggiore, where he died August 24, 1540. Parmigiano's principal altar-piece is "Santa Margherita" in the Academy at Bologna. Probably the most popular production of the artist is "Cupid Making a Bow" (1536, Vienna), frequently attributed to Correggio. Consult Affò, *Vita del Mazzola* (Parma, 1784).

PARNAHYBA, pär'nä-ē'bà. The name of two rivers and of a town in Brazil. See PARANAHYBA.

PARNASSIENS, Les, lā pär'nä'syăN'. A school of French poets, so named because they contributed to a lyric anthology known as *Le Parnasse Contemporain*. One of the first Parnassiens to come forward was Théodore de Banville (1823-91); but the real founder of the school was Théophile Gautier (1811-72), who formulated the doctrine of art for art's sake. Gautier's unhappy friend Baudelaire (1821-67) upheld this poetic dogma, but he died rather too early to belong to the Parnassian school, save by his tendencies. Under the leadership of Leconte de Lisle (q.v.), in whose house they gathered on Saturdays as early as 1856, a score of writers composed poems wherein they endeavored to suppress personal feeling, to avoid preaching, and to cultivate art for art's sake. Leconte de Lisle himself was called the impassive, but in him, as in others, one often feels an emotional lyric undertone, and this bursts forth in a truly lyric cry in *Les Montreurs*, a poem in which Leconte de Lisle utters his beliefs with a great lack of his habitual Olympic impassivity. The Parnassiens aimed at great finish in thought and form, and many of them achieved their aim. Xavier de Ricard, Anatole France, Catulle Mendès, Armand Silvestre, François Coppée, Sully Prudhomme, Léon Dierx, and José Maria de Hérédia, to name the most distinguished Parnassiens, undertook also to rid French poetry of a false sentimentality, borrowed, they thought, from the Lake School (q.v.), and to combat the imitation of Lamartine.

PARNAS'SUS (Lat., from Gk. Παρνασσός). A mountain in Phocis, Greece. It has twin peaks, now called Gerantorachos and Lykeri (8070 feet), which rise from a rough plateau and form a conspicuous landmark in Eastern Greece. During all but the summer months the summits are covered with snow. From the plateau rise other lesser peaks, and on the side of a hill at the south above Delphi is the Corycian Cave, dedicated to Pan and the Muses. On the slope of Parnassus was the fountain Castalia (q.v.), whose waters were supposed to fill the minds of those who drank of them with poetic inspiration. The Thyiades are said by Pausanias to have celebrated the orgies of Dionysus on the highest summits. On the southern slope lay Delphi (q.v.), the seat of the famous oracle.

PAR'NELL, CHARLES STEWART (1846-91). An Irish statesman and Parliamentary leader. He was born at Avondale, in the County of Wicklow, Ireland, June 28, 1846, of an old Protestant family. He was the son of John Henry Parnell and Delia Tudor Stewart, daughter of Rear-Admiral Charles Stewart of the United States Navy. Parnell was educated in the University of Cambridge, but returned to Avondale without a degree. After traveling in the United States (1872-73) he became high sheriff of his county, and in 1875 he entered Parliament for Meath County. From the outset he displayed remarkable ability for leadership in politics and for parliamentary warfare. Reserved and dignified, with few of the ordinary graces of an orator, Parnell contrasted strikingly with the enthusiastic impulsive Irish debater of the type of O'Connell. But the very absence of these Irish qualities impressed upon the English the fact that now for the first time they had to reckon with a strong, well-directed Irish opposition.

In 1877, in conjunction with Biggar, Parnell brought together the hitherto disunited forces of opposition in a compact party of Nationalists, whose object was Home Rule for Ireland in all local affairs, including necessarily the restoration of the Irish Parliament. (See HOME RULE.) The method of political warfare followed by Parnell was bold and effective. He adopted extreme tactics of obstruction: to delay all public business as far as possible; to make combinations with any party that might be in opposition in order to embarrass the Government; to use the balance of power in such a way as to secure concessions as the price of votes; and, in a word, to make all legislation extremely difficult until the demands of Ireland should be considered and accepted. For the support of this policy Parnell looked to the Fenians of Ireland and of America, and to the Land League, which he helped organize in 1879, and of which he was the first president. The object of the League was not only to secure fair rents and

to transfer the ownership of the soil to the tenants, but also to bring about Home Rule. (See LAND LEAGUE.) Meantime Parnell carried out his Parliamentary warfare with singular tenacity and persistence, against the bitter opposition of both of the great English parties. The conservative traditions of the House of Commons were speedily set at naught; its rules were ingeniously perverted to defeat their own objects; every important piece of legislation was attacked, delayed, and in some cases defeated by the able combinations of the Irish party under its great leader, with some of the other elements of opposition. In 1877 and 1878 the Parnellites, as they began to be called, persistently opposed the bill for the annexation of the Transvaal, the flogging clauses of the Mutiny Act, and the Prisons Bill; and, joined by Joseph Chamberlain and leading Radicals, they carried the bill abolishing flogging in the army. Side by side with the development of this new policy the land agitation in Ireland grew and became a source of widespread public interest. To aid the movement, and to relieve those tenants who suffered by eviction, Parnell in the winter of 1879-80 made a visit to America, where he raised large sums by popular subscription. On his return he was simultaneously elected to Parliament from Meath, Mayo, and the city of Cork, the last of which he chose to represent. His claim to lead his party was formally ratified when in May, 1880, the Irish members of Parliament chose him leader by a vote of twenty-three to eighteen. Supported by powerful social and political organizations, and at last by the Catholic Church, and controlling the words as well as the votes of his followers with a strong will and an iron hand, Parnell was now a formidable power in English politics. Continuing the land agitation, he was arrested and imprisoned in October, 1881, on the charge of intimidation, and of obstructing the operation of the new Land Act. (See IRISH LAND LAWS.) He remained in Kilmainham jail until April, 1882, when he was released on parole.

At the general election of 1885 he was reëlected from Cork, and by a political bargain with the Conservative Party secured the election of a number of Conservative candidates, though soon afterwards he repudiated the agreement and threw his votes on the Liberal side (January, 1886), thus defeating the Conservative Administration of Lord Salisbury. Gladstone, who by this change succeeded to office, was now definitely committed to the adoption of a measure of Home Rule for Ireland, and henceforth the Irish supported the Liberal Party. On April 8, 1886, Gladstone had a bill introduced to give Home Rule, which ruptured the Liberal Party and led to the formation of the new Liberal Unionist Party (q.v.), and Gladstone's Administration was thereupon defeated and resigned in July, 1886. Nevertheless, Parnell introduced a bill for the relief of tenants, which, as a whole, the Salisbury Government refused to accept, though many of its important provisions were subsequently incorporated into the Government's own measure. Toward the close of the session of 1887 a sensation was caused by the publication in the *London Times* of the fac-simile of a letter purporting to have been written by Parnell to a friend, palliating the murder of the permanent Under-Secretary for Ireland, Thomas Henry Burke, in Phœnix Park, Dublin, in 1882. On the night of the publication of this document Parnell returned to the House of Commons, from which he had been absent, and denounced the letter as a base and infamous forgery. But when Sir Charles Lewis, a Conservative, moved that the publisher of the *Times* should be prosecuted for libel at the expense of the Government, the Irish members declined on the ground that they had no confidence either in the Government or in English juries. Some time afterwards this letter and others of a similar nature were found on investigation by a judicial commission to be the forgeries of a man named Pigott, who after the exposure fled from the country and died at Madrid by his own hand. Parnell brought suit for libel against the *Times*, and recovered £5000 damages. He was now at the very height of his prestige, but his downfall was near at hand.

For a long time rumors had been current in political circles connecting the name of Parnell with that of the wife of Capt. W. H. O'Shea, formerly member of Parliament for Galway, and long an enthusiastic follower of Parnell. These rumors were confirmed when in 1889 Captain O'Shea applied for a divorce from his wife on the ground of adultery with Parnell. The case was tried in November, 1890, and, as no defense was made, the divorce was granted, and Parnell was condemned in costs. This decision proved fatal to his reputation and political power. His offer to resign the leadership of the Irish party was at first declined, but soon it became known that Gladstone had written to John Morley that the continuance of Parnell's leadership would be disastrous in the highest degree to the cause of Ireland, implying that Parnell could no longer have the support and coöperation of the English Liberals. After this letter had been made public it was supposed that Parnell would renew his offer to resign. As he resolutely refused to give up the leadership, he was deposed by a vote of his Parliamentary colleagues. The result was a division of the Irish party into Parnellites and Anti-Parnellites. The fallen leader now bitterly denounced both Gladstone and his own late colleagues who had turned against him. His appeal to the people, however, was answered by the defeat of three Parliamentary candidates whom he had nominated. Nevertheless, he struggled with desperate energy to recover his leadership till his health broke down completely, in September, 1891. In July of that year he had married Mrs. O'Shea, and on the 6th of October following he died.

Life of Parnell (Dublin, 1887); Clayden, *England Under Lord Beaconsfield* (London, 1880); *England Under the Coalition*, etc. (ib., 1892).

PARNELL, Henry Brooke, First Baron Congleton (1776-1842). A British politician, born in Ireland. He studied at Eton and at Trinity College, Cambridge, and in 1797 entered politics as a member of the Irish House of Commons. In 1802 he was elected to the British Parliament for Queen's County, which, with an interval of four years (1802-06), he continued to represent until 1832, when he declined to stand again. The next year he was elected from Dundee, which he continued to represent from that time until his elevation to the House of Lords as Baron Congleton of Congleton in 1841. He became Secretary of War in Lord Grey's Cabinet in 1831, but was dismissed the next year for refusing to support the Ministry on the Russo-Dutch War question. His chief interest was in financial and agrarian subjects, and in 1838 he strongly urged the abolition of the corn laws. He wrote a number of works, including *Observations Upon the State of Currency of Ireland* (1804; 3d ed. 1804); *An Historical Apology for the Irish Catholics* (1807); *Treatise on the Corn Trade and Agriculture* (1809); *On Financial Reform* (4th ed. 1832); and *A Treatise on Roads* (2d ed. 1838).

PARNELL, Thomas (1679-1718). An Anglo-Irish poet, born in Dublin. He graduated at Trinity College, Dublin, and was ordained deacon, though under the canonical age. In 1706 he was appointed Archdeacon of Clogher; in 1713, prebendary to Saint Patrick's Cathedral, Dublin; and in 1716, Vicar of Finglas. He contributed to the *Spectator* and *Guardian*, and was the associate of Swift, Pope, Arbuthnot, and Gay, in the 'Scriblerus Club.' On the fall of the Whig Government, near the close of Anne's reign, he went over to the Tories, and stood in high favor with the Oxford Administration. But his prospects of advancement from that quarter were destroyed by the overthrow of the Tories on the death of the Queen. His disappointment at not obtaining better promotion, and the death of his wife (1711), threw him into deep melancholy, and he is said to have hastened his death by intemperance. He died at Chester in October, 1718. Besides the occasional papers written for Addison and his share in *Scriblerus*, Parnell helped Pope in the translation of the *Iliad*, and contributed to the first volume an *Essay on the Life, Writings, and Learning of Homer* (1715). His poems were collected by Pope in 1721. The volume contains twenty poems, among which are *The Hermit*, *A Night Piece on Death*, and *A Hymn to Contentment*. On these poems Parnell's reputation chiefly rests as a fluent and graceful verse-maker in the manner of Pope. They also point forward to the next generation—to Collins and Goldsmith. In 1758 appeared the *Posthumous Works of Parnell*. The volume adds nothing to his fame. Consult the *Life of Parnell* by Goldsmith, and the edition of Parnell's poems by Aitken in the Aldine series (London, 1894).

PARNY, pär'nē'. Evariste Désiré Desforges, Vicomte de (1753-1814). A French poet, born in the Isle of Bourbon. In his childhood he went to Paris, became a soldier, and in 1773-75 he revisited his native land and there loved a Creole whose praises he sang in the *Poésies érotiques* (1778). His later epics have less literary merit. They are frivolous and obscene. Of these, *La guerre des dieux anciens et modernes* (1796) is characteristic. His *Works* were published at Paris in 1808 in five volumes. The latest edition of his *Poésies complètes* appeared in 1887.

PARODY (Lat. *parodia*, from Gk. *παρωδία*, parody, from *παρα*, *para*, beside, beyond + *ᾠδή*, *ōdē*, song, ode, from *ἀείδειν*, *aeidein*, *ᾄδειν*, *adein*, to sing). As understood by the Greeks in early times, a parody was a comic imitation of an epic poem or of some part of it. The rhapsodists, in reciting the *Iliad* or the *Odyssey*, were accustomed, it is said, to throw in humorous passages of their own, composed in the style and metre of the original, but on a trivial subject. From this use the term was extended to the comic imitation of any poem, and afterwards to the comic imitation of any variety of prose, such as history and fiction. Parody, like travesty, is a form of burlesque. The essence of burlesque is the treatment of a light theme in the style appropriate to a serious work. Such, for example, is Chaucer's *Nun's Priest's Tale*, wherein the hubbub caused by Master Reynard in the widow's household is described in language suggestive of the fall of Troy. The humor lies in the contrast between subject matter and the treatment of it. In the travesty, such as the clever *L'Enéide travestie* of Paul Scarron, the characters of the original are turned to a humorous account by some change in the incidents that results in a debasement of the original theme. In the parody, the theme and characters are greatly modified or completely changed, but the style of the original is closely followed in those peculiarities that easily lend themselves to ridicule.

Though the word parody has come to us from the Greeks, it is not to be supposed that they were the first people to feel the impulse toward this kind of satire. Parody belongs to the folk literature of many and perhaps all races. In very early literary stages, writers have laid hold of their legal and religious phrases for giving a humorous turn to the common affairs of life. All that can be said is that the parody as a distinct literary type of satire has been handed down from the Greeks, giving form to the folk parodies of the Western nations. The first Greek parodist, according to Aristotle, was Hegemon of Thasos (fifth century B.C.), who gained a prize at the Athenian games with his *Gigantomachia*, or *Battle of the Giants*. By others the invention of the form has been ascribed to Hipponax (fifth century B.C.). But these are doubtful traditions. At any rate, the best extant parody of the epic among the Greeks is *The Battle of the Frogs and the Mice*, running closely on the lines of a Homeric combat, and dating from the second or the third century before Christ. At a later period great renown was won, it is said, by a certain Œnonas, a Greek born in Italy, who burlesqued the public reciters of Homer by transforming Polyphemus into a sentimental lover, and by giving Ulysses the speech of the common people. The great master of parody was Aristophanes, into whose comedies were taken over whole passages of Euripides and many current phrases for the purpose of ridicule. Aristophanes was followed

by Lucian, who in *The Dialogues of the Gods* freely employed the language of Homer, and in *The True History* built up an extravagant romance on incidents from the *Iliad* and contemporary tales of adventure. That the Romans were fond of parody is known from Cicero, who in his *De Oratore* enumerates its several kinds. Catullus was a favorite with the parodist, and Vergil did not escape.

Among the Romans are found the first parodies of the legal testament, or will. It was a custom, as early as the time of Julius Cæsar, for men to satirize their enemies by sarcrilous remarks about them in their wills. Out of the practice seems to have grown the humorous testament, in which some animal, a pig or an ass, bequeaths at death his property or qualities to posterity. These animal testaments, of which the earliest one extant goes back to the third century of our era, spread through the Latin races, appearing in French, Spanish, and Portuguese during the early Renaissance. Akin to them are the many imaginary testaments written on various occasions in later times. A fine specimen is *The Will* by John Donne, the Elizabethan poet. Closely related to the humorous testament is also the parody on the epitaph, which goes back to the Middle Ages. This kind of satire is seen in its perfection in the *Ballade des pendus* of François Villon, composed in anticipation of the gallows. Indeed, both the Lesser and the Greater Testament of Villon are parodies so excellent in their kind as to form a type. Almost equally famous is Goldsmith's *Retaliation* on the imagined death of his friends, including Burke, Garrick, and Reynolds.

For centuries the most fruitful source of parody was the Bible and the liturgy of the Christian Church. This was, of course, in line with the work of Lucian, though it was at first in no direct way connected with him. From the twelfth century onward, increasing greatly during the Reformation period, flourished parodies of the mass, the creed, the litany, the paternoster, and prayers and hymns to the Virgin. They were sometimes written in Latin, and at other times in the vernacular speech. In *Cynthia's Revels*, Ben Jonson introduces a light parody of the litany; and Lord Somers, who framed the *Declaration of Rights*, parodied the first four chapters of Saint Matthew. In 1817 William Hone, a London author and bookseller, was prosecuted for publishing parodies on the litany, the Athanasian creed, and the catechism, which he had employed for political satire. These are but a few examples taken from a class numbering hundreds.

The purely literary parody, aiming at good-natured banter, though not unknown to the ancients, is mainly a modern development from the harsh invective of the earlier times. It has long been expected that a popular poet or novelist will have his peculiar style and way of viewing things held up to ridicule. So kindly is this ridicule that not even the most sensitive author can receive other than pleasurable emotions from it. Shakespeare amused his audiences with the rant of the contemporary drama and the euphuism of John Lyly, and evidently was not hurt when friends like Beaumont and Fletcher paid him in his own coin. In more than one instance Shakespeare even parodied himself. The bombast and nonsense of Dryden's tragedies received its just castigation in the Duke of Buckingham's *Rehearsal*. Among the parodies of Milton the *Splendid Shilling* of John Phillips (died 1707) is still reckoned the best, although the almost contemporary *Tunsonia Burn*, now easily accessible in the works of Lady Winchelsea (1903), is almost as good. Passing by Gray, Goldsmith, and Cowper, each of whom had his parodist, we come to the nineteenth century—the age *par excellence* of parody. The first romantic group of English poets, including, among others, Wordsworth, Keats, and Shelley, were especially exposed to ridicule. Then came Tennyson and Browning with marked mannerisms, and finally the so-called Pre-Raphaelites, like Rossetti, William Morris, and Swinburne, with their florid imaginations, distorted female figures, and unreal landscapes. There could be no finer material for the parodist. In their *Rejected Addresses* (1812) Horace and James Smith burlesqued deliciously Wordsworth, Southey, Byron, and Scott. Following in the line of the Smiths are R. H. Barham's *Ingoldsby Legends* and the *Bon Gaultier Ballads*, the joint work of W. E. Aytoun and Theodore Martin. Among other clever verse-parodists were Thomas Hood, W. M. Thackeray, C. S. Calverley, Lewis Carroll, Sir Frederick Pollock, J. K. Stephen, and the numerous contributors to *Punch*, who have closely watched for absurdities of sentiment and style. From this list should be selected Calverley as undoubtedly the most felicitous parodist in the whole range of English literature. Especially successful was he in imitating Tennyson's *Brook* and Browning's *Rosny and the Rook* in *The Wanderers* and *The Cock and the Bull*. And the eccentricities of the Pre-Raphaelites are finely exaggerated in the *Ballad*.

The English novel began its career with parody. Richardson had no sooner published *Pamela* than humorous continuations were placed upon the market. All of them are now forgotten except Fielding's *Joseph Andrews*, which begins with ridicule of Richardson's point of view and a close parody of his epistolary style. Sterne was likewise the sport of a score of humorists. Before publishing *Vanity Fair*, Thackeray paid his compliments to Bulwer, Disraeli, Lever, and G. P. R. James, and afterwards to Scott. The mine opened by Thackeray in these *Burlesques* was further worked by Bret Harte in two series of *Condensed Novels* dealing with the older novelists, and Mrs. Humphry Ward, Anthony Hope, Conan Doyle, Hall Caine, and Kipling. In like manner Owen Seaman in *Borrowed Plumes* (1902) burlesqued Mrs. Craigie, Miss Fowler, Marie Corelli, George Meredith, Maurice Hewlett, Henry James, and other novelists of the day.

Parody has been considerably cultivated by American writers with at least fair success. Of colonial parodists the most important is doubtless Joseph Green of Boston, the witty rival of Mather Byles, the punning parson. The Revolutionary satirists naturally made use of parody, a good illustration being John Witherspoon's parody of the *Petition* of Rivington, the Tory printer. After the Revolution the 'Hartford Wits' essayed parody and the mock-heroic in *The Echo* and *The Anarchiad*. The absurdities of the Della Cruscans and the pretensions of the new Democratic-Republican Party furnished materials to parodists and satirists, but the first

elaborate parody of real consequence, Irving's *Knickerbocker's History of New York*, changed under its author's hands into a masterpiece of humorous narration. With the next generation came authors original enough to be parodied not only in America, but in England; for example, Willis, Longfellow, and Poe. It was even found worth while to parody, in a volume modeled on the *Rejected Addresses*, versifiers whose names are now scarcely remembered. The Civil War gave an impetus to the writing of parodies. Some clever ones are to be found in the works of professed humorists like D. R. Locke ("Petroleum V. Nasby") and R. H. Newell ("Orpheus C. Kerr"), but the most important and sustained is Richard Grant White's *New Gospel of Peace*. Of recent years Walt Whitman is naturally the writer who has best lent himself to parody. Bret Harte (q.v.) and Bayard Taylor, in *The Echo Club and Other Literary Diversions*, are probably the most important writers of parody with regard to both quantity and quality. For the early history, consult, with its bibliography, Delepierre, *Essai sur la parodie* (London, 1871). A popular history of parody with examples from modern literature is given by Martin in *On Parody* (New York, 1896). For a larger collection, consult Hamilton, *Parodies of the Works of English and American Authors* (London, 1884-89). Some good specimens of recent verse-parody may also be found in Miles, *The Poets and Poetry of the Century*, vol. ix. (ib., 1897), and in other anthologies. See also the articles on the writers here mentioned, and the article on BURLESQUE.

PAROLE (Fr. *parole*, word, from Lat. *parabola*, comparison, speech, parable). When a military or naval officer is released from close confinement, or allowed any extraordinary privilege on the sole security of his word of honor, he is said to be on parole. On guard, or any other post, where precautions against an enemy are necessary, a certain word is previously agreed upon, which is known only to the officers of the guard and of the day, and such other officers as for special reasons may be intrusted with it. It differs from the countersign (q.v.) in that the latter is given to all sentries and men of the guard, while the parole is confided entirely to officers of the guard and those in similar authority.

PAROQUET. See PARRAKEET.

PA'ROS (Lat., from Gk. Πάρος). An island of the Cyclades, in the Grecian Archipelago. It is situated west of Naxos, from which it is separated by a channel from four to six miles wide. Greatest length, fifteen miles; greatest breadth, nine miles; area, about ninety-five square miles. Population, in 1896, 7740. The island is chiefly a mountain mass, rising in the centre in the ancient Marpessa, now Mount Saint Elias, to a height of nearly 2500 feet. In the valleys the vine and grain are cultivated, but the chief importance of the island in ancient times was due to the marble, and especially the highly esteemed *Lychnites*, which was much sought by sculptors. Parikia, on the west coast, on the site of the ancient Paros, is the principal town. Ancient tradition attributed the early colonization of the island to Cretans, who called it Minoa; later it was settled by Ionians. It early enjoyed prosperity from its marble and its numerous sculptors. Later it submitted to Persia, and was unsuccessfully attacked by Miltiades after the battle of Marathon. After the Persian wars it joined the Delian League, and shared the fortunes of the neighboring islands. Like other Cyclades, it passed under the rule of the Ptolemies of Egypt, and in B.C. 197 was presented to the Athenians by Rome. Since then it can scarcely be said to have had a separate history. It was celebrated in literature as the native place of the poet Archilochus, and is also known from the discovery of the famous Parian Chronicle. See ARUNDEL MARBLES.

PAROTID GLAND. See SALIVARY GLAND.

PARQUETRY (Fr., inlaid flooring, from *parqueter*, to floor with small pieces of wood, from *parquet*, inlaid floor, diminutive of *parc*, inclosure, park). A kind of wood mosaic used for flooring and sometimes for wainscoting or furniture. In the more elaborate kinds of parquetry, veneers are used, but it is much more generally composed of blocks of wood often of different colors, laid down so as to combine and form a geometric pattern. The patterns are usually bounded by straight lines. The pieces are laid flush and flat on the upper surface. For this purpose the edges are usually grooved so as to fit snugly into each other, though other methods of laying are also followed.

PARR (so called probably from the parr-marks or cross-bars on the sides). A young salmon before its first migration to the sea, and when its sides still show indistinct bars. Compare SMOLT; see SALMON.

PARR, CATHARINE (1512-48). The sixth and last Queen of Henry VIII. of England. She was the daughter of Sir Thomas Parr, of Vendal, Westmoreland. Married first to Lord Burgh, and afterwards to Lord Latimer, she was wedded, not without misgivings, to Henry VIII., on July 12, 1543. She was distinguished for her learning and knowledge of religious subjects. Her influence was for good; she persuaded Henry to restore the right of succession to his daughters; wished to educate them and Prince Edward, and interested herself on behalf of the universities. In 1544, during the absence of Henry at the siege of Boulogne, she acted as Regent of the kingdom. After Henry's death she married (1547) Sir Thomas Seymour, and died after childbirth the following year.

PARR, Mrs. LOUISA (maiden name TAYLOR) (c.1848?—). An English novelist, born in London. She passed her early life in Cornwall. Marrying a physician in 1869, she settled at Kensington. Before this she had written a story entitled *How It All Happened* (in *Good Words*, 1868). This graceful story, translated into French, appeared also in the *Journal des Débats*. Her first three-volume novel, *Dorothy Fox* (1870), was well received. But she first gained her audience with *Adam and Eve* (1880), which depicted with faithfulness the quaint fishing village of Polperro in Cornwall. Among subsequent novels are *Loyalty George* (1888); *The Squire* (1892); and *Can This Be Love?* (1896).

PARR, SAMUEL (1747-1825). A once notable English scholar, born at Harrow-on-the-Hill. He was sent to Emanuel College, Cambridge,

in 1765; but the death of his father, two years afterwards, compelled him to withdraw and to accept an assistant-mastership at Harrow, where he remained five years. In 1776 he was appointed master of Colchester School, where he was ordained priest, and obtained the curacies of Hythe and Trinity Church. Next year he became master of Norwich School; but in 1786 settled at Hatton in Warwickshire, where he spent the rest of his life. In 1787 he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity. Parr was a man of vast learning, but his scholarship was not of high order. Consult De Quincey's essay, *Dr. Samuel Parr on Whiggism in Its Relations to Literature*.

PARR, THOMAS (c.1483-c.1635). An English centenarian, known as 'Old Parr.' In 1635 he was brought by the Earl of Arundel to London and presented at Court as then 152 years of age. He was long a favorite chap-book character, but assertions of his extreme age have been investigated and contradicted by W. J. Thoms and Sir G. C. Lewis. The chief source of information concerning Parr is a curious pamphlet by John Taylor, entitled *The Olde, Olde, Very Olde Man* (1635).

PARRAKEET (Fr. *perroquet*, from Sp. *periquito*, diminutive of *perico*, parrot, from *Pedro*, Lat. *Petrus*, Gk. Πέτρος, Peter, from πέτρος, rock; also explained as from It. *parrochetto*, diminutive of *parocco*, parish priest, jestingly applied to the bird). Any of many small kinds of parrots, especially the long-tailed East Indian and Australian species of the genus Palæornis and its allies. The American parrakeets are chiefly of the genus Conurus, one species of which is found within the limits of the United States, and not elsewhere. At the beginning of the nineteenth century the Carolina parrakeet (*Conurus Carolinensis*) was found throughout the Eastern and Central United States as far north as Nebraska, Wisconsin, and central New York. It was not merely a summer visitor, but occurred also in winter, so that it was remarkably hardy for a parrot. At the beginning of the twentieth century the species was almost extinct, and survived only in the most inaccessible parts of Florida and Indian Territory. It is a beautiful bird, and also noisy, gregarious, and tame, so that it has been an easy victim. It is a trifle more than a foot long, bright green in color, with the head and neck yellow, forehead, cheek, and bend of wings orange. It feeds on seeds, nuts, and so on, and is very destructive to fruit. On account of the damage it did in orchards, it was ruthlessly killed in early days. Its nesting habits have never been authentically described, and there is some dispute as to whether its eggs are laid in a hole in a tree as is customary with parrots. One of the most beautiful groups, combining gracefulness of form with splendor of plumage, is that to which the Alexandrina or ring parrakeet (*Palæornis Alexandri*) belongs. It is about the size of a common pigeon, green, with a red collar, and is a native of the East Indies. It is said to have been brought to Europe by Alexander the Great's expedition to India, and to have been the first parrot known to the Greeks and Romans, by whom it was highly prized, as it still is, not only for its beauty, but for its docility and its power of imitating human speech. Immense flocks live in some of the cocoanut groves of Western Ceylon, and fill the air with deafening screams. The ring parrakeet has many congeners, natives chiefly of the East Indies, which exhibit much variety of splendid plumage, among which the East Indian rose-ringed *Palæornis torquatus* is one of the most familiar; its general color is green, the neck of the male ornamented with a rose-red, black-edged collar.

Much like them in length and form of tail, but with longer and stronger legs, is the small ground-parrakeet (*Pezoporus formosus*) of Australia and Tasmania. This bird inhabits thickets and runs much on the ground, but occasionally takes a short low flight. It makes no nest, but lays its eggs in a hole in the ground. Its colors, dark green above, and yellowish below, are less brilliant than in many of the parrot tribe, but the bird is finely marked and mottled. Its flesh has a very strong game flavor. There are numerous other Australian species, distributed in several genera, some of which exhibit great splendor of plumage. Most familiar is the grass, shell, or zebra parrakeet (*Melopsittacus undulatus*), a very beautiful little bird, which has long been one of the favorite cage-birds in all parts of the world, and often sells under the dealers' name 'budgerigar' (q.v.). It is small, slender, and long-tailed. It has a yellow head, with three black cheek-spots surmounted by a blue patch; the back is yellow with black transverse markings; the wing-quills brown with green outer webs and yellow margins; the rump and under parts green, the tail green, bounded with yellow, but with the two central quills blue. (For illustration see Plate of PARROTS.) In the vast inland plains of Australia this parrakeet is to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small 'grass parrakeets,' such as those of the genus Euphema.

PARRAL, pär-räl', or HIDALGO DEL PARRAL. A city of the State of Chihuahua, Mexico, situated on the Parral, 120 miles south of Chihuahua (Map: Mexico, F 4). The town possesses very old and productive silver mines that are now in the hands of Americans. It is in the midst of the wine-making district of Mexico, and is noted for its fine aguardiente. A United States consular agent is stationed here. Population, 6000.

PARRAMATTA, pär'ä-mät'tä, or **PARAMATTA**. A town of New South Wales, Australia, pleasantly situated near the western extremity of Port Jackson, on a small river of the same name, 14 miles west of Sydney, with which it is connected by steamer and railway (Map: New South Wales, F 3). The houses are mostly detached, and the streets are wide and regular, the principal one being about a mile in length. It is the centre of an extensive fruit-growing district, and has important manufactures of 'colonial tweeds,' 'Parramatta cloths,' and salt. The great reservoir of the Sydney water-works is located here. Formerly called Rosehill, Parramatta is, with the exception of Sydney, the oldest town in Aus-

tralia. The first grain raised in the colony was grown here, and the first grants of land made. Population, in 1891, 11,700; in 1901, 12,568.

PARRAS DE LA FUENTE, pär'räs dā lā fwān'ta. A town of the State of Coahuila, Mexico, situated near the east shore of Lake Parras (Map: Mexico, H 5). The town lies in a fertile valley, and is surrounded by orchards and vineyards. Its chief manufactures are wines and brandies, for which the town is celebrated. Population, in 1895, 8326.

PAR'RATT, WALTER (1841—). An English organist and conductor, born at Huddersfield. His first organ appointment was near Huddersfield (age eleven). The next year he was appointed organist of Saint Peter's Church, London, and studied with George Cooper. He also occasionally accompanied an anthem at the service in Saint Paul's Cathedral. In 1854 he returned to Huddersfield, where he was in great request for organ recitals throughout the north of England. In 1861 he accepted an appointment at Worcester, where he was also private organist to the Earl of Dudley. In 1872 he became organist of Magdalen College, Oxford. On the retirement of Sir George Elvey as the organist of Saint George's Chapel, he was appointed to fill the vacant position. He was knighted by the Queen in 1892, and received the appointment of private organist to Her Majesty, and the following year became master of the Queen's music, continuing those offices under King Edward VII. He is more famous for his work in that direction than for his compositions, which latter, however, while not numerous, are of a high order of merit. They include music to the *Story of Orestes*, many anthems and services, and a few songs. He edited *Madrigals* for the Bach Choir, and *Choral Songs by Various Writers and Composers* (1889), and contributed ten important articles to Grove's *Dictionary of Music and Musicians* (1879-89).

PARRHA'SIUS (Lat., from Gk. Παρράσιος). One of the greatest painters of ancient Greece, the son of Evenor, himself an artist. He was a native of Ephesus, but, like his elder contemporary Zeuxis, practiced his profession in many places, and seems to have received Athenian citizenship as a reward for his picture of Theseus, since later writers sometimes call him an Athenian. He lived near the end of the fifth century B.C., but exact dates are not known. Certainly apocryphal is the story of Seneca that for his painting of Prometheus he tortured a captive from Olynthus, as the artist could scarcely have been living at so late a date (B.C. 347) if he were a celebrated painter during the lifetime of Socrates, over fifty years before. (Cf. Xenophon, *Memorabilia* iii. 10.) His art is known to us only from ancient criticism, and chiefly from a passage in Pliny, *Hist. Nat.*, xxxv., 67, where he is praised as the first to introduce accurate proportions into painting, and as especially successful in his drawing and rendering of contours. It seems that he was the first successfully to employ light and shade in such a way as to suggest the round, as distinguished from the relief. His painting of the Athenian Democracy (*Demos*) was held to express in a wonderful way the variety of disposition which marked that very variable person. Other works of his were a "Hermes," believed to be his own portrait; a "Heracles," which claimed to show the hero as he had appeared to the artist in a dream; a "Naval Commander in Full Armor"; "Ulysses Feigning Madness"; "Æneas, Castor, and Pollux"; "Dionysus and Virtue"; "Meleager, Heracles, and Perseus"; "Thracian Nurse with a Child in Her Arms"; "Priest with a Child Bearing Incense"; "Two Boys"; "Healing of Telephus"; "Contest for the Armor of Achilles"; "Philoctetes on Lemnos"; and others. For recreation he is said to have painted licentious little pictures, one of which, "Meleager and Atalanta," was a great favorite of the Emperor Tiberius, who chose it rather than a million sesterces.

PARRICIDE (Lat. *parricida*, OLat. *paricidus*, murderer of his parent, of a magistrate, or of a free citizen, assassin, probably from *par*, equal + *cædere*, to kill; associated in popular etymology with *pater*, father). One who kills his father, or a man who stands in the place of a father, as a father through adoption. The term is derived from the Roman law, where the crime of *parricidium* included the murder of many near relatives besides the father, as a grandfather, son, brother, sister, and others. By the *lex Pompeia de Parricidiis* (B.C. 52), the murder of an ascendant, as a father or grandfather, or a son, was punished in most severe manner, the parricide being sewed up in a leather sack, along with a live dog, viper, cock, and ape, and cast into the sea or a near-by river. In England and the United States the punishment of a parricide does not differ from that of a murderer of a stranger. See MURDER. Consult the authorities referred to under CRIMINAL LAW; CIVIL LAW.

PAR'RIS, SAMUEL (1653-1720). A New England clergyman. He was born in London, went in youth to Massachusetts, and studied at Harvard College, but did not graduate. After being a successful merchant in Boston, he entered the ministry, and was pastor of the church at Danvers, Mass. (then a part of Salem), in 1689-96. He is remembered from the fact that the delusion of Salem witchcraft originated in his family in 1692, his daughter and his niece accusing Tituba, a South African slave living as a servant in the family, with bewitching them. Mr. Parris beat her and compelled her to confess herself a witch. The delusion and persecution thus commenced lasted sixteen months. Mr. Parris having been a zealous prosecutor in the witchcraft cases, his church brought charges against him. He acknowledged his error, but was dismissed. He preached afterwards at Stow, Concord, and Dunstable. Consult his *Life* by Fowler (Salem, 1857).

PAR'RISH, EDWARD (1822-72). An American pharmacist, born in Philadelphia, and member of a distinguished family of physicians. He was principal of the Philadelphia School of Pharmacy, where he became professor of materia medica in 1864. He is best known through a non-official preparation, the compound syrup of phosphate of iron, popularly known as Parrish's chemical food. He published *Practical Pharmacy* (Philadelphia, 1856; 5th ed. 1884); *The Phantom Bouquet* (Philadelphia, 1863); and

1 LESSER LEMON CRESTED COCKATOO (CACATUA SULPHUREA) ½ NATURAL SIZE
2 PENNANT'S OR BLUE-TAILED PARRAKEET (PLATYCERCUS PENNANTI)
3 GRAY-HEADED MADAGASCAR LOVE BIRDS (AGAPORNIS CANA)
4 FORBES'S ... PARRAKEET ...

Education in the Society of Friends (Philadelphia, 1866).

PARRISH, Maxfield (1870—). An American painter and illustrator, born in Philadelphia. He was a pupil of the Pennsylvania Academy of Fine Arts, and of Howard Pyle. He became widely known by his decorative posters and designs for magazine covers. His work is usually in the flat tints used by a number of the modern illustrators, and is remarkable for strong, delicate line, clever gradation of tone, and the rich detail of the background. His illustrations, which include those for *The Golden Age* of Kenneth Grahame, *Mother Goose in Prose*, and *Knickerbocker's History of New York*, are full of charm and humor. Among his paintings are "The Sandman" and "The Bulletin Board." He became a member of the Society of American Artists in 1897, and received honorable mention at the Paris Exposition of 1900.

PARRISH, Stephen (1846—). An American landscape painter and etcher, born in Philadelphia, Pa. He first exhibited at the Pennsylvania Academy in 1878, and a year afterwards at the National Academy in New York City. Among his pictures are "Low Tide," "In Winter Quarters," "Evening," and "The Road to Perry's Peak." His subjects are usually large, open expanses of country—often winter scenes—treated with much poetic feeling. His etchings include the series of plates, "Cape Ann to Marblehead," and many other American seaboard scenes.

PARROCEL, pȧ'rō'sĕl'. A family of French painters, the first of whom was Barthélemy (c.1600-c.60), a painter of religious subjects. The most important was Joseph (1646-1704), the battle painter, born at Brignolles. He studied under his father and elder brother, Louis, and afterwards was the pupil of Le Bourguignon in Rome. He was made a member of the Academy in 1676, his reception picture being "Louis XIV. Repulsing a Sortie of the Maestricht Garrison" (Louvre). He is said to have known nothing of actual soldiering, but he had a vigorous brush and considerable skill in composition. There are also pictures by him at Versailles, and in Notre Dame and the Invalides, Paris. He left several etchings after his own designs, which include forty-eight scenes from the life of Christ. Other painters of this name were his son Charles (1688-1752), a battle painter; his nephew, Pierre (1670-1739), whose subjects were mostly religious; and Ignace François (1704-81), son and pupil of Pierre, an historical and genre painter.

PARROQUET. An alternative spelling for 'parrakeet' (q.v.). In the United States the group is represented by the Carolina parroquet or parrakeet.

PARROT (probably from Fr. *Perrot*, *Pierrot*, diminutive of *Pierre*, Peter). A bird of the group Psittaci, which is related to the cuckoos and plantain-eaters, and includes two families, the Psittacidæ and Trichoglossidæ, together numbering about 500 species. Most of them are natives of the tropics, and especially of the Australian and Malayan regions, and about 100 species occur in New Guinea alone. South America has about 150 species, and Africa and Southern Asia the remainder. Few inhabit or even enter the temperate zone, the most northerly one, perhaps, being the now nearly extinct Carolina parrakeet (q.v.) of the United States. The determining feature in the family is the beak, which is short, stout, and greatly arched, the upper mandible hooking over the lower, and movably hinged to the skull. The feet are short and strong, and the toes are two before and two behind. The wings are likely to be rather short and in some groups rounded; and the tail may be short and broad as in the true parrots, or very long and pointed, as in the parrakeets, noticeably broad in others, and so on. Most parrots are gaudily colored, but some are soberly clad; and there is likely to be a crest very prominent in the cockatoos and less so in some others—or other modifications of the feathers of the head, as in the facial disks of the owl parrots or kakapos (q.v.). The sexes are usually much alike.

Most parrots are forest-birds, although a few are of terrestrial habits and are styled ground-parrots, and a few others, like the grass-parrakeets, inhabit grassy or bushy plains. As a rule, also, they are gregarious, and many species go in large flocks. Their food with few exceptions is vegetable—plantains, papaw-apples, figs, and tamarinds being varied by flowers, buds, leaves, palm-nuts, and other hard fruits, grass-seeds, and grain. This supplies so much moisture that little drinking seems necessary. Exceptional foods are the bulbs and tubers for which cockatoos dig, while some species search the bark of trees for insects, or extract honey and insects from flowers with their brush-tipped tongues. (See Lory.) Lastly, the kaka (q.v.) has acquired a taste for flesh. They gather this food by climbing about the branches like the nimblest of acrobats, using their beaks freely in support of their bodies, and manipulating their food with their claws as no other bird ever does.

The voices of parrots as a rule are harsh, and the great macaws and cockatoos scream most discordantly. Some, however, utter low and sweet twittering notes. Many have great facility in imitating other sounds or human speech, and some learn to articulate words and phrases with much distinctness, if given patient training. There is a popular notion that this process may be aided by slitting the tongue, a practice as useless and foolish as it is barbarous. It is not certain that the tongue has anything more to do with the enunciation of parrots than in the case of other birds, where it plays no part in utterance. The tongue is always large, round, and fleshy. In the subfamily Nestorina (the kakas) it is fringed; and in lories it has a brush of hairs toward the tip.

The typical, and perhaps the best-known, parrot is the African gray parrot (*Psittacus erithacus*) of equatorial Africa, which is ashy gray, with black wing-quills, a red tail, and whitish, naked face. It is in high esteem among most of the African tribes, who rear it from the nest as a house pet, enjoy its flesh, and seek its feathers as ornaments, some setting apart the red tail feathers for their chiefs as insignia of rank. Long ago these parrots were carried to Europe, and afterwards to all parts of the world, and have shown themselves not only hardy, long-lived, and affectionate, but the clearest talkers of the whole tribe. A closely allied but much darker West African species is made

to talk at all. In their native wilds these parrots go about in flocks during the day, and return at night to certain 'roosts.' They eat various fruits and nuts, especially palm-nuts. They breed in holes in trees, often in companies, and aid one another in defending their homes. All parrots nest in holes in trees except a few aberrant ones, like some in New Zealand, which lay their eggs in holes or hollows of the ground or among rocks. All lay white eggs. Fossil representatives of this tribe carry its history back to the Lower Miocene Age.

Bibliography. The latest monographer of the parrot family is Count Salvadori. For his papers and those of other systematic ornithologists, consult Newton, *Dictionary of Birds* (New York, 1893); also Evans, *Birds* (ib., 1900). For descriptions and treatment of these birds as pets, consult Greene, *Parrots in Captivity* (London, 1884), three royal octavo volumes with colored plates.

See Plates of Parrots, Cockatoos and Macaws.

PARROT-FISH, or Loro. Any of many species of the family Scaridæ, particularly of the genus Scarus. The form is oblong and massive, with large scales. They are fishes of brilliant colors in general, and some have wonderful splendor, and have received their name partly on this account and partly on account of a fancied resemblance in their jaws to a parrot's bill. They are mostly herbivorous, some feeding on corals, and are not good food fishes. Most of them are natives of the tropical seas. One species in the Mediterranean (*Scarus Creticus*) is the 'scarus' of the ancients, about which many wonderful stories were told as to its love, its wisdom, its ruminating, etc. Several species inhabit tropical American waters, and are known in the West Indies as 'loros,' 'viejas' (i.e. old wife), 'guacamaias,' etc.

PAR'ROTT, Robert Parker (1804-77). An American soldier and inventor of ordnance, born at Lee, N. H. He graduated at West Point in 1824, and was assigned to the artillery. Until 1829 he remained at the Military Academy as an instructor, then performed garrison duty for several years, and in 1836 took part in the operations against the Creeks. He was promoted to be captain on January 13th of that year, but resigned from the service in the following October to become superintendent of the West Point Iron and Cannon Foundry at Cold Spring, N. Y., a position which he held until 1867. While there he invented the famous Parrott cannon used by the Federal Army and Navy during the Civil War. Captain Parrott was first judge of the Court of Common Pleas in Putnam County from 1843 to 1847, and was superintendent of schools at Phillipstown from 1848 until 1856. For a description of the Parrott gun, see Ordnance.

PAR'RY, Charles Christopher (1823-90). An American botanist, born in Worcestershire, England. He was educated at Union College, and afterwards practiced medicine in Davenport, Iowa. His study of the botany of the district resulted in his appointment to the geological survey of the Northwest (1848), then to the survey of the Mexican boundary (1849-52), and he was successively botanist to the Pacific Railroad survey of the 35th parallel and to the Department of Agriculture from 1867 to 1871. His publications include: *Botanical Observations in Western Wyoming* (1874); *Botanical Observations in Southern Utah* (1875); *Revision of the United States Pacific Coast Species of Arctostaphylos* (1883); *Revision of the Genus Chorizanthe* (1884); and *The North American Genus Ceanothus* (1888).

PARRY, Charles Hubert Hastings (1848—). An English composer, born at Bournemouth. At the age of seven he was sent to a private school at Malvern. His earliest attempts at music, in the form of chants and hymn-tunes, date from this time. In 1860 he was sent to Twyford School, and took lessons from the village organist; while there he came under the influence of Samuel Sebastian Wesley, the organist of Winchester Cathedral. In 1861 he entered Eton. He studied composition under Elvey and often acted as composer, organist, or vocalist for the musical society of the college. In 1867 he entered Exeter College, Oxford, where he came under the notice of Sir John Stainer, and became the founder of the University Music Club. He obtained in 1874 his degree of master of arts, and took advanced study in music under Bennett and MacFarren, together with an extended course under Dannreuther. Upon leaving Oxford he was anxious to adopt the profession of music, but his family opposed the plan. After three years in a business house, however, he devoted himself entirely to music. His first success as composer was with his *Intermezzo Religioso* (1868). Other compositions include: *Prometheus Unbound* (1880); *Symphony No. 1 in G* (1882); *The Glories of Our Blood and State* (1883); the oratorio *Judith* (1888); *Ode on Saint Cecilia's Day* (1889); *The Lotus Eaters* (1892); and *Hypatia* (1893). He was appointed Choragus of Oxford University in 1883, and in the same year was granted the degree of musical doctor by Cambridge, followed in 1884 by Oxford, and in 1891, by Dublin. He was appointed director of the Royal College of Music in 1894, and was made a knight by Queen Victoria in 1898.

PARRY, Sir William Edward (1790-1855). A British Arctic explorer and naval officer, born at Bath, on December 19, 1790. He joined the British Navy as midshipman in 1806, rose to the rank of rear-admiral, was in the hydrographic service from 1823 to 1829, and retired from the navy in 1852. He is best known as an Arctic explorer. In command of the ships *Griper* and *Hecla* he left England in 1819 to seek the Northwest Passage. He passed up Baffin Bay, explored and named Barrow Strait, Prince Regent's Inlet, and Wellington Channel, and reached Melville Island in September of that year, having crossed longitude 110° W., thereby winning a reward of £5000 offered by Parliament. He returned to England in November, 1820, and published a narrative of his expedition. He sailed again in 1821 with the *Fury* and *Hecla* to make the Northwest Passage, and reached Repulse Bay, which he proved to be land-locked instead of a strait leading to the west as was supposed. He wintered on Melville Peninsula, where he made a study of the Eskimos, discovered Hecla and Fury Strait the next summer, but was baffled by ice and compelled to spend the succeeding winter at the east entrance to Hecla and Fury Strait. The expedition underwent many hard-

ships and was so enfeebled in the following summer that it was compelled to return to England, where it arrived in October, 1823. In May, 1824, Parry left with the same ships to make another attempt to discover the long-sought passage, but after a winter in the ice and the loss of the *Fury*, the expedition returned home in October, 1825. Parry then obtained the Admiralty's consent to attempt to reach the North Pole by the Spitzbergen route. He sailed on the *Hecla* for Spitzbergen in May, 1827, left his ship in Truenberg Bay on June 21st, and started for the north with two boats, fitted with steel runners to serve as sledges, 28 men, and supplies for 71 days. The advance was extremely difficult, the party exchanging from floe ice to water several times each day, and the southward drift of the ice deprived Parry of many of his hard-won miles to the north. The highest point attained was in latitude 82° 45′ N., which secured for England a new record of highest latitude and remained the highest north for forty-eight years. Parry died on July 8, 1855, after serving two years as governor of Greenwich Hospital. His best-known books are *Journal of a Second Voyage for the Discovery of the Northwest Passage*, which appeared in 1824, and *Narrative of an Attempt to Reach the North Pole in Boats* (1827).

PAR'RY ISLANDS. A group of large islands in the Arctic archipelago of North America, lying chiefly north of the 75th parallel of latitude (Map: America, North, G 2). The chain extends westward from Baffin's Bay, south of Ellesmere Land, being bounded on the south by Lancaster and Melville sounds. The principal members of the group are North Devon, Grinnell Land, and Cornwallis, Bathurst, Melville, and Prince Patrick islands. All the islands are irregular in outline, with numerous fiords and headlands. The coasts are rocky and steep, while the interior is covered with glaciers. They are uninhabited, and their vegetation is very scanty, though sufficient in summer to support herds of reindeer and musk-oxen. One of the earliest explorers of the group was Parry, who wintered on Melville Island in 1819. The discoveries in these regions, however, were mainly accomplished during the search for Sir John Franklin.

PARSIFAL, pär'sē-făl. A festival music-drama by Richard Wagner. The outline of the music was finished in 1879, the orchestration in 1882, and the first performance was given in Bayreuth, July 26, 1882. The story is based upon the Arthurian legend of Perceval and the Holy Grail, and particularly on the metrical version by Wolfram von Eschenbach. (See PERCEVAL.) The scene is in or near the Castle of the Holy Grail (Monsalvat, Spain). The principal characters are: Parsifal; Amfortas, who has been one of the Knights of the Grail, but who has lost the Holy Spear, been wounded by it, and has fallen into the power of Klingsor, a magician hostile to the knights; and Kundry, one of the beautiful women through whom Klingsor hopes to gain authority over the knights (as he has over Amfortas) by tempting them to break their vows of chastity. In the first act the inexperienced Parsifal is brought to the castle by one of the knights, witnesses the adoration of the Grail, but does not appreciate its significance, and is cast out by the knights. In the second act Parsifal withstands Klingsor's various attempts to overcome him, even Kundry is unsuccessful, and he finally wins from the magician the Holy Spear and starts on his search for the Castle of the Grail, whose importance he now realizes. In the third act, after a lapse of many years, Parsifal meets Kundry and one of the knights. Kundry has repented, and after baptizing her Parsifal is led by the knight to the castle. There he heals the old wound of Amfortas by touching it with the Holy Spear (the only possible cure); Kundry dies in happiness, and Parsifal is hailed as King of the Knights of the Grail. See the article WAGNER, RICHARD.

PARSIMONY (Lat. *parsimonia*, *parcimonia*, frugality, from *parcere*, to be frugal, to spare; connected with *parcus*). THE LAW OF. The statement in explicit terms of the demand of thought that principles of explanation should not be unnecessarily multiplied.

PARSIS, pär'sēz, or **PARSEES** (Pers., Hind. *Pārsī*, Persian, fire-worshipers). The modern Zoroastrians, especially in India, where, in 1901, they numbered 94,190. Less than a hundred years after the Arab invasion in the seventh century, and the fall of the Iranian kingdom and faith, a considerable number of Zoroastrians left Persia to gain greater religious liberty, and moved as a community with their priests down to the city of Ormuz, on the Persian Gulf. After residing there some fifteen years, they determined to seek the shores of India, and they landed first on the island of Diu, off the coast of Kattiawar. Here they remained for nineteen years until circumstances brought them farther south. They landed in 716 at Sanjan, some distance to the north of the modern Bombay, and settled among the Hindus, after complying with certain simple regulations. In 775 a second band seems to have joined these pioneers, and together they formed a community, which flourished for more than five hundred years. In 1465 the Mohammedans who were invading India attacked the Parsis of Sanjan, who had made an alliance with their Hindu protectors. The allies were defeated, Sanjan was destroyed, and the Parsis were forced to seek refuge in the Bharbut hills, where they kept alive their sacred fire and preserved their ancient rites. In the sixteenth and seventeenth centuries the Zoroastrians spread quite widely through Gujarat, settling in Surat, Navsari, Bombay, and other places. The Parsi settlement in Bombay began as early as the time of the Portuguese occupation (1530-1661). The Bombay Presidency has remained the centre of the Parsi population of India, although representatives of the community are to be found as far northward as Peshawar, as far east as Calcutta, and as far to the south as Madras, or even Ceylon. Almost all the Parsis are well to do, and a large proportion of them wealthy. They are often called the Jews of the East.

The Parsis have in general remained faithful to the tenets of their ancient creed. But in consequence of emigration from Persia, and because also of their contact with the Hindus and others, some changes have crept into their customs. Nor have they kept free from sectarian controversy. As early as 1680 there is evidence of a vigorous dispute as to supremacy of position, between

the priests of Navsari and the original clerical leaders of Sanjan. Early in the eighteenth century another dispute arose with regard to the dating of the calendar, which in India gradually fell a month behind the Persian Zoroastrian calendar, because of failure properly to introduce the intercalary month. This resulted in dividing the Parsi community into two sects, Shenshahis and Kadmis. The Shenshahis adhered to their customary Indian reckoning of months, without the intercalation, but the Kadmis adopted the Persian reckoning with the month duly inserted; thus the Shenshahi calendar remains still a month behind the Kadmi. They are generally united on the main tenets with regard to their god Ormazd (q.v.), their prophet Zarathushtra (see ZOROASTER), and a belief in angels and archangels. They follow the same general rites, feasts, fasts, manners, and customs. In theology they are strongly monotheistic today. At present, however, a belief in the resurrection of the body seems less pronounced among them than their sacred texts would appear to warrant. As to the doctrine of spiritual authority, the infallibility of their Dasturs is unhesitatingly questioned by the less strict conformists, but all unite in acknowledging the religious leadership of those priestly heads.

If we may judge from the old Greek accounts of the Persian faith, the Parsis, from time immemorial, have kept up the idea of ceremonial purification. Scrupulous care is taken to preserve the elements, earth, fire, and water, from defilement, especially from dead matter. Nor would a strictly orthodox Parsi to-day spit into the fire or blow out a light, any more than in the days of Cyrus, although in practical matters they often have to make concessions, and Parsis may even serve in the fire department of Bombay. Many who are less strict have taken to smoking tobacco, although this is not in keeping with the tenets of their faith. To the designation 'Fire-worshipers,' which is so often applied to them, they strongly object, for their religion teaches the presence of Ormazd behind the fire, which stands merely as one of the emblems of his power. As in the days of the Avesta, they still wear the sacred shirt and girdle (now called *sūdrah* and *kusti*), and their priestly class are conspicuous for their white flowing robes.

Some of the present Parsi observances connected with birth and marriage may show slight traces of influence from the Hindus, but the Parsi rites connected with death have remained most individual and striking. As is well known, they expose the bodies of their dead on *Dakhmas*, or Towers of Silence, to be devoured by vultures. In this they adhere strictly to the precepts of the Avesta, although through force of circumstances, or otherwise, they are occasionally obliged to forego this manner of disposing of the dead. As a community, their moral status is ranked very high. In matters of education, especially female education, they are very advanced for Orientals. In all that relates to progress and civilization they are inclined largely to follow European examples. There is a growing tendency among them to spread a knowledge of their ancient sacred literature, and numerous editions or reprints of Avesta and Pahlavi texts and translations are yearly published by them. For acts of charity, benevolence, and generosity they are conspicuous. On the Parsis of Persia, see GHEBERS.

(Chicago, 1893); Bharucha, *Zoroastrian Religion and Customs* (Bombay, 1893); Seervai and Patel, *Gujarāt Pārsis from Their Earliest Settlement to the Present Time* (ib., 1898); Menant, *Les Parsis, Histoire des communautés Zoroastriennes de l'Inde* (Paris, 1898).

PARSLEY (dialectic *parsil*, from OF. *persil*, *pierre essil*, Fr. *persil*, It. *petrosello*, *petroselino*, parsley, from Lat. *petroselinum*, from Gk. *πετροσέλινον*, rock-parsley, from *πέτρος*, *petros*, rock + *σέλινον*, *selinon*, sort of parsley), *Carum*. Annual or biennial smooth branching, tripinnate-leaved herbs of the natural order Umbelliferæ. Common parsley (*Carum Petroselinum*), a native of the south of Europe, is grown from seed sown in good garden soil, and is used for flavoring soups, garnishing meats, etc. Varieties with curled leaflets are generally preferred to those with plain leaflets. Hamburg parsley is a variety with large white carrot-like roots which are used in much the same way as the carrot or parsnip.

PARSLEY FAMILY. A popular name for the natural order Umbelliferæ (q.v.).

PARSLEY PIERT. A rosaceous plant. See LADY'S-MANTLE.

PARSNIP (ME. *parsenip*, *pasnepe*, from OF. *pastenaque*, *pastenade*, Fr. *pastenade*, *panais*, Sp., Port., It. *pastinaca*, from Lat. *pastinaca*, parsnip, from *pastinum*, sort of two-tined dibble), *Peucedanum*. A genus of annual, biennial, and perennial herbs of the natural order Umbelliferæ, with carrot-like fleshy roots and pinnate leaves. The common parsnip (*Peucedanum sativum*), a native of Europe and Northern Asia, is a biennial, with angular-furrowed stems two to three feet high, ovate leaflets, white roots, which are aromatic, mucilaginous, sweet, but slightly acrid. Cultivation has greatly modified the qualities of the roots, rendering them much more bland, and greatly increasing their size and fleshiness, thus improving their edible qualities. The parsnip delights in a very open rich soil, but will succeed in clayey soils far too stiff for the carrot. The mode of cultivation of the parsnip scarcely differs from that of the carrot. The parsnip is used chiefly in winter, whether for the table or for feeding cattle, for which it is highly valued, especially in Europe. It is improved rather than injured by frost; but is apt to become rusty if allowed to remain too long in the ground, and to become acrid after it has begun to grow again in the spring. Another species, the cut-leaved parsnip or sekakul (*Pastinaca Sekakul*), or Malabaila pumila of some botanists, with pinnatifid cut leaflets, a native of India, Syria, and Egypt, cultivated in the Levant, is very similar in its uses to the common parsnip. See Plate of ONIONS, OYSTER PLANT, ETC.

PARSON (OF. *persone*, Fr. *personne*, from ML. *persona*, person, curate, parson, Lat. *persona*, person, actor's mask). Strictly, one who

has full possession of all the rights of [illegible] chial church, as the representative or impersonator of the Church, which is an invisible body. The term is colloquially applied in a loose sense to any clergyman.

PARSON-BIRD, or TUI. A small, noisy forest-dwelling bird of New Zealand (*Prosthemadera Novæ-Zealandiæ*, of the family Meliphagidæ). Its plumage is black, excepting two small outgrowths of white feathers, one on each side of the throat, which suggest the 'bands' of a

THE PARSON BIRD.

clergyman in the pulpit robes of the Church of England. It "utters a wild song, laughs, coughs, sneezes, and mimics generally." Consult Buller, *Birds of New Zealand* (London, 2d ed., 1888). See Plate of CREEPERS.

PAR'SONS. A city in Labette County, Kan., 137 miles south by west of Kansas City, on the Missouri, Kansas and Texas and the Saint Louis and San Francisco railroads (Map: Kansas, G 4). One of the State insane hospitals has been located here, and five of the buildings are in process of erection. Among other prominent structures are the high school, the Missouri, Kansas and Texas railroad depot, the Catholic Church, Rasbach Hotel, the business college, the Masonic building, and the railroad Y. M. C. A. There are two fine parks—Forrest and Glenwood. The Missouri, Kansas and Texas maintains here car and machine shops, and its general offices for the State. The industrial establishments include also flouring and feed mills, grain elevators, a creamery, foundry, handle factory, chicken feed factories, etc. Natural gas is generally used for fuel and lighting. Founded and incorporated as a third-class city in 1871, Parsons became a city of the second class in 1873. The government is administered by a Mayor, elected every two years, and a council. Population, in 1890, 6736; in 1900, 7682.

PARSONS, ALBERT ROSS (1847—). An American musician and archæologist, born at Sandusky, Ohio. He studied music with several American teachers; with Moscheles, Reinecke, Papperitz, and Richeter in Leipzig, 1867-69, and with Tausig, Weitzmann, and Kullak in Berlin, 1870-71. He became a very successful teacher and composer, and his songs are especially popular. "Night Has a Thousand Eyes," "Break, Break," and "Three Fishers" have been extensively sung throughout America and Europe. During his career as a teacher he originated the 'synthetic method' for pianoforte; he translated Wagner's *Beethoven* (1870); wrote *Parsifal: New Light from the Great Pyramid* (1893), a study in cosmic religion and prehistoric Christianity; and edited Kullak's *Complete Works of Chopin*. He held several important New York church organist-ships. In 1890 [illegible] president of the Music Teachers' National Association, and subsequently acted as [illegible] American College of Musicians of the [illegible] of the State of New York, and [illegible] the Metropolitan College of Music.

PARSONS, ALFRED WILLIAM (1847—). An English painter, born at Beckington. He studied at Heatherley's and at the South Kensington schools, and afterwards worked [illegible] from nature. He first exhibited at the Royal Academy in 1871. His best known pictures [illegible] of English scenery. They [illegible] drawn and brilliant in color. His [illegible] "When Nature Painted All Things Gay" (1887), bought by the Chantrey Bequest; "A May Morning;" "The First Frost;" and "The Vale [illegible] by the Links." He received a gold medal for water color and a silver medal for oil painting at Paris in 1889, two medals at Chicago in 1893, and a second-class gold medal at Munich in 1893. He also worked in black and white, and his illustrations include those done with E. A. Abbey for *Old Songs* and *A Quiet Life*; *The Warwickshire Avon*; *Wordsworth's Sonnets*; and *The Danube from the Black Forest to the Black Sea* (1891).

PARSONS, CHARLES (1821—). An American painter and illustrator, born in Manchester, England. He studied at the National Academy of Design in New York City, and [illegible] worked in lithography. From 1861 until 1889 he had charge of the art department of Harper and Brothers, New York City. His work includes landscapes and marines, which are mostly in water color, and, like his illustrations, are notable for their picturesque qualities. He was elected an associate of the National Academy of Design in 1860, and a member of the American Water Color Society.

PARSONS, FRANK (1854—). An American educator, born at Mount Holly, N. J. He graduated at Cornell in 1873, and in 1897 became professor of history and political science at the Kansas Agricultural College. In 1900 he was appointed professor of political science and economics at Ruskin College, Missouri, and from 1892, lecturer on law at Boston University. His publications include [illegible] (1894); *The [illegible]* (1898); [illegible] (1899); and [illegible] (1900).

PARSONS, or **PERSONS,** ROBERT (1546-1610). An English Jesuit and controversialist, born at Nether Stowey, Somersetshire, June 24, 1546. He is said to have been the son of a blacksmith. Educated at Saint Mary's Hall and Balliol College, Oxford, he was elected fellow of Balliol (1568) and subsequently dean (1574). [illegible] Dr. [illegible] that the story [illegible] was slander; but in 1574 [illegible] Oxford for [illegible] into the Society of Jesus (1575), and [illegible] (1578). In 1580 he was sent with [illegible] to England to help the [illegible] clergy. He [illegible] converts among [illegible] bility. Having [illegible] a printing press [illegible] was moved from place to place, he [illegible] in connection with it many [illegible] among which were *A Brief Discourse* [illegible] *Certain Reasons why Catholics Refuse* [illegible]

Church (1580), and Campion's more famous *Decem Rationes* (1581). In 1581 Campion was caught and executed, but Parsons escaped to Normandy. His great energies were now devoted to the restoration of the Catholic Church in England. Going to Spain, he urged on the attempted invasion of Philip II., which resulted in the disaster of 1588. He also labored at the Catholic courts of Europe to save Mary, Queen of Scots. A skillful organizer, he founded schools for English Roman Catholics at Eu in Normandy (1584), at Saint Omer (1592), and at several places in Spain. Appointed rector of the English College in Rome in 1597, he exerted immense influence. Parsons died in Rome, April 15, 1610. He wrote a clear and vigorous English style, which was commended by Swift and Gibbon. Consult Foley, *Records of the English Province of the Society of Jesus* (5 vols., London, 1877-79).

PARSONS, Samuel Holden (1737-89). An American soldier and judge, born at Lyme, Conn. He graduated at Harvard in 1756, studied law at Lyme, Conn., with Governor Matthew Griswold, his uncle; began practice in 1759; and was, for eighteen years, a member of the Connecticut Assembly. In 1774 he removed to New London and became a member of the Connecticut Committee of Correspondence. At the outbreak of the Revolutionary War he took command of the Sixth Connecticut regiment, was present at the siege of Boston and at the battle of Long Island, and planned the attack on Ticonderoga, being promoted for his services to the rank of brigadier-general in August, 1776, and of major-general in 1780. At the close of the war he practiced law at Middletown, Conn. In 1785 he was a member of a commission appointed to treat with the Miami Indians; in 1788 he sat in the convention which ratified, for Connecticut, the Federal Constitution; and in 1789 he became on Washington's appointment, the first judge of the Northwest Territory. He settled near Marietta, Ohio, and soon afterwards, on behalf of Connecticut, bought from the Indians about Lake Erie their claim to the 'Western Reserve.' He was drowned in the Big Beaver River while returning from this expedition. Within recent years letters have been discovered which seem to convict Parsons of treason in supplying the British with information during the Revolutionary War, but the evidence is not conclusive. Parsons published a paper on the "Antiquities of the Western States," in vol. ii. of the *Transactions of the American Academy*. Consult Loring, *A Vindication of General Parsons* (1888).

PARSONS, Theophilus (1750-1813). An eminent American jurist. He was born at Byfield, Mass., February 24, 1750, and graduated at Harvard in 1769. From 1770 to 1773 he taught school at Falmouth, now Portland, Maine, at the same time studying law, and was admitted to the bar in 1774. He began the practice of his profession at Falmouth, which was laid waste by a British squadron in October, 1775; and Parsons, whose prospects for professional success at Falmouth were ruined by this disaster, returned soon afterwards to Byfield, his native town. There, for some years, he studied under Judge Edmund Trowbridge, of the Massachusetts Superior Court. Parsons finally removed to Newburyport, where he soon acquired an extensive practice. In 1778 he was active in the discussion of the new Constitution of Massachusetts, then recently framed by the Legislature. Parsons was strongly opposed to the adoption of that instrument; he was a member of the 'Essex Junto,' which comprised a large number of the citizens hostile to the new Constitution; and the pamphlet called *The Essex Result*, which had a great influence in bringing about the defeat of the Constitution, is attributed to him. In 1779 he sat in the convention which drew up the Constitution which with some changes still exists as the fundamental law of Massachusetts. In 1788 he was a member of the State convention called to ratify the Federal Constitution, which he warmly supported, and the so-called *Proposition* in favor of its adoption, though offered by John Hancock, was drawn up by Parsons. He settled in Boston in 1800. From 1806 until his death he was Chief Justice of the State Supreme Court. His judicial opinions have not been fully reported, but those preserved in the early Massachusetts reports and in his *Commentaries on the Law of the United States* (1836) show great ability and learning, especially in the department of real property and marine insurance. He died at Boston, October 30, 1813. A memoir (Boston, 1859) was prepared by his son, Theophilus. Consult also a sketch by Knapp (Boston, 1821).

PARSONS, Theophilus (1797-1882). An American jurist and legal author; born at Newburyport, Mass., in 1797. He graduated at Harvard in 1815, was admitted to the bar, and began to practice in Taunton. Soon afterwards he removed to Boston, where he became the founder and editor of the *United States Literary Gazette*. He was also a frequent contributor to the *North American Review*. In 1847 he was appointed Dane professor of law in the law school of Harvard University, an office which he filled with distinction for a quarter of a century. His works are characterized by accuracy and practical usefulness to the profession, rather than by profundity of knowledge or great legal acumen. They were consequently very successful in winning the favor of the profession and have, through successive revisions, retained their position as useful legal hand-books. His best known works are: *Treatise on the Law of Contracts* (1853; 8th ed. 1893); *Elements of Mercantile Law* (1856); *Law of Partnership* (1867; 4th ed. 1893); *Marine Insurance Average* (1868). He was a Swedenborgian, and he produced a number of works maintaining the doctrines of the New Jerusalem Church. The most important are *Essays*, in three series; *Deus Homo* (1867); and *The Infinite and the Finite* (1872).

PARSONS, Thomas William (1819-92). An American poet and translator of Dante, born and educated in Boston. In 1836 he went to Italy, where his studies in the literature of that country resulted in his well-known translation of the first ten cantos of Dante's *Inferno* (1843). This part of the *Divina Commedia* he completed in 1867. He translated much of the *Purgatorio* and a few fragments of the *Paradiso*, but he never completed the work. He later took up dentistry as a profession, and practiced in Boston and in London. The last twenty years of his life were

spent in or near Boston. Parsons owes his fame almost wholly to his interpretation of Dante. Most of this translation is in rhymed couplets. It may be said without exaggeration that Parsons has come nearer to Dante than any other translator in English, nor is his best work rivaled by foreign translators. Aside from his Dante translations, his work includes: *Ghetto di Roma* (1854); *The Magnolia, and Other Poems* (1867); *The Old House at Sudbury* (1870); and *The Shadow of the Obelisk, and Other Poems* (1872). His best-known poem, *On a Bust of Dante* (first published in the Boston *Advertiser and Patriot* in 1841), like most of his verse is characterized by depth of feeling and dignity and delicacy of expression. He is the Poet of Longfellow's *Tales of a Wayside Inn*. Parsons died in Scituate, Mass., September 3, 1892. His poems appeared in a definite edition in 1893.

PARSONS' CAUSE. The name of a celebrated case decided by the court of Hanover County, Va., in December, 1759; remembered chiefly because of a speech made before the court by Patrick Henry (q.v.). From the earliest history of the colony the salaries of the clergy in Virginia had been paid in the form of tobacco, long the colony's chief staple. Owing to fluctuations in the value of tobacco, the actual amount thus paid had varied widely, the clergy receiving the advantage of a rise in price and correspondingly suffering the disadvantages of a fall. In 1748 the Legislature of Virginia passed an act fixing the salary of the clergy at 16,000 pounds of tobacco, and George II. formally approved the act. In 1758, when the price of tobacco was unusually high, the Legislature passed an act, to be in force for twelve months, similar to a previous act of 1755, which had lapsed, and which had provided that the salary of the clergy might be paid in paper currency instead of tobacco, at the rate of two cents per pound, a price below the market value of tobacco at that time. Upon the protest of the clergy the act of 1758 was disallowed by the King, and various clergymen forthwith brought suit against their vestries for the salaries legally due them for the year 1758. One such suit was brought by the Rev. James Maury before the court of Hanover County, and Patrick Henry, then a young, almost unknown lawyer, was engaged by the defendants as counsel. The Court decided against the validity of the act of 1758, such act having been disallowed by the Crown, but the jury, influenced by an impassioned speech by Henry, returned a verdict of only one penny damages. The speech made by Henry was the first in which he attracted general attention, and was sufficiently radical to be considered incendiary and treasonable by the conservative element in the colony. According to the report of Maury, Henry argued that since the act of 1758 was an act of general utility, it could not be annulled by the King, and asserted that "a king by disallowing acts of this salutary nature, from being the father of his people, degenerates into a tyrant, and forfeits all rights to his subjects' obedience." Consult Tyler, *Patrick Henry* (Boston, 1887), in The American Statesmen Series.

PARSON'S TALE, THE. The last of Chaucer's *Canterbury Tales*, and, like "Melibœus," written in prose. It is a discourse on penitence, from the Vulgate text of Jeremiah, vi. 16, and is mainly an adaptation from Frère Lorens, *La somme des vices et des vertus*, published in 1279, through the English translation entitled *The Ancrene of Iwyt* (remorse of conscience). It contains many quotations from the Latin Fathers, and was probably once a separate treatise written before 1380. It has been inferred from the closing Retractation that Chaucer became a Wicliffite, but leading authorities consider this view far-fetched.

PAR'SONSTOWN, or BIRR. A town in King's County, Ireland, on the Brosna, 43 miles northeast of Limerick (Map: Ireland, D 3). It is an important corn market, a considerable centre of inland commerce, a military station, and the seat of a union workhouse, and is one of the handsomest and best built towns in Ireland. It has several fine churches and chapels, a nunnery, a statue of the Duke of Cumberland, a bronze statue of the Earl of Rosse, a town hall, a library, literary institute, a model school, and other educational institutions. The principal attractions are the castle, the observatory, containing a great telescope, 52 feet long, and the laboratory of the late Earl of Rosse (q.v.), still maintained in active use by the present Earl. Birr had its origin at an early period in a monastery founded by Saint Brendan, and was the scene of many important events, both in the Irish and in the post-invasion periods. Population, in 1901, 4438.

PART (OF., Fr. *part*, from Lat. *pars*, part; connected with Lat. *parare*, to prepare, Gk. ἔπορον, *eporon*, I prepared). In music, when a piece of music consists of several series of sounds performed simultaneously, each series is called a part. In a composition a distinction is made between *real parts* and *auxiliary parts*. *Real parts* are those that progress through an entire composition as so many individual voices. A vocal fugue may be written for three, four, or five voices. It has, therefore, three, four, or five *real parts*, even if one or more voices rest for a number of bars. *Auxiliary parts* are in reality but detached tones serving to mark a strong accent by doubling some or all tones contained in the *real parts*. It is evident that in vocal music no *auxiliary parts* can occur. But in writing for keyed instruments or full orchestra composers make frequent use of such auxiliary tones. In a composition for pianoforte, for example, let us say four *real parts* are used. In certain places the composer desires more sonority and there he writes six or even more tones to be struck simultaneously. Any number above *four* tones constitutes the *auxiliary part*, for such voices are added only occasionally. Care must be taken not to introduce *auxiliary parts* too closely together, as the ear is apt to conceive them as *real parts*, and consequently to demand adherence to the strict rules of progression exacted in the real parts. A splendid example of the use of *auxiliary parts* is furnished by the opening bars of Beethoven's A Major Symphony, where the strings are used in *auxiliary parts* to give a strong accent to the first beat of the 1, 3, 5, and 7 measures, while the *real parts* are given to the wood-wind.

In this example the oboes have a *real part* throughout; the clarinets enter with a *real part* in the third bar; the flutes in the sixth; the

horns in the fifth; the bassoons in the seventh bar. The violins throughout have only *additional* parts or notes. The detached notes of the other instruments before their participation in the *real* parts are also considered additional parts.

four singers could sit opposite, facing each other in pairs.

Soprano	Tenor
Alto	Bass

This was a decided improvement. Such part-

PARTANNA, pär-tän'nä. A town in the Province of Trapani, Sicily, 38 miles southwest of Palermo (Map: Italy, G 10). It is on a hill which commands an extensive view, and is interesting because of the remains of Greek works of art found here. Ruins of several Saracenic castles are still to be seen. There is a trade in grain, wine, and oil. Population (commune), in 1881, 13,144; in 1901, 14,059.

PARTANT POUR LA SYRIE, pär'tän' poor lä sē'rē' (Fr., departing for Syria). A ballad by Count de Laborde (1809). A young warrior, Dunois, by his bravery in Syria, wins a battle and gains the daughter of his lord. Queen Hortense composed music for the ballad, which became extremely popular long after her death, during the Second Empire.

PART-BOOK. In music, a book containing an entire part of a composition for a single performer. Before the seventeenth century scores were practically unknown. The individual voices or parts of a polyphonic composition were printed in separate books, just as are the separate parts of an orchestral composition used by the members of a modern orchestra. In order to simplify the interpretation of the music, part-books were also so arranged that all the parts were printed in a single book, but not in score. The soprano and alto appeared on the left-hand page, while the tenor and bass were printed on the right-hand page.

Soprano	Tenor
Alto	Bass

The music was so arranged that all parts turned at the same time. Jacques Moderne in 1539 printed a part-book in such a manner that the books containing all the parts were printed in very large type for the convenience of the performers; whereas the single part-books were generally printed in very small type.

PARTHE'NIUS (Lat., from Gk. *Παρθένιος*). A Greek grammarian and poet, who lived at Rome in the first century B.C. He taught Vergil Greek, and was an intimate friend of the elegiac poet Cornelius Gallus, to whom he dedicated his *Erotic Experiences* (*Περὶ ἐρωτικῶν παθημάτων*), the only work of his which has survived. This was a collection of thirty-six brief stories of unhappy lovers, compiled from ancient poets, and was intended to furnish Gallus with themes for his epic and elegiac poems. The work contains interesting quotations from the Alexandrine poets, and is valued as a precursor of the Greek novels. It has been edited by Westermann in his *Μυθογράφοι* (Brunswick, 1843), and by Hirschig, in the *Scriptores Erotici Graeci* (Paris, 1856). According to the Ambrosian manuscript of Vergil, the latter's poem *Moretum* was an imitation of Parthenius's Greek work of the same title.

PARTHENOGEN'ESIS (Neo-Lat., from Gk. *παρθένος, parthenos*, virgin + *γένεσις, genesis*, production, from *γίγνεσθαι, gignesthai*, to become). The essential phenomenon of sexual generation is the union of a male with a female cell. Within the past half century, however, comparatively numerous cases have been discovered where unfertilized eggs have developed into an adult organism. Such cases in certain animals are known to be in a degree regular, normal methods, and the phenomenon is called agamous, virgin reproduction, or 'parthenogenesis,' the name proposed by R. Owen. The most

typical case of parthenogenesis is that of the aphis or plant-louse. The species is represented in the aphides by eggs alone. (See Hop-Insects.) In the spring females alone hatch, and no males appear until at the close of summer. Bonnet discovered that a virgin aphis may become the parent of millions of aphids, like itself, there being nine generations through the summer. Duval obtained eleven generations in seven months, while Kyber even observed that a colony of *Aphis dianthi*, which had been brought into a constantly heated room, continued to propagate for four years in this manner, without the intervention of males. At the approach of cold weather males appear; they mate with the females, the latter laying eggs. There are thus two sets of females, the parthenogenetic and the normal oviparous forms. The queen bee also lays eggs in the drone or male cells of the honeycomb, which are unfertilized and give rise to males.

Cases of parthenogenesis are known to occur rarely in other Hemiptera than aphids, namely in bark-lice, and in the silk-worm, and 25 or more other species of moths. Among Hymenoptera, besides the honey bee and some wild bees (as Halictus), the currant worm (*Nematus ventricosus*) and twelve other species of saw-flies have been known to lay parthenogenetic eggs; also many gall-flies; in several species of ants, and in wasps (Polistes), the parthenogenetic eggs produce males. Among beetles, *Gastrophysa raphani* and a species of caddis-fly are at times parthenogenous; also certain mites and other insects, and in the crustaceans Apus, Artemia, and Limnadia.

It was formerly supposed that these parthenogenetic eggs were different from normal eggs, and they were called 'pseudova' by Huxley, but this view is untenable, since these 'pseudova' arise just like ordinary eggs and develop like them, as they undergo cleavage of the yolk and form germ-layers. R. Hertwig claims that parthenogenesis is "a sexual reproduction in which a degeneration of fertilization has taken place, and the facts of parthenogenesis show that under change of conditions the normal mode of sexual reproduction (amphigony) may be modified for the benefit of the species."

Pædogenesis. The larva or maggot of a certain gall-gnat fly is known to produce young which is developed within the body of the larva from a 'germ-ball' essentially agreeing with an ovary in appearance. The asexual larvæ begin life as egg-like bodies developed from the germ-ball, just as eggs are developed in the little tubes of which the ovary is an aggregation. Both Wagner and Leuckart conclude that the processes of embryonic growth agree in all essential points with the ordinary phenomena of development in a

PARTHENOGENESIS.

Larva of a gall-gnat (*Cecidomyidæ*) with pædogenetic daughter-larvæ.

fecundated egg, and exactly as in the case of Aphis parthenogenesis. The only difference consists in the germ chambers of the cecidomyid larvæ separating from the germ-stock, and moving freely about in the cavity of the body, while in the aphids, in which there is no metamorphosis, the germ-stock is a true ovary. It thus appears that the true ovary or germ mass of the parent maggot becomes prematurely developed, and the growth of young is thus greatly accelerated. The maggots live under the bark of the apple tree in Germany, Denmark, and Russia, the phenomena occurring in two species of Cecidomyiidæ (*Miastor metroloas* and *Oligarces paradoxus*). Here also belongs the case of larval reproduction in Amblystoma.

Oreysalogenesis. This term is applied by Packard to a form of pædogenesis which occurs in the chrysalis of a gnat of the genus Chironomus. In 1869 Grimm discovered the pupa of a species of this gnat laying eggs. In autumn other pupæ changed to flies without laying eggs, while the fly was observed to deposit a larger number of eggs than the spring pupa. It is thus seen to be a seasonal phenomenon, dependent on the temperature. Grimm also found that on removing from the perfectly developed insect, before it has left the pupa case, the eggs which otherwise would have been fertilized, and nurturing them in water, the development of the larvæ took place in them also, but lasted a little longer (about six days).

Metagenesis. This term was proposed by Owen in 1848 in his *Parthenogenesis*, and afterwards more fully in his *Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals* (London, 1858). His examples are the alternation of generations of the distomes, the hydroids, medusæ, and even the metamorphoses of the echinoderms, the gemmation of Nais and other annelids, as well as the metamorphoses of the fish-lice (Œthera, etc.), which he says "is a slightly modified parthenogenesis;" again, he regards the phases they pass through as "much more those of a metagenesis than a metamorphosis." (See Alternation of Generations.) In his paper on the agamic reproduction of Aphis, Huxley employs the term 'agamogenesis,' which he says occurs "when the produced 'zoöid' is capable of development into an independent organism without the influence of an act of conjugation with another zoöid. The producing zoöid may be devoid of sexual organs, as in the Salpæ, many Hydrozoa, and many Trematoda," in fact in the great majority of cases of agamogenesis; and to this kind of alternation of generations he applies Owen's term 'metagenesis,' restricting the term 'parthenogenesis' to cases where the parent ('protozoöid') possesses sexual organs (ovaries), and its buds have all the histological characters of ova. Metagenesis is defined by R. Hertwig as "alternation of generations in the narrower sense." It is the alternation of at least two generations, of which one reproduces only asexually, by division or budding, the other either exclusively, or at least to a great extent, sexually. The first generation is called the 'nurse;' the second, the 'sexual animal.' The best example is furnished by the mode of reproduction of Hydromedusæ. (See Hydrozoa.)

Heterogony. This differs from metagenesis by the fact that the asexual generation is replaced by parthenogenesis. For example, in certain Crustacea (Daphnidæ) only females occur in the summer time, which increase by unfertilized eggs. Then males appear for a short time, which fertilize the winter eggs which

now produced, from which again parthenogenetic generations arise (R. Hertwig).

Causes of Asexual Reproduction. Taking all these cases together, asexual reproduction or parthenogenesis in general is seen to be due to budding or cell-division in the egg. The asexual aphids bud out from the ovary. It was for a long time held, says Hertwig, that the cells from which the cercariæ arose were not eggs, but 'internal buds,' 'germinal granules.' The fact seems to be that normal reproduction with growth and parthenogenesis are but extremes of a single series. The asexual mode of reproduction is most probably due to temperature and other changes in the conditions of life, as change of food, and, in parasitic animals, change of host (Packard). The phenomenon takes place in the summer, and in almost every case ceases at the approach of cold weather.

The case of dimorphism of a thread-worm has been incorrectly regarded as heterogony, but it is simply due to changes of temperature. Thus in low temperature filaria-forms directly arise from the young of *Rhabdonema* (*Anguillula*) *intestinalis;* but in the summer heat indirectly forms a Rhabditis form. Wasman was able, during three summers, to induce parthenogenesis in the workers of *Formica sanguinea* and their slaves (*Formica pisca*) by artificially warming the nests. Abundant food favors parthenogenesis, though in Phylloxera the stoppage of the food supply induces parthenogenesis. See *Effects of Changes of Temperature*, under Evolution.

Artificial Parthenogenesis. Experiments by Herbst, R. Hertwig, T. H. Morgan, and especially by Loeb, show that the unfertilized eggs of the sea-urchin may be so stimulated by chemical solutions as to undergo the earlier phases of development. Herbst experimented with potassium chloride and lithium chloride, but found that while the larvæ developed, they were monstrous and finally perished. Hertwig and also Morgan showed that if unfertilized eggs be treated by weak solutions of sodium chloride, magnesium chloride, or strychnine, they exhibit some of the preparatory changes of yolk-division, and might actually divide, though without producing an embryo. Loeb finally succeeded in rearing large numbers of perfect larvæ from eggs which, without fertilization, are first treated with a weak solution of magnesium chloride, and then transferred to normal sea-water. It thus appears that experiments carried out under rigidly controlled conditions show that the egg, without union with a sperm-cell, is capable of complete development. In commenting on these discoveries E. B. Wilson (*International Monthly*, July, 1900) remarks that even in normal fertilization we must regard the stimulus to development as being given by a specific substance or substances carried by the spermatozoön. The experiments lead us to suppose that the chemical salts used "are individually poisonous to the egg, but are normally so balanced as to neutralize one another's injurious effects and maintain the equilibrium of the egg. If this armed neutrality be disturbed, the egg responds, undergoing degenerative changes, and dying if the change be too violent, passing through an abnormal development and giving rise to monstrous embryos if the new conditions be less unfavorable, but under appropriate stimulus being, as it were, released from bondage, and rendered free to run its normal course of development."

In Plants. Among plants an embryo is frequently formed by a budding outgrowth from tissues outside of the egg, and to such a phenomenon the term parthenogenesis has often been wrongly applied. The general term covering all cases of the appearance of embryos without fertilization, when that process is ordinarily required, is apogamy (q.v.), parthenogenesis being that form of apogamy in which the embryo comes from an unfertilized egg. In tracing the origin of sex among plants, it seems evident that the sexual cells (gametes) are derived from such cells as the sexless swimming spores (zoöspores) of the algæ. These spores have the power of producing new plants, so that when sexual cells, without pairing in the process of fertilization, independently produce new plants, it is simply the resumption of an ancestral power. The most primitive sexual cells show no distinction of sex, and in such cases parthenogenesis is very common. In the higher development of sexuality, however, the pairing gametes are very unlike, becoming the sperm and egg, and in such cases parthenogenesis is more rare, and occurs only in connection with the egg.

By the process of fertilization the egg is induced to divide, and this is the beginning of an embryo. Certain eggs may be artificially induced to divide by other means than fertilization, and to produce embryos. Just what the stimulus is which induces the egg to divide is yet undetermined, but it seems probable that natural parthenogenesis results from the same general conditions that obtain in artificial parthenogenesis.

As might be expected, parthenogenesis in plants is most common among the algæ and fungi, there being well-known cases, as the water molds (Saprolegnia), in which the eggs are never fertilized, and parthenogenesis is the normal method of embryo formation. Among the higher groups of plants, however, it is the exception, and among seed-plants (spermatophytes) probably the very rare exception. But three cases of real parthenogenesis among seed-plants have been determined, though doubtless there are others. These are in certain species of Antennaria (Compositæ), of Alchemilla (Rosaceæ), and of Thalictrum (Ranunculaceæ).

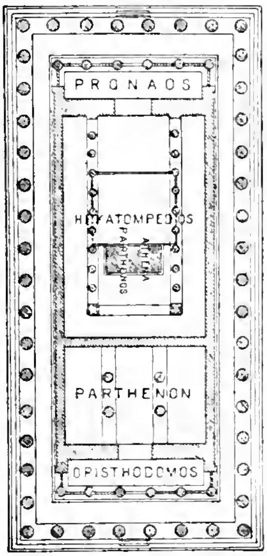
Wagners Entdeckung von Larven, die sich fortpflanzen, Herrn Ganins verwandte und ergänzende Beobachtungen und über die Pädogenesis überhaupt* (Saint Petersburg, 1865); Taschenberg, *Historische Entwickelung der Lehre von der Parthenogenesis* (Halle, 1893). This last named work contains a full bibliography up to and including 1892.

PAR'THENON (Lat., from Gk. Παρθενών, from παρθένος, *parthenos*, virgin). A celebrated temple of the virgin goddess Athena, on the Acropolis of Athens. The highest triumph of Greek Doric architecture, it was the work of the architect Ictinus, while the sculptures are generally believed to have been designed by Phidias. The building was a Doric octostyle peripteros with 17 columns on the long sides. It was 100 by 225 Attic feet (about 101 by 228 English feet), and from the top of the stylobate to the gable about 59 feet. Back of the outer row of 8 columns, at either end of the temple, are 6 columns, forming the fronts of the *pronaos* and *opisthodomos*. The main hall of the temple, called the *hekatompedos*, was 100 Attic feet in length, and contained the great gold and ivory statue of Athena by Phidias. Back of this was another room, entered from the opisthodomos only, and called the *parthenon*. In the building the most delicate refinements were introduced in order to correct optical distortions. The lines of the stylobate, cornice, and columns were delicately curved, though with such nicety that much can be detected only by the most careful measurement. That these refinements were carefully calculated from the start is shown by the cutting of the rock on which the crepidoma rests to allow of the proper curvature in the lines of the stylobate. The whole building was of carefully selected white Pentelic marble, with the exception of the tiles of the roof, for which Parian marble was employed. (See Colored Plate under ARCHITECTURE.) Begun about B.C. 447, the temple was sufficiently completed to permit the installation of the statue in B.C. 438. It continued in use till the end of the fifth or possibly the sixth century of our era, when it was transformed into a Christian church, dedicated at first to Saint Sophia and later to the Virgin. After the capture of Athens by the Turks (A.D. 1458) it became a mosque, and a minaret was built in the southwest corner. It was, however, but little damaged, and in 1674 the sculptures were drawn by Jacques Carrey and other artists in the suite of the Marquis de Nointel. In 1687, during the siege of Athens by the Venetians, the Turks used it as a powder magazine, and on September 26th a Venetian bomb fell through the roof, causing an explosion which killed 300 persons, and completely destroyed the central portion of the buildings. Early in the nineteenth century Lord Elgin secured permission to remove the sculptures to London. (See ELGIN MARBLES.) Apart from its value in the history of architecture, the Parthenon is of the greatest importance for the history of Greek sculpture. The two pediments were filled with colossal sculptures in the round, those in the east representing the birth of Athena from the head of Zeus, and those in the west the contest of Athena and Poseidon over Attica. The ninety-two metopes, all of which were sculptured, represented the struggle between the gods and the giants on the east, and the Athenians and Amazons on the west. On the south was the battle between the Centaurs and Lapithæ, and on the north the capture of Troy and the victory over the Persians. But the great glory of the temple was the long frieze which ran entirely around the outer wall of the cella and over the columns at either end, wrought in low relief in the most perfect style of the noble art of the fifth century. It represented the great Panathenaic procession, in which all classes of Athenians assembled to do honor to the goddess. The effect of the sculptures and architecture was enhanced by the use of color and metal to bring out the details. The metopes show marked stylistic differences, both in design and execution, and cannot all be attributed to the mind of a single artist, nor can it be supposed that the other sculptures were the work of a single hand, though they seem to most critics to show the influence of one master mind. They are characterized by a severe simplicity, scorning anything that savors of sensationalism or prettiness, but full of life and vigor in the animation of the frieze, of calm dignity in the figures of the gods, and everywhere marked by harmony and beauty in the lines and almost perfect technical skill in the treatment of the material. (See PROPYLÆA and ATHENS.) In addition to the treatises on Greek sculpture cited under GREEK ART, consult: Michaelis, *Der Parthenon* (Leipzig, 1871), the standard work; Penrose, *Principles of Athenian Architecture* (2d ed., London, 1888); Magne, *Le Parthénon* (Paris, 1895); and the unfinished work of Laborde, *Le Parthénon* (Paris, 1848), containing Carrey's drawings.



PLAN OF PARTHENON.

PARTHENOPE, pär-thĕn'ō-pē (Lat., from Gk. Παρθενόπη). (1) The daughter of Stymphalus, beloved by Hercules. (2) A siren who drowned herself for love of Ulysses. She was cast up by the sea at Naples, which was named for her.

PAR'THENOPE'AN REPUBLIC (from *Parthenope*, the ancient name of the city of Naples). The name given to the State into which the Kingdom of Naples was transformed by the French Revolutionists, January 23, 1799. It only lasted until the following June, when the invaders [illegible] to retreat.

PAR'THIA (Lat., from Gk. Παρθία, *Parthia*, [illegible], *Parthuaioi*, Παρθοι, *Parthoi*, Parthians). An ancient country, which consisted of part of the territories of the old Persian Empire, lying to the southeast of the Caspian Sea. The original inhabitants were probably of Turanian stock, related to the great

tribes of Central Asia, whence have come the Huns, Mongols, Turks, and Magyars. The Parthians were distinguished by primitive simplicity of life and extreme bravery, though at the same time they were much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback, and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenseless after the first discharge, and, to gain time for adjusting a second arrow to the bow, turned their horses and retired, as if in full flight, but an enemy incautiously pursuing was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory or exhausted their quivers. They generally discharged their arrows backward, holding the bow behind the shoulder, a mode of attack more dangerous to a pursuing enemy than to one in order of battle. They were conquered by Cyrus in the sixth century before Christ, and their country was organized into a satrapy under Darius. Parthia was included in the conquests of Alexander the Great and after his death formed a part of the Seleucid Syrian kingdom, until about B.C. 250 the people revolted successfully under Arsaces, founder of the dynasty of the Arsacidæ (q.v.), who maintained a most tyrannical despotism. The capital of the Parthian monarchy was Hecatompylos ('the city of the hundred gates'). The dominion of Parthia rapidly extended to the Euphrates and the Indus, and it became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanidæ—and other celebrated cities date their rise from this period, and soon eclipsed, in size and splendor, the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans, the Parthians maintained their independence (see CRASSUS, MARCUS); and though Trajan, in A.D. 115-117, seized certain portions of the country, the Romans were soon compelled to abandon them. In 165, however, the Romans took from Parthia considerable territory. The final struggle with Rome took place in 217, when a desperate drawn battle at Nisibis made both parties desirous of peace. The Parthian kingdom was then weakened by dissension, and in 226, during the reign of Artabanus IV., the last of the Arsacidæ, a revolt headed by Ardshir, son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, the Persian dynasty of the Sassanidæ (q.v.) taking the place of the Arsacidæ. Some scions of the Parthian royal family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance. Consult: Rawlinson, *The Sixth Great Oriental Monarchy* (London, 1873); id., *The Story of Parthia* (New York, 1889).

PARTICIPLE (Lat. *participium*, participle, a sharing, from *particeps*, partaking, from *pars*, part + *capere*, to take). In grammar, a word partaking of the characteristics of a verb and an adjective. Like the verb, it governs nouns or pronouns, and, like the adjective, it agrees in gender, number, and case with the noun or pronoun which it modifies. The double function of the participle is illustrated in such sentences as *μέμνημαι αὐτὸν τοῦτο ποήσαντα*, 'I remember him doing this;' *Flaminio restitit agrum dividenti*, 'he resisted Flaminius dividing the territory.' Participles are either active or passive, and are of various tenses, as present, past (aorist), perfect, and future. In English the active participle coincides in form with the abstract verbal noun, as *going*. The two forms must be sharply distinguished in speech, as, *he is building the house*, but, *forty and six years was this temple in building* (whence such colloquial and archaic forms as *a-building*).

PAR'TICK. A town and western suburb of Glasgow, Scotland, with numerous shipbuilding yards, flour mills, cotton factories, and bleachfields, and 1500 feet of wharfage along the Kelvin River (Map: Scotland, D 4). A large proportion of the inhabitants occupying extensive ranges of handsome villa residences are engaged in business in Glasgow. Population, in 1851, 3132; in 1891, 36,538; in 1901, 54,274.

PARTICULAR BAPTISTS. See BAPTISTS.

PARTIES. In law, in a general sense, those who have personal connection with an affair, or transaction, or who are united in interest in any act or thing; in a specific sense, litigants in a legal action or proceeding. In cases in equity all persons who have a material interest in the subject matter of the proceeding, whether legal or equitable, must be made parties, and persons whose interests are antagonistic cannot be joined as complainants. In an action at law there are generally two parties, or classes of parties, the plaintiff, or complainant, and the defendant, but variations occur, as in attachment cases, in actions *in rem*, etc. In general, any person not under legal disability of some kind, such as an alien enemy, an idiot or an infant, may become a party plaintiff, or may be made a party defendant. For such persons as are under legal disability of any kind the law appoints or allows others to act for them, either in their names or on their behalf. Consult: Dicey, *Treatise on the Rules for Selection of Parties*, etc. (Jersey City, 1886); Barbour, *Summary of the Law of Parties to Actions*, etc. (Albany, 1884); and the authorities referred to under PLEADING; EQUITY; LAW, etc. See also ACTION; DEFENDANT; PLAINTIFF; INFANT; INSANITY; ALIEN.

PARTING. See CLEAVAGE OF CRYSTALS.

PART'INGTON, MRS. A character similar to Mrs. Malaprop in her wrong use of words. Its origin was probably the person of that name described by Sydney Smith in a speech on the position of the House of Lords in reference to the Reform Bill, as attempting to keep back the Atlantic Ocean with her mop.

PARTINICO, pär'tē-nē'kō. A town in the Province of Palermo, Sicily, on the Palermo-Trapani Railroad, 14 miles southwest of Palermo (Map: Italy, H 9). Corn and fruit are produced in the vicinity, and there are manufactures of wine, oil, linen, and woolen goods. Population, (commune), in 1881, 21,000; in 1901, 23,729.

PARTITION (Lat. *partitio*, division, from *partiri*, to divide, from *pars*, part). A division of lands, tenements, and hereditaments, or of goods and chattels, by or for the benefit of per-

sons who have an undivided common interest in them so that each becomes the sole owner of one part or portion of the property. Compulsory partition was first allowed in the early common law as to co-parceners, who became joint owners of real estate by inheritance, on the theory that, as they became joint owners by operation of law, and without their consent, they should be entitled to have it divided if their ideas as to management were not in accord. But as estates held in joint tenancy and tenancy in common were ordinarily created by the voluntary act of the parties, or with their consent, the old rule was that they could only be dissolved in the same way. In the course of time, however, the common-law rules were changed by statute, and since the reign of Henry VIII. all estates held in common have been subject to partition. The English law has continued to be the common law of the United States.

Originally, compulsory partition was obtained by means of a writ of partition, issued from a court of law, but subsequently the courts of chancery assumed jurisdiction; and in most States the action is now considered more in the nature of an equitable action because of the character of the relief obtained. Compulsory partition is now confined almost exclusively to real estate, as personal property, when left by a decedent, is sold and the proceeds distributed by the executors or administrators; and it is seldom held in common except by virtue of a partnership relation, in case of the dissolution of which the sale of the property, or an accounting, is resorted to as the most convenient method of adjusting the rights of the partners.

Where the common owners of property agree upon a partition, it is usually effected by exchanging deeds, each conveying and releasing to the other all his right, title, and interest in and to the portion which the latter is to receive. It is held in some States that a parol partition followed by actual possession of the respective portions of the parties is valid, on the ground that a conveyance is not necessary under the statute of frauds, as each party owned every portion in common with the others, but this is a most doubtful and unsatisfactory method.

Where the parties do not all agree that there should be a partition, and upon the shares to which each should be entitled, one or more of them may commence an action for partition. All parties having any possible interest in the property who do not join as plaintiffs should be made parties defendant. In some cases where the owners in common are all friendly, it is agreed that partition shall be made by the court, and one or more will consent to be made parties defendant, in order to give the proceeding the form of a litigated action. A few States permit all the parties in interest to join in an *ex parte* application to the court for partition, that is, to apply by a petition in the name of all, no one being made party defendant. In all 'friendly' suits the costs are apportioned among the parties according to their respective interests.

The respective proportions or interests of the various parties are first determined, and the court then decides upon the division which will be equitable and just to all. The courts generally favor a division of the property itself where that is possible from its nature and situation. In some cases the courts may make a division of real estate among the interested parties, and order those who receive parcels of greater value than the others to make a certain compensation to the latter. This is sometimes called 'equity equality of partition.' In the actual division and apportionment of lands, values of the respective portions are considered as well as area, and where the action is brought in a court of equitable jurisdiction each party will be allotted the portion which seems best adapted to his interests. A partition sale is conducted on the same principles as any other judicial sale. See REAL PROPERTY; JOINT TENANCY. Consult the authorities referred to under REAL PROPERTY and EQUITY.

PART-MUSIC, or **PART-SONG**. A composition for at least three voices without instrumental accompaniment. The voices may be *equal* (all male or all female) or *mixed*. It is immaterial whether the words are sacred or secular.

PARTNERSHIP (ME. *partener, parcener*, OF. *parcenier*, from ML. *partionarius*, having a portion, from Lat. *partitio*, division). An unincorporated association of two or more persons who have agreed to combine their labor, property, and skill, or some of them, and who, in accordance with this agreement, carry on a lawful trade or business with a view to profit. The term is often used in popular speech, and sometimes in legal documents, with a different signification. We find the first charter of the Levant merchants (granted 1581) designating the grantees as partners; but the association was in truth a corporation, not a partnership. In an early New York case, the Court of Chancery was called upon to decide whether the members of a steamboat company, who had styled themselves partners in their articles of agreement, were partners or part owners (q.v.); and the decision was that they were part owners. It is to be borne in mind, therefore, that partnership is a technical term in legal nomenclature. Persons may be called partners, and even call themselves by that name, without constituting a partnership. On the other hand, they may deny that they are partners, and believe that they are not partners, while in fact the partnership relation does subsist between them. How are we to determine, in a particular case, whether a partnership exists or not?

THE TEST OF PARTNERSHIP. Ordinarily the answer to the foregoing question is not difficult, if we apply the definition given above. First, we inquire whether the association is incorporated. If it is, then it is not a partnership. If it is not, we are next to ask whether the association is a voluntary one; for the law does not institute the relation of partners between persons against their will. Property may be left to children by a parent. This does not make them partners. Each has a right to say whether or not he will combine his interest with the interests of the others in carrying on a common business. The reason for this rule will be apparent when we consider a little later the authority possessed by each partner to sell firm property and to bind his co-partners by contracts and even by torts. It follows from this necessity of a binding agreement between the parties that they must possess legal capacity to contract; and

that the partnership agreement must be of such nature and form as to be legally enforceable. An infant is not bound by a partnership contract. Convicts, alien enemies, and, as a rule, corporations, are prohibited from entering partnerships. Judges are often debarred by statute from becoming partners in law firms. At common law married women were incapable of binding themselves by contract, and consequently could not become partners. Even when the parties have contractual capacity, their partnership contract may be worthless, either because its object is illegal or against public policy, or because its form does not comply with the Statute of Frauds. (See FRAUDS, STATUTE OF.) Courts have properly refused to enforce partnership agreements for highway robbery, for conducting gambling establishments or houses of ill-fame, cornering markets, and for creating monopolies.

The third question to ask is whether the parties are carrying on a business in common. A land-owner often lets his premises to a tenant 'to farm on shares.' This arrangement does not make them partners. Owners in common of a building agree that one of them shall have the general management of it and provide funds for necessary repairs, so as to make it habitable by tenants, and to divide the rent. Such an agreement does not amount to a partnership. If, however, they agree to supply the building with furniture at their joint expense, and to let furnished rooms to various tenants, they may well be held to intend the carrying on of a business in common. The presumption that common owners of land or of interests in land, as well as common owners of chattels, are not partners in their use of it, is due to the fact that such ownership was recognized and the relations of the owners defined by the common law long before the institution of partnership came before English courts for consideration. While it is now possible and even common for partnerships to exist for buying and selling real estate or for renting it, the courts usually require that the intent of joint owners to throw such property into a fund as partnership stock shall be distinctly manifested. Such intent will not be presumed.

Still a fourth question to be answered before a decision as to the partnership character of an association can be reached is whether it was entered into with a view of profit. The earliest form of partnership known to English law was that of ordinary merchants. Its sole object was pecuniary gain. Hence the courts of England and of this country have had no hesitation in declaring that "societies and clubs, organized and maintained for the promotion of temperance, for the enforcement of particular laws, for musical culture among their members, for the propagation of political, social, or religious doctrines, or even for mutual protection or insurance, are not partnerships, even though they may have for one of their objects the accumulation of property to be owned and enjoyed in common."

Formerly, the sharing of the profits of a business was thought to constitute one a partner, at least toward those dealing with the business, whether he was a co-owner in the enterprise or not. This view has been discarded in England and in most of our jurisdictions. A person may share the profits, as a servant or agent, as a lender of money, or as the lessor of property, without becoming a partner. Sharing the profits of a business is *prima facie* evidence that one is a partner; but it is no longer deemed conclusive. It may be overcome by evidence that the sharers are not carrying on the business in common—that they are not its joint proprietors.

CLASSES OF PARTNERSHIP. Various classifications have been made by writers and judges. A general partnership is one organized for the conduct of a business in accordance with the general usages of trade. A particular partnership is confined to a single transaction or enterprise. Joint-stock companies are a form of general partnership at common law, in which the members are allowed to transfer their shares, without dissolving the firm, and the control of which is vested in a few designated managers. Mining partnerships are substantially joint-stock companies. All of these forms are again classified as ordinary partnerships, in contradistinction to limited partnerships.

LIMITED PARTNERSHIPS. This species was introduced into this country from the law of France. It has never gained a foothold in England, although strenuous efforts were made to develop it there after it had proved successful with us. Such efforts have ceased since the organization of joint-stock companies has become popular under modern British statutes. New York was the first of our States to provide by legislation for limited partnership. Connecticut followed this example closely, and now nearly every State has a statute upon the subject. The distinctive characteristic of a limited partnership is the conjunction of at least one general partner, who is liable for all the debts of the firm as every member of an ordinary partnership is, with one or more special partners, whose liability is limited to their contribution to the capital of the firm. In a few States limited partnership associations are authorized. These differ from the regular limited partnership in that their capital alone is responsible for their debts; none of the partners is subject to any personal liability. Both of these institutions, it will be observed, are creatures of statute. Accordingly, if the statutory provisions are not complied with, all the members of the association are liable as general partners. It is impossible to describe with fullness, in this connection, the statutory requirements for the formation of a limited partnership, for they are different in the various States. The chief requirements, however, are these: A certificate must be signed, acknowledged, registered, and published by the partners, stating the name under which the partnership is to be conducted; the general nature of the business to be done; the names and residences of the various members with a designation of the general and of the special partners respectively; the amount of capital contributed by the special partners; and the times at which the partnership is to begin and to end. An affidavit must also be made and filed in the proper office, stating that the sums specified in the certificate to have been contributed by the special partners have been actually and in good faith paid in cash. In some States the capital of the special partners may be contributed in property other than cash.

KINDS OF PARTNERS. In addition to the two kinds of partners designated by limited partnership legislation—the general partner and the

special partner—we have three others, which must be briefly described. The active or ostensible partner is one who frankly avows his membership in the firm, and thereby actively and openly promotes its business. The dormant partner is one who conceals from the public his connection with the firm. In England, and in a few of our States, he may take part in the conduct of firm affairs, without losing his status; but the view prevailing generally in this country is that he must take no part in the business—that both secrecy and inactivity are included in the term 'dormant.' The third kind goes under various names. Sometimes he is called the 'nominal' partner; at others the 'holding-out' partner. Still again he is described as the *quasi* partner, or partner by estoppel. Each of these designations indicates that he is not a partner at all; but still he is liable, as if he were a partner, to those persons who have acted upon his representations that he was a partner and who would be harmed if he were permitted to show the truth of his non-partnership.

THE NATURE OF A PARTNERSHIP. After a partnership has been formed the association is generally spoken of as a firm, and the name in which it does business is called the firm name. Unless a statute forbids, the firm may adopt any name it pleases and may change it at will, or it may go without a name. Occasionally the Legislature prohibits the use of 'and company' or '& Co.' unless such terms represent an actual partner; or it forbids the assumption of a corporate name. Even in the absence of a statute, a partnership is not at liberty to choose a firm name which will operate as a fraud upon the public or upon others trading under substantially the same name. Accordingly, if a business has been conducted successfully under the name of the 'Guinea Coal Company,' another firm will not be allowed to carry on the same line of trade in the name of the 'Pall Mall Guinea Coal Company,' especially if it has its envelopes, letter heads, and business cards so printed as to resemble those of its competitor.

The law merchant treats the firm as a legal entity—as a sort of artificial person much like a corporation. When the partners make their contribution to firm capital they cease to own it as individuals, and title passes to the firm. The firm becomes their debtor for the capital. They lend money to the firm, or borrow from it. The firm, in other words, has its own property, its own creditors, and its own debtors. This conception of the firm prevails very generally among the mercantile classes both in England and in this country. It is always observed by partnership bookkeepers. To some extent it has been recognized by State and Federal statutes, permitting the firm to sue and be sued as an association, and to be declared 'a bankrupt.' The entity theory of partnership, however, has never received full judicial sanction by English or American courts. And American judges, who, in construing mercantile contracts, have given effect as far as possible to the mercantile conception of partnership, have declared "that the firm is not recognized by lawyers as distinct from the members composing it." It follows from this view that if lands are purchased by a firm, the deed should name the partners as grantees; and if the partnership sells lands, the deed should name the partners as grantors, and they and their wives should execute and acknowledge the conveyance precisely as though they were owners in common of the property.

But this conception of a firm, as a mere association of individuals, is not applied consistently in any jurisdiction. For example, we have said that an infant, because of his legal incapacity, is not bound by his agreement to become a partner, nor by the partnership agreement with third persons. Yet, after he has entered a firm and taken part in its management, he is not allowed to withdraw his capital until firm debts are paid. That is, he may escape personal responsibility for partnership obligations, but the firm ownership of firm property prevents his taking away any money or goods which he had contributed to the firm. Again, a partner's share in the firm is not the interest of a tenant in common in specific articles. It is only a *chose in action*—a right to his proportionate share of the net proceeds of firm property upon a final settlement. Accordingly, if the creditor of one partner gets a judgment against him and levies upon firm property, he cannot sell and give perfect title to any particular articles. All that he can dispose of is the judgment debtor's interest therein, which may be something or nothing, and which is nothing whenever the firm is insolvent, or the debtor partner has exhausted his interest in the firm property.

THE POWERS OF PARTNERS. Each member of a normal partnership is the general agent of the firm and of his copartners in carrying on the ordinary business of the firm. He can sell and give a perfect title to firm property, can collect debts, and can subject the firm and his copartners to most extensive obligations both in contract and in tort.

How extensive a general partner's agency is depends upon the nature of the firm's business. His implied authority may be summarized as follows: If the partnership is a trading or commercial firm, he may sell or pledge any of its property; he may buy on credit such property as it is accustomed to deal in; he may borrow money, and issue in the firm name negotiable paper; he may hire servants and agents; and he may render the firm and each copartner liable in tort by wrongful acts or omissions in the ordinary course of the business of the firm. Moreover, his admissions and representations concerning the firm's affairs and in the ordinary course of its business are receivable as evidence against the firm and his copartners who are sued as such.

This implied agency of a partner may be [illegible] [illegible] partnership articles confer the power of [illegible] upon particular members. It may be taken from him without his consent by a majority acting in good faith. Such limitations upon a partner's agency must be brought to the knowledge of those who deal with the firm, or they will not be [illegible].

DUTIES OF A PARTNER. The most important of these is his observance of the utmost good faith towards his copartners. Not only must he give to the firm the benefit of every advantage or gain he can make in the business, but he must devote the whole of his time and energies

ing business hours, to the promotion of its interests, unless he has stipulated in the partnership contract for exemption in these respects. Moreover, if his copartners have been compelled to pay more than their shares of the firm debts and expenses, he is bound to contribute toward their indemnity.

Dissolution of Partnership. This may result by operation of law, or from the acts of the parties, or from judicial decree. The happening of any event which makes it unlawful for the business of the firm to be carried on, or for the particular contracting members to continue as partners, dissolves the firm at once, as does the death or the bankruptcy of a partner. The partnership may terminate by reason of an agreement made in advance that it shall terminate at a fixed date, or at any time by mutual consent. In the United States one partner may break up a firm against the wishes of his copartners, subject to his liability to damages for breach of his partnership contract. A court will ordinarily decree a dissolution, at the request of a partner, upon the insanity or permanent incapacity of a member of the firm, or for the misconduct of one of the defendant partners, or when it appears that the business can only be carried on at a loss. As soon as a firm is dissolved, the agency of the partners ceases, except so far as this is necessary to winding up the firm's affairs. Sometimes a particular member is agreed upon as liquidating partner, to whom exclusive authority in settling firm matters is confided.

Distribution of Firm Assets. In winding up a partnership its assets are to be applied as follows: First, to paying the general creditors of the firm; second, to paying to each partner ratably what is due from the firm to him for advances as distinguished from capital; third, paying to each partner ratably what is due from the firm to him in respect of capital; fourth, the distribution of the residue, if any, shall be among the partners in the proportion in which profits are divided. If losses have been sustained, these are to be paid first out of profits, next out of capital, and lastly, if necessary, by the partners individually in the proportion in which they were entitled to share profits. Of course, these rules may be varied, so far as their application to partners is concerned, by provisions in the partnership articles.

Consult: Bates, *The Law of Partnership* (Chicago, 1888); Bates, *The Law of Limited Partnership* (Boston, 1886); Parsons, *A Treatise on the Law of Partnership* (ib., 1893); Burdick, *The Law of Partnership, Including Limited Partnerships* (ib., 1899).

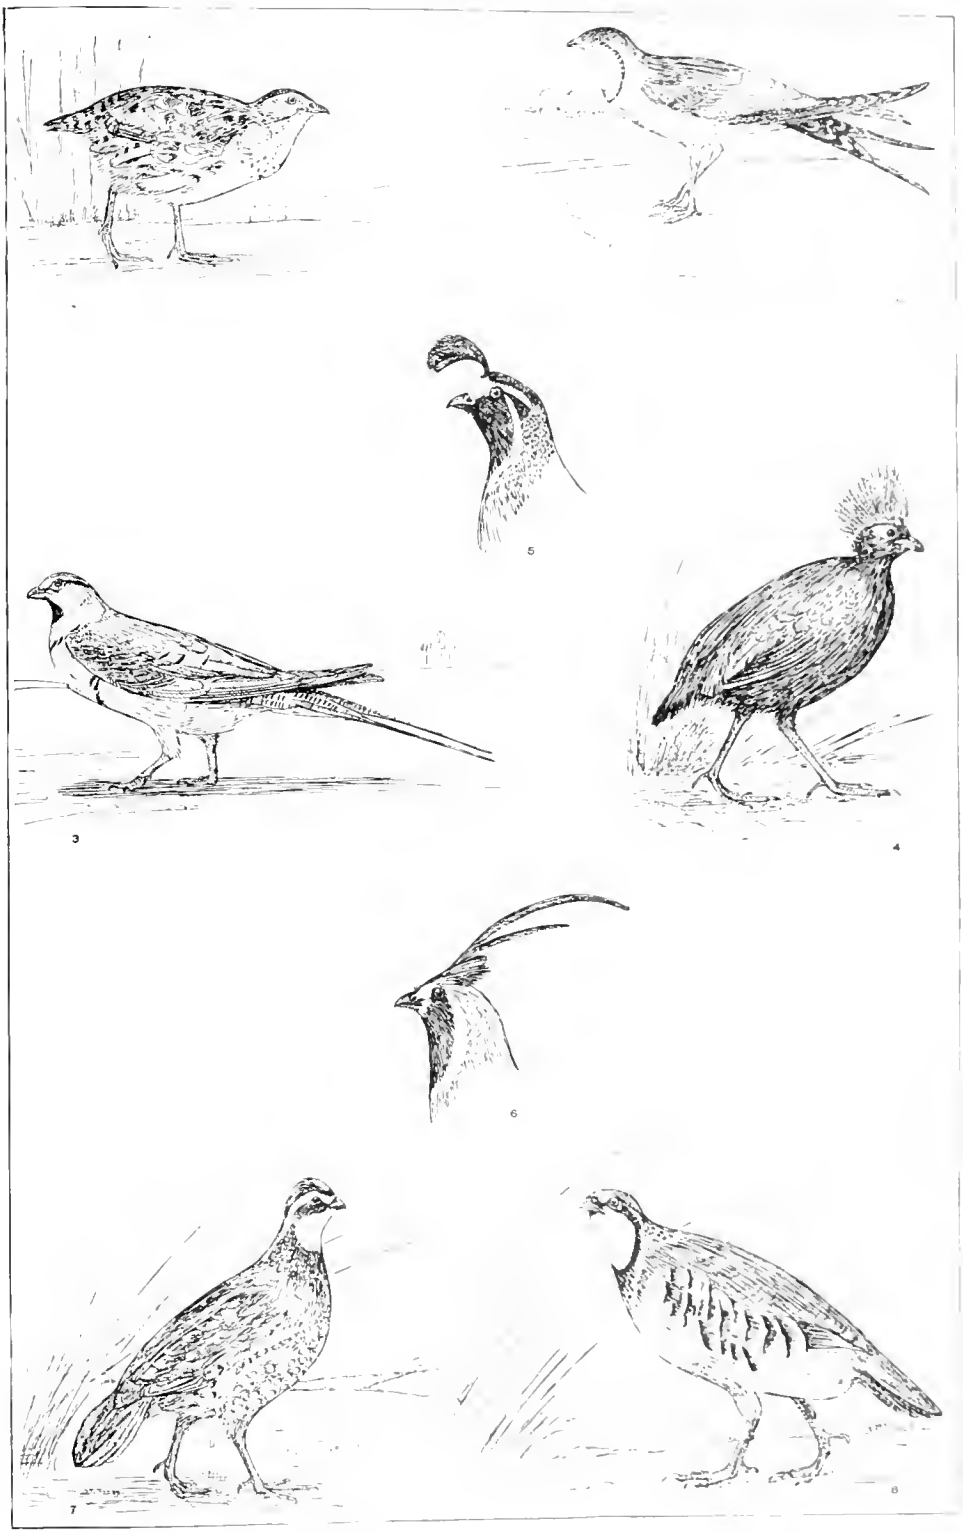
PAR'TON, Arthur (1842—). An American painter, born at Hudson, N. Y. He was the pupil of W. T. Richards in Philadelphia, and was elected to the National Academy in 1884. The coloring in his landscapes is usually in a low key, but his later work, with quite as much quality, has more vigor. His pictures include: "Mountain Brook" (1875); "Nightfall" (1881); "In the Gloaming" (1885); and "Palisades in Winter" (1885).—His brother Ernest (1845—), born at Hudson, was his pupil, and also a landscape painter. Among his works are "Silver and Gold" (1882) and "Last of October" (1886), both characteristic of his refined poetic style of painting.

PARTON, James (1822-91). An American biographer, born in Canterbury, England, February 9, 1822. Parton was brought to the United States in 1827, and was educated in New York City and White Plains, N. Y. He taught in Philadelphia and New York, and began a long literary career by journalistic work on the *Home Journal*. His first book was a *Life of Horace Greeley* (1855), which gained immediate success. He afterwards devoted himself wholly to authorship and to lectures on political and literary topics, residing in New York until 1875, and afterwards at Newburyport, Mass. His principal publications were: *Life and Times of Aaron Burr* (1857); *Life of Andrew Jackson* (3 vols., 1859-60); *General Butler in New Orleans* (1863); *Life and Times of Benjamin Franklin* (1864); *Famous Americans of Recent Times* (1867); *The Words of Washington* (1872); *Fanny Fern*, a memorial to his wife (1873); *Life of Thomas Jefferson* (1874); *Caricature and Other Comic Art in All Times and Many Lands* (1877); *A Life of Voltaire*, his most meritorious production (1881); *Noted Women of Europe and America* (1883); and *Captains of Industry, a Book for Young Americans* (1884 and 1891). In 1856 he married Sara Payson Willis (born at Portland, Me., July 9, 1811; died at Brooklyn, N. Y., October 10, 1872), sister of the poet N. P. Willis, a popular authoress who wrote under the name of 'Fanny Fern.' She left, by a former marriage to Charles H. Eldridge, a daughter, whom Parton afterwards married.

PART OWNER. In its broadest sense, any person who owns property in common with another or others, except partners. Specifically, one of the coöwners of a ship.

Part owners of a ship may transform this ownership into a partnership title by agreement. Such transformation, however, will not be presumed; it must be proved. So long as they remain part owners, they manage the vessel by, and delegate their interests to, various agents, of whom the principal are the ship's husband and the master. Formerly the ship's husband was generally in fact a part owner, but he need not own an interest in the vessel in order that his authority extend to all matters connected with its equipment, repair, and management. A majority of the part owners have the right to use the ship for a particular voyage against the will of the minority. When the majority exercise this power, however, a court of admiralty may require them to secure the minority owners to the extent of their shares. Consult: Lindley, *The Law of Partnership* (London, 1895); Kent, *Commentaries on American Law* (Boston, 1896).

PARTRIDGE (OF. *perdris, perdriz, pertrix*, Fr. *perdrix*, It. *perdice, pernice*, from Lat. *perdix*, from Gk. *πέρδιξ*, partridge). A popular name for various gallinaceous birds, or other birds superficially like them, the precise application of which depends not only on the country, but on the part of the country where the term is used. The name was originally given, and properly belongs, to birds of the grouse family, of the genus Perdix, all of which are confined to the Old World. They have a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip; the wings and tail short, the tarsi as well as the toes naked, the tarsi not spurred. In North America the term is hardly



1. COMMON EUROPEAN QUAIL (Coturnix communis).
2. PRATINCOLE (Glareola pratincola).
3. SAND GROUSE (Pterocles alchata).
4. CROWNED WOOD QUAIL (Rollulus roulroul).
5. CALIFORNIA VALLEY QUAIL (Lophortyx Californ...).
6. CALIFORNIA PLUMED or MOUNTAIN QUAIL (Lophortyx p...ctus).
7. AMERICAN QUAIL or BOB-WHITE (Colinus V...ginianus).
8. RED-LEGGED PARTRIDGE (Caccabis rufa).

applicable properly, as our larger Gallinæ are grouse, while the smaller ones are preferably known as quails, although not precisely the same as the true quails (Coturnix) of the Old World. In the Northeastern United States the ruffed grouse (see GROUSE) is almost universally called 'partridge,' while in the Southern States the common quail (q.v.) receives that name, and the grouse is known as 'pheasant.' The term seems most properly applied in America to the small game-birds of the Pacific Coast, such as Gambel's partridge, and the 'mountain' and 'valley' partridges of California. In South America tinamous (q.v.) are called 'partridges.'

The true partridge of the Old World is typified by the common gray partridge (*Perdix cinerea*) of Great Britain and Europe generally, which is the most plentiful of all the game-birds in Great Britain, and becomes increasingly plentiful as cultivation is extended. On the Continent of Europe it is abundant in almost all suitable districts from Scandinavia to the Mediterranean, and is found also in the north of Africa and in Western Asia. It varies considerably in size; those found in rich lowlands are generally the largest, and about 12½ inches in entire length, while those which inhabit poorer and more upland districts are rather smaller. The female is somewhat smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. The partridge is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvæ and pupæ, and the pupæ of ants are generally the food sought at first for the young. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from 12 to 20 eggs. Until the end of autumn the parent birds and their brood keep together in a *covey;* late in the season several coveys often unite into a *pack*, when it becomes much more difficult for the sportsman to approach them. The flight of the partridge is strong and rapid for a short distance, but the bird does not seem to be capable of long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary. Other species occur in Asia.

Of a different genus is the red legged or French partridge (*Caccabis rufa*), a native of Southern Europe and now plentiful in the south of England, where it has been introduced. It is rather larger than the common partridge, stronger on the wing, and less easily approached by the sportsman, while it is also less esteemed for the table. The upper parts are of a reddish ash color; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth. Two other species nearly allied to this are found in Southern Europe. India has a number of species, the habits of which much resemble those of the common partridge, the best known of which is the chukor (q.v.). In India, however, the name is extended by sportsmen to a large variety of small game-birds, more or less like the true partridge, such as the bamboo partridges, hill partridges, and tranedins (of which the 'black partridge' (*Francolinus vulgaris* of the Eastern Mediterranean region is a familiar example). In Australia one of the bush-quails (Pedionomus) is so-called, and in South Africa the 'redwing' partridge of the colonists is a tranedin (*Francolinus to Vaillantii*).

See Colored Plates of GAME BIRDS, with article GROUSE, and of EGGS OF WATER AND GAME BIRDS.

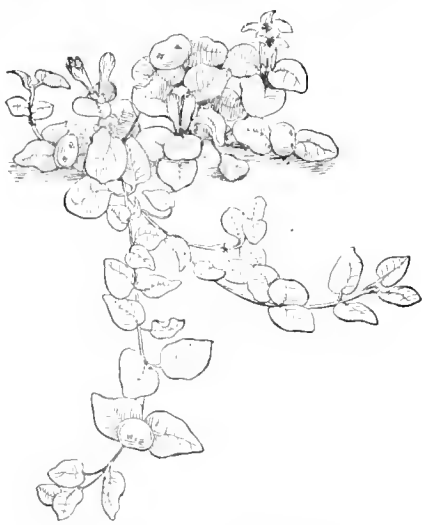
PARTRIDGE, ALDEN (1785–1854). An American educator, born at Norwich, Vt. He graduated at the newly founded Military Academy at West Point in 1806, was commissioned first lieutenant of engineers, and was assigned to duty there as assistant professor of mathematics. From 1813 to 1816 he was professor of engineering. In 1818 he resigned from the army, and in 1820 returned to Norwich, where he founded the American Literary, Scientific, and Military Academy, better known as the Norwich Military Academy. The success of this undertaking was immediate and in 1834 the State granted it a charter as the Norwich University. At the invitation of other States, Partridge founded similar military schools at Portsmouth, Va., Pembroke, N. H., Harrisburg, Pa., and Brandywine Springs, Del., and devoted much time to organizing and drilling their militia.

PARTRIDGE, JOHN (1644–1715). A famous London astrologer and almanac maker. Bound apprentice to a shoemaker, he nevertheless learned by himself Latin, Greek, and Hebrew, and seems subsequently to have studied medicine at Leyden. He wrote a treatise on the *Old Principles of Astrology* in 1697. In 1680 he had begun to issue an almanac called *Merlinus Liberus*, which, after a short suspension, was regularly published from 1689. This masterpiece of equivocation soon became exceedingly popular. As a parody upon it Jonathan Swift issued at the beginning of 1708, *Predictions . . . by Isaac Bickerstaff, Esq.*, in which it was foretold that Partridge would "infallibly die upon March [next, about 11 at night, of a raging fever." On March 30th Swift published a pamphlet in which the prediction was said to be accomplished. In vain Partridge tried to convince the public that he was still alive. Swift followed up the humorous attack in an *Elegy on the Death of Mr. Partridge* (1708) and the *Vindication of Isaac Bickerstaff* (1709). Partridge was so completely crushed that not another *Merlinus* appeared till 1711. Partridge's *Almanac*, issued by the Stationers' Company in 1711, has appeared

regularly ever since. The name Isaac Bickerstaff (q.v.), which Swift took from a sign in Longacre, soon spread far and wide. It was appropriated by Steele in the *Tatler* (1709).

PARTRIDGE, William Ordway (1861—). An American sculptor and author, born in Paris. He was educated at Columbia University, in New York City, and studied modeling under Galli in Florence, and Welonski in Rome. He first became known by his portrait busts, which include "An Old Woman," in the Corcoran Gallery, Washington, and bas-reliefs of Sir Henry Irving (1892) and Edward Everett Hale (Salon, 1893). One of his first large works, the bronze statue of Hamilton in front of the Hamilton Club, Brooklyn, N. Y., is a striking conception of the great statesman in a moment of dramatic interest. It exhibits in a marked degree the restraint that characterizes all his productions. Another notable work is the "Shakespeare," unveiled at Lincoln Park, Chicago, in 1894. His bronze equestrian statue of General Grant (1896) in Brooklyn is a model of unity and technical ability. His largest ideal work is the Kauffman Memorial at Washington. Other busts include a noble "Madonna" (1897), Whitman, Lincoln, Whittier, "Dreams," and "Midsummer Night's Dream." Mr. Partridge also became well known as a lecturer and writer on art and letters and municipal improvements. His publications include: *Art for America* (1894); *Song Life of a Sculptor* (1894); *The Technique of Sculpture* (1895); *The Angel of Clay* (1900), a novel; and *Nathan Hale* (1902). For a time he was professor of fine arts at Columbian University, Washington, D. C.

PARTRIDGE-BERRY, or Checker-Berry. Members of the genus Mitchella, of the natural order Rubiaceæ (madder family), represented by one species in America and one in Japan. The



Partridge Berry (*Mitchella repens*).

American species, Mitchella repens, which extends from Canada to Mexico, is a small trailing evergreen, with a branching stem, a foot or more long, usually covering the ground. It is named in honor of Dr. John Mitchell, a Virginian botanist, correspondent of Linnæus. Its favorite habitats are dry, sandy knolls in piney woods, but it may be found in most dry woods. Its leaves are smooth and shining, round-ovate, opposite with short petioles, and traversed with light lines; flowers in pairs with ovaries united. The fruit is a beautiful scarlet berry crowned with the calyx teeth of the two flowers, each with four small seed-like and bony nutlets. The berry, which is about the size of that of the wintergreen, but almost tasteless, remains on the plant during the winter. Blossoms appear in June and July.

PARTRIDGE DOVE, or Partridge Pigeon. An Australian pigeon of the genus Geophaps, approaching in character and habits to the gallinaceous birds, and particularly to partridges. The plumage has a bronze tinge and lustre on the wings, which resembles that of the closely allied bronzewings (q.v.). There are several species. They live mostly on the ground, and rise with a whirring noise, like the pheasant, when disturbed. They are highly esteemed for the table. *Geotrygon montana*, a species of another genus, bears the name 'partridge dove' in the West Indies. It also seeks its food chiefly on the ground, although it affects well-wooded districts.

PARTRIDGE-WOOD. A very pretty, usually reddish, variously streaked hard wood from the West Indies and Brazil, where it is used in shipbuilding. In choice specimens the layers of wood are curled upon one another so as to resemble the feathers of the partridge; hence its name. Its chief use in other countries is for cabinet-work, parasol-sticks, fans, and other small articles. It is said to be yielded by *Andira inermis*, a leguminous tree.

PARTS OF SPEECH. See the section on *Parts of Speech*, under Grammar.

PARTURIENT APOPLEXY. A disease of live stock. See Milk Fever.

PARTURITION. See Obstetrics.

PARTY NAMES (OF., Fr. *partie*, from ML. *partita*, party, part, Lat. *partita*, fem. sg. of *partitus*, p.p. of *partiri*, to divide). The following is a partial list of the political groups which have existed in the United States, some of which, however, were never definitely organized as parties.

Abolitionists.—Those who strove to secure the abolition of slavery. (See article on this title.) *Adamites.*—The political supporters of John Quincy Adams. The expression was current from about 1821 to 1832. *American Party.*—A party which originated in New York in 1835, and which was organized as a national party about 1852. Its purpose was expressed in the motto, 'America for Americans.' Later it became known as the 'Know-Nothing Party.' The name was also applied to two other parties in the history of the United States. (See American Party, and Know-Nothings.) *Anti-Federalists.*—The name applied to those who opposed the adoption of the Constitution of the United States and who later opposed the liberal construction of that instrument. (See Anti-Federalists.) *Anti-Imperialists.*—(See Imperialism.) *Anti-Masons.*—A party which originated in New York in 1826, its chief principle being hostility to the Masonic Order. (See Anti-Masons.) *Anti-Nebraska Party.*—A party formed in 1854 after the enactment of the Kansas-Nebraska Bill and

composed mainly of Northern Whigs, who were opposed to the repeal of the Missouri Compromise. *Anti-Renters.*—The name applied to those in New York who opposed the collection of rent from the tenants occupying the old patroon estates. The movement flourished during 1839-47. (See ANTI-RENTISM.) *Barnburners.*—The radical wing of the Democratic Party in New York for several years after 1844. They were arrayed against the Hunkers (q.v.) or the moderate wing. (See BARNBURNERS.) *Black Republicans.*—The name applied, chiefly in the South at the close of the Civil War, to those supporting the Republican Party, on account of their sympathy for the negro. *Bourbons.*—Originally applied to the Southern Democrats of the old school, but now used of any reactionary who adheres obstinately to tradition. *Bucktails.*—A political faction originating in New York in 1815, and opposed to the administration of Governor Clinton. They were so called from the habit of wearing bucktails in their hats. *Carpet-Baggers.*—See article on this title. *Constitutional Union Party.*—A party organized in 1860 and composed mainly of former Southern Whigs. (See CONSTITUTIONAL UNION PARTY.) *Copperheads.*—The name applied by the Republicans during the Civil War to the Democrats of the North who did not believe in prosecuting the struggle with the South, and some of whom sympathized with the cause of the Confederates. (See COPPERHEADS.) *Coöperationists.*—The term applied at the time of the secession controversy in the Southern States to those who favored the secession of their own State only in the event of 'coöperation' of their sister States. *Court Party* (old and new).—The term applied to the supporters of two rival superior courts in Kentucky. (See KENTUCKY.) *Democratic Republicans.* See DEMOCRATIC PARTY. *Democrats.*—See article on DEMOCRATIC PARTY. *Doughfaces.*—The name sneeringly applied by John Randolph of Roanoke, about 1820, to Northern members of Congress who supported the slavery interests by their votes. *Drys.*—Another term for those favoring the prohibition of the liquor traffic. *Federalists.*—See article on this title. *Free Soilers.*—A party which first came into prominence in 1848. It was made up of men opposed to the extension of negro slavery. (See FREE-SOIL PARTY.) *Gold Democrats.*—A party of disaffected Democrats who refused to support the regular party platform and candidates in 1896. They adopted a platform favoring the gold monetary standard and nominated J. M. Palmer, of Illinois, for President. *Grangers.*—See article on this title. *Greenbackers.*—A party advocating the issue of an irredeemable paper currency. It was prominent during the decade from 1876 to 1886. (See GREENBACK PARTY.) *Half Breeds.* The moderate wing of the New York Republicans, 1881-85, opposed to the Stalwarts (q.v.). *Hunkers.*—See HUNKERS. *Jacksonites.* The followers of Andrew Jackson, 1825-29, opposed to the *Adamites*. *Know-Nothings.*—See article on this title. *Liberals or Liberal Republicans.* Those Republicans who opposed the reëlection of President Grant in 1872, and favored a more liberal policy as regards the Southern question. (See LIBERAL REPUBLICAN PARTY.) *Liberty Party.*—A party which was formed about 1840 for the purpose of securing the abolition of slavery. (See article on this title.) *Lily Whites.*—The term applied to white Republicans in the South who favor the exclusion of negroes from the party. *Loco Focos.*—A popular nickname given to a faction of the Democrats in New York about 1835. (See article on this title.) *Loose Constructionists.*—The term applied frequently to the Federalists and later to the Whigs, on account of their advocacy of a liberal interpretation of the Constitution of the United States. *Mahonists.*—A party in Virginia consisting of the followers of Gen. William Mahone, who bolted from the Democratic Party in 1878. (See READJUSTERS.) *Middle-of-the-Road Populists.*—See POPULIST PARTY. *Mugwumps.*—See article on this title. *National Republicans.*—See WHIG PARTY. *Native Americans.* See the article KNOW NOTHINGS. *Nullifiers.* Those who advocated the right of a State to suspend within its own boundaries the operation of a law of the United States. Only in South Carolina, 1828-32, did this become the basis of a party organization. (See article on NULLIFICATION.) *People's Party*, or *Populist Party.*—A political party first organized on national lines in 1892. (See article on POPULIST PARTY.) *Prohibitionists.*—Those who advocate abolition of the liquor traffic. Since 1872 there has been a national Prohibition Party. (See article on PROHIBITION.) *Radicals.*—The name applied after the Civil War to the extreme wing of the Republican Party as regards its policy in dealing with Southern questions. *Readjusters.*—A local party in Virginia in 1878 headed by Gen. William Mahone, and favoring a conditional repudiation of the State debt. (See article on READJUSTERS.) *Repudiators.*—A party in Mississippi which advocated the repudiation of a large number of Union bank bonds, the payment of which the State had guaranteed. (See article on REPUDIATION.) *Relief Party.*—The name applied to the supporters of a movement in Kentucky which had for its purpose the enactment of measures by the Legislature for relieving the people of economic and financial burdens. 'Relief' parties were common in other States from 1830 to 1860. (See KENTUCKY.) *Republicans.*—See article on the REPUBLICAN PARTY. *Scalawags.*—The name applied to native Southerners during the reconstruction era who affiliated with the Republican Party. *Silver Grays.*—The conservative wing of the Whig Party. *Silver Party.*—A party made up chiefly of disaffected Republicans in 1836, who favored the free coinage of silver. It indorsed the Democratic nominees for President and Vice-President in that year. *Socialists*, or *Socialist-Labor Party.*—This first appeared as a national movement in 1892, when it nominated candidates for President and Vice-President, and adopted a platform advocating a socialistic policy in governmental affairs. *Stalwarts.*—A wing of the Republican Party in New York from 1880 to 1885, led by Roscoe Conkling, and representing the 'machine' politics of the party. (See article on this title.) *Strict Constructionists.*—The name given to those who advocated the strict interpretation of the Constitution of the United States. *Union Labor Party.*—A movement which first became national in 1888. It nominated candidates for President and Vice-President and adopted a platform of principles. *Union Leagues.*—Organizations of a political character in the Southern States for a time after

the Civil War, composed chiefly of negroes and white Republicans. *Washingtonians.*—The term early applied to the Prohibition Party. *Whigs.*—See WHIG PARTY. *Woman's Rights Party.*—A party which first appeared as a national movement in 1884. Both in that year and in 1888 it held national conventions and nominated candidates for President and Vice-President, pledged to advocate the general introduction of female suffrage.

PARTY WALL. A wall dividing adjoining properties and owned in common by the owners of the properties or so that they have common rights in its use and maintenance. By the English common law, where the wall is partly on both lots, the adjoining proprietors are regarded as tenants in common of the wall, and probably of the land on which it stands, during the existence of the wall. In the United States, if the wall stands so that it is partly on both lots, the owner of each lot retains the fee in the part of his land covered thereby, and also owns the portion of the wall standing on his lot, subject, however, to the easement of support incident to a party wall, in favor of the adjoining owner, and he has reciprocal rights in the other portion of the wall.

A party wall may, like any other easement, be created by grant, by prescription, or twenty years' user, and in a few States by virtue of statutes authorizing a person to build a party wall between his land and that of another and exact contribution from the latter under certain circumstances. The weight of authority in the United States is to the effect that statutes of the nature above referred to are unconstitutional, as taking private property without compensation, especially as it is for private purposes. In the few States where such statutes exist they are held valid as a legitimate exercise of the police power. Neither owner of a party wall has a right to extend the front and rear walls of his building farther than to the middle of the party wall, nor can either maintain a window therein, even if the other party is not using his side. Either owner may increase the height of a party wall, provided the wall is thick enough "to bear the increased weight, or may increase its thickness on his own land." When a party wall becomes unsafe or dangerous, either party may repair it, even to the extent of rebuilding it, without causing injury to the other; but the one repairing or rebuilding cannot in general require the other to pay his proportionate share of the cost thereof. In most jurisdictions it is held that if the wall is totally destroyed by any cause the easement is at an end, and neither party can rebuild without the consent of the other. Consult the authorities referred to under EASEMENT and REAL PROPERTY.

PĀRVATĪ (Skt., mountain-born). In Hindu mythology, the beneficent aspect of the wife of Siva (q.v.). She was a reincarnation of Uma (q.v.), and was born as a daughter of Himavant or the Himalaya Mountain, from which circumstance she received her name. According to another account, she was the daughter of the combined glances of Brahma (q.v.), Vishnu (q.v.), and Siva, and was born on Mount Kailasa in the Himalayas. She was then white, red, and black, the colors of Brahma, Vishnu, and Siva respectively, but at Brahma's request divided herself into three forms, of which the white, Sarasvati, was the wife of Brahma; the red, Lakshmi (q.v.), the wife of Vishnu, and the black, Parvati, the wife of Siva. Parvati plays little part in Hindu mythology, manifesting her power chiefly under her aspects of Durga (q.v.) and Kali (q.v.). Consult Wilkins, *Hindu Mythology* (2d ed., London, 1900), and see, for illustration, Plate of HINDU DEITIES in the article INDIA.

PAR'VIN, THEOPHILUS (1829-98). An American obstetrician. He was born in Buenos Ayres, was a graduate of the universities of Indiana and of Pennsylvania, and, after a dozen years' practice in Indianapolis, became professor in the Ohio Medical College (1864). From 1869 to 1872 he taught in the medical department of the University of Louisville; then was professor of obstetrics and infantile diseases in Indiana Medical College, and in 1883 was chosen to a like chair in Jefferson Medical College, Philadelphia. He wrote *The Science and Art of Obstetrics* (1886), and edited *Winckel on the Diseases of Women* (1887).

PAS'ADE'NA. A city in Los Angeles County, Cal., 10 miles northeast of Los Angeles, on the Southern Pacific, the Atchison, Topeka and Santa Fe, and the Salt Lake railroads (Map: California, D 4). It is an attractive residential place and a well-known winter resort, its healthful climate and beautiful situation contributing to its popularity. Green Hotel, Maryland Hotel, Hotel La Pintoresca, and Raymond Hotel, are among the most prominent buildings of Pasadena. There are also the Throop Polytechnic Institute, and a public library that contains over 20,000 volumes. The Pasadena Academy of Sciences possesses a valuable museum of archæology and natural history. The city has voted (1903) $300,000 for parks and other improvements, besides $100,000 for a new high school building. Pasadena was settled in 1874 by a colony from Indianapolis and soon became known for its horticultural enterprise. It is the centre of extensive fruit-growing interests, the cultivation of oranges and lemons being especially prominent. There are large packing houses, many drying establishments, a large cannery, and manufactures of woodwork, boots and shoes, and brick. Pasadena was first incorporated in 1886. It is governed, under a charter of 1901, by a mayor, elected every two years, and a unicameral council. Population, in 1890, 4882; in 1900, 9117.

PASAR'GADÆ (Lat., from Gk. Πασαργάδαι, possibly from OPers. **Pārsa-vardana*, city of Persia, equivalent in meaning to *Persepolis*). The ancient capital of Persia, before the foundation of Persepolis. Its site is generally supposed to have been on the Plain of Murghab northeast of Persepolis, where there is an ancient tomb which the best authorities all believe to be the tomb of Cyrus. The neighborhood was the burial place of the Achæmenian kings and the ancient tribe called Pasargadæ dwelt in the vicinity. The region was the home of the royal family of the Achæmenidæ. Consult Curzon, *Persia and the Persian Question* (London, 1892); and the authorities referred to under PERSEPOLIS.

PASCAGOULA, păs'kȧ-gōō'lȧ. A river of Mississippi, formed by the junction of the Leaf

and the Chickasawhay, both flowing southward through the southeastern part of the State (Map: Mississippi, H 9). It empties through a beautiful estuary into Mississippi Sound at Scranton, near the Alabama boundary. With its main headstream, the Chickasawhay, it is 250 miles long, and navigable 100 miles for small steamers. It is the outlet for the lumber cut in the large pine barrens through which it flows.

PASCAL, pȧ'skăl'. BLAISE (1623-62). A distinguished French philosopher, mathematician, and author, born at Clermont-Ferrand. He came of an Auvergnat family, ennobled in 1478, and for generations occupied in the civil service. His mother died in his infancy, and his father moved in 1631 to Paris. Here he was educated by his father, and showed remarkable precocity in mathematics. In 1641 the family removed to Rouen, where for a number of years Pascal was engaged in scientific studies, especially in physics. In 1648 his sister Jacqueline was attracted to the Jansenist convent at Port-Royal, and Pascal frequently accompanied her there, till their father took them both to Clermont, where Pascal remained for two years. In 1650 the family returned to Paris, and the next year the father died; Jacqueline joined Port-Royal, but Pascal remained in Paris till 1654, when he followed her thither. His decision to embrace the austere life of Port-Royal is said to have been caused by a carriage accident, though it is quite clear from minor writings of this period, such as *Prière pour demander le bon usage des maladies* (1648), and *Lettres sur la mort du père de M. Pascal* (1651), that the Jansenist faith and what is uncritically called Pascal's skepticism were already firmly fixed in his mind. From this moment he gave himself utterly to Port-Royal, continuing to believe in and labor for the progress of science, though sure that mental and moral certitude could be found only in revelation. He was not then a theologian, and he never acquired more than a superficial acquaintance with the Fathers of the Church. Yet, with the equipment of his unsurpassed literary instinct and scientific training, he entered on his famous controversy with the Jesuits in the eighteen *Lettres provinciales*. They were published clandestinely and pseudonymously in 1656 and 1657. The title of the collected letters reads: *Lettres écrites par Louis de Montalte à un provincial de ses amis et aux RR. PP. Jésuites; sur la morale et la politique de ces pères.* Subsequently the collection was entitled simply *Les provinciales*. It is evident that they were written under intense excitement, stimulated by the supposed miraculous cure of his niece through contact with a relic of the crown of thorns at Port-Royal. The letters were immensely popular and successful, but brought down both ecclesiastical and civil censures upon the unknown author. They are perhaps the greatest masterpieces in the literature of irony; there is no trace of declamation or of indignation, only a contemptuous smile, an insinuation of sarcasm, which in the latest letters yields occasionally to a stern but not impassioned invective, less effectual and less agreeable than the earlier manner. Pascal's style is unsurpassed in graceful energy and brilliant wit. It lacks tenderness and melody, but has the characteristically French virtues of being sharp, clear-cut, compact, and yet full in its utterance. He is the first French prose-writer thoroughly at home with rhetorical tools. There has been gradual adaptation to new needs, but French prose has neither made nor needed to make a great advance since the *Lettres provinciales*. Considered, now or, from the point of view of honest controversy, they cannot be praised too highly. At best they are special pleadings, and do not represent the general spirit of the Jesuit Order. Accurate scholarship has pointed out numerous passages which misquote or misapply the authors quoted, or distort an *obiter dictum* of some obscure Jesuit, sometimes even a proposition condemned by the Society, into its official teaching. His colleagues at Port Royal, especially Nicole, furnished materials and collected references, and others were taken from a Calvinist collection published at Geneva in 1632. Pascal's part was that of the earnest and convinced barrister who pleads a case from materials put into his hands by others. He himself said, it is true, that he had read Escobar through twice, and had never used a passage from any author without having looked it up with its context. The real issue, however, is not between Jesuits and Jansenists, but between Puritanism and Probabilism. Pascal leads an ascetic reaction against the naturalism of the sixteenth century as we find it, on the one hand, in Rabelais and Montaigne, and, on the other, in Ronsard and the Classicists. This double movement of the Renaissance the Jesuits had sought to reconcile with Christianity by their ethics. Against this Pascal makes a Puritan and Augustinian protest, somewhat as Calvin had made it in a previous generation. The critic Brunetière thinks that Pascal made a mistake in scoffing at casuistics, while he attacked Probabilism, and that in seeking to ruin the moral credit of the Jesuits he directed a blow against religion itself, which might have had serious consequences had it not been in some degree parried by Pascal's second great work, *Pensées sur la religion et sur quelques autres sujets* (1670).

For Pascal had not yet finished *Les provinciales* when he conceived the idea of supplementing this destructive work of criticism by a constructive *Apologie de la religion chrétienne*, by which, of course, he meant Jansenism. At this he worked serenely, though with much physical suffering, and some self-inflicted refinements of asceticism, until his death, in 1662. He left it little more than a series of disconnected fragments, published with omissions, alterations, and some errors of mere carelessness in 1670. A more exact text, edited by Faugère, appeared in 1844. The general idea of the work is obvious if we conceive it to be a book of Jansenist apologetics. Pascal urges the wretchedness of man in himself and in his environments, the impotence of reason, the protest of despair, the invincible hope of better destiny, the solution of the difficulty in the doctrine of original sin, and the consequences of the acceptance of that doctrine, namely, expiation and redemption, dogmas foreshadowed in the Old Testament, confirmed by miracles, forming the essentials of Christianity, and credible by an effort of will.

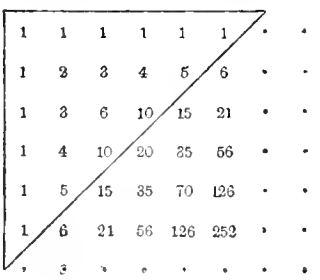
Pascal's work in mathematics was also of considerable importance. He was the first one to attempt a philosophy of mathematics. When only sixteen years old, he wrote a work on the *Conic Sections* (1639), most of which is lost, though a fragment has been restored from its correspondence with Leibnitz. It contained

two important theorems, the one which is known as Pascal's theorem (see CONCURRENCE AND COLLINEARITY), and another, due to Desargues, that if a straight line cut a conic in P and Q, and the sides of an inscribed quadrilateral in A, B, C, D, we have the following relations: $\frac{PA \cdot PC}{PB \cdot PD} \frac{QA \cdot QC}{QB}$. In 1665 he published his arithmetical triangle, a device for determining the coefficients of the expansion $(a + b)^n$. (See PASCAL'S TRIANGLE.) The theory of probabilities (see PROBABILITY) assumed form under the hands of Pascal and Fermat (q.v.). Pascal's last work dealt with a curve called by him the roulette, and known later as the cycloid (q.v.). The best study of his scientific works is Desloves, *Etude sur Pascal et les géomètres contemporains* (Paris, 1878).

There are modern editions of *Les provinciales* by Lesieur (1867), Saey (1877), Soyres (1880), Derôme (1880-86), Brunetière (1896), and others. Of the *Pensées* may be mentioned here the modern editions by Molinier (1877-79), Guthlin (1896), Michaut (1896), and Brunschvieg (1897). With the *Pensées* are usually included the chief minor works, *Entretien avec M. De Saci*, *Discours sur la condition des grands*, *L'esprit géométrique*, *Préface d'un traité du vide*, and the Letters to Mlle. de Roannez. Both *Les provinciales* and the *Pensées* have been frequently translated. An elaborate and, it is hoped, definite edition is being prepared by Boutroux. A full bibliography may be found in Petit de Julleville, *Histoire de la langue et de la littérature française* (Paris, 1896 et seq.). There are biographies and studies of Pascal by Condorcet (1776), Bossuet (1779), Sainte-Beuve in his *Port-Royal* (5th ed., 1887), Maynard (1850), Cousin (5th ed., 1858), Bertrand (1891), Sourian (1898), and Boutroux (1900). Consult also: Tulloch, *Pascal* (London, 1878); Vinet, *Studies on Pascal* (Eng. trans., Edinburgh, 1859); Nasmith, *Pascal* (New York, 1892); Clark, *Pascal and the Port-Royalists* (ib., 1902); Parsons, *Studies in Church History* (ib., 1896); Dreydorff, *Pascal, sein Leben und seine Kämpfe* (Leipzig, 1870).

PASCAL'S THEOREM. See CONCURRENCE and COLLINEARITY.

PASCAL'S TRIANGLE. A device studied by Pascal for the determination of the coefficients of the expansion $(a + b)^n$, where n is any positive integer. The triangle is constructed in the following way:



where every number is equal to the sum of the numbers to the left and immediately above it, the figures in the nth diagonal extending upward from left to right in the coefficients of the expansion $(a + b)^n$.

PASCHAL, păs'kal. The name of two popes. PASCHAL I., Saint, Pope 817-824. The chief general importance of his pontificate lies in his relations with Louis le Débonnaire, who in 817 gave him concessions, the record of which forms the earliest extant document concerning the temporal possessions of the Roman See. In 823 he crowned Louis's son Lothair as 'Augustus' or coregent with right of succession to the Empire. His letters are in Migne, *Patrologia Latina*, cii. Consult Simson, *Ludwig der Fromme* (Leipzig, 1874-76).—PASCHAL II., Pope 1099-1118, Raniero di Bieda. As a monk of Clugny, he came to Rome on business for his Order, and on account of his usefulness was detained there. Gregory VII. made him a cardinal. On his election to the Papacy, he was opposed by an antipope claiming the title of Clement III., and three others followed before the schism was extinguished. His administration was marked by vehement conflicts with the civil power which concentrated in the question of investiture (q.v.). The Emperors Henry IV. and Henry V. and King Henry I. of England were his principal opponents; Philip I. of France was also excommunicated for his illegal union with the wife of Fulk of Anjou, but finally submitted and was reconciled.

The name of Paschal was also borne by two antipopes. One opposed Sergius I. from 684, but in 687 was deposed and shut up in a cloister, where he died in 692. The other, who took the title of Paschal III., was set up in 1164 by the faction of Frederick Barbarossa and died in 1168. He is chiefly remembered for having canonized Charlemagne at the instance of Frederick.

PASCHAL CHRONICLE (Lat. *Chronicum Paschale*). A chronicle compiled in part from the Paschal canons (rules for the Easter festival) of various districts and towns, and containing a summary of events in chronological order from Adam to A.D. 629, which was the twentieth year of Heraclius. It was at one time named also *Alexandrinum*, because then attributed to a writer of Alexandria. The name of the author, however, is not known. It at first extended, according to the opinion of some, only to A.D. 354, in the reign of Constantius, the continuation of it with additions to the first part being the work of a later compiler. Others, however, regard it all as the work of one man. The manuscript in which it now exists (in the Vatican) is Byzantine work of the eleventh century. It is sometimes called also *Fasti Siculi*, because it was found in an old library in Sicily, from which it was taken to Rome. Notwithstanding its numerous faults, both of matter and style, it contains much valuable chronological information. There is a convenient edition in two volumes (Bonn, 1832).

PASCHASIUS (păs-kā'sĭ-ŭs) **RADBERTUS.** A distinguished theological writer of the Carolingian Age. He was born about the end of the eighth century, near or in Soissons. In 814 he joined the Monastery of Corbie, of which he was subsequently elected abbot. He was a member of the Synod of Paris, and took part in the Assembly of Chiersy in 849. Two years afterwards he resigned his position as abbot and devoted himself entirely to literary work. The

most important of his writings are *De Corpore et Sanguine Domini,* which caused a prolonged controversy on the doctrine of the Lord's Supper; *Expositio in Lamentationes Jeremiæ;* and *De Fide, Spe et charitate.* His works were published collectively at Paris in 1618 under the editorship of Girmond.

PASCO, pä'skō, Cerro de. A city of Peru. See Cerro de Pasco.

PAS-DE-CALAIS, pä-de-kȧ'lâ' (Fr. for Strait of Dover). A department in the north of France, embracing most of the old Province of Artois and part of Picardy, bounded on the north by the Department of Nord and the Strait of Dover, and on the west by the Strait of Dover and the English Channel (Map: France, J 1). Area, 2606 square miles. Population, in 1896, 906,249; in 1901, 955,391. The surface is level, with the exception of a ridge of hills running from the southeast to the northwest, ending in Gris-nez Cape (q.v.), and forming the watershed between the North Sea and the English Channel. The highest point (695 feet) is reached a little to the southwest of Desvres. The rivers, which are of no considerable length, are the Scarpe and Lys in the basin of the North Sea, and the Authie and Canche belonging to the basin of the English Channel. The rivers are navigable within the department, and are connected by canals. The coast-line is 80 miles in length, and the shores are in certain parts low and sandy; while for several miles on either side of Gris-nez cliffs similar to those of Dover front the sea. The climate is mild, but variable. The soil is fertile—all the usual cereal and leguminous crops being produced in abundance. Fishing is actively carried on along the coast, particularly in the neighborhood of Boulogne. Coal of an indifferent quality is obtained, excellent stone is quarried, and considerable quantities of turf are cut. The industrial establishments are numerous and important, including iron foundries, glass works, potteries, tanneries, bleach works, and mills and factories of various kinds. Boulogne and Calais are the principal ports. Capital, Arras.

PASDELOUP, pä'd'-lōō', Jules Étienne (1819-87). A French musical conductor, born in Paris. At ten years of age he entered the Paris Conservatoire, and in 1834 won the first prize for his piano-playing. He held a Government position after 1848, but three years later began the formation of an orchestra composed of conservatory students whom he trained to produce the symphonies of the best French and foreign composers. This was the beginning of the 'concerts populaires' which from their foundation in 1861 truly merited their name. The Legion of Honor and other marks of distinction were conferred on him, and his Sunday concerts were subsidized by the Government and were carried on for more than twenty years. Pasdeloup managed the Lyric Theatre (1868-70) and was an instructor at the Conservatoire in 1847-50, and again in 1855-68.

PASEWALK, pä'ze-välk. A town of Pomerania, Northern Prussia, situated on the Ucker, 22 miles northwest of Stettin (Map: Prussia, E 2). It contains several churches, and a bronze statue of Frederick III. erected in 1895. The manufactures include tobacco, starch, flour, oil, and plaster, and there are iron foundries and saw mills. Population, in 1900, 10,299.

PASHA, pȧ-shä' (Turk. *pasha,* from Pers. *pāsha, pād-shāh,* king, from *pād,* protector, master (connected with Skt. *pati,* Lith. *patis,* lord, Lat. *potis,* able) + *shāh,* OPers. *xshāyathiya,* king, connected with OPers. *xshatra,* Av. *xshathra,* Skt. *kshatra,* kingdom, from *kshi,* to rule), or Bashaw. A title used in the Ottoman Empire, originally bestowed upon members of the royal family only. It is now used also for high civil and military officers. Of the latter there are three grades, symbolized by the number of horse-tails formerly borne before them on occasions of state. Three tails signify general-in-chief, two tails general, and one brigadier. The actual symbols were abolished by Mahmud II. (1808-39), but the grades still exist. Admirals also have the title pasha. Civil officers of the rank of Vizier, provincial governors, and others also receive the title. The province governed by a pasha is known as a pashalik or vilayet. The authority of the pasha in his province was formerly absolute, but it is now held in check by local councils, and the Sultan may at any moment remove the pasha and even put him to death.

PASHIUBA PALM. See Iriartea.

PASHKOFF, pash'kŏf, Vasili Alexandrovitch (?-1902). A Russian religious reformer, founder of an evangelical sect, called after him the Pashkovski. An officer of the Imperial Guard and with high connections, he was brought to accept Lord Radstock's views of primitive Christianity (1874); founded an association for the encouragement of religious reading (1876), which was abolished about ten years later; and did a simple and unassuming evangelical work in which he met with great success, especially among his own class. Almost his entire fortune he spent in wise charity. During the reign of Alexander II., with whom Pashkoff was personally intimate, the work was uninterrupted; but in 1884 he was forced into exile, first from Saint Petersburg and then from Russia, the immediate occasion being his attempt to unite the Stundists and Baptists of the south with his own northern sect by means of a simple creed. He afterwards lived in Austria, England, and France.

PASHTU, päsh'tōō, or **PUSHTU,** pōōsh'tōō. See Afghans.

PÁSIG, pä'sēg. The outlet of the Laguna de Bay, in Luzon, Philippine Islands. See article Manila.

PASIG. The capital of the Province of Rizal in Central Luzon, Philippines (Map: Luzon, E 8). It is situated near the northwestern corner of the Laguna de Bay, seven miles east of Manila. The city was burned during the insurrection of 1897, and only a few well-built stone houses remain, the majority of the people living in bamboo or nipa huts. Population, 22,000.

PASINI, pȧ-sē'nē, Alberto (1826-99). An Italian landscape and figure painter, born at Busseto, near Parma. He came to Paris about 1840 and first studied lithography. Afterwards he became a pupil of Ciceri, Isabey, and Théodore Rousseau. He traveled much in the East, particularly Turkey and Persia, and took most of his subjects from those countries. His pictures are full of atmosphere and color, and as characteristically Oriental as those of Gérôme.

He was awarded the medal of honor at the Paris Exposition of 1878. An excellent example of his work is the "Entrance to a Mosque," in the Metropolitan Museum, New York City.

PASIPHAË, pā-sĭf'ā-ē (Lat., from Gk. *Πασιφαη*). In Greek mythology, the daughter of Helios and sister of Circe. She was the wife of Minos, but, in consequence of his neglect to perform a certain vow, Poseidon rendered her enamored of a bull, and she became the mother of the Minotaur. See MINOS; MINOTAUR.

PASITH'EA (Lat., from Gk. *Πασιθεα*). The wife of Hypnos, and one of the Graces.

PASKEVITCH, pȧs-kā'vĭch, IVAN FEODOROVITCH, Count of Erivan, Prince of Warsaw (1782-1856). A Russian field-marshal, born at Poltava. He belonged to a Polish family, was a page of the Emperor Paul, and, entering the army in 1800, served in the campaign of Austerlitz. He fought subsequently against the Turks. He was also actively engaged in the campaign of 1812, was present at the battle of Leipzig in 1813, and participated in the conflicts under the walls of Paris. In 1826 he gained a great victory over the Persians under Abbas Mirza at Yelizavetpol and in the following year conquered Persian Armenia and captured Erivan. He obtained for Russia the advantageous Peace of Turkmantchai (1828). For these services he was created Count of Erivan. In 1828 and 1829 he made two campaigns against the Turks in Asia, taking Kars, Erzerum, and other important places. In 1831 Paskevitch, now a field-marshal, succeeded Diebitsch as commander of the Russian forces in Poland; he put an end to the revolt within three months after his appointment, taking Warsaw after a desperate resistance, September 8, 1831. He was made Governor-General of Poland, and such was the vigor and severity of his rule that the eventful year of 1848 passed without any attempt at revolution. When Russian intervention in Hungary had been resolved upon in 1849, Paskevitch marched into that country at the head of 200,000 men. The Hungarian main army, unable to make head against the double foe, laid down its arms at Világos, August 13th. In 1854 Paskevitch took the command of the Russian army on the Danube; but after an unsuccessful siege of Silistria he resigned his command and retired to Warsaw, where he died, February 13, 1856.

PASMA (Neo-Lat., from Gk. *πάσμα*, a sprinkling, from *πάσσειν*, *passein*, to sprinkle). A non-officinal healing powder, which is regarded as very serviceable in burns, ulcers, excoriations, etc. It is composed of 30 parts of silica, 12 of magnesia, 6 of alumina, 2 of protoxide of iron, and 50 of starch from the olgra root. The name is also applied to a paste or salve, or to a poultice.

PAS'PALUM (Neo-Lat., from Gk. *πάσπαλος*, *paspalos*, sort of millet, from *πᾶς*, *pas*, all + *πάλη*, *palē*, meal). A genus of numerous species of grasses, natives of warm climates, with solitary or variously grouped spikes, one-flowered spikelets, and awnless palea. *Paspalum scrobiculatum*, the cereal koda, cultivated in India, grows in dry loose soils. *Paspalum exile* is called fundi (see FUNDI) or fundungi in West Africa, where it is similarly cultivated. *Paspalum racemosum* is a very important fodder-grass in the coast districts of Peru during the dry months of February and March. It has been introduced into France; but it is apt to be injured by frosts, and seldom ripens its seeds in the neighborhood of Paris. Several perennial species are indigenous in the Southern United States, where they are highly appreciated as fodder and pasture grass. They have some of the characteristics of Bermuda grass (q.v.). *Paspalum compressum* (or *Paspalum platicaule* of some botanists), commonly known as Louisiana grass, is considered an excellent lawn grass for the Southern States, being superior to Bermuda and less difficult to eradicate.

PASPATIS, pȧs-pä'tĭs, ALEXANDROS GEORGIOS (1814-91). A modern Greek historian, born on the island of Scio. He was enslaved in 1822, but was manumitted in Smyrna, came to the United States, and graduated at Amherst in 1831. He studied medicine at Paris and Pisa, and, after many years' practice in Constantinople, became professor in the University of Athens in 1878. He wrote: *Etudes sur les Tchinghianés ou Bohémiens de l'empire ottoman* (1870); *The English Version of the Revised New Testament* (1882); *The Great Palace of Constantinople* (trans. from the Greek by Metcalfe, 1893); and various works in Greek, of which the most important is on the capture of Constantinople by the Turks in 1453 (1890).

PASQUE-FLOWER (OF. *pasque*, Fr. *pâque*, Easter, from Lat. *pascha*, Gk. *πάσχα*, Easter, from Heb. *pesach*, a passing over, Passover, from *pāsach*, to pass over), *Anemone*. A genus of perennial silky herbs of the natural order Ranunculaceæ, by some botanists separated into the genus Pulsatilla, the chief distinguishing characteristic being the long feathery awns of the fruit. The common pasque-flower (*Anemone Pulsatilla*) is a native of Europe, with widely bell-shaped bluish-purple flowers, the petals of which are often used to color Easter eggs. *Anemone pratensis* has smaller and more perfectly bell-shaped blackish-purple flowers. These plants emit, when bruised, a pungent smell, due to an essential oil. *Anemone patens* is acrid and is said to blister the skin occasionally. *Anemone patens Nuttalliana*, the American pasque-flower, occurs abundantly from Illinois northward and westward.

PASQUE-FLOWER (*Anemone Pulsatilla*).

PASQUIER, pȧ'skyā', ETIENNE (1529-1615). A French jurist and author. He early studied law under the ablest jurists of France and Italy,

and in 1549 was called to the bar. Having already secured a considerable practice, he in 1560 published the first part of his *Recherches de la France*—an antiquarian treatise on national politics, literature, and religion. In 1565 he made his celebrated speech defending the University of Paris from the encroachments of the Jesuits. He was in 1585 appointed by Henry III. advocate-general of the Court of Accounts.

PAS'QUINADE'. See PASQUINO.

PASQUINO, pȧs-kwē'nō. The name given in Rome to a mutilated antique statue discovered in the Piazza Navona, and erected in a little square which bears the same name, near the Palazzo Braschi. From the end of the fifteenth century it was customary to affix to it epigrams on current events, frequently in the forms of questions and answers passing between Pasquino and another statue known as Marforio. These epigrams were called Pasquinades. The name is said to have been taken from a witty tailor of the early part of the sixteenth century, who was renowned for his pungent criticisms of public men. The Roman populace, when the government checked their freedom of speech, found this an outlet for their opinions; but since Marforio was transferred to the Capitoline Museum, Pasquino has not had much to say.

PASSAGE (OF., Fr. *passage*, from ML. *passaticum*, right of passage, from *passare*, to pass, to step, from Lat. *passus*, pace). In music, a term applied to a rapidly executed ornamental figure which is not essential to the melodic outline. In concertos for solo-instruments it is customary to give the performer an opportunity to display his mastery of mere technical skill. In the finale, just before the end, the composer indicates such a place by placing the word *cadenza* there. Such a cadenza has really nothing to do with the composition and consists of an extensive series of rapid ornamentations, without any accompaniment. This is called 'passage-work.'

PASSAGLIA, pȧ-sȧ'lyȧ, CARLO (1812-87). An Italian theologian. He was born near Lucca, became a Jesuit in 1827, and in 1844 was appointed professor of canon law, and later of dogmatic theology, in the Collegium Romanum. During the temporary withdrawal of the Jesuits from Rome in 1848-51, Passaglia, with some of his brethren, went to England, where he taught theology to the young brethren of his Order, and on the reëstablishment of the Jesuits in the Roman College he resumed possession of his chair. During the discussions which preceded the definition of the doctrine of the Immaculate Conception (q.v.) he published an elaborate treatise on the doctrine and history of that question (1855). Becoming interested in the movement for Italian unity in 1859, he left the Society of the Jesuits, and entered warmly into the discussions as to the temporal power of the Pope. Having fallen under suspicion in Rome, he withdrew from that city to Turin, where he established a journal entitled *Il Mediatore*, which appeared till 1866. In 1861 he was appointed by the King professor of moral philosophy, and subsequently of theology, in the University of Turin. In 1863 he became a member of the Turin Parliament. He is said to have sought reconciliation with the Church, but to have failed to make the required retractation. He died in Turin, March 12, 1887. Passaglia's [illegible] works are a treatise on the Immaculate Conception already referred to; a treatise (Latin) on the primacy of Saint Peter (1850); a scholastic treatise entitled *Commentarius Theologicus de Partitione Divini Voluntatis* (1851); an apology for the cause of Italian unity, entitled *Pro Causa Italica ad Episcopos Catholicos* (1861), in which he attacked the temporal power of the Pope and recommended the Church to make peace with the nation; several essays on religious and political subjects, and a reply to Renan's *Vie de Jesus* (1864).

PASSAIC. A river of northern New Jersey (Map: New Jersey, D 2). It rises a few miles southwest of Morristown, flows in a devious course northeastward to Paterson, then bends abruptly to the south, and flows into Newark Bay between Newark and Jersey City. It is about 100 miles long, and navigable 13 miles for small steamers and sloops. At Paterson it has a perpendicular fall of 50 feet, which furnishes immense water power.

PASSA'IC. A city in Passaic County, N. J., 11 miles northwest of New York City and 4 miles south by east of Paterson, at the head of navigation on the Passaic River, and on the Erie, the Lackawanna, and the New York, Susquehanna and Western railroads (Map: New Jersey, D 2). It has two public libraries, the Jane Watson Reid Memorial Library, completed in 1903, being the finest edifice in the city. Among other prominent features are the municipal building and the city hall and park. The city is extensively engaged in manufacturing—the industrial establishments include rubber and woolen mills, pantasote leather works, print works, chemical works, silk mills, and handkerchief and enameline factories. There are also large vineyards and a winery. Under a revised charter of 1874, the government is vested in a mayor elected every two years, a council, and in administrative officials, the majority of whom are nominated by the executive with the consent of the council. The school board is independently elected by popular vote. Population, in 1890, 13,028; in 1900, 27,777. Settled about 1679, and organized as a township in 1693, Passaic was incorporated as a village in 1869, and chartered as a city in 1873. Until about 1852 it was known as Aquackenonk Landing. In November, 1776, Washington, retreating through New Jersey, crossed the Passaic at this point. Consult Pape and Scott, *History of Passaic* (Passaic, 1899).

PASSAMAQUOD'DY (perhaps, pollock-catchers). A small Algonquian tribe, closely related to the Anaki'eite and less intimately to the Abnaki proper, and formerly residing about Passamaquoddy Bay and Saint Croix River, in Maine and New Brunswick. In customs they resembled the Abnaki, and, like them, acted with the French in the colonial wars. They are now gathered, to the number of about 200, at Pleasant Point and on Lewis Island, on the bay of their name.

PASSAMAQUODDY BAY. An inlet of the Bay of Fundy, forming part of the boundary between Maine and New Brunswick (Map: Maine, K 6). It is 12 miles long by 6 wide, and shut in by a cluster of islands so as to form an excellent harbor. It receives the Saint Croix and other rivers. The city of Eastport, Maine, lies on one

of the islands, and at the head of the bay is the town of Saint Andrews, New Brunswick. The tide here rises 25 feet.

PASSANT, pă'sănt' (Fr., passing). An heraldic term used to express the attitude of an animal in a walking position, with his head straight before him. See HERALDRY.

PASSAROWITZ, păs-să'rō-vĭts (Serv. *Pozarevac*, pō-zhă'rĕ-văts). A town of Servia, situated about 35 miles southeast of Belgrade (Map: Balkan Peninsula, C 2). It has a considerable trade in agricultural products. It is noteworthy for the treaty concluded here on July 21, 1718, between Turkey, on one side, and Austria and Venice on the other. Turkey ceded the Banat, part of Servia (including Belgrade), and parts of Bosnia and Wallachia to Austria. She retained the Morea, which had been reconquered from the Venetians in 1715. Population, in 1900, 12,957.

PASSAU, *Ger. pron.* päs'sou. An ancient town of Bavaria, Germany, situated at the confluence of the Danube, the Inn, and the Ilz, on the Austrian frontier and about 90 miles northeast of Munich (Map: Germany, E 4). The town proper is situated on the rocky tongue between the Danube and the Inn, and is remarkably picturesque with its old-fashioned houses rising in terraces above each other. The two suburbs of Innstadt and Ilzstadt are situated on the Inn and the Ilz respectively. Opposite Ilzstadt stands the old fortress of Oberhaus, dating from the beginning of the thirteenth century. The centre of the old town is the Domplatz, with its beautiful cathedral founded in the fifth century and rebuilt in the rococo style in the seventeenth century. Adjoining the cathedral is the post office, formerly the canons' residence, where the Treaty of Passau (q.v.) was concluded in 1552. Worthy of mention are also the old and the new rococo episcopal residences and the recently restored Rathaus. In the Innstadt is situated the pilgrimage church of Mariahilf. The educational institutions include a gymnasium founded in 1611, a *Realschule*, a school of agriculture, a training school for teachers, and a number of institutes for girls. The city manufactures hard-wood flooring, leather, paper, mirrors, porcelain, matches, wire, etc., and trades in wood, salt, and grain. Population, in 1890, 16,333; in 1900, 17,988, chiefly Roman Catholics.

Passau proper occupies the site of the Castra Batava of the Romans, and Innstadt is identified with the Celtic settlement of Boiodurum, founded about one hundred years B.C. The bishopric of Passau, of which the town is the seat, was founded in 738, secularized in 1803, and re-established in 1817. Consult Moun, *Passau* (Passau, 1878).

PASSAU, TREATY OF. An agreement made in the year 1552 at Passau, by the Elector Maurice of Saxony and Ferdinand, King of the Romans, representing his brother, the Emperor Charles V. It was signed by Maurice on August 2d and agreed to by the Emperor a few weeks later. It established peace between the Catholics and Lutherans pending the settlement of ecclesiastical matters by the next Diet, thus guaranteeing the free exercise of their religion to the adherents of the Confession of Augsburg in the States which had adopted this form of worship. A definitive settlement was effected at the Diet of Augsburg in 1555. Consult Barge, *Die Verhandlungen zu Linz und Passau und der Vertrag von Passau* (Strassburg, 1893). See REFORMATION, THE PROTESTANT.

PASSAVANT, pă'sà'vänt', JOHANN DAVID (1787-1861). A German art critic and painter, born at Frankfort-on-the-Main. He studied painting with David and Gros at Paris, and afterwards with the Nazarites in Rome. His paintings are unimportant, but he eventually became inspector of the Städel Institute at Frankfort, and did much to promote art, by virtue of his position, and also by his literary works. The principal of these are: *Rafael von Urbino und sein Vater Giovanni Santi* (1839-58); *Die christliche Kunst in Spanien* (1853); and *Le peintre-graveur* (6 vols., 1860-64), an appendix to Bartsch's standard work on the same subject. Consult his autobiography (Frankfort, 1863), and the biography by Cornill (ib., 1865).

PASSAVANT, WILLIAM ALFRED (1821-94). An American philanthropist, born at Zelienople, Butler County, Pa. He graduated at Jefferson College in 1840, and at the Lutheran Theological Seminary in 1842; was ordained to the Lutheran ministry in the latter year; was pastor of churches at Baltimore, Md., and Pittsburg, Pa., successively, and subsequently became widely known as the founder of hospitals and orphan asylums at various places in the United States. In 1870 he, with A. Louis Thiel, founded Thiel College, at Greenville, Pa., and in 1819 he founded the Lutheran Theological Seminary in Chicago. He introduced the order of deaconesses into the United States. He was founder and editor of *The Workman*, published at Pittsburg; from 1845 to 1861 edited *The Missionary*, and subsequently was a co-editor of *The Lutheran*, into which *The Missionary* was merged in 1861.

PASS CHRISTIAN. A town in Harrison County, Miss., 58 miles east by north of New Orleans, on Mississippi Sound (Gulf of Mexico), and on the Louisville and Nashville Railroad (Map: Mississippi, G 10). It is one of the most popular watering places on the Gulf, having a healthful climate and excellent facilities for boating, bathing, and fishing. Among its attractions is a wide shell-paved avenue, lined with fine trees. It extends for seven miles along the shore, where there are many pleasure piers. Pass Christian is the centre of an important oyster industry; it also has a large packing establishment. Population, in 1890, 1705; in 1900, 2028.

PASSÉ, pă'sā'. A tribe of the great Arawakan stock (q.v.), formerly the most numerous tribe on the Japura River, Northwestern Brazil, but now nearly extinct. Both men and women are noted for their light complexion, fine figures, and handsome features, approaching the Caucasian type. They are clean in habit, intelligent, gentle, and industrious, and have been called the noblest tribe of the Amazon region. They tattoo their faces; the men cut the hair close, while the women wear it flowing loosely. They bury their dead in circular graves and are greatly under the influence of their priests.

PASSENGER PIGEON. The American wild or migratory pigeon. See PIGEON. Also Plate of PIGEONS.

PASSENGERS. See CARRIER, COMMON.

PASSEPIED, pās'pyā' (from Fr. *passer*, to pass, from Lat. *passus*, step, from *pandere*, to stretch + *pied*, foot, from Lat. *pes*, foot). An old French dance in three-eighth or six-eighth time. It resembled the minuet, but was a little more lively. During the time of Louis XIV. it was introduced into the ballet, and was also often inserted in suites. It was divided into a number of parts of eight or sixteen bars each.

PASSERAT, pās'rä', JEAN (1534-1602). A French poet and scholar, born at Troyes. He taught in various Provençal colleges until 1599, when he gained the patronage of Henri de Mesmes, and settled in Paris. In 1572 he succeeded Ramus as professor of eloquence and Latin poetry at the Collège de France, where his learning and wit brought him many pupils. But Passerat was a patriot, and during the Wars of the League he had to suspend his courses. At this time he was one of the authors of the *Satyre Ménippée* (1594), which was his chief literary achievement. The grace, point, and erudition of his verse make him one of the most interesting of the post-Pléiades. His works include: *Vers de chasse et d'amour* (1597); *Kalendæ Januariæ et Varia quædam Poemata* (1597), and commentaries on Tibullus, Catullus, and other Roman poets. His collected works were edited by Blanchemain in 1881 (Paris).

PASSERES, pā-sē'rēz (Lat., sparrows), or PASSERIFORMES. The largest order of birds, nearly corresponding to the old order Insessores or 'perchers.' The order takes its name from a typical genus (Passer) represented by the common house-sparrow (q.v.). The Passeres are characterized by the possession of four toes, three in front and one behind, all inserted on the same level. The muscle that bends the hind toe is separate from the muscle which bends the other toes collectively; there is no ambiens, and no accessory femoro-caudal muscle; the sternum has a single notch on each side behind; there are more than six secondaries and the rectrices are almost always twelve; the palate is egithognathous; there is a single carotid, the left; the oil-gland is nude; there are two cæca; the upper cervical feather-tract is directly continuous with the dorsal tract, and the femoral tracts are weak; the young are hatched naked and helpless. More than half of all known birds are Passeres. They are found everywhere, and their habits, colors, food, songs, eggs, etc., show the greatest diversity. According to the structure of the syrinx, they are grouped as Clamatores (Passeres anisomyodæ), or as Oscines (Passeres diacromyodæ). Consult Evans, *Birds* (London, 1900).

PASSI, pās'sē. A town of Panay, Philippines, in the Province of Iloilo, situated 19 miles north of Iloilo (Map: Philippine Islands, C 5). Population, 13,802.

PASSING NOTES. A term in music. In passing from one chord to another, an intervening note, not belonging to either chord, may be used to assist the progression. Such a note is called a passing note or note of transition, as the notes marked * in the upper part of the subjoined example:

They differ from suspensions in not being prepared and in always entering upon the unaccented beat.

PASSINI, pās-sē'nē, LUDWIG (1832-1903). An Austrian painter, born in Vienna. He was a son and was first instructed by the engraver Johann Passini (1798-1874), then studied at the Vienna Academy under Führich and Kupelwieser, and finally devoted himself to painting in water-colors under Karl Werner, with whom he traveled in Italy. In 1855 he made his home in Rome, where he first painted architectural subjects and interiors with figures, but gradually cultivated more exclusively genre scenes from Italian popular life. He settled in Venice in 1876, and thenceforth devoted his lavish industry to those delineations of Venetian life with which his name is associated as one of the most distinguished aquarellists of his day. Prominent examples of his work are: "Canons in St. Peter's, Rome" (1870, National Gallery, Berlin); "Reading Aloud from Tasso to Fishermen at Chioggia" (1872); "Pompeian Vendors in Venice" (1876, Vienna Museum); "Curious People on a Bridge" (1885, Breslau Museum); "Venetian Women at a Fountain" (1890). He also painted excellent portraits.

PASSION, or PASSION MUSIC. From the earliest times it was customary in the Church to chant the story of the passion of Christ during Holy Week. As a musical art form the passion first appears in Germany about 1570. At the same time Italy originated the form of the oratorio, and for the next half century no marked distinction appears between the two forms. Then the passion began to assume characteristic traits which distinguish it from the oratorio. These traits are the frequent introduction of chorales, the retention of the character of the 'narrator' (which entirely disappeared from the oratorio), and the use of the chorus for contemplation and reflection upon the events related. See ORATORIO; SACRED MUSIC.

PASSIONATE PILGRIM, THE. A small collection of sonnets and lyrics by Shakespeare, Marlowe, Barnfield, and Raleigh, published by W. Jaggard in 1599. Shakespeare's name appeared on the title page, but was evidently unauthorized, as it was dropped in later editions, and several of the poems were erroneously attributed to him.

PASSION CROSS (Lat. *passio*, suffering, from *pati*, to suffer). A cross supposed to reproduce the form and proportions of that on which Christ suffered, with a long upright and one or two short transverses near the top. It often bears the figure of Christ, and is heavier in proportions than the resurrection cross, which also belongs to the type of the Latin cross. A passion cross, when elevated on three steps or degrees (said by heralds to represent the virtues of faith, hope, and charity), is called a cross Calvary.

PASSION-FLOWER (*Passiflora*). A genus of forty-odd species of mostly climbing plants of the natural order Passifloraceæ. The species, which are almost exclusively natives of the warmer parts of America, have alternate, simple, variously lobed leaves, from the axils of which the peduncles are produced. The flowers are usually regular, with a generally fine segmented

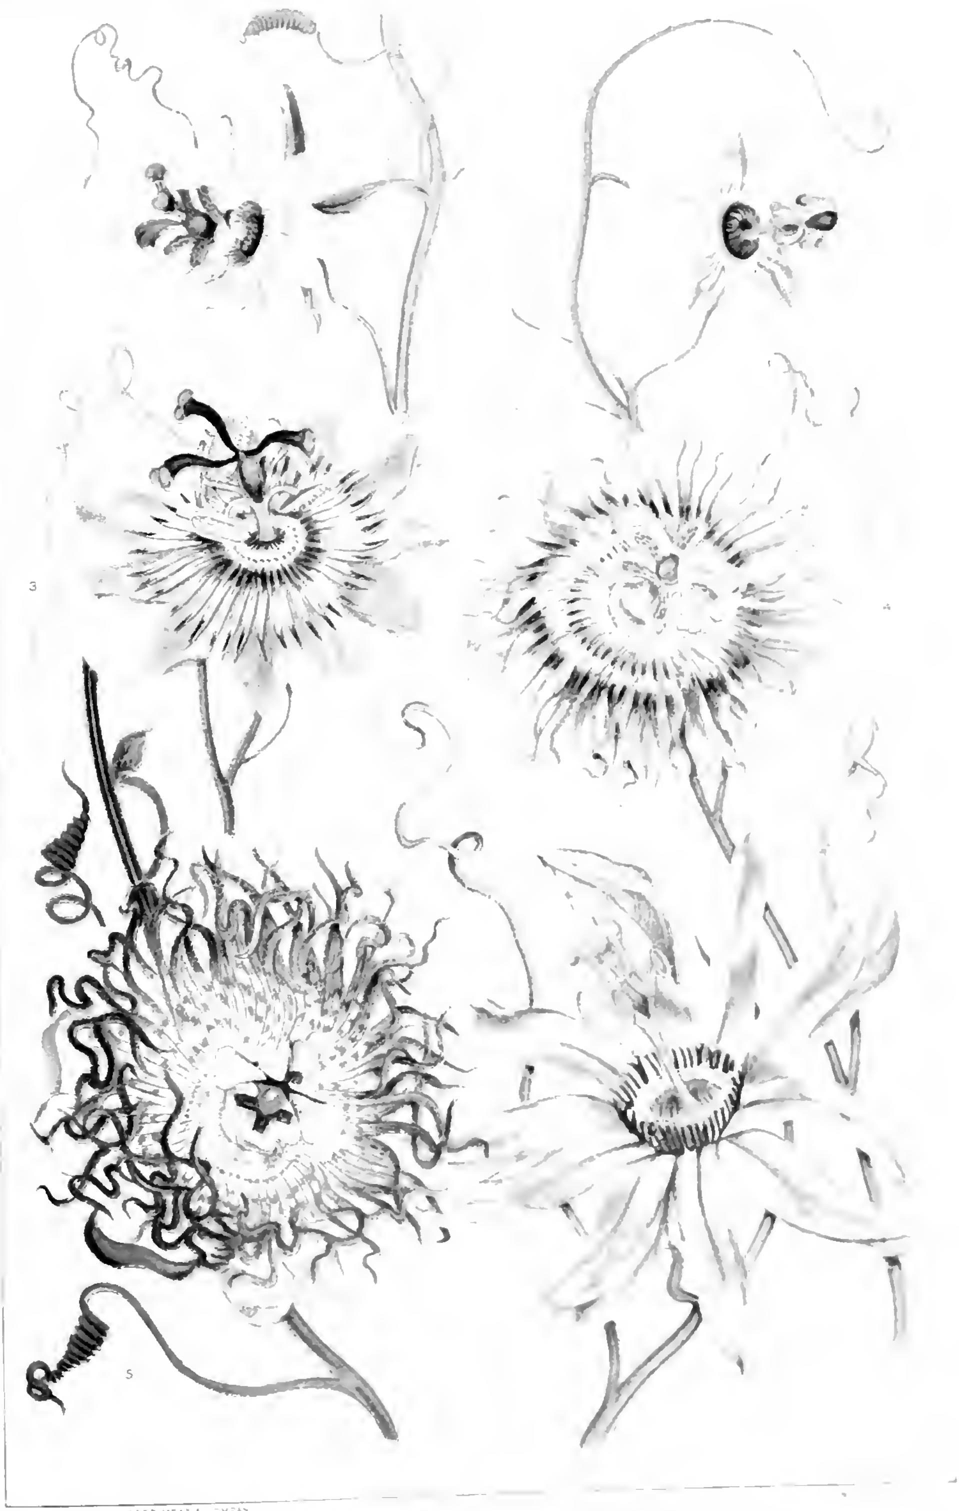
colored calyx, and similarly segmented or absent corolla. Several rows of filamentous processes spring from within the cup, which is formed by the consolidated calyx and corolla. The genus received its name from fanciful persons among the first Spanish settlers in America who imagined a representation of the Lord's passion, the filamentous processes being taken to represent the crown of thorns, the three styles the nails of the cross, and the five anthers the marks of the wounds. On account of the large and beautiful flowers, many of the species are cultivated in greenhouses; some are also grown in tropical countries for their fruit, particularly *Passiflora edulis*, or granadilla (q.v.). *Passiflora quadrangularis* is a larger edible species known as the large granadilla. One of the best known species is *Passiflora cærulea*, a native of Peru and Brazil, extensively grown for its beautiful white, pale blue, or rose-colored flowers. Like most species, it succeeds in the open only in tropical and subtropical climates. Among the popular cultivated species are *Passiflora gracilis* and *Passiflora racemosa*. About ten species are natives of the United States, among which are *Passiflora incarnata*, the May-pop of the Southern States, a showy flowered edible fruited species. The passion-flower is propagated by seeds and by cuttings of the young wood.

PASSIONISTS. The name generally applied to the order formally known as "Barefooted Clerks of the Holy Cross and Passion of Our Lord," founded by Saint Paul of the Cross (q.v.). Their first permanent settlement was made on Monte Argentaro, near Genoa, in 1737; they received the first Papal approbation as a society of mission preachers from Benedict XIV. in 1741, and their rule, modified in some points, was again confirmed by Clement XIV. in 1769, who four years later gave them the Church of Saints John and Paul on the Celian Hill in Rome, now the headquarters of the Order. The members take, besides the usual monastic vows, a fourth to remember and meditate continually upon the sufferings of Christ. Their work is principally the conversion of sinners, especially by preaching missions. Their habit is black, with a white heart-shaped piece of stuff sewed on the left breast, in which are represented the instruments of the passion—cross, nails, crown of thorns, etc. The general (*præpositus*) is elected by the general chapter for six years; each house has a rector, chosen for three years. The Order has now eight provinces—four in Italy, one in England, one in America, one in France, and one in Spain. In 1901 they numbered eighty-seven professed fathers in the United States (to which they came in 1852), with ten monasteries.

PASSION PLAY. A performance which takes place every tenth year in the village of Oberammergau, in the Bavarian highlands. In 1633, as an act of gratitude for the cessation of a plague which had desolated the surrounding country, the villagers vowed to represent the passion of Christ every ten years, and have ever since observed their vow. The inhabitants of this secluded spot, long noted for their skill in carving wood and ivory, have a rare union of artistic cultivation with perfect simplicity. The personator of Christ considers his part an act of religious devotion; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about six hundred in number, are all villagers, who, though they have no artistic instruction except from the parish priest, act their parts with much dramatic power and a delicate appreciation of character. The Gospel narrative is closely followed; the acts alternate with tableaux from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanor prevails as among the performers. Consult: Stead, *The Passion Play* (London, 1890); Grein, *Das Oberammergauer Passionspiel* (Leipzig, 1880). See MYSTERY.

PASSOVER (translation of Heb. *pesach*, a passing over, from *pāsach*, to pass over). The first of the three chief festivals prescribed by the Pentateuchal codes (Ex. xii.; Lev. xxiii. 4-8; Num. ix. 1-14; xxviii. 16-25; Deut. xvi. 1-8). Its celebration begins on the evening of the fourteenth day of Nisan (corresponding to the older Abib) and lasts for eight days. The Jewish Church associates the festival with the Exodus from Egypt, and this historical character was so impressed upon it as to obscure its original significance. By a careful study, however, of the passages referring to the Passover in the various Pentateuchal codes, modern scholars claim that they have traced the gradual development of the festival and have shown that it was a mixture of various elements, originally having nothing to do one with the other. In the first place, distinction must be made between two festivals combined in the Passover, viz. (1) a feast of unleavened bread known as *massōth*, and (2) a festival in which the chief rite was the sacrifice of a sheep within the family circle and the sprinkling of the lintels and doorposts of the houses with the blood. This sacrifice was called *pesach*. Of these two festivals the former is the old Canaanitish harvest festival, commemorative of the first ripening of the corn, which the Hebrews naturally adopted when they took possession of the Canaanitish soil. Thanksgiving offerings were made on this occasion to Yahweh as the 'Baal,' to whom the land belonged. Since the presentation of such gifts, consisting of the first-fruit sheaf, involved a visit to a Yahweh sanctuary, the occasion became a *khāg*—the ancient Semitic designation for a mirthful festival with dances and processions at a sanctuary and a sacrificial meal as the symbol of communion between the god and his worshipers. It was customary at this festival to eat only unleavened bread, which merely represents the usual food during the harvest season, when the people, busy with field labors, did not take time to wait in baking their bread until the completion of the slow process involved in the leavening of the dough; hence the festival became known as the *khāg ham-massōth*, i.e. the festival of unleavened bread. On the other hand, the sacrifice of the *pesach* stands in no connection with agriculture and is originally a rite of propitiation or lustration observed during a pestilence or on some other special occasion. It consisted in sprinkling with blood the entrance to the house (or tent), which was particularly sacred. It is still customary among the Bedouins to sprinkle their camels and flocks with blood as a protection against the ravages of a pestilence. This blood

PASSION-FLOWERS



1 PURPLE-FRUITED PASSION-FLOWER - [illegible]
2 SLENDER PASSION-FLOWER - PASSIFLORA GRAC[illegible]
3 COMMON PASSION-FLOWER - PASSIFLORA CÆRULEA
4 [illegible] FLORA INCARNATA
5 [illegible] PASSIFLORA QUADRANG[illegible]
6 [illegible] PASSION-FLOWER [illegible]

rite, from being indulged in on extraordinary occasions, became a regular custom observed in the spring, the bearing time of the flocks, when it became especially important to secure the protection of the deity. Already in the earliest of the Pentateuchal codes these two festivals, one belonging to the agricultural stage, the other a survival of the nomadic stage, are brought into connection with the Exodus from Egypt, and combined with each other. The combination once made, there resulted a series of ceremonial observances which gradually assumed the elaborate character of the Jewish Passover festival. The sprinkling of the blood became the symbol of the protection granted the Hebrews by Yahweh at the time that pestilence struck the Egyptian households. The offerings of the first-fruits of the field to Yahweh led to the view that firstlings of the flock and the first-born of the household likewise belonged to the deity. The sacrificial lamb and the unleavened bread were also brought into connection with the Exodus, the former pictured as a ceremony indulged in on the eve of the departure of the people, the latter a symbol of the 'haste' with which the deliverance was brought about, so that the people did not have time to bake bread from leavened dough. In later Judaism the historical association was still further emphasized, and there grew up an elaborate service for the eve of the Passover, known as the *sēder*, the chief features of which were the recalling of the Exodus by reciting the narrative in the household, the preparation of dishes symbolizing the affliction and hardships of the people in Egypt, together with thanksgivings and songs of praise accompanied by benedictions over wine for the miraculous deliverance. For eight days unleavened cakes are eaten and no food prepared of any leaven material is to be eaten. In fact, all traces of leaven are to be removed out of the house, and in orthodox Jewish households separate sets of dishes are used during the eight days of the Passover. In the Christian Church the paschal lamb became preeminently the type of the sacrifice of Christ.

Bibliography. Consult the Hebrew archæologies of Nowack and Benzinger, and the commentaries on Exodus by Dillmann, Strack, Baentsch; R. Schäfer, *Das Passah Mazzot Fest nach seinem Ursprung und seiner Entwickelung* (Gütersloh, 1900); Trumbull, *The Threshold Covenant* (New York, 1896); and for the later Jewish customs, Schröder, *Satzungen und Gebräuche des talmudisch-rabbinischen Judenthums* (Bremen, 1851); Dembitz, *The Jewish Services in Synagogue and Home* (Philadelphia, 1898).

PASSOW, päs'sō, Franz (1786–1833). A German philologist. He was born at Ludwigslust, studied at Leipzig, and was called in 1807 to the chair of Greek in the Weimar Gymnasium, and in 1815 to that of ancient literature in the University of Breslau. His principal work is his *Handwörterbuch der griechischen Sprache* (1819–24). He also published *Grundzüge der griechischen und römischen Litteratur- und Kunstgeschichte* (2d ed., 1829), and other volumes.

PASSPORT (Fr. *passe-port*, from *passer*, to pass + *port*, Lat. *portus*, port, harbor). A written instrument issued by the authority of a government for the identification and protection of its citizens when traveling abroad. It is first a certificate of the citizenship of the bearer, and, second, a formal permit authorizing him to leave the State of which he is a subject. The origin of the practice of granting passports grew out of the right of nations, which was formerly more frequently exercised than now, to withhold from foreigners the right of transit through their territory. The formal permission granted to a foreigner by a government to pass through its territory was a passport. To avoid the inconvenience of this requirement, the practice was adopted by which a subject of one government leaving his country for travel in another obtained from his government a certificate of citizenship which was accepted by the other government as a passport. This is presented to the foreign government as an identification of the bearer, who, instead of receiving a passport from the foreign government, is given permission to pass through by the act of an officer in putting a *visé* upon the certificate itself. At present Russia, Turkey, Portugal, and Greece are the only European countries where travelers cannot travel freely without passports, though some of the German States require certification for the purpose of police protection, where parties desire to reside for a considerable period in one place. In the United States passports are issued only by the Department of State and only to citizens upon application supported by proof of citizenship. No distinction is made between native-born and naturalized citizens in the granting of passports. The fee is $1, and a passport for the head of a family includes the wife and minor children. In foreign countries they may be obtained by citizens of the United States only by the chief diplomatic representative or by the consul general, or, in the absence of both of those officers, by a consul. A fee of $5 is allowed to be charged for each passport granted to a citizen of the United States abroad by a diplomatic representative. An application to a diplomatic officer for a passport by a native citizen must be accompanied by a written declaration under oath stating the name, age, and place of birth of the applicant, supported if possible by the affidavit of a creditable person to whom the applicant is personally known. If the applicant claims to be a naturalized citizen, he must produce a copy of the decree of the court by which he was naturalized. In both cases an oath of allegiance is required for transmission to the Department of State. Every such passport to be valid must be renewed either at the Department of State or at a legation of the United States abroad at the expiration of two years from its date. Passports are not granted to aliens who have declared their intention to become citizens of the United States, although they may obtain authenticated certificates of their declaration (intention which entitle them to a qualified protection while traveling abroad. Nor are they granted to naturalized citizens who have returned from long residence abroad and, under circumstances to have abandoned their nationality. The chief value of a passport is that it provides the holder with authentic proof of his national character and frees him from inconveniences which he might otherwise experience while traveling in foreign lands. It is only issued it is prima facie evidence of citizenship and as such must be respected not only by the administrative officers but by the courts of the government which [illegible] to which it may be sojourning; but it furnishes [illegible]

exemption from the jurisdiction of the country in which he may be. It is nothing more than a request to foreign governments to admit the bearer to the enjoyment of the rights and privileges to which he as citizen of the country issuing the passport may be entitled by treaty or convention.

In some European States no subject is allowed to depart therefrom without first securing a passport from his government authorizing him to leave the country. Where this rule prevails the passport is required to be countersigned by the minister or consul of the country which the bearer visits. In time of war passports or safe conducts are frequently granted by military commanders to allow persons to pass through the lines or to insure the safety of officers while in the performance of some duty which takes them beyond the lines. They may also be granted for the passage of goods as well as for individuals. Diplomatic representatives upon departing from a State in which they have been residing usually demand and receive passports to enable them to withdraw in safety.

PASSY, pȧ'sē'. A western suburb of Paris, included in the city since 1860.

PASTA, pȧ'stȧ (née NEGRI), GIUDITTA (JUDITH) (1798-1865). An Italian singer, and one of the most distinguished opera sopranos of modern times. She was born near Milan, and received her musical education partly at Como, under the chapelmaster of the cathedral there, and partly in the conservatory at Milan. After 1811 she appeared at various theatres of the second rank in Northern Italy. Her first great triumph was achieved at Verona in 1821. The year following she was engaged at the Paris Italian Opera, where her singing excited great admiration. From 1825 to 1830 was the period of her greatest triumphs, which were won principally in London and Paris. Vienna, where she accepted an engagement in 1832, witnessed the last. Some time afterwards she withdrew from the stage and purchased a villa on the banks of Lake Como, where, and at Milan, she resided. She had a magnificent voice, which easily passed from clear, shrill soprano notes to the gravest contralto tones, besides which she had great dramatic energy, and a stateliness of manner that suited lofty and imposing characters. Her principal rôles were in *Medea*, *Desdemona*, *Semiramide*, *La Sonnambula*, and *Norma* (these operas were written for her by Bellini), and Giulia in *Romeo e Giulia*. Donizetti and Pacini also wrote operas for her.

PASTEL (Fr. *pastel*, from Lat. *pastillus*, little roll, lozenge, diminutive of *panis*, loaf, bread). Colored crayon. (See CRAYON.) Also, by abbreviation, the process of drawing in color by means of such crayon. The substance is generally sold in small cylinders. The paper used is not very smooth. The drawing is carried on exactly as with black and white drawing, with this distinction, that a color effect may be, and generally is, sought, depth of shade and gradations of light and dark being replaced by gradations in colors. One of the special difficulties with the pastel process is the perishable nature of the result. A sharp jar or blow will dislodge some of the particles of color, and a touch of a soft brush or cloth will make a great scar in the colored surface. It is possible to remedy this in part by the use of a fixative; but a pastel drawing remains the most easily injured of all works of art. To guard against this, it is almost universally the custom to cover such a drawing with glass; and, moreover, the drawing must not touch the glass. Properly protected, a pastel may remain beautiful for a century and a half, as is seen in the very admirable drawings in the Louvre by French masters of the eighteenth century. The special beauty of a pastel drawing is in its soft, velvety surface, giving a bloom and depth to the color harmonies hardly attainable elsewhere; but this beauty is at once marred when it is seen through the glass covering. It will be best, then, to risk the chance of injury to pastels of no special value, keeping them in closed portfolios; and, for those of great importance, to have the glass arranged to open readily.

On the whole, pastel seems more fitted for the sketching of an artist who cares for color than for any other purpose. It gives a great facility to the artist who wishes to work rapidly, and who does not wish to wait while liquid washes or semi-liquid touches are drying.

There are crayon drawings in two or three colors which date from the sixteenth century, but pastel in the usual sense hardly appears before the second quarter of the eighteenth century. Rosalba Carriera of Venice (1675-1757), the most original of all woman artists, seems to have brought pastel drawing to its full charm during her stay in France, about 1720. The chief of all pastel-draughtsmen is generally admitted to be Maurice Quentin de la Tour (in the eighteenth century), whose works are chiefly in the Louvre and in the Museum of Saint Quentin (Aisne). Jean Baptiste Greuze, in the eighteenth century, and Eugène Delacroix, in the nineteenth did admirable work in this way, and the Swede Lundberg, who died about 1780, is also famous, though his work is not much known out of Sweden.

The art underwent a sort of revival during the last quarter of the nineteenth century. In Brussels, Emile Wauters, a portraitist of real merit, and in France H. G. E. Degas, the impressionist, have used pastel with surprising originality. Other noted pastel artists of the present day are Pierre Carrier-Belleuse, René Gilbert, Emile René Ménard. In the United States this medium has been used with success by William M. Chase, J. Appleton Brown, and especially by J. Wells Champney. Consult: Robert, *Le Pastel* (Paris, 1890); Jännicke, *Kurze Anleitung zur Tempera- und Pastelltechnik* (Stuttgart, 1893); Retscher, *Anleitung zur Pastellmalerei* (4th ed., Dresden, 1900).

PASTEUR, pȧs'tẽr', LOUIS (1822-95). A celebrated French scientist, born at Dôle. He early devoted himself to the study of chemistry and took his doctor's degree in 1847. In 1848 he became professor of physical science at Dijon, and in the following year accepted the professorship of chemistry at Strassburg. In 1854 he founded the faculty of sciences at Lille, of which he became dean. Here he remained until 1857, when he went to Paris as scientific director of the Ecole Normale Supérieure and was elected a member of the Institute. In 1863 he became professor of geology, physics, and chemistry at the School of Fine Arts, and from 1867 to 1875 was

professor of chemistry at the Sorbonne. Later he carried on his researches at the institute bearing his name. The results of Pasteur's investigations have formed contributions of the highest importance to nearly every branch of physical and natural science. By his classical researches on optically active substances and their separation into isomeric modifications of identical chemical but different physical properties, Pasteur became the founder of modern stereo-chemistry (q.v.). In the province of fermentation and the germ theory his work was even more valuable. He showed that lactic, butyric, acetic, and other fermentations are caused by micro-organisms, and established on a firm scientific basis the principle that spontaneous generation cannot take place, at least under ordinary conditions. The different processes of putrefaction and fermentation set up by the air are invariably produced by germs the presence of which in the atmosphere Pasteur demonstrated by passing a current of air through guncotton, and dissolving the latter in a mixture of alcohol and ether; an insoluble residue was thus obtained, in which the germs of organisms could be readily seen with the aid of a microscope and could be shown to be capable of developing into mature organisms.

Pasteur's studies on the diseased conditions of wine and beer have rendered possible and easy the prevention of these conditions. No less important were his investigations on the silkworm's disease *pébrine* and its cure. His discovery of bacteria as the cause of anthrax (splenic fever) in cattle was epoch-making in the science of diseases. Similar results were obtained with regard to fowl-cholera; and his experiments show success in preventing the various diseases caused by septic bacteria, by inoculating animals with a milder form of the disease by means of a weaker brood of bacteria, artificially cultured. Pasteur found that by keeping a cultured crop of specific micro-organisms at a certain temperature with a full supply of oxygen, he could reduce organisms to an incapacity for producing spores, therefore to sterility. But before this point is reached the cultured organism loses its virulence, although still germinating; vaccination with it then produces a mild disease, which effectually protects from the fatal scourge of splenic fever, of fowl's cholera, and other diseases.

In the same manner he dealt with splenic apoplexy, which he showed to be caused by the presence of specific bacteria in the blood. By artificially cultivating these bacteria he succeeded in developing a weaker crop of germs; and by inoculating healthy animals with the virus he produced a milder form of the disease, which is believed to afford protection from the more violent and dangerous malady. Pasteur's well-known treatment of hydrophobia (q.v.) is based on a similiar principle.

His published works include: *Nouvelle exemple de fermentation déterminée par des animalcules infusoires pouvant vivre sans contact de l'air* (1863); *Etudes sur le vin, ses maladies, causes qui les provoquent*, etc. (1866); *Etudes sur le vinaigre, ses maladies*, ... *les moyens de les prévenir*, etc. (1868); *Etudes sur la maladie des vers à soie* (1870); *Nouvelles études sur la maladie des vers à soie*, etc. (1871); *Etudes ... la bière, ses maladies*, etc. (1876); *Les microbes* (jointly with Tyndall, 1878); *Sur les maladies ... contagieuses et en particulier sur la maladie appelée vulgairement choléra des poules* (Paris, 1880); and several important articles in the *Annales de Chimie*. Consult: Bournand, *La bienfaitrice de l'humanité: Pasteur, sa vie, son œuvre* (Paris, 1896), and a *Life* in English by Mr. and Mrs. Percy Frankland (New York, 1898).

PASTEURIZER. An apparatus for preserving by means of heat milk, milk, and other solutions from decomposition.

PASTICCIO. pä-stēt'chō (It., medley). In music, a term applied to works that are patched up from various earlier works of a composer. In the eighteenth century operatic composers did not always trouble themselves to compose new music to a new text. They took arias or choruses from their other earlier operas and adapted them to a new text. Gluck's *Paride e Elena* is such a pasticcio in which the composer used the best arias of operas previously written by him. Handel made liberal use of this inartistic device, even in some of his best works. Thus the famous chorus from the *Messiah*, "For unto us a child is born," is not original, but the music is taken note for note from a madrigal composed by Handel himself in 1712 to a text representing a jealous lover.

PASTO, pä'stō. The capital of the province of the same name in the Department of Cauca, Colombia, near the border of Ecuador, and 120 miles northeast of Quito (Map: Colombia, B 3). It is situated at an altitude of 8650 feet in the midst of a large plain at the foot of the volcano of the same name. The town is well constructed, with broad, well-paved streets, and many fine private residences. It is an episcopal seat with a seminary and collegiate institute. It has manufactures of woolen blankets, hats, and certain kinds of decorated pottery. It maintains a regular trade with Ecuador. Its population is about 10,000. Pasto was founded by order of Pizarro in 1539. It was twice burned during the wars of independence and ruined by an earthquake in 1827, in which 10,000 people perished.

PASTON LETTERS. The correspondence of the Paston family in Norfolk, England, including over 1100 letters, together with a few State papers which came into the family's possession. The letters cover the years 1422-1509 and are of the utmost value as affording us our only glimpse into the public and private life of the time in all its phases. They were first published by Sir John Fenn in five volumes (London, 1787-1823), the last volume appearing by another hand after the principal editor's death. The disappearance of the manuscripts after their publication naturally led to doubts as to their genuineness. Gairdner defended their authenticity on the grounds of internal evidence, and the soundness of his argument was completely proved by the subsequent reappearance of several volumes of the lost manuscripts. He also prepared an admirable edition of the letters in three volumes (London, 1872-75; reprinted in 1896), with an introduction containing a full history of the Paston family in connection with the history of the times. This edition was speedily exhausted and a new one by the same editor, containing 105 new letters, appeared in four volumes (London, 1900-01).

PASTOR (Lat., shepherd: so called because frequently seen near flocks of sheep). The popular, as well as the generic name of certain birds of the starling family (Sturnidæ). They differ from starlings in the compressed and slightly curved bill. In habits, as in structure and food, the groups are very similar. (See Oxpecker.) They are confined to the Old World, and especially to the Orient, though one species, the rose-colored pastor, or rose-starling (*Pastor roseus*), glossy black, with pink back and abdomen, is occasionally seen (sometimes in vast flocks) about the Mediterranean. It is not only a very handsome bird, but is very useful, especially where locusts occur, as the pastors eat the young locusts greedily, and are for this reason sometimes called 'locust-birds' (q.v.). In India the species is numerous and familiar, and is included with the mynas. See Plate of Larks and Starlings.

PASTOR, päs'tôr, Ludwig (1854—). A German historian, born at Aix-la-Chapelle. He studied at the universities of Bonn, Berlin, and Vienna, became a lecturer at Innsbruck in 1880, and was appointed to a professorship of history there in 1886. In the preparation of his historical works he made extensive research in the archives of Germany, France, and Italy, particularly those of the Vatican, first made accessible by Leo XIII. His chief publication is his *Geschichte der Päpste seit dem Ausgang des Mittelalters* (1886-95; 4th ed., 1899-1901; English trans., London, 1891-98), an extensive and thorough history of the Papacy from the close of the Middle Ages. Other volumes by him are *Die kirchlichen Reunionsbestrebungen während der Regierung Karls V.* (1879), and *Die Korrespondenz des Kardinals Contarini während seiner deutschen Legation* (1880).

PASTORAL EPISTLES. A sub-group in the collection of New Testament letters which in their several addresses claim to have been written by the Apostle Paul. They comprise the following three writings: I. Timothy, II. Timothy, and Titus. They are called *Pastoral* because of the rather unusual character of their contents, as compared with the Apostle's other letters, being addressed to helpers of the Apostle, whom he had left in pastoral care of certain fields, and whom he wished in these communications to instruct regarding the duties involved in their charges. See the articles on the individual Epistles.

PASTORAL POETRY (Lat. *pastoralis*, relating to a shepherd, from *pastor*, shepherd; connected with *pascî*, to feed, *pabulum*, food, OChurch Slav. *pasati*, to feed, Skt. *pâ*, to protect). A kind of poetry in which the incidents, thoughts, and emotions of cultivated society are presented under the disguise of rustic life. The characters are shepherds and shepherdesses, in a setting of valley and hillside, and the usual theme is love. This artificial literary *genre* flourished in antiquity and for centuries throughout Western Europe. The oldest extant forms are the idyl and the eclogue, but the pastoral motive may enter the romance and the drama.

Antiquity. The pastoral undoubtedly takes its root far back in Greek literature. According to Ælianus (*Varia Historia*, x. 18) its inventor was Stesichorus of Himera in Sicily (who died about B.C. 555); and his subject was the blindness of Daphnis, afterwards the typical love-lorn cowherd. According to the ancient grammarians, it originated in the rustic cult of Artemis at Syracuse (*Scholia* upon Theocritus). These traditions certainly point to very old folksongs now lost. The extant pastoral dates from Theocritus, who flourished about B.C. 270 at the courts of Syracuse and Alexandria. To him are attributed thirty-one idyls (little pictures of life), of which ten are strictly bucolic. Here first occur Thyrsis, Tityrus, Corydon, Damoetas, Daphnis, Lycidas, Menalcas, and Amaryllis, names since made familiar to Western Europe. Theocritus seemingly reproduces the language of the peasants, their melodies, superstitions, and custom of answering one another in verse. His idyls are short descriptive lyrics combined with little dramatic pieces, sometimes comic, like the mimes which had been popular in Sicily since Sophron (about 440 B.C.). The poet introduces himself under the name of Simichidas, and devotes an idyl to his patron Ptolemy Philadelphus of Alexandria, and another to Hiero II. of Syracuse. Theocritus was followed by two poets: Bion of Symrna, known for his beautiful *Lament for Adonis*, and Moschus, author of the still more beautiful *Dirge* for Bion. Several centuries later an unknown Greek writer told the story of *Daphnis and Chloe* in prose. The theme of the romance is artless innocence; its tone is sensuous and decadent. The pastoral poem had already been adapted to Italy by Vergil (d. 19 B.C.). However much Theocritus may have idealized his country scenes, he yet had nature before his eyes. The purely artificial pastoral began with Vergil, who took his notes not so much from nature as from Theocritus. Vergil composed ten graceful bucolics, which he called *eclogæ* (i.e. selections). Like Theocritus, he wove into them incidents from his own life. From Vergil the pastoral motive spread to Horace, Catullus, and other Roman poets, and eventually throughout Western Europe.

Italy. The pastoral of the Renaissance did not spring from Vergil alone. To it contributed the *pastourelles*, love songs with a rustic setting, which were cultivated in various countries of Southern Europe in the thirteenth century. They especially flourished in Provence, as early as the twelfth century, whence they were largely diffused. They were in no way connected with Vergil, but they seem to have had their source in folk-song. In the fourteenth century the two streams of influence—the native and the classic—united to form the modern pastoral. The Vergilian revival first took the form of allegories, in which the learned addressed Latin epistles to one another under pastoral names. Eclogues of this kind passed between Dante and Giovanni del Virgilio, professor of Latin at Bologna (about 1320). Dante figures as Tityrus and his friend as Mopsus. Petrarch (1304-74) also composed a pastoral in twelve eclogues, in which he worked out an elaborate allegory. Dante and Petrarch thus mark the reappearance of Vergil as a literary force. Boccaccio (1313-75) blends the ancient and the indigenous pastoral. He wrote Latin eclogues much in the manner of his great compatriots. His *Ameto* (1342) is the first pastoral romance in the vernacular. He took as his model the song-fable in which prose is employed for the narrative and verse for the expression of the feelings. Under the names Caleone and Fiammetta Boccaccio veiled his passion for Maria, natural daughter of King Robert of

Naples. The *Ameto*, with its disguised personal history and cross-loves, is the prototype of the later Italian pastoral romances, of which a famous specimen is the *Arcadia* (1504) by Jacopo Sannazaro. Another aspect of the pastoral, which indeed is found in Petrarch, was rendered by Mantuan (d. 1516). His rustics were made a medium for fierce satire on women, the Court, and the Church. Attention has already been called to the dramatic element in the pastoral as early as Theocritus. When the popularity of the mediæval mystery play began to wane, the pastoral drama, easily expanded from the eclogue, was one of the forms that took its place. Even in Boccaccio's *Ninfale Fiesolano* the pastoral begins to assume a dramatic turn. But the first distinctive pastoral drama is the *Orfeo* of Poliziano, a sort of opera given at Mantua in 1471. It is founded on the story of Orpheus and Eurydice. During the next century many similar pastorals were produced at the Italian courts. By far the best of them is the *Aminta* of Tasso, performed at Ferrara in 1573. Equally well known in its own time was the *Pastor Fido* of Guarini (1590).

SPAIN. In the Spanish Peninsula the native pastoral songs counted for much more than elsewhere. As early as 1300 the *pastourelle* was cultivated at the Court of Dom Diniz, King of Portugal. And in Spain proper the Christmas mystery play, performed by real shepherds, was in fact a pastoral. The way was thus prepared for Juan de la Encina (d. 1534), who, besides translating Vergil's eclogues, composed pastoral pieces for recital before audiences at the house of the Duke of Alba. To this time belong also the pastoral lyrics by Garcilaso (d. 1536), one of Spain's greatest poets. Under Italian influences, the pastoral romance made its appearance with the *Menina e Moça* (Girl and Maiden) of the Portuguese Ribeiro (d. 1550). It was followed by the more famous *Diana* (1558) of Montemayor, a Portuguese by birth who chose to write in Spanish. For Spain the pastoral sentiment received its most refined expression in Cervantes, in his *Galatea* (1584) and the closing chapters of *Don Quixote* (1616).

FRANCE AND GERMANY. In Southern France the pastoral love song goes back to the twelfth century. At the outset this kind of poetry belonged to the country folk, who sang it especially in May, but as early as Marcabru the pastoral is already an artistic form and becomes stereotyped. A knight, happening to come where a shepherdess is, makes love to her, but he is usually dismissed. This is the theme of all. No pastorals of genuinely popular design have survived. The pastoral soon appeared in Northern France. From the beginning of the thirteenth century the French *pastorele* strongly influenced that of Provence. The shepherd Robin or Robert was adopted in the South, and Marion, too. The old theme blooms charmingly in the *Jeu de Robin et de Marion* (c. 1283) by Adam de la Halle. Though the song fable of *Aucassin et Nicolette* (c.1225) contains delightful rustic scenes, it is hardly a true pastoral. During the sixteenth century the pastoral disguise was sometimes employed by the poets. Clément Marot (d. 1544) addressed an eclogue to the King, in which he described the course of his life under the symbol of the four seasons. The pastoral ideal, enforced by translations of the Italian *Arcadia*, the Spanish *Diana*, and the Greek *Daphnis and Chloe*, culminated in the *Astrée* (1610-25) of Honoré d'Urfé, an immense prose romance. Here the bucolic lie reached its extreme idealization. The nymphs appear in gilded buskins, arms adorned with bracelets, and heads covered with garlands of pearls. From the *Astrée* the pastoral made its way into Germany, where it flourished for more than a century. Of the German pastorals may be cited the *Hercinie* of Opitz (1622), the *Daphnis* (1754) and the *Idyllen* (1756) of Gessner, the *Luise* (1795) of Voss, and Goethe's *Hermann and Dorothea* (1797), in which the idyl returned to the truthfulness and simplicity of Theocritus.

ENGLAND. Before the sixteenth century there was nothing beyond the realistic treatment of the shepherd scenes in the religious drama, and *Robene and Makyne* of Robert Henryson (d. 1506?), written in the Scotch dialect. The pastoral on the Continental model made its first English appearance in the six dull eclogues of Alexander Barclay (d. 1552). They closely resemble the work of Mantuan. In 1563 appeared eight equally dull eclogues by Barnabe Googe. To *Tottel's Miscellany* (1557) Surrey contributed two beautiful pastoral songs in the Italian manner. The important date for the English pastoral is 1579, when Edmund Spenser published the *Shepherd's Calendar*. In twelve eclogues under this title, Spenser handles the leading motives—allegory, satire, and love. During the next quarter of a century English literature became saturated with pastoral sentiment. In all the great writers lived the image of a 'golden world' somewhere in Arcadia or the Forest of Arden. The pastoral poem was cultivated in many lyrics, of which may be cited Marlowe's *Passionate Shepherd*; and in many collections, as *Britannia's Pastorals* of William Browne and the *Eclogues* of George Withers. Of romances inspired originally by Italy and Spain, the most typical is Sir Philip Sidney's *Arcadia* (1590), which had many imitators. There was, moreover, another large group of romancers, at the head of whom stood Robert Greene and Thomas Lodge, the authors respectively of *Menaphon* (1589) and *Rosalind* (1590). Undying charm was given to the pastoral ideal by Fletcher, Ben Jonson, and Shakespeare, in *The Faithful Shepherdess*, *The Sad Shepherd*, and *As You Like It*. A generation later Milton placed the masque in an exquisite pastoral setting and composed his great elegy in the manner of Moschus, Bion, and Theocritus. After Milton the English pastoral fell into sad ways. The pastorals of Pope and Ambrose Philips—each published in 1709—are utterly conventional. Their imagery, when not borrowed, is either false or so general as to convey nothing. In imitation of Philips, John Gay professed to depict rustic life with the gift of his *Shepherd's Week* (1714), which comes somewhere near country manners. William Shenstone wrote several pretty ballads, in which appear Strephon and Chloe. We come to something better in Allan Ramsay's *Gentle Shepherd* (1728), a genuine picture of Scotch rural life. Later in the eighteenth century, the pastoral was fused with other forms of descriptive poetry and hardly exists as an independent species. The pastoral elements may be woven, be uncovered. For example, the summons from the city to the country, as in

quent in Cowper, is a motive of Spenser. And the lyrics of Burns, many of them, are pastoral songs. The Vergilian type of pastoral has become thoroughly discredited. But several of the greatest English poets in the nineteenth century drew upon the Sicilian idylists. There they found truth, grace, and charm. The two finest dirges since Milton—Shelley's *Adonais* and Arnold's *Thyrsis*—go back to Bion and Moschus. Pastoral themes were beautifully rendered by Landor in some of his *Hellenics* (1847), for example "The Hamadryad." Theocritus is easily discovered in Tennyson's *Dora* and *The Miller's Daughter*.

Bibliography. Material for the history of the pastoral is scattered. Consult: Lang, *Theocritus, Bion, and Moschus*, "Golden Treasury Series" (London and New York, 1880); Gaspary, *Geschichte der italienischen Litteratur* (Berlin, 1885-88); better in the translation of Zingarelli, *Storia della letteratura italiana* (Turin, 1889-91); Warren, *History of the Novel* (New York, 1895); Dunlop, *History of Prose Fiction* (1888); Herford, *Spenser: Shepherd's Calendar* (ib., 1895); Chambers, *English Pastorals* (ib., 1896); Stedman, *Victorian Poets* (ib., 1887); Smith, "Pastoral Influence in the English Drama," in the *Publications of the Modern Language Association* (Baltimore, 1897); the authorities referred to under Provençal, French, and Spanish Literatures; and the writers mentioned in this article.

PASTORAL STAFF. See Crosier.

PASTORAL SYMPHONY, The, or Recollections of Country Life. The title of Beethoven's sixth symphony, F major, opus 68, written in the country in 1807, and produced December 22, 1808, at Vienna in the An der Wien Theatre. It belongs to Beethoven's so-called second period, and is representative of the free, joyous music which characterizes his compositions of the years 1800-15. See Beethoven.

PASTORELS (OF. *pastorel*, Fr. *pastoral*, from Lat. *pastoralis*, relating to a shepherd). A name given to certain disorderly bands which appeared in France during the thirteenth and fourteenth centuries. They were recruited from the lower orders of society, including many shepherds, whence the name. In the year 1251 a certain Jacob, who claimed to be Lord of Hungary, and is commonly known as Jacob of Hungary, appeared as their leader in Flanders. He was an unprincipled adventurer and fanatic, but an able man. The King, Louis IX. (Saint Louis), was then in the East, engaged in the disastrous Seventh Crusade, and the preceding year had been a prisoner in the hands of the Mohammedans. Jacob preached that God had rejected princes and the mighty and would free the Holy Land by means of the common people. He claimed to have special revelations and assumed ecclesiastical functions. He formed his followers in well-organized companies, and, ostensibly on the way to Palestine, they began to overrun the country. The true character of the movement soon became evident. The rulers were attacked, property was destroyed, priests and monks were murdered, and the Jews in particular suffered cruel persecution. The disorders were ultimately put down with a firm hand. Jacob was killed while haranguing a crowd in Paris, or, according to another account, in a conflict at Bourges. Seventy years later, under Philip V., similar disorders broke out under the same pretext. These bands of Pastorels ultimately threatened to attack Avignon, when the Pope, John XXII., excommunicated them, and the Seneschal of Carcassone dispersed them with an army.

PASTOR FIDO. See Guarini.

PASTO'RIUS, Francis Daniel (1651-1719). An American colonist, born at Sommerhausen, in Franconia, Germany. Having joined the Society of Friends while in England, where he met William Penn, Pastorius, in 1683, led a party of German and Dutch Mennonites to the new colony of Pennsylvania, where they founded Germantown. He was a man of noble character and deep learning, and exerted great influence among his countrymen. Five years after his arrival in America he signed a protest addressed to the Friends' yearly meeting in Burlington, N. J., which characterized slavery as unchristian. This protest is said to have been the first formal plea for emancipation made in America, and is the subject of Whittier's "Pennsylvania Pilgrim." Whittier also translated the Latin ode to posterity which Pastorius prefixed to the Germantown book of records. Among his other writings is an interesting *Geographical Description of Pennsylvania*, first published under the title, *Umstandige geographische Beschreibung der allerletzt erfundenen Provintz Pennsylvaniæ* (1700).

PASTURAGE (OF. *pasturage*, Fr. *pâturage*, from OF. *pasturer*, Fr. *pâturer*, from ML. *pasturare*, to pasture, from Lat. *pastura*, feeding, pasture, from *pavi*, to feed; connected with *pastor*, shepherd, *pabulum*, food, OChurch Slav. *pasati*, to feed, Skt. *pâ*, to protect). In law, the right of one who is not the owner of land to put his cattle and sheep on such land to feed there. In England the strips of waste land between inclosed fields and the public highways are presumed to belong to the owner of the inclosed land, subject to the right of passage in the public, and he can pasture his own cattle there, and prevent others from doing so. Pasturage is one of the rights in 'common' in many communities in Great Britain. The right is seldom separated from the ownership of the land itself in the United States. See Common, Tenancy in; Easement.

PASTURE, PASTURAGE. The word pasture signifies in its widest sense land for the grazing of domestic animals; in its limited sense, the inclosed lot or meadow found on nearly every farm in which the stock feeds on the growing herbage. The word pasturage also has two different meanings, being used in the one sense for the growing grass and other green plants eaten by stock, and in the other as a synonym for pasture. Pasture is here used in its limited sense, and pasturage as meaning the growing grass and herbage on which stock feeds. The area of the ranges, those great natural pastures of the Rocky Mountain and Great Plains regions, is decreasing as the land is being brought under cultivation by settlers. The pampas of South America, and to some extent the steppes of Asia, are vast natural feeding-grounds corresponding to our ranges. Sometimes the different kinds of farm animals are confined in one inclosure, but most farmers have a separate pasture for swine. Horses and cattle are generally pastured to-

gether, although they sometimes annoy and injure each other. Sheep graze much closer than horses and cattle, and so place the latter at a disadvantage when pastured with them, while, on the other hand, they are useful in keeping down certain weeds which horses and cattle do not eat. A dairy herd is always most profitably pastured by itself. In the United States, and in all countries where new lands are brought into cultivation, the native prairie is often used for pastures, while in older countries or long-settled regions the cultivated soil is laid down to grass for this purpose. Native grasses are hardy and adapted to the prevailing conditions of soil and climate, so that when they are used the element of uncertainty is entirely eliminated. Pasturing more stock than can be well fed in a pasture of this kind has the effect of killing out the grasses and encouraging the growth of weeds, especially during times of drought. Occasional light applications of well-rotted barnyard manure, followed by a thorough harrowing, are very beneficial when the sod has become unproductive and hard. The care of native pastures further requires that the weeds be always kept down and that hardy tame or wild grasses be sown on places where the sod is becoming bare.

The practice of laying down land to pasture is common in all farming regions, and often forms a part of the crop rotation. Pastures on cultivated land intended for only a few years are called temporary pastures, and those for a long series of years permanent pastures. In starting pastures on cultivated land the first and most important requisite is a good condition of the soil. The kinds of soil best adapted for pastures are loams and clays, while loose, sandy, and gravelly soils are entirely unsuitable in this connection. Before the land is seeded down the soil is brought to the best possible condition of cultivation and fertility, and if the natural drainage is inadequate artificial drains are laid. A high state of fertility is conducive to a luxuriant growth of grass and a rapid formation of a good sod. A heavy dressing of barnyard manure is well adapted to grass lands, because it not only furnishes all the necessary elements of plant food, but also has a beneficial effect on the mechanical condition of the soil. It is preferable to lay land down to pasture after a hoed crop like corn, which leaves the soil in a good condition of tilth and comparatively free from weeds. The methods of preparing the soil and sowing the grass seed are the same in pasture-making as in laying down land to grass for a meadow (q.v.).

The choice of grasses depends largely upon the conditions of climate and soil. On ordinary soils in regions where the rainfall is generally sufficient, Kentucky blue grass (*Poa pratensis*), Canada blue grass (*Poa compressa*), tall fescue (*Festuca elatior*), red top (*Agrostis vulgaris*), perennial rye grass (*Lolium perenne*), orchard grass (*Dactylis glomerata*), and red and white clover form a good mixture for pastures. Red top, alsike clover, creeping bent grass (*Agrostis stolonifera*), and perennial rye grass are grown in wet pastures, and red fescue (*Festuca rubra*), red top, Kentucky blue grass, and white clover in pastures on light sandy soils. In the Southern States, Bermuda grass (*Cynodon Dactylon*), carpet grass (*Paspalum platycaule*), large water grass (*Paspalum dilatatum*), and Texas blue grass (*Poa arachnifera*) are the common pasture grasses. Timothy (*Phleum pratense*), although an excellent hay grass, is often sown for pastures, but it is rather subject to injury by the trampling of stock and close grazing, and it does not form a good turf. Unlike the course [illegible] for meadows, in selecting pasture grasses those species are sought which furnish a succession of green foliage throughout the season. For temporary pastures annual and biennial and short-lived grasses are suitable, but for permanent pastures perennial and good turf-forming species are required.

Many farmers grow forage crops near their pastures to feed to the stock during times of drought, to prevent injury being done by too close cropping. The droppings of the stock are not sufficient to keep up the fertility of the soil, and hence, as mentioned above, top dressings of barnyard manure and commercial fertilizers are applied to supply the deficiency. The droppings of cattle ought to be broken up and scattered over the ground. Harrowing a pasture in the spring admits heat and light into the soil and favors the growth of grasses and leguminous plants. Weeds should never be allowed to grow in pastures, and the coarsest and rankest grass should be mowed once or twice each year. Reseeding old pastures is usually not so profitable as breaking and working up the sod and growing a few crops before the land is again seeded down. An abundance of pure water in pastures is a prime necessity. A few trees on the highest points where the stock can find cool shade are of great benefit. A paddock is a small pasture generally located near the barns. Compare MEADOW.

PAT'AGO'NIA. A name formerly applied to the whole southern portion of the South American continent, extending from the Strait of Magellan indefinitely northward to about the 38th parallel of south latitude. In its present use, though the name has no political significance, it is generally restricted to the region lying east of the Andes and south of the Río Negro (Map: Argentina, D 13). The name is supposed to be derived from the Spanish word *[illegible]*, a 'large foot,' in allusion to the large footprints found by the first explorers; but it may also come from the Quichua word *patagonia*, meaning 'terraces.' The region was visited by various Spanish and English explorers after it was first seen by Magellan in 1520. It remained unclaimed by any country until 1881, when it was incorporated into Argentina, while the strip west of the Andes was given up to Chile. The latter portion now constitutes the Chilean Territory of Magallanes (q.v.), and Patagonia proper consists of the Argentine Territories of Río Negro, Chubut, and Santa Cruz (qq.v.).

PATAGONIAN CAVY. See CAVY.

PĀTĀLA, pä'tä'lä. In Hindu mythology, the name of a series of lower worlds, each 10,000 *yōjanas*, or miles, in depth. According to the Puranas (q.v.), they are usually seven in number: Atala, Vitala, Sutala, Rasatala, Talatala, Mahatala, and Patala. Other authorities make eight: Patala, Tala, Atala, Vitala, Tala, Vidhi-Patala, Sarkara-Bahmi, and Vijaja. These regions are entirely distinct from the Narakas (q.v.), or hells, and are inhabited by various classes of semi-divine beings. The soil is white, black, purple, yellow, sandy, stony, and golden, respectively, and they are embellished with magnificent palaces, decorated with brilliant jewels, and filled with delicious viands and wines. There are in these regions beautiful groves, and streams and lakes, where the lotus blows, and the skies are resonant with the songs of birds.

PATALIPUTRA, pä'tä-lē-pōō'trä. A famous city of ancient India, and the capital of the Kingdom of Magadha. It was situated at the junction of the Son (Sanskrit Śōna, classical Erannoboas) River with the Ganges. It seems, therefore, to have stood near the site of the modern city of Patna. It was the chief city of the Nanda and Maurya dynasties, and is famous as the residence of Megasthenes during his stay in India. It was also called Pushpapura and Kusumapura, both terms meaning 'Flower City.'

PAT'AMAR (East Indian name). A species of sailing vessel or boat used along the coast of India, especially in the vicinity of Bombay. It is of the grab (q.v.) type, is fast, and has a large carrying capacity. It was formerly much used for carrying despatches, but steam vessels have now superseded it in this work.

PATAN, pä-tän', or **PATTAN**. A town in the State of Baroda, India, 55 miles northwest of Ahmedabad (Map: India, E 3). It contains over a hundred Jain temples, and is celebrated for its collections of Jain manuscripts. It occupies the site of Anhilvada, the ancient capital of the Gujarati kingdom, renowned for its beautifully sculptured buildings, which was captured by Mahmud of Ghazni in 1024. Population, in 1901, 31,402.

PATAN. A town in Gujarat, India. See SOMNATH.

PATAÑJALI, pä-tän'jä-lē. (Probably second century B.C.) The founder of the Yoga (q.v.) system of Hindu philosophy. There seems to be little reason to doubt that he actually composed the *Yōga-sūtras* (edited and translated by Rajendralala Mitra, Calcutta, 1883), which formulate the principles of the Yoga philosophy. He is generally regarded, probably correctly, as the author of the *Mahābhāshua* (edited by Kielhorn, 3 vols., Bombay, 1878-85), a commentary on the *Vārttikas*, or Explanations, of Katyayana (q.v.), which form in their turn a commentary on the grammar of Pāṇini (q.v.). Consult: Garbe, *Sāṅkhya und Yoga* (Strassburg, 1896); Müller, *Six Systems of Indian Philosophy* (New York, 1899).

PATAP'SCO. A river of Maryland, entering Chesapeake Bay by a large and wide estuary at the head of which stands Baltimore, and which is navigable for the largest ships (Map: Maryland, M 4). The upper course of the river is very swift and furnishes considerable water power.

PATARINES, or **PATARENES**, pät'ä-rēnz. A name applied in Milan in the eleventh century to the reforming party, who held their meetings in the *Pataria* or ragmen's quarter. Under the leadership of Anselm of Lucca and the deacon Arialdo, they took energetic steps to suppress clerical concubinage and simony. They were supported by the popes, but the emperors and many of the nobility opposed them forcibly, and as a popular movement the *Pataria* died out early in the twelfth century. The name of Patarini was, however, appropriated by the Cathari (q.v.) or Manichæan heretics of Northern Italy and Southern France.

PATAS, pä-täs' (African name), **MONKEY**. One of the guenons (*Cercopithecus patas*), a native of Senegambia, distinguished from all others by its reddish color, and grayish cheeks and under parts. It is usually to be seen in menageries. See GUENON.

PATCH, SAMUEL (1807-29). An American noted for various feats of leaping. He was born in Rhode Island, went to sea in early life, and afterwards settled at Paterson, N. J., where he was a cotton-spinner. Because of his threats to jump from a bridge over the Passaic River, he was finally placed under arrest. A few months afterwards the successful performance of the feat gave him such widespread notoriety that he traveled about, leaping from the yard-arms or topmasts of ships. He lost his life in making a jump of 125 feet into the Genesee River below the falls at Rochester, N. Y.

PATCHOGUE, pă-chōg'. A village in Suffolk County, N. Y., 55 miles east of New York City, on the shore of Great South Bay, and on the Long Island Railroad (Map: New York, H 5). It is popular as a place of residence and as a summer resort, and has several hotels, fine church edifices, a high school, and a public library. The village has large oyster and fish interests, ice and cold storage plant, lumber yards, and manufactories of lace curtains, paper, and surveyor's steel tapes and supplies. It was incorporated in 1893. The government is administered by a village president, who holds office for a year, and a board of trustees, elected on a general ticket. Population, in 1900, 2926.

PATCHOU'LI (Fr., from the East Indian name). The powerfully odoriferous dried branches of Pogostemon patchouli or Pogostemon heyneanus, of the natural order Labiatæ, which first appeared in commerce in 1844. The plant is a native of the Malay coast, Ceylon, Java, the neighborhood of Bombay, and probably also of China and Japan. The odor of patchouli was known in Europe before the material itself was introduced, because of its use in keeping moths out of Cashmere shawls, hence genuine Cashmere shawls were known by their scent until the French found the secret, and imported the herb. In India, where it is known as puchapat, it is used as an ingredient in fancy tobaccos, as a perfume for the hair, and for keeping insects from linen and woolen articles. Patchouli yields by distillation a peculiar heavy brown oil, disagreeably odoriferous, which requires extreme dilution for perfumery purposes.

PÂTÉ DE FOIE GRAS, pä'tä' de fwä grä (Fr., paste of thick liver). Sometimes called 'Strassburg pie,' a dish greatly esteemed by epi-

cures, and, as the name indicates, made of the livers of abnormally and artificially fattened geese or ducks. Strassburg and Toulouse are the chief places of manufacture. The *pâtés* are exported to every part of the world, and the trade amounts to several hundred thousand dollars annually. The fowls are fed to repletion with salted maize, and by this means the liver is increased to the unnatural weight of two or even three pounds.

PATEL, pä'tĕl', Pierre (*c.*1605-76). A French landscape painter, born probably in Picardy. He is said to have been a pupil of Vouet, and also to have studied in Italy. He was one of the many painters employed on the Hotel Lambert, and on the decorations in the Louvre. His paintings are in the manner of Claude Lorraine, and he chose like subjects—the ruins of old buildings and masses of finely drawn architecture, in which he shows considerable variety in the arrangement of the surrounding landscape. He also had Claude's genius for aërial perspective and fine, glowing skies. Their works are sometimes confounded. Patel had a son who imitated his father. The Louvre contains several pictures by the older Patel; these include "Exposure of Moses," "Moses Burying the Egyptian," and some landscapes. There are other works by him in the provincial museums of Besançon, Montpellier, Nantes, and Marseilles.

PATELLA (Lat., small pan or dish, kneepan, patella), or Knee-Cap. A sesamoid bone, developed in the common tendon of the *rectus, vastus externus,* and *vastus internus* muscles—the great extensor muscles of the leg. It is of rounded, somewhat heart-shaped form, the broad end being directed upward and the apex downward. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striæ, while the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-bone, while the two facets (of which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture. Dislocation is rare. It may occur either inward or outward; but it is most frequent in the outward direction. The displacement may be caused either by external violence, or by too sudden contraction of the extensor muscles in whose conjoined tendon it lies, and is most liable to occur in knock-kneed, flabby persons. It may be readily detected by the limitation of active motion, and by the bones being felt in its new position; the dislocation is usually capable of being reduced without great difficulty.

Fracture of the patella may (like dislocation) be caused either by muscular action or by external violence. Fracture by muscular action is the more common, and occurs thus: A person in danger of falling forward attempts to recover himself by throwing the body backward, and the violent action of the extensors (chiefly the *rectus*) snaps the patella across, the upper fragment being drawn up the thigh, while the lower portion is retained *in situ* by that portion of the common tendon which is continued from the patella to the tubercle of the tibia, and which is called the ligamentum patellæ. The conservative treatment consists in relaxing the opposing muscles by raising the trunk and slightly elevating the limb, which should be kept in a straight position, while straps and other devices are applied directly to the fragments to secure their close approximation. In consequence of the great difficulty of bringing the broken surfaces into exact apposition, it is very difficult to obtain bony reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all. The practical results in these cases as regards the use of the limb are fairly satisfactory, however.

The operative treatment consists in cutting down on the fragments and fastening them together with catgut, wire, or some other form of suture. It is attended with remarkably perfects results, but is not devoid of danger. A measure intermediate between operative and non-operative treatment consists in the application of hooks or other devices which seize the fragments through the skin and hold them in apposition until union has taken place.

PATELLA. See Limpet.

PATEN (Lat. *patena, patina,* flat shallow dish, from *patere,* to lie open; connected with Gk. πετανύναι, *petannynai,* to spread out). The plate on which the bread in the eucharistic service is consecrated, sometimes used also for the distribution to the faithful. In the earliest centuries it was of wood, glass, or the more ordinary metals, and underwent the same changes as the chalice (q.v.), which it accompanied. As early as the fourth century, however, patens were often made of silver or gold, weighing thirty pounds and more. These early examples were of large size and called *patenæ ministeriales* or *communicales.* The smaller patens (*patenæ parvæ*) for the use of the celebrant at the altar were of far later origin. Special patens were used for the chrism in baptism and confirmation (*patenæ chrismales*). Patens were usually circular, though later examples are sometimes polygonal or square. A very few examples remain of the Byzantine and Romanesque periods, of silver with decoration in low relief, niello, or enamel.

PATENT, and **PATENT LAW** (from Lat. *patens,* lying open, patent, pres. part. of *patere,* to lie open; originally in the phrase *littera patentes,* letter patent, open letter). A patent, in the most general sense, is a letter patent (q.v.), but the term is mostly used in the specific sense of a letter patent granted by the Government to secure to an inventor the exclusive right to make, manufacture, and sell for a certain period the thing invented or discovered by him. The term patent law is used to designate the law affecting the granting of such letters patent and their use, protection, etc. By the common law an inventor has no protection in the exclusive use of his invention, and therefore all patent law is founded upon statutes. The policy of encouraging useful discoveries and inventions in the arts and industries by securing to discoverers and inventors the exclusive benefits of their discoveries is an old one among governments. It was a common practice among the Tudor sovereigns of England to grant to inventors such exclusive privileges. At first the inventor was required to use his invention within the king[dom,

and in some instances to pay a tax to the Crown or share with it the profits derived therefrom. Until 1852 the British patent law was restricted to England, patents in Scotland being issued under the common law. In 1852 the basis of the present British system of patent legislation was laid by a comprehensive statute which was applied to the whole kingdom. The British policy of encouraging by exclusive privilege the invention of new and useful articles was extended to the English colonies in America, and we find occasional colonial statutes empowering certain persons to exercise the exclusive right to manufacture articles of use which they had invented.

The Constitution (Art. I., § 8) of the United States recognized and sanctioned the policy by conferring authority upon Congress to secure to inventors the exclusive use of their inventions for limited periods of time. In pursuance of this authority, Congress in 1790 passed an act to provide for the granting of patents to the inventor of "any useful art, manufacture, engine, machine, or device, or any improvement therein not before known or used." Applications for patents under this law were required to be made to a board consisting of the Secretary of State, the Secretary of War, and the Attorney-General. The patent was issued by this board upon the concurrent action of two members, was authenticated by affixing the great seal of the United States, and was valid for such term not exceeding fourteen years as the board might in its discretion agree upon. The law of 1790 contained provisions for the punishment of infringements and provided that no distinction should be observed between foreigners and American citizens in the granting of letters patent. A small fee amounting to less than five dollars was charged for the patent. In 1793 a new statute was passed, repealing the Act of 1790 and making several changes in the system. The new act restricted the grant of patents to citizens of the United States; required applicants to surrender to the United States any patents which they might have received from any State prior to the adoption of the Constitution; provided that applications should be made to the Secretary of State, that conflicts between applications should be decided by a board of three arbitrators, and that patents obtained by fraud or misrepresentation could be declared void by a United States district court upon due proof. Supplemental acts of 1794 and 1800 were passed, the latter of which extended patent privileges to aliens who at the time of application had resided in the United States for a period of two years. All applicants were now required to make oath that to the best of their knowledge and belief the invention for which they were seeking a patent had not been known or used in any foreign country. About this time the judicial question arose as to whether the power of Congress was exclusive in the matter of patents (Gibbon vs. Ogden, 9 Wheat. i.); but the precise point as to the right of a State to grant patents was not decided. Since then, however, the opinion has become settled that the power of Congress in the premises is exclusive.

The year 1836 marks the beginning of an era in the patent system of the United States. In that year all previous statutes were repealed and a comprehensive act was passed which brought the system somewhat into its present condition, retaining many old features, but introducing new and important changes. In the first place, it created a patent office to be attached to the Department of State, at the head of which was to be a commissioner of patents. The most important provision of the Act of 1836 was the introduction of the policy of preliminary examinations for the purpose of determining the patentability of an invention before issuing the patent. The Act of 1836 also provided for a board of appeal to hear appeals from the decisions of the examiner and commissioner against the patentability of an invention. The patent privilege was now extended to any alien who had resided one year in the United States and who had made a declaration of intention to become a citizen. The fee was fixed at $30 in the case of citizens and resident aliens, $500 for the subjects of Great Britain, and $300 for the subjects of other nations. Provision was also made for filing caveats on incompleted inventions and the policy of reissuing patents was confirmed and extended. Exclusive jurisdiction of cases involving patent rights was conferred upon the United States Circuit Courts. Provision was also made for extending the duration of patents for a period of seven years after the expiration of the original fourteen, the power of extension being placed in the hands of a board consisting of the Commissioner of Patents, the Secretary of State, and the Solicitor of the Treasury. Various amendments of the patent laws were made during the succeeding years. In 1842 provision was made for patenting designs for a period of seven years. By an Act of 1861 the term of patents for inventions was extended from fourteen to seventeen years; all former acts discriminating between aliens and citizens were repealed; a uniform scale of fees was adopted; and a board of examiners intermediate between the regular examiners and the Commissioner was established to hear appeals from the former. The whole system of patent legislation was revised and codified in 1870, and brought into its present condition.

As the laws now stand (Rev. Stat. § 4886) any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may upon payment of the fee required by law obtain a patent therefor.

Patents are obtained by making application to the Commissioner of Patents in accordance with forms prescribed by law. The form prescribed is that of a petition together with an oath that the applicant believes himself to be the first inventor. The application is accompanied by a specification describing the invention in a full, clear, and concise manner. Drawings accompany the specification in cases which admit of it, and the Commissioner may require the applicant to furnish the office with a model of the article; but this of late years has not usually been required except where necessary to a correct understanding of the article. The application upon being received is referred to the proper examiner for inquiry as to whether the article possesses nov-

elty and utility and whether it has already been anticipated in the United States or abroad. If no objection is found by the examiner the patent is issued. If objection is raised by the examiner the applicant may amend his application so as to eliminate from the claims the features that are old. If still refused he may appeal to the board of examiners, and from their decision he may appeal to the Commissioner of Patents. Finally, an appeal lies to the Court of Appeals of the District of Columbia. The fee upon filing an application is $15; on issuing the patent, $20; on application for extension of a patent, $50; on granting an extension, $50. A prior patent by the inventor in a foreign country does not debar him from receiving a patent in the United States, provided the application be made within seven months of the application for the foreign patent.

Where a person has made an invention, but has not completed the details to his satisfaction, or feels that he can improve on it after further experiment, he may protect himself against a patent being granted meanwhile for the same thing, by filing a 'caveat' in the Patent Office. A caveat is a notice which contains a description of the thing claimed as an invention, and concludes with a request that the inventor's rights be protected until he has completed his invention and has an opportunity to apply for a patent. A caveat is kept secret by the Patent Office, thereby avoiding giving information which might be fraudulently utilized by clever persons, and entitles the caveator to notice of the filing of an interfering application for a period of one year. If such notice is sent him, the caveator, to retain his rights, must file his application, specifications, and, if necessary, models or samples, within three months thereafter. Where he does this his invention is considered to date back to the date of filing the caveat.

The interpretations by the courts of the various words and phrases in the sections above quoted form the great body of the substantive law of patents, in connection with the statute itself. The alternative use of the words 'invention' and 'discovery' early attracted attention, and the question arose as to whether different meanings were to be ascribed to them. It was undisputed that the mere discovery of a force of nature could not be patentable, as natural forces and elements belong to all mankind, and it was finally determined that the word 'discovery' as used was synonymous with 'invention' and involved the exercise of inventive or creative genius or faculties. For example, the person who discovered electricity as a force could not have obtained a patent allowing him the exclusive use of that force of nature, but Morse, who applied electricity to the communication of messages, was allowed a patent on his system of telegraphy, as that was a device calling for inventive genius in its creation, and was not merely the finding of an already existing thing.

Under the word 'art' many of the 'processes' now held patentable are classified. A process is a combination of the elements or laws of nature designed to accomplish a useful result. Much controversy arises over this class of patents. The word 'machine' includes all contrivances whereby mechanical parts or pieces are arranged to move together for the production of some useful result, and it is under this head that most patents are granted in the United States. The word 'manufacture' is construed to mean anything new, made by the hand of man, which is not included in the other terms employed in the above sections, and covers fabrics, furniture, clothing, etc. The term 'composition of matter' may be defined as the mixing of two or more elements or substances by chemical union or by mechanical mixing, and includes such products as paints, medicines, etc. Frequently it is very difficult to determine under which of the above heads an invention should properly be classified, but it is held not to be absolutely essential for an inventor to do so, provided it is certain that his invention comes under one or more of them. The section allowing patents for designs is liberally construed to include ornamental as well as useful designs.

Besides consisting of one of the above subject-matters, a thing for which a patent is asked must have the three general characteristics prescribed by the statute, viz.: it must be an invention; it must have novelty, that is, be new; and it must be useful. The determination of whether a thing presented really constitutes an invention is frequently a very difficult matter. In general, it may be said that it is not invention to devise something that is not a practical working device, but needs more thought or experiment to enable it to produce the result; or to construct or produce something which any mechanic or reasonably skilled person in the particular line would produce, upon request, in the exercise of his ordinary skill; or to put in better materials or workmanship into a known article; or to change the size of a thing; or to omit a useless or 'dead' part of a machine or device; or to substitute an equivalent which merely performs the same office as the part taken away, without improving the operation of the whole; or to make a new or 'double' use of a known article, without improving on it, as by utilizing the principles of an ice-cream freezer for the purpose of preserving fish. A person who produces a combination of elements, or of mechanical devices, need not be able to explain the scientific reasons for their combination or adjustment in the particular manner or form in which he presents them, in order to be considered the inventor, provided he can describe the materials and the combination or construction so that the same result may be accomplished again. See INVENTION.

A distinct and original improvement on an old invention is patentable, but a patent on the improvement does not disturb the rights of the inventor of the first device to its exclusive use as before. It is not necessary that an inventor be personally able to construct the device which he has conceived, if he can dictate his ideas to a skilled mechanic, so that the latter can readily construct the device without the exercise of his own inventive genius. However, the mere conception of a result, without being able to suggest a practical means of attaining it, is not invention.

The word 'new' in the statute is not confined to its ordinary meaning, but includes anything which has not before been made public or been given to the world. For example, if A presents a model of a machine together with an application for a patent on it, at the Patent Office, he is first entitled to a patent, although another inventor may later bring there a machine identically the same as the first, and be able to

prove that he had conceived and constructed it long before A, provided the inventor who first conceived the machine had not used it or made it public in any way. However, if the thing which is sought to be patented has been previously used in a single instance by other parties, even though that use was not known to the public at large, it is sufficient to defeat a claim for a patent on the device presented, for want of novelty, although the one presenting it and claiming to be the inventor had never heard of the previous use of his alleged invention. But a patent may be granted for a new method of producing a result theretofore accomplished in another manner, as, for instance, if a new machine should be devised for making pins.

The statute also requires that an invention, to be patentable, must be useful. This is perhaps the most liberally construed of the three general essentials, and as a result, almost anything which is not injurious to public health or morals can be patented if it contains the other essential characteristics, and contributes to the comfort, convenience, or pleasure of mankind. Thus, a toy, intended for the amusement of children, may be patented.

A patent will be issued only to the inventor, except that if he dies before making application, his personal representatives are permitted to do so, and that he may sell his rights in his invention before obtaining a patent, and in making his application ask that the patent issue to his assignee, which will be done. Joint inventors must have their inventions patented to both jointly. Foreign inventors may obtain patents in the United States, with the condition that if their inventions are not known in the United States before they make application, and a citizen of the United States has made the same invention without knowledge that it had previously been produced abroad, the latter can obtain a patent in preference to the former, even though his application be filed subsequently. Where an employee makes a new thing under the guidance and direction of his employer, the latter is entitled to the patent, as he is the actual inventor; but if an employer, independently of the suggestions of his employer, conceives and produces something which is patentable, he is entitled to the patent, as his inventive faculties were alone employed; but the employer may by the terms of his contract with the employee be entitled to an assignment of the patent. Before or after filing a caveat or application, an inventor may abandon his invention to the public by express acts or words, or by such conduct that an intention to do so may be presumed. Delay in making or completing an application and lack of public exhibition or use of the invention are considered evidence of abandonment. However, any acts or words are subject to explanation, and if the inventor was too poor to defray the expenses of an application, or was unable through temporary insanity, illness, or any other reasonable cause, to make application, the above presumption will be rebutted.

Where a patentee has reason to believe that his patent is defective by reason of an insufficient description in the specifications, or that his claims were not broad enough to include all the principles of his invention, or if there was an error affecting it in the Patent Office, he may surrender the old patent and at the same time file an application to have a new one issued to him, upon proper specifications. This is known as 'surrender and reissue.' A good patent cannot be thus surrendered for the purpose of having a new one containing the features of a subsequent improvement, issued to the inventor. The reissue must be for the same invention.

Where a claim in a patent covers more than the patentee is lawfully entitled to, the patent is wholly void. However, where this has occurred through inadvertence or mistake, the patentee may file an instrument known as a 'disclaimer,' which should contain a clear statement of what he justly claims as his own invention, and what he disclaims. Unless this is done, such a patentee cannot maintain an action to protect whatever rights he is actually entitled to in the invention. A disclaimer is not the proper method of correcting defective specifications, as it only amounts to an abandonment of a thing previously claimed.

Where two or more patents contain claims which are identical, they are known as interfering patents. In such a case, any one of the patentees may bring an action in equity to have the respective rights of the interfering patentees determined, and only one of the patents can be sustained as valid.

Patents are considered as property, and may be sold and transferred from one person to another, by assignments in writing. Provision is made for recording such assignments in the Patent Office, and unless this is done within three months after its date, an assignment will be void as against innocent purchasers or mortgagees for value. Prospective purchasers should therefore search in the Patent Office for possible assignments. Patents may be held by joint owners, partners, or corporations. An owner of a patent may convey an interest in it, or grant a license to another to use it upon payment of royalties or a fixed rent, or may grant the right to make and sell it for an agreed period.

All patented articles should be marked with the word 'patented,' and with the exact date on which the patent was granted. Unless this is done no damages can be recovered in an action for an infringement, if the infringer had no previous notice of the existence of the patent. Where an unpatented article is marked 'patented,' the person so marking it is liable to a penalty of not less than $100 and costs, to be recovered in a *qui tam* (q.v.) action, one-half of which goes to the informer, and the other half to the Government.

An infringement of a patent consists in wrongfully making, using, or otherwise dealing with a patented invention. A person to whom the patentee sells a patented machine may make necessary repairs from time to time, but they must not amount to a reconstruction of the machine, and he cannot build a new machine without being guilty of an infringement. Many cases of infringement arise in regard to patented compositions of matter, by an infringer substituting an equivalent for one element. A patentee has two remedies for an infringement. He may sue at law for damages, or may apply to a court of equity for an injunction restraining the infringer from continuing his acts, and incidentally be awarded damages for the injury suffered. If the patented article is properly stamped, it is

no defense that the infringer had not seen or heard of it.

The United States Government will not issue a patent except with the consent of the patentee, as the relation between them is in a sense contractual, as the patentee pays certain fees and complies with certain regulations in return for his protection. The grant of a patent is not the grant of a monopoly in the strict sense of that word, which is that certain rights or privileges theretofore enjoyed by the whole public are granted exclusively to one or more individuals, and the general public restrained in the exercise of those rights. A patent is merely protection for a limited time in the enjoyment of something which has been created or produced by an inventor, and which had not theretofore been enjoyed by the general public. Consult the treatises on the *Laws of Patents*, by Walker (3 ed., New York, 1895); Phillips (5th ed., Boston, 1867); Curtis (4th ed., Boston, 1873); Carpmael, *Patent Laws of the World* (2d ed., London, 1889), and the official Government reports of the United States, Great Britain, etc.; Merwin, *Patentability of Inventions* (Boston, 1883); Munn & Co., *United States Patent Law* (New York, 1870). See COPYRIGHT; LETTERS PATENT; MONOPOLY; TRADEMARK.

PATENT OFFICE. A Government department or bureau established by act of Congress in 1836, with a commissioner at its head charged with performing all duties relative to the granting of patents. In 1849 the Patent Office was transferred to the newly created Interior Department, where it has since remained. From the beginning provision was made for the collection and preservation of models, as a result of which an immense collection of specimens and designs has been gathered. In 1836 the building in which the models were kept was burned and many of them were destroyed, but Congress made an appropriation of $100,000 to procure duplicates of the most valuable ones. Again in 1877 a part of the building was burned together with many models, but the most of these were replaced by the manufacture of new ones.

The business of the Patent Office during the early years of its existence was small, the number of patents granted varying from 400 to 600 annually during the period from 1837 to 1847. In 1840 the applications for patents amounted to 735, while the number of patents actually issued was 458. In 1899 the number of applications was 35,352, while the number of patents granted was 23,550. The receipts of the Patent Office usually exceed the expenditures, although there have been exceptional years. In 1840 the receipts and expenditures were respectively $38,056 and $39,020; in 1899 they were $1,325,457 and $1,211,783. The Commissioner of Patents is required to make an annual report of the business of the office, giving with other information a list of patents issued during the year, with the names of the patentees. Specifications and drawings of all inventions are likewise published in a monthly volume. Until 1862 the Patent Office also published an annual volume on agriculture. An official gazette containing lists of patents, issued together with brief descriptions and drawings, decisions of the office on important questions arising in the course of the administration, and important judicial decisions affecting patents, is now one of the regular weekly publications of the office. The Commissioner of Patents is aided by an assistant commissioner, three examiners in chief, and a large number of examiners, each of whom has charge of a distinct class of inventions. Besides these there are several hundred assistant examiners, clerks, messengers, etc.

PATER, pā'tĕr', JEAN BAPTISTE JOSEPH (1695-1736). A French genre painter, born in Valenciennes. He was a pupil of Watteau, and painted subjects similar to those of his master. The 'fêtes galantes' were depicted by him with something of the grace and ease that distinguished Watteau himself. But although he was a good colorist, he was not a good draughtsman. His works include: "Fête Galante" (in the Dresden Gallery); "Women Bathing" (in the National Gallery, Edinburgh); "Fête Champêtre" (1728), in the Louvre; "The Bath" (in Versailles); and "The Comical March" (in the Metropolitan Museum, New York City).

PATER, pā'tĕr, WALTER HORATIO (1839-94). An English essayist, born at Shadwell, in the East of London, August 4, 1839. He was educated at King's School, Canterbury, and at Queen's College, Oxford, graduating B.A. in 1862. In 1864 he was elected fellow of Brasenose College. Except for his visits to the Continent and a short residence in London, he passed his life at Oxford. He had come to the university with the intention of entering the Church of England; but by 1865—the date of his first visit to Italy—he had lost all belief in Christian doctrines. He found his mission in interpreting to his age the spirit of the Renaissance in art and literature. For this end he employed the historical novel, the story, and mainly the essay. In all his work—much of which originally appeared in the reviews—he wrought with the greatest care, aiming at absolute precision in the expression of his thoughts and emotions. The result was an extremely delicate and refined style, delightful in its rhythm, but lacking in vigor and simplicity. After a quiet career as tutor and author, Pater died at Oxford, July 30, 1894. His publications in book form comprise: *Studies in the History of the Renaissance* (1873), containing the brilliant essay on Winckelmann; *Marius the Epicurean* (1885), a masterly exposition of the best phases of Epicureanism, put into the form of an historical romance; *Imaginary Portraits* (1887), studies in philosophic fiction; *Appreciations* (1889), containing his most subtle literary criticism and a notable essay on style; *Plato and Platonism* (1893); and *The Child in the House* (1894), an imaginary portrait. After his death appeared *Greek Studies* (1895), and a volume of essays collected from contributions to the *Guardian* (1897). His *Works* in eight volumes appeared in 1900.

PATER'CULUS, GAIUS VELLEIUS. A Roman historian, descended from an ancient and wealthy Campanian family. He is thought to have been born about B.C. 19. He entered the army at an early age, and from A.D. 4 to 12 served under Tiberius as *praefectus equitum* or *legatus* in Germany, Pannonia, and Dalmatia. He was a great favorite with Tiberius, and when the latter became Emperor, A.D. 14, Paterculus was appointed *praetor*. He was alive in A.D. 30, as his history comes down to that year; but it is conjectured

that in the following year he was perhaps put to death as one of the friends of Sejanus, of whom he speaks highly in his work. Paterculus's claim to remembrance is his *Historiæ Romanæ*, a compendium of universal, but more particularly of Roman, history, in two books. The work, as we have it, is not complete, the beginning and a portion following the eighth chapter being wanting. It seems to have commenced with the fall of Troy, and describes only the most prominent historical incidents, but these, fortunately, with considerable fullness of detail. The *editio princeps* of the *Historiæ Romanæ* appeared at Basel in 1520. Later editions are by Orelli (Leipzig, 1835); Kritz (ib., 1840); Haase (ib., 1863); and Halm (ib., 1876). There is a partial English translation by Baker (London, 1814), and a complete one in the Bohn Library (ib., 1859).

PAT'ERE'RO (corrupted from *pederero*, from Sp. *pedrero*, swivel-gun, from ML., *petraria*, stone-throwing engine, from Lat. *petra*, from Gk. πέτρα, rock). A small gun, firing a shot weighing 12 pounds or less, formerly much used as a swivel. It was mounted on the ship's rail or in the bow of a boat. (See article on GUNS, NAVAL.) The name is also applied to a small mortar for firing salutes on holidays and at festivals, especially in Roman Catholic countries.

PATER JOCHEM, pä'tĕr yō'kĕm. A Swiss patriot. See HASPINGER, JOACHIM.

PATERNO, pä-tĕr'nō. A town in the Province of Catania, Sicily, situated on the slope of Mount Etna, 11 miles northwest of Catania by rail (Map: Italy, J 10). There are some interesting remains here of the Roman period. On a height overlooking the city stands an ancient Norman tower now used as a prison. There are mineral springs, and a trade in wine, oil, and flax. Paterna is built on the site of the old Greek city of Hybla Major. Population (commune), in 1881, 17,353; in 1901, 23,453.

PATERNOSTER (Lat., Our Father). A name for the Lord's Prayer (q.v.) commonly used among Roman Catholics, from the opening words of the Latin version employed in all their services. In the rosary (q.v.) it is combined with the Hail Mary; the larger beads of the rosary are thus called paternosters, and the name was at one time applied to any beads about the same size, even when used for trimming a dress.

PATERNOSTER ROW. A noted London street, long the focus of the publishing and book trade of the city. Its name is derived from the makers of rosaries and prayer-books, who formerly made it their headquarters.

PAT'ERSON. An important manufacturing city, the county-seat of Passaic County, N. J., 16 miles northwest of New York City; on the Passaic River, the Morris Canal, and the Erie, the Lackawanna, and the New York, Susquehanna and Western railroads (Map: New Jersey, D 2). The city, with an area of about 8½ square miles, extends over a broad plain around a curve of the river. The Passaic has a perpendicular fall of 50 feet at this point, and a descent of 20 feet more to the plain, affording great water power. The streets are broad and well drained. Sixty-four miles are paved, the great proportion with macadam. The street railroad system, including 50 miles of track, extends beyond the city, connecting with important towns and cities of the vicinity. Paterson has a public library of about 37,000 volumes; two city parks—East Side and West Side parks; an imposing soldiers' monument; Paterson General Hospital and Saint Joseph's and isolation hospitals; Old Ladies' Home and Children's Nursery, and other charitable institutions. Among prominent structures are also the new city hall, court-house, post-office, and several banking buildings. The manufactures, which make this the third city of the State in importance, include silk and silk goods, locomotives, steel trusses and bridge work, engines and boilers, iron and steel, brass castings, general machinery, cotton goods, linen thread, jute, paper, malt liquors, etc. The silk mills are the most extensive in the United States, employing an army of operatives, and representing a considerable amount of capital.

The government is vested in a mayor, elected every two years; a council; and in subordinate administrative officials, appointed or elected as follows: board of education and library trustees, by the executive; park commissioners and health board, by the executive, subject to the consent of the council; and heads of city departments such as are employed in the city hall, by the council. Paterson spends annually, in maintenance and operation, about $1,175,000, the main items of expense being $295,000 for schools, $145,000 for interest on debt, $120,000 for the fire department, $115,000 for the police department, $75,000 for municipal lighting, $60,000 for charitable institutions, and $55,000 for street cleaning and sprinkling. The city's bonded debt is (1901) over $3,200,000, and the valuation of property (real and personal) is assessed at nearly $50,000,000.

Paterson was founded in 1792 by "The Society for Establishing Useful Manufactures," in which Alexander Hamilton was much interested. It was thought that the town would soon become the manufacturing metropolis of America. It was incorporated as a town in 1791, William Paterson then being Governor of the State, and was chartered as a city in 1851. The steady growth of the city is indicated in the following statistics: Population, in 1840, 7596; 1850, 11,334; 1860, 19,586; 1870, 33,579; 1880, 51,031; 1890, 78,347; 1900, 105,171. The population in 1900 included 38,800 persons of foreign birth and 1200 of negro descent.

PATERSON, JOHN (1744-1808). An American soldier, born at New Britain, Conn. He graduated at Yale in 1762; practiced law for a time in New Britain; removed to Lenox, Mass., in 1774, and was elected a member of the Massachusetts Provincial Congress. Immediately after the battle of Lexington he led a regiment of minute-men to Cambridge and helped to erect the first redoubt near Boston. He afterwards served with great gallantry in the Canada and New Jersey campaigns in the operations against Burgoyne, and became a brigadier-general (1777) and a major-general (1783). He held a command in the Massachusetts militia during Shays's Rebellion in 1786, and afterwards (1794) removed to Lisle (now Whitney's Point), N. Y., and became county judge of Broome County. He served four terms in the State Legislature, was a

member of the State Constitutional Convention in 1801, and was a member of Congress in 1803-05. From 1805 until his death (at Lisle) he devoted himself to farming. Consult Eggleston, *Life of Major-General John Paterson* (2d ed., New York, 1898).

PATERSON, Robert (1715-1801). A Scottish stonemason, born near Hawick, who is immortalized by Sir Walter Scott, as 'Old Mortality.' After his marriage he leased a quarry of his own, but being a Cameronian with the courage of his convictions, his house was burned and himself made prisoner by the Jacobites on their retreat from England with Prince Charles in 1745. Paterson began his wanderings by taking monuments into the Galloway district for the graves of the Covenanters, and from 1758 he forsook his wife and family in his enthusiasm for his self-appointed task. For more than forty years he and his old white pony were well-known figures in the vicinity of every churchyard of Southern Scotland where there were Cameronian monuments. 'Old Mortality' restored their lettering and otherwise kept them in order. He depended for his living chiefly upon Cameronian hospitality, which never failed him, had ever a melancholy mania for discoursing upon the persecutions of the hill-men, and died in poverty.

PATERSON, William (1658-1719). A British financier, born in Dumfriesshire, Scotland. When a young man he removed to England, and then went to the Bahama Islands. Returning to London, he engaged in trade, and soon acquired a considerable fortune. Paterson is chiefly famous for having been the originator of the Bank of England and for having projected the Darien scheme. His first overtures to the Government for the establishment of the bank were made in 1691, but it was not until 1694 that Parliament adopted his plan and passed the act creating for ten years the corporation called the "Governor and Company of the Bank of England." Paterson was one of the original stockholders of the bank, but in less than a year he resigned, and soon afterwards took up the more visionary Darien scheme (q.v.). Removing to Edinburgh, he succeeded in persuading the Scottish Parliament to pass the Act of 1695, which created the "Company of Scotland trading to Africa and India," under the management of which the settlement at the Isthmus of Darien was made. Paterson, who had, because of a quarrel with the directors, accompanied the expedition merely as a private individual, lost his wife by death and suffered greatly from hardships and sickness. Upon his return to England he was an active and influential advocate of the union between Scotland and England, and had a considerable share in framing the articles of the treaty relating to trade and finance. In consideration of his public services, the united Parliament of 1708 recommended that he be given an indemnity for his losses in the Darien undertaking, but this was not done until 1715, when he received £18,241. Paterson published anonymously more than twenty works on finance, colonial enterprises, legislative union, and other subjects. His *Works* have been collected by Bannister in three volumes (London, 1859). Consult also, Bannister, *Life of W. Paterson* (Edinburgh, 1858).

PATERSON, William (1745-1806). An American statesman and jurist, said to have been born at sea. He came to America when very young, graduated at the College of New Jersey (Princeton) in 1763, studied law, and was admitted to the bar in 1769. In 1776 he was a member of the Legislative Council of New Jersey, and of the State Constitutional Convention. The same year he was elected Attorney-General and served ten years. He was a delegate to the Continental Congress in 1780-81, and in 1787 to the National Constitutional Convention. Here, as a representative of the smaller States, who feared to enter a union in which population or wealth should govern representation, he proposed (June 13th) the famous 'New Jersey plan.' This provided for a single legislative house, in which each State should have one vote; an Executive Council removable by Congress, and a supreme judiciary to be elected by Congress. The National Government should have power to regulate commerce, levy import duties, and, if necessary, make requisitions for money upon the States. He was one of the first Senators from New Jersey in 1789, but resigned in 1790. From 1791 to 1793 he was Governor of the State, and the town of Paterson was named in his honor. In 1793 Washington appointed him an associate justice of the Supreme Court, on which he served until his death. A collection of his letters has been published under the title *Glimpses of Colonial Society and the Life at Princeton College, 1766-1773, by one of the class of 1763*, edited by Mills (Philadelphia, 1903).

PATERSON, William Romaine (1871—). An English novelist, better known by his pseudonym, Benjamin Swift. He was born in Glasgow, and studied a year at Lausanne. His books are: *Nancy Noon* (1896); *The Tormentor* (1897); *The Destroyer* (1898); *Siren City* (1899); *Nude Souls* (1900); and *The Game of Love* (1901). Of these the earlier were overfanciful or consistently disagreeable in matter, and in manner imitations of Meredith, but with *Siren City* he struck an original note.

PATHANS, pȧ-thänz'. One of the names of the Afghan peoples of the border-land of Hindustan and Afghanistan. The Indian Pathans have been of considerable historical importance, and the less cultured tribes have at times fought desperately against the British. Consult: Bellew, *The Races of Afghanistan* (London, 1880) and *Inquiry into the Ethnography of Afghanistan* (London, 1891); Oliver, *Across the Border, Pathan and Biloch* (London, 1890).

PATHELIN, pȧt'lăN', or Maître Pathelin. A noted French farce, composed probably at Rouen in 1465. Pathelin is a tricky lawyer, whose dishonest shifts form the staple of the action. It was worked over in modern style by Brueys and Palaprat (1706) as *L'avocat Patelin* and had great success. From their dialogue comes the familiar phrase *Revenez à vos moutons*, used there to recall Patelin to the sheep whose disappearance is under discussion. Consult Schaumburg, *Die Farce Pathelin und ihre Nachahmungen* (Oppeln, 1887).

PATHFINDER. A name given to Gen. John Charles Frémont, on account of his success in exploring the passes of the Rocky Mountains.

PATHFINDER, The. A novel by James Fenimore Cooper (1840). It is the third in the *Leatherstocking Series*, and continues the career

of Natty Bumppo under the name of the Pathfinder. The scene is about Fort Oswego and Lake Ontario during the French and Indian War of 1756, and displays the sagacity of the hero in the perils of the wilderness.

PATHOLOGICAL ANATOMY (from Gk. *πάθος, pathos,* disease + λογία, *-logia,* account, from λέγειν, *legein,* to say). The branch of anatomy which treats of organs, tissues, and cells as changed from the normal by disease. It is usually studied in connection with the causative disease; and therefore in this work the pathological changes occurring during a disease are described in the article which treats of that disease.

PATHOLOGY (from Gk. *πάθος, pathos,* disease + λογία, *-logia,* account, from λέγειν, *legein,* to say). The study of disease as a province of scientific knowledge; pathological physiology. Disease is well defined as 'the expression of the sum of abnormal cell activities' (Schmaus). Such activity disturbs the regular cell life in one of three directions: nutrition, function, or multiplication. It is evident, then, that pathology is equally with physiology a department of biology.

Many theories of disease and its causation are found in the history of medicine. Athenæus, of Attalia (A.D. 69), was the founder of the pneumatic pathology. He held that there is a certain spiritual principle, the pneuma, which reaches the heart by way of the respiration and is thence driven through the whole body. When working regularly, and mixed with warmth and moisture, it occasions health. When mixed with warmth and dryness it occasions acute diseases. When mixed with cold and moisture it produces the phlegmatic diseases. When mixed with cold and dryness it causes melancholy. He also claimed that in febrile diseases the humors of the body became corrupted or putrefied. This putridity, he asserted, was a process within the fluids by which they exhaled much water.

Galen (130-c.201) elaborated and advanced the humoral pathology of Hippocrates (c.460-357 B.C.). He selected four fluids, or humors, of the body as the primary seats of disease: blood, phlegm, yellow bile, and black bile. Health he conceived to be the due combination, or 'crasis,' of these; while illness he considered was the result of a disturbance of this condition. During favorable progress of disease, these humors underwent a change, or 'coction,' which was taken as a sign of returning health and as a preparation for the 'crisis,' when an expulsion of morbid matter occurred. The humoral pathology was long in vogue. Sylvius (1478-1535) and Boerhaave (1668-1738) championed a new pathology. They asserted that the iatro-chemical 'acridities' of the fluids played a most important rôle. They classified acid, saline, oleaginous, glutinous, alkaline, and mixed 'acridities,' which were supposed to originate in the food and to be especially active in chronic diseases. Glisson (1597-1677) advanced the theory of 'irritability,' attributing it to both solids and liquids. Life itself was considered to be 'irritability.' Hoffmann (1660-1742) originated the 'solidist pathology.' He claimed that disease was "a marked disturbance in the movements of the solids and the fluids." In these disturbances the solids are the active and the fluids are the passive agents. Excessive movement produces 'spasm' and defective movement produces 'atony.' Disease, he admitted, "might be due to alteration in the humors, and especially to a gradual thickening of the vessels, which tends at once to hinder their free circulation and to prevent the excretion of waste products." His four main sources of disease were, therefore, spasm, atony, altered humors, and deficient excretion. Barthoz (born 1734) launched the mystic and vague vitalistic pathology. He assumed the existence of a 'vital principle,' neither soul nor body. Disease he asserted to be the effort of the vital principle to resist harmful agencies, or to be due to "a morbid idea manifesting itself by alterations in sensibility, abnormal movements, or an aberration in those acts which regulate the chemical constitution of the humors."

It was reserved for Virchow in 1858 to enunciate clearly and elaborate convincingly the cellular pathology, now accepted the world over, and forming the basis of a universal view of the organs and the diseases which affect them.

The complex human organism may be reduced to very simple elements—the cells and the intercellular substance to which they give origin. All parts of all organs and tissues are composed of cells or products of cells. Blood and lymph are tissues, differing from muscular or fibrous tissues in that they have fluid intercellular substance. Cells are the conductors of vital functions, normal or abnormal. Their condition changes with age, disease, and fatigue on the one hand, and reparation and nutrition on the other.

Pathological conditions affect an organ in one of two ways: as an increase or as a decrease in vital activity. Hence such conditions may be divided into two classes: the retrogressive and the progressive disorders. It is obvious that each of these processes involves functional as well as anatomical differences and abnormalities. Between the two processes seems to stand the condition of arrest of development, due to mechanical causes or to interrupted vascular supply. If development begins, but is arrested, the condition is termed *aplasia.* If the arrest is partial, the condition is termed *hypoplasia.* If an organ is wholly undeveloped, the condition is termed *agenesia.*

The pathologist's attention is fixed largely upon the nature of anatomical changes found, and the explanation of their occurrence. These changes are termed 'lesions,' and upon more or less accurate idea of their nature and extent depend the success of measures taken for the relief of disease. Having established a conception of the lesions present, the investigator turns to their cause. The inquiry as to causation is embraced in the branch of pathology termed etiology. This department includes not only the study of vegetable organisms (bacteria) and animal organisms (such as plasmodia), and mineral toxins, and their agency in producing lesions, but also the study of reaction following the activity of the agent. This reaction depends, in some measure, upon the developmental disorder present, or the inherited dispositions of the tissues as to resistance or susceptibility. Inherited conditions are largely speculative and inferential, and this factor of etiology is of less importance in the analysis of disease. The essential feature of the whole matter is the adequate comprehension of the abnormal expression of cellular life.

There are, then, three subdivisions of pathology: etiology, or the study of causes of disease; morbid anatomy, or the study of structural changes in disease; and morbid physiology, or the study of disturbances of function, including morbid chemical action.

Pathology naturally separates into two great divisions: (1) general pathology, or the study of morbid conditions which are common to several different diseases; (2) special pathology, or the study of individual diseases. To illustrate, fever is a morbid condition which enters into a number of diseases, and therefore belongs to the realm of general pathology; while the study of the lesions of typhoid fever, an individual disease, belongs to special pathology. The study of the gross and microscopic anatomy of diseased tissues is termed pathological histology. The study of the lesions in diseases referred to the surgeon for treatment and of the lesions in postoperative conditions constitutes surgical pathology.

General Pathology. Of prime importance to the pathologist is the study of *disorders of circulation*, whether (1) *hyperæmia*, arising from excess of supply or diminished escape of supply of blood; or (2) *anæmia*, a decrease of supply of arterial blood; or (3) *hemorrhage* (see Bleeding); or (4) *ædema* (q.v.); or (5) *thrombosis* (q.v.), under which is to be considered *embolism* (q.v.), with consequent necrosis or relief by anastomosis.

Necrosis (q.v.) is a local death of tissue, due to circulatory disorder, thermic action, or inflammation. A regressive disorder of the life of cells in which there is diminished nutritive and functional derangement is *degeneration*. Ten forms occur. The degeneration may be parenchymatous (or albuminous), fatty, mucous, colloid, amyloid, hyaline, glycogenic, or hydropic, or may appear in the form of petrification or pigmentation. Some of these forms of degeneration are described in the article Bright's Disease. In some forms of degeneration products of imperfect metamorphosis accumulate within the cells. In others, necrotic cells and tissue elements or foreign material collect between the cells. In still others, there is a gradual degeneration of the cell elements and a deposition in their place of a new substance. Atrophy (q.v.), on the contrary, is essential loss of substance without deposit of pathological or foreign material. Each component part of the tissues shrinks in volume. Yet atrophy may be accompanied by deposits of various kinds, and in such cases coexists with degeneration, as in arterio-sclerosis (q.v.). Defective innervation, exhausting diseases, disuse, long-continued moderate pressure, or certain drugs may be the cause of atrophy, in different tissues, and these causes must be weighed by the physicians in determining pathological conditions in the course of treatment of a diseased person.

Among the progressive processes, or those in which the vital activity of the organism is actually increased, the most important are the reproductive. Inherent in every cell is the tendency for reproduction. Stimulus of various kinds awakens this innate tendency, which results in production of new tissue of various forms. Closely allied to the reproductive energy is the stimulus and the power to repair, to replace lost parts. Should the process of rebuilding go on to an excess of mere replacement, or should regular physiological growth be excessive, and the result be an increase in size as well as an increase in number of the elements, the condition is termed *hypertrophy* (q.v.). Under the influence of bacteria or chemical agents or unascertained causes, and accompanied by pronounced vascular disturbance, a certain progressive process results in *inflammation* (q.v.). Still another progressive process results in the formation of neoplasm, or new growths, constituted of tissues of a different kind from those adjacent and developing at their expense. Most of these formations are considered under Tumor.

With this preliminary knowledge of the processes at work, it is usual, in taking up the study of *special pathology*, to consider first the diseases of the blood, next those of the lymphatic tissues, then those of the various systems with their organs — respiratory, gastro-intestinal, urinary, and reproductive—and then the diseases of bones and of joints, of voluntary muscles, of the brain and its membranes, of the spinal cord and its membranes, and of the peripheral system of nerves.

To bacteria are ascribed the production of lesions, and they certainly influence chemical and physiological processes, locally and systemically. To their agency are ascribed pneumonia, diphtheria, cholera, leprosy, bubonic plague (qq.v.), etc. Animal parasites also play an important rôle in the production of pathologic conditions. Among them are the *Amœba coli*, the *Hæmatozöon malariæ*, *etc.* It is believed, though not yet demonstrated, that to some protozoa are due scarlet fever, measles, and smallpox. There are also parasitic worms which produce diseases such as tapeworm, lumbricoides, filaria (qq.v.), etc. The special pathology of the different diseases is considered under the proper title for each disease.

Consult: Green and Murray, *Pathology and Morbid Anatomy* (Philadelphia, 1900); Stengel, *Textbook of Pathology* (ib., 1901); Schmaus and Ewing, *Pathology and Pathological Anatomy* (ib., 1902).

PATH'ROS. The Hebrew corruption of the Egyptian name for Upper Egypt, *Pa'to'rēs*, literally 'the South-land.' It occurs in five passages of the Old Testament: Isaiah xi. 11; Jeremiah xliv 1-15; Ezekiel xxix. 14; xxx. 14. The name was probably pronounced *Pathoris* by the Hebrews, as is indicated by the Greek rendering Παθούρης and Φαθούρις. In Assyrian it appears as *Paturisi*. The Pathrusim, mentioned in Genesis x. 14 and I. Chronicles i. 12, are the people of Pathros or Upper Egypt. Consult Erman, in *Zeitschrift für die alttestamentliche Wissenschaft*, vol. x. (Giessen, 1890).

PATIALA, pŭt'i-ä'lä. An eastern native State of the Punjab, India. Area, 5951 square miles. Population, in 1891, 1,583,521; in 1901, 1,586,030. Capital, Patiala.

PATIALA. The capital of a native Punjab State of the same name, India, 25 miles southwest of Ambala (Map: India, C 2). Population, in 1891, 55,856; in 1901, 53,545. There are about 5000 Sikhs; the rest are almost equally divided between Hindus and Mohammedans.

PATIENCE. A comic opera by Sir Arthur Sullivan with libretto by W. S. Gilbert (1881). It is a satire on the æsthetic craze in England in

typified in the ridiculous character [illegible]. It was one of the most successful of Savoy operas.

PATINIR, pä'te·nēr', or **PATENIER**, -nyā', JOACHIM (c.1490-1524). A Flemish painter, born at Dinant. He was probably the pupil of Gheeraedt David at Bruges. Afterwards he lived in Antwerp, where Albrecht Dürer painted his portrait on the occasion of his second marriage in 1521. He was the first of the Flemish painters to make figures subordinate to the landscape in his pictures. He had little knowledge of perspective, and the small figures he introduced are fantastically grouped. He painted with extreme detail. His best pictures are: "Baptism of Christ," Vienna Museum; "Virgin of the Seven Sorrows," Brussels Museum; "Temptation of Saint Anthony," and "Repose in Egypt," Madrid Museum.

PATKUL, pät'kul, JOHANN REINHOLD VON (1660-1707). A Livonian nobleman, prominent as an opponent of the Swedish power during the last part of the seventeenth century and the beginning of the eighteenth. He was born at Stockholm, where his father was then a prisoner of State, and after receiving a military education entered the Swedish Army and rose to the rank of captain. His bold advocacy of the rights of the Livonian nobility, which the Swedish Crown had suppressed, gained him the hatred of Charles XI., who in 1694 condemned him to mutilation and the loss of his estates. Patkul escaped, and, in 1698, took service with Augustus the Strong, Elector of Saxony and King of Poland, as a member of the Privy Council. He was instrumental in bringing about the alliance of Russia, Poland, Saxony, and Denmark against Charles XII. in 1700, but soon after left the Saxon Court and entered the service of Peter the Great. In 1704 he was Russian Ambassador at Warsaw, where his outspoken criticism of the conduct of Augustus led to his being imprisoned. In the Treaty of Altranstädt concluded between Saxony and Sweden in 1706, Augustus promised to surrender Patkul to Charles XII., but privately gave orders to the commandant of the prison to connive at his escape. Before this could be effected, however, a Swedish detachment entered Warsaw and Patkul was delivered into their hands. At Kazimierz, near Posen, on October 10, 1707, Patkul was broken on the wheel and quartered as a traitor to his country. Consult Buchholz, *Beiträge zur Lebensgeschichte J. R. Patkuls* (Leipzig, 1803).

PAT'MORE, COVENTRY KEARSEY DIGHTON (1823-96). An English poet, born at Woodford, Essex. His earliest publication was a volume of *Poems* (1844), praised by Bulwer and utterly condemned by *Blackwood* in an unsparing review. He also contributed to various periodicals, in particular to the *North British* and the *Edinburgh*, critical articles, which, although marked by valuable detached observations, are unsatisfactory because of his failure to understand work other than his own. It was he who asked Ruskin to send to the *Times* the latter's famous letter in defense of the Pre-Raphaelites, and he wrote for the *Germ* an essay on *Macbeth*, and verse, including *The Seasons*. However, he was not much concerned with the Pre-Raphaelite movement, and latterly at least held no complimentary opinion of Rossetti. He was at one time a disciple of Tennyson, and in 1850 recovered the manuscript of *In Memoriam* from a cupboard in which it had been left. From 1846 to 1866 he was assistant in the printed-book department of the British Museum. His published verse includes: *The Angel in the House* (in part, 1854; complete, 1863; last ed. 1896); *The Unknown Eros and Other Odes, i.-xxxi.* (1877); and *Poems* (in a definitive edition, with a treatise on English metrical law, 1886; reprinted, 1890, 1894, 1897). Of these, the more pretentious are in narrative form, quite lacking in any unity of interest and at times bathetic, but with fine isolated passages, particularly convincing descriptions of natural scenery, set in the mass of context. His triviality and baldness have been perhaps too monotonously dwelt upon by the critics, and the high esteem of eminent contemporaries is not wholly to be disregarded; but his work seems much less remarkable than his rugged and striking personality. Of his prose may be mentioned *Principles in Art* (1889; new revised and rearranged ed. 1898), essays reprinted from the *Saint James's Gazette*, and *Religio Poetæ* (1893; revised and rearranged, 1898). He wrote, also, a memoir of the poet Procter, better known as 'Barry Cornwall' (1877). Consult Champneys, *Memoirs and Correspondence of Coventry Patmore* (London, 1900).

PAT'MOS (Lat., from Gk. *πάτμος*). An island of picturesque and irregular shape, about 10 miles in extent from north to south, lying off the coast of Asia Minor (Map: Turkey in Asia, B 4). The most prominent physical feature of the island is its masses of volcanic hills, which rise 800 feet at their highest point. The island has borne no conspicuous part in history and owes its reputation to the reference made to it in the Bible (Rev. i. 9), where it is stated that Patmos was the place to which Saint John was exiled and that there he received the visions contained in the Book of Revelation. The island is now under Turkish rule and its condition has steadily deteriorated. The most important feature of modern Patmos is the Monastery of Saint John, founded in the eleventh century. Here was once gathered a very valuable library, many of the most important books in which have been sold.

PATNA. A native State of India, feudatory to the Central Provinces (q.v.). Area, 2399 square miles. Population, in 1891, 332,197; in 1901, 277,566. After having been several years under British administration, the State was restored to a descendant of its ancient Rajput rulers.

PAT'NA. A division of Behar, Bengal (q.v.), British India, comprising the districts of Patna, Gaya, Shahabad, Saran, Champaran, Muzaffarpur, and Darbhangarh. Area, 23,686 square miles. Population, in 1891, 15,811,600; in 1901, 15,464,400. It is watered by the Ganges and its tributary, the Son. The climate is very hot in summer and mild in winter. The soil is fertile and well cultivated. Rice, wheat, and barley are grown, and the opium poppy is extensively raised. Capital, Patna (q.v.).

PATNA. The capital of a district and division of Bengal, British India, on the right bank of the Ganges, 130 miles east of Benares (Map: India, E 3). It covers a large area, stretching with its suburbs for 9 miles along the river

bank; its streets are crooked and dirty, and there are few interesting buildings. The Golah, a large, circular structure with walls more than 12 feet thick, originally built as a granary, is remarkable for its acoustic properties. The city has extensive bazaars, contains the largest opium factories in India, and is an important centre for the indigo trade. In the European quarter on the west are a Roman Catholic cathedral, Protestant churches, Government offices, schools, the Nabob's palace, and the great tank.

Patna, under the former name of *Padmavati*, or Lotus City, is supposed to have been the capital of Behar as early as B.C. 419. Here, at an early period, the East India Company established factories, and traded in opium, rice, etc. In 1763 disputes about transit-duties arose between the company's servants and the native Government. A war ensued, resulting in the British taking possession of the district. Patna was the headquarters of the Wahabi or Mussulman conspiracy in 1864. It lies on the principal railroad of the Ganges Valley, and also has considerable shipping on the river. Population, in 1891, 165,192; in 1901, 134,785, most of whom were Hindus, with about 40,000 Mohammedans and 500 Christians.

PA'TON, Sir Joseph Noel (1821-1901). A Scottish historical painter. He was born at Dunfermline, Scotland, December 13, 1821. His first work in art was the designing of patterns for damask fabrics. He entered the Academy Schools, London, in 1843, and in 1845, as well as two years later, his designs received prizes in the Westminster Hall Competition. He became a member of the Royal Scottish Academy in 1850, and in 1857 he settled in Edinburgh. In 1866 he received the appointment of Queen's Limner for Scotland, and was knighted in 1867. He made the cartoons for the glass of the great windows of Dunfermline, restored in 1884 by Andrew Carnegie. He died at Edinburgh, December 10, 1901. His subjects are drawn from fairy tales, history, poetry, and religious lore, and his painting, though imaginative and sympathetic, is faulty in drawing and sometimes harsh in color. His chief works include "The Spirit of Religion" (1845); "Reconciliation of Oberon and Titania" (1847), National Gallery, Edinburgh; "Home from the Crimea" (1856); "Luther at Erfurt" (1861); "Death Barge of King Arthur" (1865); "Love in Tenebris" (1879).

PATOS, pä'tosh, Lagoa dos. A lake in Brazil. See Lagoa dos Patos.

PATRAS, pä'trâs, or **PATRÆ**. A fortified seaport of Greece and the capital of the Nomarchy of Achaia, situated in a fertile plain on the Gulf of Patras (Map: Greece, C 3). The town is dominated by a citadel-crowned ridge, the site of the ancient acropolis. It is well built, with wide and straight streets, and has a fine church and post-office, a high school, and ruins from ancient Greek and Roman times. The harbor is only a roadstead, protected by a breakwater, but the town is, nevertheless, an important trade centre, and the seat of a United States consul. The chief exports are currants, wine, oils, valonia, and skins. Population, in 1889, 33,529; in 1896, 37,958. Patras was one of the foremost among the 'twelve cities' of Achaia, and during the Middle Ages was the chief commercial city of the Peloponnesus. It was destroyed by the Turks in 1821, but was soon rebuilt.

PATRIA POTESTAS (Lat., paternal power). The power of the father over his children in early Roman law was similar to that which existed among other Aryan peoples at the same stage of social development. (See Parent and Child.) What was peculiar in later Roman law was the extent to which this early power was maintained even at an advanced stage of civilization, and the duration of the power, in the case of sons, until the father's death. Daughters (at least in the earlier law) passed out of the paternal power upon marriage, but sons remained subject even after their marriage. The son had no *potestas* over his children until his father's death. *Patria potestas* was thus the authority not merely of the father over children, but of the ancestor over all descendants in the male line (son's children, son's son's children, etc.).

In early Roman law the father had an unlimited right to expose all infant daughters except the first-born. Sons and first-born daughters might also be exposed if they were deformed and the deformity were attested by five of the nearest neighbors. The father had also, as domestic magistrate, the right to punish his children, even with death, after a trial at which the kinsmen were present. These paternal rights existed throughout the Republican period, unchecked except by the arbitrary power of the censors and of the popular assembly to punish abuses of paternal power. In the Imperial period, however, exposure of children was forbidden and the right of punishment was reduced within disciplinary limits.

The father had also the right to sell the child. Sale into slavery was unusual; in the later Empire it was permitted only in the case of new-born children and only when the father was in extreme poverty, and even then the father retained the right of ransom. To pledge the person of a child for the father's debt (which was originally accomplished by sale with the right of ransom) was not uncommon, nor was this practice forbidden until the Imperial period. It was also not unusual for a father to sell his son's services for a number of years. A so-called royal law (i.e. a rule of the old religious law; see Civil Law) forbade the sale of a married son; and another royal law declared that a son sold three times should be free from the father—a rule of which the jurists took advantage in devising a form of emancipation (q.v.). Sales of children for the purposes of emancipation or of adoption into a new family, and sales of daughters as a method of giving them in marriage, were of course purely formal.

Sons and daughters under *patria potestas* had no property of their own; whatever they acquired was acquired for the head of the house. In the Imperial period, however, the son and also the daughter obtained property rights: (1) Whatever the son acquired in the military or civil service of the Empire (*peculium castrense, quasi castrense*) was his own; (2) whatever a son or daughter acquired from the mother or from maternal relations (*bona materna, materni generis*), and, finally, whatever a son or a daughter acquired from anyone except the father (*bona adventicia*), passed indeed into the control and usufruct of the father, but the equitable interest was in the child. Accordingly the father was for-

bishop to real land thus acquired, and his estate was accountable to the children for all goods and money thus acquired.

With the development of the legal recognition of the child's right to life came the recognition of his right to support. With the development of independent property rights of the child came the duty to support an indigent parent.

Even at early Roman law there was one field in which sons were independent, viz., that of public law. The son under paternal authority had political rights and was eligible to office; and, if clothed with official power, he could control the actions of the father.

Paternal authority existed over children born to the father in lawful marriage. In the later Empire children born of a concubine (*filii naturales*) could be legitimized by the subsequent marriage of their parents or by rescript of the Emperor. Children thus legitimized and children brought into the family by adoption (*arrogatio* or *adoptio plena*; see ADOPTION) were subject to *patria potestas*.

Patria potestas was extinguished not only by the death of the father, but by his loss of liberty or of citizenship (*capitis deminutio maxima, media*). His capture and enslavement by foreign enemies, however, only suspended his paternal authority, and if he escaped or was ransomed it revived. The practical meaning of the rule was that condemnation to any penalty which carried with it loss of freedom or of citizenship destroyed *patria potestas*. Forfeiture of paternal authority was also imposed, by Imperial legislation, on the father who exposed his child or prostituted his daughter. The marriage of a daughter extinguished her father's authority as long as marriage (q.v.) carried the woman into the power (*manus*) of her husband; but when the free marriage was developed, the married woman remained under her father's authority. Even in such a marriage, however, her children were under the paternal authority of her husband or of her husband's father. Paternal authority was extinguished, in the older Roman law, when a son became a flamen of Jupiter or a daughter became a vestal virgin. In the law of Justinian the same result attached to the elevation of the son to the episcopate or his appointment to any important secular office. Finally, paternal authority was extinguished when the son or daughter was voluntarily emancipated or transferred to an adopted father. The emancipation of children originally deprived them of all right of inheriting property in their original family except by testament; but this result was obviated, as regarded the father's estate, by the praetorian edict, and, as regarded the estates of brothers, sisters, and paternal relatives, by Imperial legislation. Consult the authorities referred to under CIVIL LAW.

PATRIARCH (Lat. *patriarcha, patriarches*, from Gk. *πατριάρχης*, patriarch, chief of a tribe, from *πατριά, patria*, lineage, from *πατήρ, patēr*, father + *ἀρχή, archein*, to rule). The name given to ten personages appearing in the antediluvian period of biblical history, who are, however, supposed by many modern scholars to represent traditional epochs or dynasties, similar in character to and standing in some connection with Berosus's list of antediluvian dynasties in Babylonia. See METHUSELAH.

In the history of the Christian Church, the title is applied to the bishops of certain great metropolitan sees of a wider jurisdiction than other metropolitans. The three earliest instances seem to be directly connected with a tradition of the establishment of those sees by Saint Peter. These are the three which the First Council of Nicæa asserts to be recognized by ancient custom —Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, which had originally been subject to the Metropolitan of Heraclea, obtained first metropolitan and then patriarchal rank, and eventually established a precedence over Antioch and Alexandria, being ranked second only to Rome. To these four patriarchates was added in 451 that of Jerusalem, which was formed out of the ancient Patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. These patriarchs had authority to consecrate the metropolitans under their jurisdiction, and to preside over councils and high judicial tribunals within the same limits. After the Greek schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the rank and title of patriarch in each of the four great Eastern sees. Since then there have been a number of patriarchs in the East, among the Greek Orthodox (one for Russia created in 1589 and removed by Peter the Great), among the Nestorian and Eutychian communities, and among those who have returned to union with Rome.

Besides the five greater patriarchates, there have been others in the West known by the name of minor patriarchates. The controversy of the Three Chapters (see CHAPTERS, THE THREE) gave the Bishop of Aquileia an opportunity to assume this title, whereupon the orthodox Bishop of Grado asserted an equal right to it. It remained in the former line even after the first bearer made his submission, until Benedict XIV. abolished it; that of Grado was transferred to Venice in 1451. In France the Bishop of Bourges at times claimed the title, and Napoleon had the idea of creating a French patriarch. Pope Paul III. granted the dignity of Patriarch of the Indies to the grand chaplain of the King of Spain, and the King of Portugal asked a similar dignity for his grand chaplain, with his see in Lisbon. As a matter of fact, by the concordat of 1886 which regulated the relations between Church and State in the Portuguese East Indies, the honorary title was conceded to the Archbishop of Goa.

PATRIARCHAL CROSS. A cross which, like the patriarchal crosier, has its upright part crossed by two horizontal bars, the upper shorter than the lower. A cross patriarchal fimbriated or was a badge of the Knights Templars.

PATRIARCHATE. (1) The rule or jurisdiction of a father. (2) Any social group, as a family, a clan, or a tribe, living under the rule of a father or eldest male member of the group. The term stands for an important stage in the development of human society, and for an important theory commonly called the patriarchal theory. In nomadic communities, and often in simple agricultural populations, there are found compound families, in which two or three generations of relatives, including many brethren

with their wives and children, live together under the rule of the eldest male, and in the common ownership of a household property. The society of the ancient Hebrews in the very early days is described in the Old Testament as patriarchal. The nomadic tribes of the Arabian desert and of the steppes of Central Asia are patriarchal now. The family and clan organization of the ancient Greeks and of the ancient Romans was patriarchal, and a large proportion of the Slavic population of Russia and of Southeastern Austria is patriarchal still. In its simplest form the patriarchal theory is stated by Aristotle in the opening pages of the *The Politics*. Society is represented as springing from a single family, consisting of a man and his wife and children. The children and children's children continue to live with the first father, acknowledging him as chief or patriarch as long as he lives. On his death his descendants divide into as many families as he has sons with offspring. Each such son becomes the patriarch of a new compound family. In the course of time many such related families, living in one district and speaking one tongue, become a tribe. Tribes enlarging divide, but if they do not separate too far they presently confederate and become a nation. This simple theory underwent great modification through the researches of Sir Henry Sumner Maine, who in *Ancient Law* (London, 1861) showed that the patriarchal family of the Romans was a partly natural, partly artificial group held together by the supreme power (*potestas*) of the eldest male. Membership in the group might be acquired through adoption as well as by actual descent from the first father, and it could not be acquired through blood relationship on the side of the mother. Neither males nor females not subject to the father's power were accounted of the group, and property descended only through kinship in the male line. The group was thus essentially not a compound family, but, rather, a clan or gens. (See GENS.) Maine attempted to prove in this work, and later in *Early Law and Custom* (London, 1883), that this highly artificial patriarchal system had been general among Aryan peoples. A destructive criticism of Maine's theories by John F. McLennan, *The Patriarchal Theory*, edited and completed by Donald McLennan, was put forth (London) in 1885. In this work it was shown that the patriarchal family has everywhere been preceded by the clan and family system based on kinship through females, and that the true *patria potestas* has been of exceptional occurrence, even after the patriarchal system has been established. Substantially the same conclusions are maintained by W. Robertson Smith, *Kinship and Marriage in Early Arabia* (London, 1885). An exceedingly interesting and instructive account of the economic aspect of patriarchal institutions, especially in Slavic communities, is found in Laveleye's *De la propriété et de ses formes primitives* (Paris, 1874; translated, *Primitive Property*, London, 1878). See MATRIARCHATE; MARRIAGE.

PATRIARCHS, TESTAMENT OF THE. See APOCRYPHA, section on *Old Testament*.

PATRIARCHS, TESTAMENTS OF THE TWELVE. See APOCRYPHA, section on *Old Testament*.

PATRICIAN (Fr. *patricien*, from Lat. *patricius*, of the rank or dignity of the fathers, from *pater*, Gk. *πατήρ*, *patēr*, Skt. *pitar*, father; connected with Goth. *fadar*, OHG. *fatar*, Ger. *Vater*, AS. *fæder*, Eng. *father*). A name given to the members of the original Roman *gentes*, of whom the *populus Romanus* consisted, and to their descendants by blood and adoption. The amalgamation of the three tribes of Ramnes, Tities, and Luceres gave rise to a distinction between *patres majorum gentium* and *patres minorum gentium*—the latter term being applied to families recently elevated to an equality with the old patrician class. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality, and the establishment of a new aristocracy of *nobiles* based on wealth and office. From B.C. 300 the old political distinction between patricians and plebeians had no real existence, except that patricians were ineligible to the tribunate of the plebs. The Empire made an end even of this relic of earlier days. Under Constantine the dignity of *patricius* became a personal title, not hereditary, but conferring very high honor and certain privileges. It was created at Constantinople, and not confined to Romans or subjects of the Empire, but sometimes bestowed on foreign princes. These patricians, unlike the old Roman order, were distinguished in dress and equipage from the ordinary citizens. The popes in after times conferred the same title on eminent persons and princes, including many of the German emperors. In several of the Germanic kingdoms the title of patrician was bestowed on distinguished subjects, and in some parts of Italy the hereditary nobility are still styled patricians. See ROME; PLEBEIANS.

PAT'RICK, SAINT (373?-463?). The apostle of Ireland. Of the existence of this holy man there is no question, but every other fact about him has been hotly disputed. This is the more strange as he left an autobiography, but as his object in it was rather to exalt the work than the worker, he was not careful to give facts in their chronological order or to detail his life; so that for the purposes of a sketch of his life the document has little value. According to the facts which can be gathered from this work Patrick was born at Banavem Tabernie, in Scotland, probably identical with the modern Dumbarton, on the Leven near its confluence with the Clyde, a few miles northwest of Glasgow. His father was Calpornius, deacon in the Church, also a decurion and a man of means and standing. His baptismal name was Sucat. When he was sixteen years old he was captured by pirates and carried to Ireland, where he was sold to Miliuc, chieftain of North Dalaradia, in the County of Antrim, North Ireland. He lived as a slave for six years, employed in tending cattle. His sad condition drove him to find consolation in God, and he learned to wait upon the divine will. In obedience to a divine intimation, he fled from his master and journeyed south 200 miles. He found a ship about to sail for France, and after a little parley was taken on board as a servant, and in three days landed at the mouth of the Loire. Then for twenty-eight days he traversed a wild country with the ship's company until they came to Marseilles. Here he parted

[illegible] patrician and went to Tours, where [illegible] Martin (q.v.) was Bishop. If, as [illegible] accounts state, his mother was the sister of [illegible] Martin, his going to Tours was the more natural. He lived with Martin for four years. At last he returned to Scotland. But the desire to devote himself to preaching the Gospel to the Irish was strengthened by visions and voices, and he went to Auxerre in France to be consecrated by Bishop Amator. It was on this occasion that he assumed the name of Patrick, by which he is now exclusively known. In 405 he began his missionary work in Ireland, and the rest of his long life was spent in incessant labors with commensurate success. He came to Ireland with a thorough knowledge of the language and of the people and seems to have encountered little opposition. He found no Christians and left no heathen. It is probable that he died at Armagh in 463. His bell is in the Museum of Arts and Sciences in Dublin; his crosier was preserved till the Reformation, but then unfortunately it was burned.

Besides the Patrick of history there is the Patrick of legend, and the less attractive Patrick of controversy. Among the many legends which have gathered about him the most familiar is that he banished the snakes from Ireland. Others represent him as escaping from his foes by miraculous agencies. For example, it is related that on one occasion when a company was lying in wait to slay Patrick and his companions, he chanted his hymn, called a 'Breastplate,' and the opponents mistook the Christians for wild deer with a fawn behind them. These legends have enhanced Patrick's reputation and doubtless some of them have some foundation in fact. The Patrick of controversy is now by birth a Frenchman, now an Irishman; now of the third century, now mythical; now a Presbyterian, now a devoted follower of the Roman Church; now deriving his orders from Scotland and now from Rome; now remarkably successful, now really accomplishing very little.

Patrick was emphatically a man of deeds and not of words, and so his literary remains are few, though of great interest. First is his autobiography, which he calls his *Confession*. This was written in Latin, in which tongue he had become very rusty. Next comes his Epistle to Coroticus, a Welsh prince, who had taken captive some of the Irish Christians. Patrick wrote to secure, if possible, their release. Finally, his hymn in Irish, called a 'Breastplate,' which is a confession of faith, showing plainly the very simple character of Patrick's faith. Other remains bearing his name have not such good claim to be called genuine. All his remains, genuine and disputed, are in Migne, *Patr. Lat.*, liii.; also in better shape with the *Tripartite Life*, one of the sources of his biography, in the "Rolls Series," No. 89, two parts, edited by Whitley Stokes (London, 1887). For English translations of his genuine works and notes, consult: Wright, *The Writings of Patrick, the Apostle of Ireland* (London, 1889); and Olden, *Epistles and Hymns of Saint Patrick* (Dublin, 1876; 3d ed. 1895). For his life, consult: Miss Cusack, *Life of Saint Patrick, Apostle of Ireland* (London, 1871, with a translation of the *Tripartite Life* from the original Irish by Hennessey); also Todd, *Saint Patrick, Apostle of Ireland* (Dublin, 1864); Morris, *Ireland and Saint Patrick* (London, 1888); Newell, *Saint Patrick, His Life and Teaching* (ib., 1890); Shearman, *Loca Patriciana* (ib., 1879).

PATRICK, Saint, Order of. See Saint Patrick, Most Illustrious Order of.

PATRICK, Simon (1626-1707). A Church of England divine. He was born at Gainsborough, Lincolnshire, and graduated from Queen's College, Cambridge, in 1648. He took orders, and in 1655 was received as chaplain into the family of Sir Walter Saint John, of Battersea. In 1662 he was appointed rector of Saint Paul's, Covent Garden, London, and endeared himself to his people by faithful instructions, and especially by remaining with them during the plague of 1665. In 1671 he was made chaplain in ordinary to the King. In 1672 he was made prebendary of Westminster, and in 1679 Dean of Peterborough. During the reign of James II. he defended Protestantism. In 1689 he was made Bishop of Chichester, and in 1691 transferred to the see of Ely. In his early life he wrote against the Non-Conformists, in a pamphlet entitled *A Friendly Debate Between a Conformist and a Non-Conformist* (1669), but after he became bishop he changed his opinion, regarded them with favor, and used his influence to allay strife. He stood next to Tillotson in learning and influence. Among his numerous works were: *Mensa Mystica, or A Discourse Concerning the Sacrament of the Lord's Supper* (1660); *The Heart's Ease, or a Remedy Against Trouble* (1660); *The Parable of the Pilgrim* (1664); *The Christian Sacrifice* (1671); *The Dignity of the Christian Priesthood* (1704). His paraphrases upon the books of the Old Testament from Genesis to Solomon's Song were published in ten volumes between 1695 and 1710. They are included with the commentaries of Lowth, Arnold, Whitby, and Lowman, in *A Critical Commentary and Paraphrase on the Old and New Testament and the Apocrypha* (London, 1809). A complete edition of his works was published in 1858 by the Rev. Alexander Taylor, in nine volumes. His *Autobiography* was published at Oxford in 1839.

PA'TRIOFE'LIS (Neo-Lat., from Lat. *patrius*, relating to a father, hereditary, ancient + *felis*, cat). A fossil creodont mammal found in the Middle Eocene (Bridger) beds of Wyoming, and of interest because it is considered by some authors to be the ancestor of the modern seals. Other writers, basing their conclusions on more recent examination of the material, consider Patriofelis to have been a terrestrial creodont with habits similar to those of the cats and presenting a lateral line of evolution that seems to have no descendants among modern carnivores. The animal, as indicated by the finely mounted skeleton in the American Museum of Natural History, was of heavy build, about six feet in length with low, crouching attitude, flexed limbs, and long tail. The skull is rather large, with small brain case, and a prominent posterior crest. The powerful jaws are armed with sharp cutting teeth. The feet are digitigrade with spreading clawed toes. Oxyæna, from the Wasatch lower Eocene beds, is a more slender, less specialized ally of Patriofelis. Consult: Wortman, "Osteology of Patriofelis, a Middle-Eocene Creodont," in *Bulletin of the*

American Museum of Natural History, vol. vi. (New York, 1894); and Osborn, "Oxyæna and Patriofelis Re-Studied as Terrestrial Creodonts," in *Bulletin of the American Museum of Natural History*, vol. xiii. (New York, 1900).

PATRIOTIC SOCIETIES (Mk. *patrioticus*, from Gk. *πατρωτικος*, *patriōtikos*, relating to descent or to a fellow-countryman, from *πατρώτης*, *patriōtēs*, fellow-countryman, from *πατρια*, *patria*, race, country, from *πατήρ*, *patēr*, father). Societies having as their objects the preservation of the records of important events in history, and especially of the wars in which the United States has participated; the encouragement of love of country; the saving and restoration of historical sites and objects; the celebration of anniversaries of historic events; and the fostering of fraternal feeling and intercourse among veterans.

Of the colonial period, the first of the hereditary patriotic bodies is the Society of the Mayflower Descendants. (See MAYFLOWER DESCENDANTS, SOCIETY OF.) The Society of Colonial Wars admits to membership adult male descendants of Colonial ancestors of distinction. (See COLONIAL WARS, SOCIETY OF.) Similar to the foregoing is the Order of the Founders and Patriots of America. Besides colonial ancestry, it requires that its members shall be descended from ancestors who were loyal to the colonies during the War of the Revolution. (See FOUNDERS AND PATRIOTS OF AMERICA, ORDER OF.) Of like character is the Settlers and Defenders of America (q.v.), which admits both men and women. The first patriotic hereditary society of women to be organized was the Society of Colonial Dames of America. It admits on invitation women who are directly descended from some ancestor of worthy life who resided in an American colony before 1776. (See COLONIAL DAMES OF AMERICA, SOCIETY OF.) Broader in its scope is the National Society of Colonial Dames of America. It admits on invitation women who are descended from an ancestor of worthy life who resided in an American colony prior to 1750. (See COLONIAL DAMES OF AMERICA, NATIONAL SOCIETY OF.) The Society of Daughters and Patriots of America admits to membership by invitation women who are descended in the direct paternal line of either father or mother from an ancestor who settled in the colonies before 1687, and of an ancestor in the same line who was loyal to the colonies during the War of the Revolution. In New York City there is the Holland Society (q.v.), which admits to membership male descendants in the direct male line of a man of Dutch blood resident in America before 1675.

Commemorating the period of the great struggle between the colonies and Great Britain are a number of hereditary societies, of which the oldest and best known is the Society of the Cincinnati (q.v.), which admits to membership descendants of officers who served in the Continental Army for at least three years. Following the centennial celebration of the battle of Lexington, there was organized in San Francisco, Cal., on October 22, 1875, the Sons of Revolutionary Sires, which, on April 30, 1889, became the Society of the Sons of the American Revolution. (See SONS OF THE AMERICAN REVOLUTION, SOCIETY OF THE.) The Society of the Sons of the Revolution has priority over the previously mentioned society in the Eastern States, and has almost identical requirements, for it admits to membership lineal descendants of participants in the War of the Revolution. (See SONS OF THE REVOLUTION.) Similarly the Naval Order of the United States (q.v.) admits to membership any officer, or descendant of one, who served in the naval forces of the United States during the War of the Revolution or any of the subsequent wars. Enlisted men who have received the naval medal of honor are also eligible to membership. One of the most distinguished among the patriotic societies is the Military Order of Foreign Wars, which admits to membership commissioned officers who participated in the foreign wars of the United States, and their direct lineal descendants in the male line. See FOREIGN WARS, MILITARY ORDER OF.

Originally the Sons of the American Revolution admitted to membership women, but, this being found unsatisfactory, special organizations were instituted for women, the first of which was the Society of the Daughters of the American Revolution, which admits any woman of acceptable character descended from an ancestor who rendered material aid to the cause of independence. (See DAUGHTERS OF THE AMERICAN REVOLUTION, SOCIETY OF.) Of similar nature is the Daughters of the Revolution (q.v.). Other societies are the Daughters of the Cincinnati, organized in New York City in 1894, and the Dames of the Revolution, organized in New York City in 1896. The Society of the Children of the American Revolution, with a membership of over 5000, was organized in Washington in 1895.

Of the period subsequent to the War of the Revolution and prior to the Civil War, there are comparatively few associations that are both patriotic and hereditary, although worthy of mention of that character is the Saint Nicholas Society of New York, organized in New York City on February 28, 1835. This society admits natives or residents of New York State who are descended from residents of the State prior to 1785. The American Order of Louisiana was organized in Denver, Colo., on December 20, 1901, and admits to membership descendants of those who rendered distinguished services in the settlement and civilization of the Louisiana Purchase States, from 1803 to 1903. The War of 1812 is commemorated by the Veteran Corps of Artillery. (See WAR OF 1812, MILITARY SOCIETY OF THE, by which name it has been known since 1892.) The General Society of the War of 1812 admits to membership any male person who is lineally descended from a participant in the War of 1812. (See WAR OF 1812, GENERAL SOCIETY OF.) Corresponding to the last mentioned is the Society of the United States Daughters, 1812. (See UNITED STATES DAUGHTERS OF 1812.) The memory of the War of Mexico is preserved by the Aztec Club of 1847 (q.v.). The Association of Mexican Veterans admits to membership descendants of any participant who served in that war.

The Civil War proved rich in the formation of commemorative societies. One of the most important of these is the Military Order of the Loyal Legion, which admits to membership officers who participated in the war, and as a second class the eldest sons of living original members. (See LOYAL LEGION OF THE UNITED

S. A. (See Military Order of.) The Grand Army of the Republic (q.v.), popularly known as the G. A. R., admits to membership any soldier or sailor who was honorably discharged after service. As the Grand Army grew in strength, there was organized as an auxiliary the Woman's Relief Corps (q.v.), which admits to membership mothers, wives, daughters, and sisters of Union soldiers. Also auxiliary to the Grand Army is the Sons of Veterans (q.v.). The Union Veteran Legion (see Veteran Legion, Union) draws the line a little closer than the G. A. R., for it admits only those who volunteered prior to July 1, 1863, for a term of three years. That is to say, it will not admit any drafted person or substitute. It has as an auxiliary the Ladies of the Union Veteran Legion, which was organized in Newark, Ohio, on February 20, 1890. The Union Veteran Union (see Veteran Union, Union) admits veterans who served between April 12, 1861, and April 30, 1865, and who participated in one or more engagements or battles, and received an honorary discharge. Of broader scope than the foregoing is the Regular Army and Navy Union of the United States of America (q.v.), in which any honorably discharged soldier, sailor, or marine, without regard to time or length of his service, is eligible for membership. Of worthy recognition in this connection is the Medal of Honor Legion (q.v.), which is composed of officers and enlisted men who have received the medal of honor (q.v.) for distinguished conduct in action. The United States Veteran Navy (q.v.) admits to membership any officer or enlisted man in the naval service during the period of the Civil War or during the Spanish-American War. There is also the National Association of Naval Veterans, to which any officer or enlisted man who served in the navy or marine corps during the period of the Civil War is eligible. (See Naval Veterans, National Association of.) Mention should also be made of the Society of the Army of the Cumberland, Society of the Army of the Potomac, and Society of the Army of Tennessee, as well as the Eleventh Army Corps Association, whose character is evident from their names. They now admit to membership descendants of original members, thus becoming hereditary societies.

The history of the Confederate States of America is preserved by three organizations, the oldest of which is the United Confederate Veterans, which admits to membership any soldier or sailor who served in the Confederate service during the Civil War. (See Confederate Veterans, United.) The United Sons of Confederate Veterans admits to membership any male descendant over sixteen years old of a soldier or sailor who served in the Confederate Army or Navy. (See Confederate Veterans, United Sons of.) The United Daughters of the Confederacy admits to membership the widows, wives, mothers, sisters, and lineal descendants of those who served in the army or navy of the Confederate States. See Confederacy, United Daughters of the.

The long period between the Civil War and the war with Spain saw the organization of two patriotic societies, the Order of the Indian Wars of the United States, founded at Chicago in 1896, and the Society of Veterans of Indian Wars of the United States, established at Philadelphia in the same year. The War with Spain (1898) was prolific in the formation of war societies. Corresponding to the Loyal Legion is the Naval and Military Order of the Spanish-American War, which admits to membership officers who were on the active list in the United States army, navy, marine corps, or revenue marine, during the War with Spain, or the subsequent insurrection in the Philippines. (See Spanish-American War, Naval and Military Order of.) The most important organization of this period, however, is the Spanish War Veterans (q.v.), which admits to membership soldiers and sailors of the volunteer army and marine corps who served honorably during the war. Of similar nature is the Society of Spanish-American War Veterans, which was organized in Trenton, N. J., on December 14, 1899. Arrangements were concluded in 1903 for the consolidation of this organization with the Spanish War Veterans. The Society of the Army of Santiago de Cuba admits to membership all officers and soldiers of the United States Army who served with the expeditionary force to Santiago de Cuba. (See Santiago de Cuba, Society of the Army of.) The occupation of Porto Rico gave rise to the Military and Naval Society of the Porto Rican Expedition. (See Porto Rican Expedition, Military and Naval Society of.) The members of the first regiment of United States Volunteer Cavalry that served in Cuba, before disbanding, organized the Rough Riders' Association. The Spanish-American War in the West Indies was also productive of the Society of the Caribbean, which was founded by American war correspondents who participated in the naval and military campaigns in Cuba and Porto Rico. Service in the Philippines led to the organization of the National Society of the Army of the Philippines. Membership is extended to soldiers and sailors who served during the war in the Philippine Islands. The Military Order of the Carabao was formed in the Philippines by officers who served in those islands during the fighting period, and any officer is eligible to membership who was there prior to July 4, 1902. Participants in the Chinese expedition for the relief of Peking, on their return to Manila, organized the Military Order of the Dragon.

Mention must be made of such organizations as the Mount Vernon Ladies' Association, which has for its special purpose the preservation of the home of Washington. Of similar nature is the Ladies' Hermitage Association, which cares for the home of Andrew Jackson, near Nashville, Tennessee, and the Betsy Ross Memorial Association, which has saved the house in Philadelphia where the first American flag was made. The Landmarks Club in Los Angeles is doing a splendid work in the restoration and preservation of the old missions which were left to us by the Spanish occupants of Alta California and the beautiful missions near San Antonio are cared for by an organization of women in Texas. In Colorado the cliff dwellings of the Mancos Cañon have been leased by the Colorado Cliff Dwellers' Association, and efforts have been made by that body to secure the permanent preservation of these ancient ruins by Congress. The Thomas Jefferson Memorial Association, which has for its object the building of a suitable memorial to the author of the Declaration

of Independence, is one of the latest of these organizations. Two national bodies have been formed for such work. Of these the American Scenic and Historic Preservation Society is the older. (See SCENIC AND HISTORIC PRESERVATION SOCIETY, AMERICAN.) The National Trust for Places of Historic Interest or Natural Beauty was formed in Washington City, in 1902. Its members were influential in the movement in 1903 that prevented the demolition of the ancient walls of Manila.

PATRIOTS' DAY. The anniversary in the State of Massachusetts of the double battle of Concord and Lexington on April 19, 1775. It was first observed April 19, 1894.

PATRIPASSIANISM (from Lat. *patrius*, relating to a father, from *pater*, father + *passio*, suffering, from *pati*, to suffer, to endure). One variety of Monarchianism, a belief held by many Christians in the West about A.D. 200, according to which Christ and God were so completely identified that the Father himself was said to have suffered and died on the cross. It seems to have originated in the East, but was brought to Rome by Praxeas, late in the second century, and a little later by Noëtus of Smyrna. Its most famous advocate was Sabellius (q.v.), whose name is often used to designate this form of belief (Sabellianism). Tertullian and Hippolytus vigorously attacked the Patripassianists, or Modalists, as they are also called. Largely under the influence of Origen's teaching, the Church rejected modalism, and defined the Catholic doctrine of the Trinity so that it expressed personal distinctions in the Godhead. See ATHANASIUS, and NICEA, COUNCILS OF. Consult: Harnack, *History of Dogma*, vol. ii. (London, 1896); Fisher, *History of Christian Doctrine* (New York, 1896).

PATRISTIC THEOLOGY. The name applied to the teachings of the early Christian writers who are collectively known as Fathers (q.v.) of the Church. They are commonly divided as follows: (1) The Apostolic Fathers. These include Clement of Rome, Polycarp, Ignatius, Barnabas, Hermas, and Papias. (2) The Ante-Nicene Fathers of the second and third centuries, whose work is mainly of an apologetic nature, against Jews on the one hand and Gentiles on the other. Of these the principal names are Justin Martyr, Irenæus, Clement of Alexandria, and Origen in Greek, and Tertullian and Cyprian in Latin. (3) The Nicene Fathers of the fourth century, who set forth the fully developed doctrines of the Trinity and the Incarnation, and defended them against heretics on both sides of the received teachings. They include Eusebius, the historian, Athanasius, Gregory of Nazianzus, Gregory of Nyssa, Cyril of Jerusalem, John Chrysostom, and Epiphanius in Greek, Hilary of Poitiers, and Ambrose in Latin. (4) Classed as Post-Nicene are, in the East, Cyril of Alexandria, Theodoret and John of Damascus; in the West, Jerome, Augustine, Leo the Great, and Gregory the Great. For extended treatment, see the articles under each of these names. From the literary point of view, there is often much to criticise in their works; but the lack of classical elegance and refinement of diction is compensated by the single-hearted fervor and devotion to their cause with which they write.

PATRO'CLUS (Lat., from Gk. Πάτροκλος, *Patroklos*). In Greek legend, a son of Menœtius, and friend of Achilles (q.v.). According to the common story, while yet a boy in Opuntian Locris, he accidentally killed a playmate, and in consequence was brought by his father to Peleus, father of Achilles, at Phthia. With Achilles he went to the Trojan War. Though he was mentioned in the stories of the earlier years of the Trojan War, it is through the *Iliad* that his name has become familiar to us. At the crisis of the battle, when the victorious Trojans had begun to burn the Greek ships, Patroclus persuaded the angry Achilles to allow him to lead the Myrmidons to the rescue. At their head he drove the routed Trojans to their walls, but fell before Apollo and Hector. Over his body raged one of the fiercest struggles of the poem, and it was only when the cry of Achilles struck panic among the Trojans that the Greeks were able to bear it to the ships, where it was mourned in touching verses by Achilles. In later times Patroclus was worshiped as a hero on the Hellespont, where he was believed to be buried with Achilles, and at Opus in Locris.

PATROL (from Fr. *patrouiller*, to patrol, dabble in the water, paw, OF. *patrouiller*, *patouiller*, *patoillier*, to paddle through water, from *patte*, *pate*, paw). In the United States Army, patrols are classified under the following heads: officers; reconnoitring, visiting, covering, or flanking and connecting patrols. Patrols organized for special or extraordinary purposes, are: exploring, harassing, expeditionary, and pursuing patrols. The general duties of patrols are to gain all information possible regarding the enemy, and prevent a similar operation on his side. Other duties are also assigned them, dictated by the specific circumstances of the case. Whenever possible, patrol duty is performed by the cavalry, particularly if the enemy is known to be at a distance. At night, or in close, broken, or wooded country the duty is of necessity performed by infantry—although a few horsemen would if possible be attached for the speedy conveying of information. In the 1901 manœuvres of Germany, France, and Austria, cyclists were found extremely useful as messengers from both cavalry and infantry patrols, wherever the nature of the country admitted of their use; and they are now regularly attached for that purpose. Ordinary patrolling may be performed by any number of men, from three to a company of infantry or a troop of cavalry; a *strong patrol* consists of from 9 to 100 men, and a *small patrol* from 3 to 8 men. *Officers' patrols* consist of from 2 to 10 men, or occasionally of two officers only. They are used in connection with the cavalry screen (q.v.). *Visiting patrols* are a part of outposts (q.v.). *Connecting patrols* are of cavalry, and maintain connection between given points or bodies of troops. *Covering* or *flanking patrols* reconnoitre along the lateral communications, keeping in touch, if possible, with the main body. *Exploring patrols* carry out many of the duties of a topographical reconnaissance (see *Military Surveys*, in the article ENGINEERING, MILITARY) besides their more specific instructions. *Harassing patrols* are assigned the duty of disturbing and annoying the enemy, by depriving him of sleep and rest. *Expeditionary patrols* are sent out to destroy the enemy's

[illegible] roads, railroads, telegraphs, etc., or to [illegible] his patrols or pickets. *Pursuing patrols* hang on the flanks or rear of a retreating enemy—keeping their own troops supplied with information regarding them. On the thoroughness of patrol service largely depends the value to the main body of effective outpost service, or of advance, rear, or flank guards. (See RECONNAISSANCE.) Excellent authorities in regard to this important service are: Shaw, *Elements of Modern Tactics* (11th ed., London, 1900); Wagner, *The Service of Security and Information* (Kansas City, 1896); and Smylie, *Points in Minor Tactics* (New York, 1898).

PATRON (OF., Fr. *patron*, from Lat. *patronus*, protector, from *pater*, father). Among the Romans, originally the appellation of a citizen who had dependents, called clients, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The Roman was not deprived of all right in his slave when he freed him; a tie remained somewhat like that of parent and child, and the law recognized important obligations on the part of the *libertus* toward his patron, the neglect of which involved severe punishment. In some cases the patron could claim a right to the whole or part of the property of his freedman. The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; and distinguished Romans were sometimes patrons of dependent States or cities, particularly where they had been the means of bringing them into subjection. Thus the Marcelli were patrons of the Sicilians, because Claudius Marcellus had conquered Syracuse and Sicily. The patron was the guardian of his client's interests, public and private; as his legal adviser, he vindicated his rights before the courts of law. The client was bound, on various occasions, to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions. Patron and client were under an obligation never to accuse one another; violation of this law was tantamount to treason, and anyone might slay the offender with impunity. As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired, in course of time, the signification of advocate or legal adviser and defender, the client being the party defended; hence the modern relation between counsel and client. Patron, in after times, became a common designation of every protector or powerful promoter of the interests of another; and the saints, who were believed to watch over the interests of particular persons, places, trades, etc., acquired in the Middle Ages the designation of their patron saints. The saint in whose name a church is founded is considered its patron saint.

PATRONAGE (Lat. *patronatium*, homage due a patron, from Lat. *patronus*, protector), ECCLESIASTICAL. The right of presenting a properly qualified person to a vacant ecclesiastical position. Such a right is under many circumstances a species of property that may be enforced in the proper courts of law. The patron originally was the person who founded or endowed the benefice, yet the title came to be applied also to one who succeeded to the right as property. Proprietors of lands were early encouraged to build and endow churches on their own possessions. In such cases the priest in charge did not look to the bishop for his support, but was allowed to receive the whole or a part of the profits of the lands with which the founder had endowed the church. Eventually it came to be stipulated with the bishop that the founder and his heirs should have a share in the administration of the property and have the right to nominate a person in holy orders to be the incumbent whenever a vacancy occurred. The person enjoying the privileges of a founder was called *patronus* and *advocatus*. He had a prominent seat and a burial place in the church; his name and arms were engraved on the church, and on the church walls, and he was specially named in the public prayers. He sometimes also had a right to a portion of the church funds, called *patronagium*.

In France the right of patronage was often extended by the sovereigns to churches not originally private foundations. Church property was bestowed in fee on laymen, who appropriated the greater part of the revenues, and took the appointment of the clergy into their own hands. It was at last ruled by the third and fourth Lateran councils (1179 and 1215) that the presentation of the patron should not of itself suffice to confer any ecclesiastical benefice when the presentee was a layman.

Toward the close of the twelfth century letters of request began to be issued by the popes to patrons that benefices should be bestowed upon particular persons. What had at first been requested as a favor was soon demanded as a right. In the thirteenth century the patronage of all livings whose incumbents had died at the court of Rome (*vacantia in curia*) was also claimed by the Pope. By the fourteenth century these claims encountered effective opposition. England took the lead in a resistance which was in the end successful. In Scotland, at the time of the Reformation, the rights of patrons were reserved and the presbyteries were bound by several statutes to admit any qualified person presented by the patron. For three centuries the question of lay patronage was a cause of contention, legislation, and litigation, but by an act of Parliament passed in 1874 patronage in Scotland was abolished, and the right of choosing their minister transferred to the congregation. Upon the Continent of Europe, in the Protestant churches of Germany, Denmark, Sweden, and Norway, ecclesiastical patronage exists to some extent. The only form of ecclesiastical patronage to be found in the United States is that in the hands of the bishops of the Roman Catholic Church. With these rights the decrees of the plenary councils of Baltimore have dealt upon the general principles laid down by the canons of the third and fourth Lateran councils.

PATRONS OF HUSBANDRY. See GRANGE.

PATRONYMIC (Lat. *patronymicus*, from Gk. πατρωνυμικός, *patrōnymikos*, relating to one's

father's name, from *πατήρ, patēr*, father + *ὄνομα, onoma*, name). Properly a name taken from one's father, but generally applied to such names as express descent from a parent or ancestor. In Sanskrit, Greek, and Latin patronymics are very numerous. They may be derived from the name of a father, mother, grandfather, or remoter ancestor, as Atrides, son of Atreus; Æacides, grandson of Æacus. The names of the founders of nations have also been used to form a sort of patronymic, as when the Romans were called Romulidæ. A number of the surnames in use in modern times are patronymics, as Johnson, the son of John. Originally these names fluctuated from generation to generation, as was the case in Shetland, where Magnus Johnson's son called himself John Magnusson or Manson. In the course of time it was generally found more convenient to take a surname from one well-known ancestor, which should descend unchanged to the children of the bearer of it.

PATROONS' (Dutch *patroon*, protector, patron, from Lat. *patronus*, protector). The name applied to a special class of settlers in the New Netherlands. In 1629, in order to facilitate emigration to America, the Dutch West India Company granted certain 'freedoms and exemptions' to such of their number as, within a period of four years after having given due notice, should plant a colony of fifty persons over fifteen years of age in the New Netherlands. Such men were to be called patroons (or patrons) and each was to have as his 'absolute property' a tract of land extending 16 miles along any navigable river (or eight miles if on each shore) and "so far into the country as the situation of the occupiers will permit." The proprietors were, besides, invested with many feudal privileges, being empowered to hold both civil and criminal courts, to appoint local officers and magistrates, and to punish offenders against the law, except in certain specified cases, where there existed a right of appeal to the Director-General at Fort Amsterdam. In practice, however, this right was virtually abrogated. The settlers were to be exempt from taxes for ten years, but were to be absolutely bound to their patroon for a specified period, and were to pay certain rentals, either in money or in kind. Schools and churches were to be established, but at the same time slavery was introduced, commerce was restricted, and manufacturing was prohibited on pain of banishment. Several patroonships were soon established, the largest (and the first) being Rensselaerswyck, which remained in the Rensselaer family until about the middle of the nineteenth century. In 1640 a new charter of 'freedoms and exemptions' was granted, by which patroonship privileges were extended to "all good inhabitants of the Netherlands," the period of settlement limited to three years, the prohibition of manufacturing rescinded, and the size of the grants limited to four miles along a coast and eight miles into the interior. At the same time many inducements were offered to smaller landholders, called masters or 'colonists.' The system gave New York one of its characteristic features throughout the colonial period, creating as it did a landed aristocracy, fostering class divisions and semi-feudal relations between landholder and tenant, and discouraging the immigration of settlers, who naturally preferred to obtain land in fee simple in other colonies rather than become tenants of proprietors in New York. Under the English régime the system remained virtually unchanged, but in 1775 some of its chief features were abolished, and the patroons or 'lords of the manor' became mere proprietors of estates. Many characteristics of the old feudal tenure, however, remained, and the relations between tenant and landlord became more and more strained, until a modification was effected by the Anti-Rent agitation of 1839-47. See ANTI-RENTISM.

PATTAN, pä-tän'. A town of India. See PATAN.

PATTÉ, pá'tā' (OF. *patte*, broad-footed, from *patte*, paw). A term in heraldry (q.v.) applied to a cross with its arms expanding toward the ends and flat at their outer edges.

PAT'TEN, SIMON NELSON (1852—). An American economist, born at Sandwich, Ill. He was educated at Jennings's Seminary (Ill.), Northwestern University (Ill.), and at the University of Halle, Germany, and received the degree of Ph.D. in 1878. During the next ten years he taught in the public schools of Iowa and Illinois. In 1888 he was elected professor of political economy at the University of Pennsylvania. His principal works are: *Premises of Political Economy* (1885); *The Consumption of Wealth* (1889); *The Economic Basis of Protection* (1890); *The Theory of Dynamic Economics* (1893); *The Theory of Social Forces* (1896); *Development of English Thought* (1899); *The Theory of Prosperity* (1901); *Heredity and Social Progress* (1903). Professor Patten ranks as one of the most brilliant and original of American economic writers. His chief contributions to economics are his analyses of dynamic forces in economic life, of monopoly elements in value, and of the bearing of the laws of consumption upon distribution. A large part of his work is rather sociological than economic.

PAT'TERSON, CARLILE POLLOCK (1816-81). An American civil engineer, superintendent of the United States Coast Survey, born at Shieldsboro, Mass. He was appointed midshipman in 1830, served in the Mediterranean squadron, and, after graduation at Georgetown College as a civil engineer in 1838, was attached to the Coast Survey (1838-41). In 1845 he led a hydrographic expedition to the Gulf of Mexico; from 1850 to 1861 commanded the Pacific mail-steamer *Oregon*; in 1861 was appointed hydrographic inspector in the United States Coast Survey, and in 1874 superintendent. This department was greatly developed by him.

PATTERSON, DANIEL TOD (1786-1839). An American naval officer, born on Long Island, N. Y. He entered the navy in 1800, and was on board the frigate *Philadelphia* in the expedition commanded by Capt. William Bainbridge when the frigate ran upon the rocks off the coast of Tripoli, and the entire crew were held prisoners until peace was declared. In 1813 he was promoted to be commander. In September, 1814, he commanded the expedition which broke up the establishment of the pirate Lafitte in Barataria Bay. He was made captain in 1815; commanded the frigate *Constitution* from 1826 to 1828; and in the latter year was appointed navy commissioner. In 1832-36 he commanded the Mediterranean squadron, and on his return was

[illegible] at the navy yard at Washington [illegible] until his death.

PATTERSON (BONAPARTE), ELIZABETH (1785-1879). An American woman, famous as the wife of Jerome Bonaparte. She was born in Baltimore, Md., and was the daughter of William Patterson, one of the wealthiest men in the United States. When Jerome Bonaparte visited Baltimore in 1803 he was fascinated by Miss Patterson and the two were married by Bishop Carroll, December 24, 1803. In April, 1804, Napoleon, through M. Pichon, Consul-General of France, in New York, declared the marriage illegal, and ordered Jerome to return to France and to leave the 'young person' behind. The other members of his family, however, accepted the situation and promised to receive her. In 1805 Jerome and his wife sailed for Europe. The latter, not being allowed to land either at Lisbon or Amsterdam, went to England, and her son, Jerome Napoleon, was born at Camberwell, July 7, 1805. Meanwhile Napoleon had requested unsuccessfully the annulment of the marriage from Pope Pius VII., but the Council of State granted the divorce. In November Madame Bonaparte returned to the United States, and lived with her father. After the battle of Waterloo she went to Europe, where she was well received in the most exclusive circles, and was much admired for her beauty and wit. In 1815, by special act of the Legislature of Maryland, she secured a divorce. From 1816 to 1819 she was in Baltimore, and subsequently spent much of her time in Europe. Her last years were spent in Baltimore in the management of her estate, which she increased to more than a million and a half. Consult Didier, *Life and Letters of Madame Bonaparte* (New York, 1879).

PATTERSON, ROBERT (1743-1824). An American educator, and director of the mint. He was born near Hillsborough, County Down, Ireland, emigrated to the United States in 1768, and lived for a time in Philadelphia. In 1774 he became principal of an academy in Wilmington, Del. In the disputes between the colonies and the British Ministry he allied himself with the Whig or Patriot Party, and in the early part of the Revolutionary War served as assistant surgeon and brigadier-major in the Continental Army. From 1779 to 1814 he was professor of mathematics in the University of Pennsylvania, being also from 1810 to 1813 vice-provost. In 1805 President Jefferson appointed him director of the mint, which position he held until a short time before his death. Always actively interested in the American Philosophical Society, he was its president from 1819 until his death. He published *The Nocturnal Sustra* (1808) and edited various works.

PATTERSON, ROBERT (1753-1827). An American pioneer, born in Pennsylvania. He emigrated to Kentucky in 1775. In October, 1776, on a trip to Fort Pitt to secure ammunition, his party was attacked by Indians and every member was killed or wounded. He took part in Col. George R. Clark's successful expedition against Kaskaskia and Vincennes in 1778, and in Capt. John Bowman's attack on Chillicothe in 1779. In April, 1779, he built a blockhouse on the present site of Louisville, Ky. In 1780 he was a captain in Colonel Clark's expedition against the Shawnees, and in 1782 was second in command under Boone at [illegible] Blue Lick. He was a colonel in Clark's second expedition into the Miami country this year, and served with Gen. Benjamin Logan's expedition against the Shawnees in 1786, in which he was severely wounded. He, with two companions, bought from John Cleves Symmes a tract of 740 acres of land opposite the mouth of the Licking River, and founded, in 1788, the town of Losantiville, now Cincinnati. He sold his interest in 1794, and in 1804 settled in Dayton, Ohio, where he lived until his death.

PATTERSON, ROBERT (1792-1881). An American soldier, born at Cappagh, County Tyrone, Ireland. About 1798 he emigrated to the United States, and finally settled in Philadelphia. During the War of 1812 he was assistant deputy quartermaster-general, with rank of captain, from 1813 to 1814, and in 1814 was appointed captain of the Thirty-second Infantry. He was commissioned major-general of volunteers in 1846, and in the Mexican War commanded a division at Cerro Gordo, directed the pursuit of the retreating Mexicans by the cavalry and leading infantry brigades, and occupied Jalapa. Under President Lincoln's three-months call for troops (April 15, 1861) he was appointed by Governor Curtin, of Pennsylvania, major-general of volunteers, organized the three-months forces in Philadelphia, and later commanded the Department of Pennsylvania. When McDowell began his march against Beauregard, Patterson was instructed to detain Johnston and prevent him from supplying Beauregard with reenforcements. This, however, he failed to accomplish. He withdrew to Charleston, about 18 miles from Winchester, and Johnston's entire force arrived in time to take part in and determine the result of the first battle of Bull Run. A long controversy ensued as to the responsibility for this event, and Patterson was vigorously criticised in some quarters. He published a vindication entitled *A Narrative of the Campaign in the Valley of the Shenandoah in 1861* (1865). Patterson was mustered out on July 27th. He invested largely in the sugar and cotton industries, and was among the leading American mill-owners.

PATTERSON, WILLIAM MCKENDREE (1838-88). A missionary of the Methodist Episcopal Church, South. He was born near Saint Louis, Mo., graduated at Saint Charles College, 1860, and entered the Saint Louis Conference in 1861. He was chaplain in the Confederate Army, 1862; agent for the American Bible Society, 1865; agent for Vanderbilt University, 1872; missionary to Mexico, 1872-88. Part of the time he edited *Mexican Evangelista*. In 1888 he became agent for the American Bible Society in Venezuela, but died of yellow fever in Caracas a few days after his arrival in the country.

PATTESON, JOHN COLERIDGE (1827-71). An English divine, Bishop of Melanesia. He was born in London, was educated at Ottery Saint Mary, at Eton, and at Balliol College, Oxford. He obtained a fellowship at Merton, went to Dresden to study German, and was ordained in 1853 to the curacy of Alfington, near Ottery Saint Mary. In 1855 he left England with Bishop Selwyn of New Zealand to enter upon a missionary career. His first work was instructing boys of the Melanesian Islands, and when the mission was regularly established there

he was, in 1861, consecrated bishop, and fixed his residence at Mota. He spoke as many as twenty-three of the native dialects, and made translations of parts of the Bible into the Mota tongue, which he regarded as the most typical. He worked for twenty years in the Islands and made great improvements in the material and spiritual condition of the natives. His position was rendered difficult by the action of British traders who sometimes used the Bishop's name to further the kidnapping of natives to be either enslaved or held as laborers upon the plantations of Fiji and Queensland. In revenge for such an outrage against the islanders of Nakapu, the Bishop himself was slain by the natives. Consult his *Life* by Charlotte M. Yonge (London, 1878); also Awdry, *The Story of a Fellow Soldier* (London, 1875).

PATTI, pät'tē. A town in the Province of Messina, Sicily, situated on the north coast, 35 miles west by south of Messina by rail (Map: Italy, J 9). Its cathedral contains the tomb of Adelasia, mother of King Roger II. of Sicily. The town has silk mills, sandstone quarries, and a shipping trade in olive oil, flour, and fish. Population (commune), in 1881, 9374; in 1901, 11,082.

PATTI, ADELINA (1843—). A celebrated operatic singer of Italian parentage, born at Madrid. When about ten years of age she appeared in a series of concerts with Ole Bull and Maurice Strakosch. After a course of professional study, she made her first operatic appearance (1859) in New York. Her real début, which occurred in London, took place in 1861, when she appeared as 'Amina' in *La Sonnambula;* after which she was acknowledged one of the greatest artists of her day. Her voice was an unusually high soprano, of rich, bell-like quality, and remarkable evenness of tone; to these qualities she added purity of style and high artistic finish. Equally at home in the portrayal of deep passion and the sprightly vivacity of light comedy, she was also conspicuously successful in oratorio. She was as popular throughout Continental Europe as in England and America. In May, 1868, she married the Marquis de Caux, from whom she was divorced in 1885. In 1886 she married Ernesto Nicolini, a well-known tenor, who died in 1898. In 1899 she married Baron Cederström, a Swedish nobleman. She resides in Wales, where she is the owner of a magnificent castle. After about 1890 she confined herself almost entirely to the concert platform.

PATTI (DEMUNCK), CARLOTTA (1840-89). An Italian vocalist, sister of Adelina. She was born in Florence, of musical parents, who were also her first teachers in singing. She afterwards studied the piano under Henri Herz at Paris. Her voice was a soprano of unusual compass, and of a clear silvery quality, and much power in the upper register; a slight degree of lameness, however, prevented her from appearing in opera. Her peculiarly sweet high notes brought her into favor with the public. She made her début in New York in 1861, where for some years previously she had made her home. She became very popular throughout America as a concert soprano, and was almost as successful in Europe, her first appearance there occurring in 1863, in London. Like her sister, she was a brilliant coloratura vocalist. She married De Munck, a violoncellist, in 1871. She died in Paris.

PAT'TISON, DOROTHY WYNDLOW (1832-78). Better known as SISTER DORA. A famous nurse, sister of Mark Pattison (q.v.). She was born at Hawkswell, near Richmond, Yorkshire. In 1864 she joined a sisterhood of the Church of England (the Sisterhood of the Good Samaritan), and early in the following year became a nurse in a cottage hospital at Walsall. In 1867 a new hospital was built, of which she had sole charge until 1877, when she resigned to become head of the municipal hospital in the same place. She had many natural gifts for her work, acquired much skill in surgery, and was tireless in philanthropic labors. Her life has been written by Margaret Lonsdale (London, 1880).

PATTISON, MARK (1813-84). An English scholar and writer, born at Hawkswell, Yorkshire. He was educated at Oriel College, Oxford (B.A., 1836; M.A., 1840). He translated the "Saint Matthew" from Thomas Aquinas's *Catena Aurea* on the Gospels for Newman (written, 1839; printed, 1842), and also contributed biographies of Stephen Langton and Saint Edmund to the series of lives of English saints published under Newman's editorship. In 1839 he was elected fellow of Lincoln, and in 1843 was ordained priest. He was appointed to a tutorship of Lincoln in 1843, and in 1848 became examiner in the school of *litera humaniores*. In 1853 he was again appointed examiner, and in 1855 resigned his tutorship. He was then for a time a private tutor at Oxford, but later was much in Germany. In 1861 he was elected rector of Lincoln. He also became a curator of the Bodleian Library and of the Taylor Institution. From 1845 his theological views greatly changed; he wrote for the *Essays and Reviews* (1860) an article on "Tendencies of Religious Thought in England, 1688-1750," intended as "a neutral and philosophic inquiry," and so recognized on the Continent, but not in England; and he remained a liberal member of the Anglican communion. His principal studies, however, were not theological or philosophical, but were directed originally to the preparation of a history of learning from the time of the Renaissance, and later to that of the more restricted account of the French school of philology. Of this work only fragments were executed, most important of which is the *Life of Isaac Casaubon* (1875; 2d ed. 1892). Other portions appear in the selected *Essays* (2 vols., 1889), edited by H. Nettleship. He also wrote an excellent *Life of John Milton* (1879; reprinted, with alterations, 1880, 1883, 1885, 1887) for the "English Men of Letters" series, and edited Pope's *Essay on Man* (1869; 2d ed. 1872) and *Satires and Epistles* (1872; 2d ed. 1874). An edition by him of the *Sonnets* of Milton, with a valuable introduction, appeared in 1883. Other published volumes are *Sermons* (1885), and the *Memoirs* (to 1861), dictated in 1883, and printed in 1885. Pattison's literary work is for the main part marked by the most thorough scholarship, eminent judgment, and a skillful presentation of material. In real academic distinction he was second to none at Oxford. He was a tireless pedestrian and angler, a student of natural history, brief and often ironic in speech, contemptuous of

[illegible] reticent in the expression of his [illegible] sometimes quite to hamper the proceedings [illegible] committees of which he was a member.

PATTISON, Robert Emory (1850—). An American politician, born at Quantico, Somerset County, Md. When he was six years old his parents removed to Philadelphia, where he was educated in the public schools, and in 1872 was admitted to the bar. Five years later he was elected city Comptroller and discharged his duties with exceptional efficiency. He was reëlected, though a candidate on the otherwise unsuccessful Democratic ticket. In 1882 his party nominated him for Governor, and he was elected by a plurality of more than 40,000, the first Democrat to hold the office in thirty years. His administration was characterized by the same energy and probity that he had shown as Comptroller. In 1890 he was again elected Governor.

PATTISON, Robert Everett (1800-74). An American clergyman and educator. He was born at Benson, Vt., and educated at Amherst College. He was ordained to the Baptist ministry in 1829, and the next year accepted a call from the First Baptist Church, Providence, R. I. In 1836 he became president of Waterville College (now Colby College), and remained until the college was obliged to suspend in 1840 from a lack of funds. He resumed preaching, and in 1843 became corresponding secretary of the Baptist Board of Foreign Missions. In 1845 he became president of the Western Baptist Theological Institute, Covington, Ky.; but he resigned in 1848 and accepted the chair of systematic theology in Newton Theological Seminary. Waterville College having reopened its doors in 1841, Dr. Pattison was again made its president in 1853, but resigned five years later on account of ill health. He was subsequently professor of systematic theology in Shurtleff College, professor of theology in the Baptist Theological Seminary, Chicago, and vice-president and professor of moral and intellectual philosophy in Chicago University. He died at Saint Louis, Mo. His one published work is the *Commentary on the Epistle to the Ephesians* (1850).

PAT'TON, Francis Landey (1843—). An American clergyman and educator. He was born at Warwick, Bermuda. He studied at Knox College, of the University of Toronto, and at Princeton Seminary, New Jersey. He was ordained to the ministry in 1865, and after holding several pastorates was, in 1871, appointed professor of didactic and polemical theology in the Theological Seminary of the Northwest (now McCormick Seminary, Chicago), where he remained ten years. During the period from 1873 to 1876 he edited the religious journal *The Interior* (Chicago), in which connection he brought charges of heresy against Prof. David Swing, resulting in the latter's trial and subsequent withdrawal from the Church. While in Chicago, he also held the pastorate of the Jefferson Park Presbyterian Church, and in 1878 was elected moderator of the Presbyterian General Assembly. In 1881 he assumed the professorship endowed for him in Princeton Theological Seminary, styled the chair of the relations of philosophy and science to the Christian religion; in 1885 he became professor of ethics in the college, and in 1888 succeeded James McCosh in the presidency. In 1891 and 1892 he was again prominent as an opponent of the so-called heretical views of Dr. C. A. Briggs, of Union Theological Seminary. In 1902 he resigned from the presidency of Princeton University, but was soon after elected to that of the seminary. His administration of Princeton was marked by the assumption of the title Princeton University in place of the charter name, 'The College of New Jersey,' and by large donations which enabled the university to make extensive additions to its equipment and buildings. The number of students nearly doubled during this period from 1888 to 1902, and new courses were added to both the scientific and academic departments. Perhaps most important in the future development of Princeton as a university was the founding of a graduate school. President Patton became widely known as a forcible speaker and a keen, logical thinker on theological subjects. He contributed frequently to leading periodicals and wrote *Inspiration of the Scriptures* (1869), and *Summary of Christian Doctrine* (1874).

PATUX'ENT. A river of Maryland, rising in Frederick County, and flowing southeastward into Chesapeake Bay north of the Potomac (Map: Maryland, L 5). It is 90 miles long, and for the last 40 miles it is a navigable tidal estuary abounding in valuable oyster beds.

PÁTZCUARO, päts'kwä-rō. A town of Mexico in the State of Michoacán, situated on the south shore of the beautiful Lake Pátzcuaro, 38 miles southwest of Morelia (Map: Mexico, H 8). It is irregularly built, with narrow, crooked streets, but is very picturesque in appearance, being surmounted by a church built on the top of a high hill. It is noted for the manufacture of fine furniture and beautiful featherwork. Population, in 1895, 7082. Pátzcuaro is supposed to have been the ancient capital of the Tarasca Indians.

PATZUM, pät-thōōm'. A town of the Department of Chimaltenango, Guatemala, 33 miles west of the city of that name. The chief industry is wool-weaving, and in the vicinity sugarcane, grain, and coffee are produced in abundance. Mines of silver, antimony, lead, and coal are found near by. Its population in 1892 was about 6500.

PAU, pō. The capital of the Department of Basses-Pyrénées, France, on the Gave de Pau, 105 miles south-southeast of Bordeaux (Map: France, F 8). It occupies a rocky height, cloven in two by a ravine and united by a high bridge. Toward the south it commands magnificent views of the western Pyrenees. Among its chief buildings are the two Gothic churches of Saint Martin and Saint James, a palace of justice, a beautiful theatre, museum, a public library containing over 55,000 volumes, and a winter palace built in 1896 in Beaumont Park. The Château of Henry IV., erected in the fourteenth century on the site of an older castle, dominates the town and contains interesting memorials of the kings of Navarre. A striking marble statue of Henry IV. stands on the Place Royale in the centre of the town. There are linen and cloth manufactures, and a trade in Jurançon wine, grain, marble, and leather. Many swine are fed in the vicinity, and from the pork the famous *jambons de Bayonne* are made. Pau is a favorite resort of the English, especially during the winter, and is a general rendezvous for those who wish to

explore the Pyrenees. Population, in 1891, 33,111; in 1901, 34,268. Founded in the tenth century, Pau became important as the residence of the sovereigns of Navarre in the fifteenth century.

PAUER, pou'ẽr, ERNST (1826—). An Austrian-English pianist and writer on music, born at Vienna. He studied there with Dirzka, Sechter, and the son of Mozart, and at Munich with Lachner. He directed musical societies in Mainz from 1847 until 1851, when he went to London, but did not sever his Continental connections, and gave concerts in Germany and elsewhere. He became a professor at the London Royal Academy of Music in 1859 and was made Austrian Court pianist in 1866. In 1867 he was made principal professor in the National Training School, and from 1883 to 1896 held a similar position at the Royal College of Music. He was appointed musical examiner at Cambridge in 1879. From 1870 he gave musical lectures throughout Great Britain upon the history of music and kindred subjects, with pianoforte illustrations. He fathered German music in London and to the Augener editions he contributed *Old English Composers for the Virginal and Harpsichord*, as well as the Bach, Handel, Schumann, and other classical and romantic selections. Some of his own studies are included in the series of one hundred called *The New Gradus ad Parnassum*, which he published. His compositions include besides three operas, a symphony, quartette, quintette, songs, and pianoforte solos.

PAUL. The Apostle of Jesus Christ who was specially commissioned to work among the Gentiles. The sources from which we secure our knowledge of his life and work are his own Epistles and the Book of Acts. From these it is clear that the condition of the Church when he came to the full prosecution of his work was one which rendered that work not only most significant for the future development of the Church, but most revolutionary to the ideas which the Church's leaders entertained as to what that development should be. These leaders were the Apostles who had formed the nucleus of Jesus's discipleship during His ministry on earth. They were men of limited education, and with no great breadth of religious ideas. As a consequence their views of the necessary development of Jesus's religion practically restricted it to a reforming of Judaism in accordance with Jesus's teaching, and as this reformed Judaism went out in a new evangelism to the world, it involved the bringing of the world into this religion through the gateway of Judaism. In view of their Palestinian training and experience, these views were perfectly natural for the Apostles to entertain; but they were also clearly impossible for the Church to carry out, if the religion of Jesus was to realize for itself that world-wide development which the Gospels show us Jesus himself intended it should have. It was at this latter point that Paul through his work and teaching introduced into the Church new conceptions which virtually revolutionized its ideas and made possible for Christianity its development as a universal religion.

Paul's early name was Saul; he was a native of Tarsus, in the Province of Cilicia (Acts xxi. 39), where he was born about the beginning of the Christian Era. His parents were Jews (Acts xxiii. 6; II. Cor. xi. 22). His early training was doubtless that of the ordinary Jewish boy, though it was apparently at an early age that he was sent to Jerusalem to be educated in the Rabbinic schools of that city, having as his teacher in the sacred law the liberal-minded Gamaliel (Acts xxii. 3; see GAMALIEL). According to his own testimony he threw his whole heart into all that was taught him there, becoming one of the straitest of the sect of the Pharisees, and having no conception beyond that of a salvation to be obtained through a perfect performance of the works of the Law (Gal. i. 14; Acts xxii. 3; xxvi. 4-5; Phil. iii. 4-6).

After his Rabbinic training he returned for a while to his native city, in order to learn his trade (Acts xviii. 3). While there he may possibly have supplemented his Jewish education by attendance upon the Gentile schools, for which Tarsus was famed. From Cilicia he came back to Jerusalem, where he became prominent in ecclesiastical affairs, being apparently chosen to membership in the Sanhedrin (Acts xxvi. 10). Though in Jerusalem for some time, it is not probable that he was there during the time of Jesus's ministry, for he does not seem to have ever seen the Great Teacher. He was, however, well acquainted with Jesus's Messianic claims and was clearly conscious of the opposition to Judaism which they involved. Consequently, when, after the Day of Pentecost, this new discipleship began to assume large proportions, and take to itself a definitely organized form, he shared in the bitter hostility to the movement which animated the religious leaders of the people. Into the persecution which this produced he threw himself with energy, participating practically in the death of Stephen (Acts vii. 58; viii. 1), and following up this assault with a rigor of inquisition that made him conspicuous among his fellows (Acts xxii. 4; xxvi. 9-11; Gal. i. 13-14). In the year 34 or 35, however, while on a journey to Damascus undertaken for the purpose of searching out the disciples in that place and bringing them bound to Jerusalem, he went through the experience of a supernatural vision that brought him to his journey's end under the deep conviction of the sinfulness of the course he was pursuing (Acts ix. 1-9). Out of this state of soul he came a Christian disciple, profoundly convinced of the Messiahship of Jesus, and distinctly conscious of having received from his Master a commission to preach His religion among the nations of the earth (Acts ix. 10-18; Gal. i. 15-16).

This mission, however, he did not immediately carry out, but for the greater part of three years withdrew into the region of Arabia (Gal. i. 17). The purpose of this withdrawal it may not be possible definitely to determine, though, from the contrast in which he places it to the alternative course of conference with the Apostles at Jerusalem, it would seem that primarily it was for the sake of meditative thought upon the spiritual revolution which had taken place in his life. At the same time, it cannot be doubted that he availed himself of such opportunity of practical work as the region afforded (Gal. i. 15-23).

Upon his return to Damascus and Jerusalem he began to preach his new-found faith, evidently with some fuller conception of the Gentile direc-

tion of his mission than he had had immediately after his conversion (Acts ix. 19-22), especially in Jerusalem, where he singled out the Greek-speaking Jews, disputing with them, doubtless largely along the lines of the Messiahship of Jesus (Acts, ix. 28-29; xxii. 18). His motive in making Jerusalem the place of his preaching was apparently the courageous one of returning to the scene of his former work of persecution, and bearing open testimony to Jesus before those with whom he had formerly been associated. That this, however, was not what the Master intended him to do is clear from the fact that while in Jerusalem he was made conscious through a vision that he was to leave the city and give himself to work among the more distant Gentiles (Acts xxii. 17-20).

In obedience to this command, he went to his home in Cilicia, visiting on the way the regions of Syria, where in all probability he accomplished some work of a Gentile character in the city of Antioch. Such a hypothesis at least explains the reason for the statement that refugees from the Stephen persecution in Jerusalem coming to Antioch changed the character of their ministry and preached the word to those who were not pure Jews (Acts xi. 19-20), and that, upon the successful outcome of their preaching, Paul was summoned from Tarsus to give his aid and assistance in the development of this new movement (Acts xi. 21-26).

Antioch became thus the place of Paul's labors, and here his ministry gradually reached the full Gentile character which the Master had intended it should have, resulting finally, under divine direction, in the sending out of Paul and Barnabas to the neighboring Gentile regions of Asia Minor (Acts xiii. 1-3). The remarkable success of this mission brought Paul at last to a consciousness of the full meaning of his Gentile commission (Acts xiii. 44-48), and also brought the Church to a full realization of the significance of this new departure. In fact, upon their return to Antioch, Paul and Barnabas were confronted with a grave and serious dispute. Parties representing the extreme Jewish element in the Mother Church came to Antioch insisting upon the need of circumcision in order to salvation. This was so contrary to Paul's fundamental conception of salvation by faith that surrender was impossible, and under the advice of the local Church the controversy was carried up to Jerusalem for submission to the Apostles and Elders there (Acts xv. 1-2). A clear understanding of the resultant council and the position in it of Paul and Barnabas on the one side, and the leaders of the Church on the other, can only be secured by recognizing the development through which Paul's work had gone from his own original conception of it, and especially from the original conception of it held by the Jerusalem Church. That Paul had the fundamentals of his theology from the time of his conversion may be accepted, as far as our records give any light; that these fundamentals included a clear conviction of the principles of justification by faith is almost necessary, if Paul's theology is to be understood as in any sense self consistent—for this principle is practically essential to his thinking. But while Paul may have possessed the principle of his theology from the beginning, it is manifestly clear that the practical experiences of his work had an effect upon the application which he gave to these principles. Few greater experiences, however, did he go through in his work than that of the wholesale conversion of the Gentiles during his first mission tour. That these experiences must have given strength to his conviction of justification by faith is of course very clear; but it is also clear that it must have widely broadened the application of that principle in the direction of the universalizing of the Gospel beyond the bounds of Judaism. If, however, such was the influence of this experience upon Paul's own views, its effect upon the slower and more conservative views of the Jerusalem Church must have been even more significant. That Paul told them fully of his commission to a Gentile work at his first visit to the city after his conversion may not be doubted; that they fairly understood his position, and frankly accepted it, would seem to be clear from the companionship with them into which the records show him to have entered; but if Paul himself at that time had but an undeveloped view of all his theology meant in the direction of a justification by faith, much less developed must have been the views on this point of those in the Jerusalem Church. It may be safely said that their conception of and agreement to Paul's position was largely theoretical until the results of this first mission tour startled them into a realization of the full significance of his commission. Treasuring as they did the Jewish origin of Jesus's religion and the Jewish character of his discipleship, this wholesale ingathering of the uncircumcised Gentiles naturally seemed to them to herald the doom of the Church.

From such a situation it was inevitable that there should come dispute and controversy. The extremists on the side of the Jerusalem Church insisted on circumcision—the distinctive feature of ceremonial Judaism—as necessary to salvation and acceptance within the Church. Paul and his followers insisted on the freedom from this rite given by the essential principle of justification by faith. It was the determination of this contention, in the light of the practical results of the first mission tour, that constituted the real question before the Jerusalem Council; and the decision which was reached to grant the Gentiles, with a few unessential provisos, full freedom from the ceremonial law was a result which was not only a triumph for the views of Paul, but a salvation for the Church itself. For, in spite of the conviction of the Jerusalem leaders, the Church's future lay beyond Judaism, and could be reached only as the way to Christ was no longer obstructed by the forms which Judaism imposed.

From this council Paul and Barnabas returned to Antioch, and soon afterwards Paul, having disagreed with Barnabas on some matters of their practical work, took with him Silas, who had come down with them from Jerusalem, and started upon his second missionary tour (Acts xv. 30-40). On this tour he first revisited the churches established at an earlier period in Syria and Cilicia, as well as those gathered together on his first journey. From one of these latter churches he secured Timothy to be a helper in his work. Upon arriving finally at Antioch in Pisidia he essayed to go farther westward into the Province of Asia, but, being divinely forbidden, he returned northward with a view ulti-

mately of entering the Province of Bithynia, but, again, being forbidden by the Holy Spirit, he turned westward to the seacoast town of Troas, the old classical region of Troy (Acts xv. 41-xvi. 8).

It is clear from his general policy of selecting the large city centres for his work that Paul's purpose in this further extension of his journey beyond Antioch had been to go to Ephesus and, when forbidden to preach there, to go northward to Byzantium, which at that time was within the Province of Bithynia. The divine prevention of this policy, confusing though it was, left him naturally convinced that the Master had for him some distinctive mission to perform. He was consequently in a receptive mood for the vision which came to him at Troas and called him across the water to Thrace.

In obedience to this divine direction he entered upon his first European mission, passing down along the commercial highway that gave him entrance at the important towns of Philippi, Thessalonica, and Berea and finally brought him to Athens and Corinth (Acts xvi. 9-xviii. 1). At all of these places, as far as Corinth, his mission efforts had been disappointing, either being broken off by persecution or being received with indifference and contempt. As a consequence he came at last to Corinth in a despondent frame of mind (I. Cor. ii. 3). At this last place, however, his work was greatly blessed, and for a year and a half he and his companions remained in that region establishing churches, not only in Corinth itself, but throughout the Province of Achaia (Acts xviii. 2-11; II. Cor. i. 1). It was during the early part of his stay in Corinth that, anxious for their welfare in the face of persecution, corrupting influences, and false teachings, he wrote his two letters to the Thessalonians, generally considered the earliest of his preserved writings. (See THESSALONIANS, EPISTLES TO THE.) From Corinth Paul returned by sea to Syria, stopping on the voyage at Ephesus long enough to reason in the synagogue and make promise of a return for more extended work. Landing finally at Cæsarea, he went up to Jerusalem with greetings to the Church, and then returned to Antioch (Acts xviii. 18-22).

After some time spent there he set out upon his third mission tour, visiting again the churches of Southern Asia Minor, and in fulfillment of his promise proceeded on to Ephesus. At this large centre of activity and influence he remained at work for the greater part of three years, carrying the Gospel, either personally or through his helpers, throughout the entire seacoast Province of Asia (Acts xviii. 23-xix. 20; xx. 17-35; I. Cor. xvi. 19). During this period he was in more or less contact with the Church at Corinth, whose problems of organization, Christian brotherhood, and moral life necessitated frequent communication with the Apostle. This produced considerable correspondence, portions of which are preserved in his Corinthian Epistles. It is quite clear that late in this period, in answer to an urgent summons, he made a hurried trip from Ephesus to Corinth by the direct route across the sea. The occasion of the visit was evidently a new manifestation of factional tendencies in the Church. The visit was apparently quite brief, and resulted in a practical failure to straighten out the situation. (See CORINTHIANS, EPISTLES TO THE.) Soon after his return to Ephesus from this fruitless trip Paul was obliged to leave the city, because of disturbances occasioned by pagan resentment of his increasingly successful work. To give himself and the people at Corinth time to recover from the disappointing experiences of his recent visit, as well as to visit the Macedonian churches established on his previous journey, he selected the less direct route by the way of Troas (Acts xix. 23-xx. 1; II. Cor. i. 23-ii. 13). On the way he again wrote to the Corinthians and engaged in more or less mission work in the provinces south of Macedonia, covering the territory up to if not across the borders of Illyricum. It is quite likely that during the progress of this work he received the startling news from the Galatian churches which occasioned his letter to them. (See GALATIANS, EPISTLE TO THE.) Reaching Corinth in the late autumn or early winter of the year 55, he remained there three months (Acts xx. 1-3). During this time he wrote his letter to the Church at Rome—a church he had not founded or seen, but to the visiting of which he looked forward with earnest longing, and largely to prepare them for this visit he sent them his letter. See ROMANS, EPISTLE TO THE.

In the spring of 56 he left Corinth for Jerusalem with quite a company, who doubtless represented the churches that had been engaged in gathering a contribution for the Mother Church (Acts xx. 4. See also I. Cor. xvi. 1-4; II. Cor. viii.-ix.). After a journey which was accompanied by some incidents of a foreboding nature, to all of which Paul's mind seemed resignedly receptive, he reached Jerusalem (Acts xx. 3-xxi. 15). His reception by the brethren of the Church was full of Christian fellowship; at the same time it was clear that the leaders were deeply impressed by the growing alienation from Paul among the believing Jews. As a consequence they suggested that he carry out in the temple a certain course of ceremonial observance designed to show his respect for the Law of Moses, and to disprove the charge that he everywhere urged its abandonment by the Christian Jews. This he willingly did; but his action was so misunderstood and the motive for it so misconstrued as to rouse against him a riotous demonstration on the part of the Jews in general, that would have ended his life but for the rescue of his person effected by the soldiers of the adjoining Roman garrison (Acts xxi. 17-32).

It is clear from this incident, as presented in the passage cited, that the head and front of Paul's offending in the eyes of the Jews was not so much his heralding of the Messiahship of Jesus as his denial of the continued obligation of the Mosaic Law. This is instructive as to the large significance of the controversy which ensued upon his first mission journey and which, in spite of the wise action of the Jerusalem Council, wrought itself into the Galatian and to a certain degree into the Corinthian churches. Paul's position as to the absolute essentiality of the principle of justification by faith alone apparently went to the heart of the whole problem of salvation as it was present before the early Church.

Having found it impossible to secure from the excited mob any idea of the offense of which his prisoner was guilty, and Paul himself asserting his rights of Roman citizenship, the chief captain of the guard, Claudius Lysias, summoned a council of the Sanhedrin and brought Paul before

it for examination (Acts xxi. 33-xxii. 30). This gathering, however, resulting in nothing but disorder among the members of the court, and, information having been brought of a desperate plot against Paul's life by a secret band of Jews, Claudius Lysias sent him away by night under heavy guard to Cæsarea with letters to Felix, Governor of the Province of Syria, whose official residence was at that place (Acts xxiii.).

Paul's stay at Cæsarea, which lasted some two years, was practically a continued commitment for trial. He appeared before Felix soon after his arrival at Cæsarea and pleaded his cause against the High Priest Ananias and certain of the elders from Jerusalem, who were accompanied by counsel. But, though the prosecution failed to make out their case, no decision was reached by the Governor (Acts xxiv. 1-23). Later Paul was summoned before Felix and his wife to speak "concerning the faith in Jesus Christ," but, though the Apostle "reasoned of righteousness, temperance, and the judgment to come" in such a way as to make a terrifying impression upon Felix, the fear was wholly transient; for Paul was returned again to prison, where Felix kept him through the remainder of his term of office, arranging frequent hearings from him and interviews with him, in hope of securing from the Apostle a bribe for his release. Finally, in order to please the Jews, he handed him over bound to his successor, Festus (Acts xxiv. 24-27).

Before Festus Paul appeared but once, being again confronted with his accusers from Jerusalem, who as before failed to make out a case against him. When, however, the Governor seemed about to follow in his predecessor's steps and ignore the evidence presented, suggesting that Paul go up to Jerusalem for another trial, the Apostle, on the basis of his rights of citizenship, transferred the case to Rome by appealing to Cæsar. Such action left the Governor no further choice, though he took the opportunity of Agrippa's presence in Cæsarea to bring Paul once more into court, and to have his case heard by his royal visitor (Acts xxv.). In his defense, the Apostle presented before Agrippa the course of his life and the grounds of his Christian hope, persuading the King, as he had in fact both Governors, that there was no reason for his being retained in bonds (Acts xxvi. 1-31). Beyond such personal impressions, however, his plea was of no use, since his appeal to the Emperor made transportation to Rome obligatory upon the authorities (Acts xxvi. 32).

The voyage to Italy was begun in the fall of 58, being marked by disastrous experiences which resulted in shipwreck on the island of Malta (q.v.). There the company remained through the winter, continuing their voyage in the spring and reaching at last their journey's end at the Imperial capital some time in the early half of the year 59 (Acts xxvii. 1-xxviii. 14). Here Paul was cordially welcomed by the Christian brethren of the city and kindly received by the authorities, being allowed to reside under guard in his own hired house, with freedom of intercourse among his friends and liberty of preaching his gospel (Acts xxviii. 15-31). It was during this period of imprisonment that he wrote his letters to the Philippians, the Colossians, Philemon, and the Ephesians. Of these, Philippians and Philemon, especially Philemon, dwell upon the Apostle's personal relation to the readers, though the practical problems of Christian brotherhood and moral living emerge quite clearly in Philippians. On the other hand, Colossians and Ephesians were intended to counteract doctrinal errors of a subtle nature involving a large element of nascent Gnosticism. This is especially true of Colossians, Ephesians, as an encyclical letter, emphasizing rather the principles of Christian solidarity in the membership of the churches. See the articles on the above letters.

It is a matter of considerable debate as to what was the outcome of this imprisonment at Rome, though the better critical opinion of the present day tends in the direction of holding that after some two years Paul was brought to trial before Nero, and on the absence of any real evidence against him was released. After this release he returned to the region of his former missionary labors in the East, engaging again in active work, in the course of which he was rearrested and transported again as a captive to Rome. At his second trial he was sentenced to death, which was accomplished not later than the year 65. During this return he wrote the letter to Titus, and the first letter to Timothy, both of which have to do almost wholly with the practical matters of Church organization and discipline. His second letter to Timothy was written after his reimprisonment at Rome, shortly before his death, and is practically his last word of personal counsel and encouragement to his trusted helper and friend. See the articles on these letters.

The picture of Paul stands clearly before us in the records which the New Testament gives—a man of education, if not of culture, for his time—a Roman citizen and yet a Jew, a student of the Scriptures, a zealot in the law, and withal a conscientious seeker for the way of life within the circle of its precepts—consequently an earnest persecutor of the disciples of Jesus until divinely convinced of his error, when all his energy and enthusiasm and loyal devotion were transferred to his new life and infused into his new work. In this new life and work, however, Paul manifestly remained a Jew. He did not conceive of his Christianity as having severed him from the Israel of God, but rather as having enabled him to realize the ideal of Israel's Godward relations. His doctrinal thinking consequently found its historical and logical background in the Old Testament, rising through its anthropology and its soteriology to its climax in its Christology. His doctrine of Christ controlled all the rest of his theology. It was the beginning point of his preaching and formed the main theme of his last letters to his churches. In all his thinking he was intense and characteristically logical, though he often clothed his thought in the old Rabbinic forms which he had brought with him from the Jerusalem schools, and frequently yielded to the rhetorical impulses more or less belonging to his intensity of nature. He was not metaphysical, even in treating the profoundest themes, but practical in the extreme and sympathetic on broad and comprehensive lines. Though his position in the matter of relationship to ceremonial Judaism was not that of the Jerusalem leaders, his views came to dominate the Church, and he himself became the Church's leader in its world work. On the theology of the Church since his day his influence has not been

even. During the centuries immediately succeeding the Apostolic age it largely if not completely disappeared, being revived in its doctrine of man and of salvation in the theology of Augustine and receiving again at these points its conspicuous restoration in the essential position of the Protestant Reformation. Since then these Pauline doctrines have come and gone with the rise and fall of that trend of thinking which may be termed Calvinistic. To-day they are not prominent, being dominated by a mode of thought which is characterized by a spiritualism of the feelings that has come to us from the Schleiermacher school, though Paul's supreme doctrine of Christ, which really controls his thought, contributes more to the present-day exaltation of Jesus than is popularly supposed.

PAUL. The name of five popes. PAUL I., Pope 757-767, the brother of Stephen II., whom he succeeded. He was the candidate of the Frankish party, and as Pope maintained close relations with Pepin I., whose help he needed both against the Lombards and against the Greek Emperor, who had not given up his claims to the exarchate and the Pentapolis. Pepin, however, was constant in his support of the Pope, and assured him a fairly peaceable possession of the ecclesiastical territory.—PAUL II., Pope 1464-71, Pietro Barbo. He was born at Venice in 1417, the nephew of Eugenius IV., to whom he owed his introduction to an ecclesiastical career. He was made a cardinal in 1440, and held a position of great influence under Nicholas V. and Calixtus III. Pius II., however, did not regard him so favorably, and his election to the Papacy as successor to Pius was largely due to the older cardinals, who had not been in sympathy with that pontiff. At the beginning of his reign he tried to form an alliance of Christian sovereigns against the Turks, but the circumstances of the time frustrated his purpose. He was obliged to oppose the claims of the French King, Louis XI., to absolute power, and demanded of him the repeal of the Pragmatic Sanction. He attempted to suppress the non-Christian or properly so-called humanistic Renaissance, especially by the dissolution of the Roman Academy, which had become a meeting-place for the enemies of religion, and by severe penalties against the scholars who combined pagan doctrine with pagan immorality.—PAUL III., Pope 1534-49, Alessandro Farnese. He was born in 1468, was educated in Rome by Pomponio Leto, and went to Florence, entering into close relations with the Medici. Alexander VI. made him a cardinal in 1493; later he became Bishop of Ostia and dean of the Sacred College. He held various important offices, twice representing the Pope during his absence as legate in Rome. He strongly advocated the calling of a general council, and was a member of the commission appointed by Clement VII. to consider the question. After his elevation to the Papacy, he vigorously pursued the reforming policy he had always advocated. He first summoned the council to meet at Mantua in 1536, then at Vicenza in 1538, and again at Mantua in 1542; but each time its assembly was prevented by the discord between Charles V. and Francis I. It finally met at Trent in 1545. (See TRENT, COUNCIL OF.) Against Henry VIII. of England he took decisive steps, finally issuing in 1538 the bull of excommunication and deposition prepared three years earlier. He took vigorous steps also for the suppression of Protestantism in Italy, reconstructing the Inquisition and establishing a strict censorship of books. (See INDEX.) The reproach of nepotism is brought against him. In 1545 he is to be credited with an enlightened patronage of letters and art. He made his natural son, Pietro Luigi Farnese, Duke of Parma and Piacenza, having appointed Michelangelo architect in chief of the Vatican and of Saint Peter's, and provided for many great works.

PAUL IV., Pope 1555-59, Giovanni Pietro Caraffa. He was born at Naples in 1476. In 1494 he entered the service of the Curia, and in 1507 was appointed Bishop of Chieti, in which see he labored most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view he established, in conjunction with several congenial reformers, the congregation of secular clergy called Theatines (q.v.), and was himself the first superior. It was under his influence that Paul III. organized the Tribunal of the Inquisition in Rome. On the death of Marcellus II. in 1555, although in his seventy-ninth year, he was elected to succeed him. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted

for the maintenance of public morality. He established a censorship, and completed the organization of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labor and perplexity. He insisted on the restoration of Church property in England, a demand which Julius III. had in the interests of peace refused to press; and on Elizabeth's accession declared her illegitimate and not entitled to the throne. He was embroiled with the Emperor Ferdinand, with Philip II. of Spain, and with Cosmo, Grand Duke of Tuscany. Having condemned the principles of the Peace of Augsburg, he protested against its provisions.—PAUL V., Pope 1605-21, Camillo Borghese. He was born in Rome in 1550. In his early life he was a distinguished canonist and theologian; and after the ordinary prelatical career at Rome he rose first to the post of Nuncio at the Spanish Court, and afterwards to the cardinalate under Clement VIII. His Pontificate is rendered memorable by the celebrated conflict with the Republic of Venice, into which he was plunged at the very outset of his career. The original ground of dispute was the question of the immunity of the clergy from the jurisdiction of civil tribunals. The Venetian Senate resisted the claim of the clergy to be tried by ecclesiastical tribunals; and further causes of dispute were added by a mortmain law, and a law prohibiting the establishment of new religious Orders or associations unless with the sanction of the Senate. Each party remaining inflexible in its determination, Paul issued a brief, directing a sentence of excommunication against the Doge and Senate, and placing the Republic under an interdict unless submission should be made within twenty-four days. The Senate persisted, and an animated conflict, as well of acts as of writings, ensued, in the latter of which the celebrated Fra Paolo Sarpi, on the side of the Republic, and on the Papal side Bellarmine and Baronius, were the leaders. Preparations were even made for actual hostilities; but, by the intervention of Henry IV. of France, the dispute was accommodated and peace restored in 1607, although dissatisfaction afterwards arose on the subject of the nomination of a patriarch. Paul's administration was a vigorous and noble one, and marked by the development of religious Orders and missionary enterprise. Consult his *Life* by T. A. Trollope (London, 1861).

PAUL I., PETROVITCH (1754-1801). Emperor of Russia from 1796 to 1801. He was the son of Peter III. and Catharine the Great. He underwent a vigorous training at the hands of his mother, and this served to harden and warp a nature which was by no means devoid of generous impulses. The memory of his father's violent death made him suspicious of all who surrounded him, and as prince or emperor prevented him from gathering a party around him. During his mother's lifetime he was allowed no share in the government, and with the exception of a journey abroad (1781-82) passed his time in brooding idleness on his estates at Gatchina. Catharine died November 17, 1796, while seriously contemplating the exclusion of Paul from the succession to the throne in favor of his son Alexander. Paul's reign began with fair promise, but speedily degenerated into an oppressive despotism which weighed alike on the Court, the army, and the intellectual life of the nation. The system of police espionage was developed to a hitherto unparalleled degree, and swift punishment was visited on those unfortunate enough to arouse the slightest suspicion in the Emperor's diseased imagination. Reluctant at first to enter the struggle against France, he finally joined the Second European Coalition against the French Republic in 1798, and in 1799 the Russian armies under Suvaroff (q.v.) gained a series of notable victories over the French and drove them out of Northern Italy. Bonaparte's astute diplomacy, however, succeeded in breeding dissension between the Russian Emperor and his allies. Paul's discontent was intensified by the conduct of England in refusing him possession of the island of Malta, to which as grand master of the Knights of Malta, an office assumed in 1798, he laid claim. His opposition to England finally developed into open hostility, and led in 1800-01 to the formation of the Northern Maritime League by Russia, Sweden, and Denmark against Great Britain. At home, meanwhile, Paul's despotism had become unendurable, and a conspiracy was formed by some of the highest officials about the Court to bring about the Emperor's abdication in favor of his son Alexander. The leaders of the conspiracy were Count Pahlen, Count Panin, Prince Suboff, General Bennigsen, and General Uvaroff. On the night of March 23, 1801, the Imperial palace was surrounded by the troops of Count Pahlen while the conspirators, some thirty in number, broke into Paul's chamber and at the sword's point demanded that he sign the act of abdication. No certain knowledge exists of what then occurred, but it would seem that the Emperor, crazed with fear, attempted resistance, that a scuffle ensued, and that in the struggle Paul was strangled with his own scarf. Of Paul's ten children, Alexander and Nicholas ruled over Russia, while Constantine was a prominent figure during the reign of the latter. Consult: Kobeko, *Der Cäsarewitsch Paul, 1754-96* (Berlin, 1886); Brenemann, *Aus den Tagen Kaiser Pauls* (Leipzig, 1886).

PAUL, APOCALYPSE OF. See APOCRYPHA, section on *New Testament*.

PAUL, CHARLES KEGAN (1828-1902). An English publisher and author, born at White Lackington, Somersetshire. He was educated at Eton and at Exeter College, Oxford; from 1853 to 1862 was a master at Eton, and, after twelve years as vicar of Sturminster, entered the publishing business, from which he retired in 1899. As an author he is best known for his biographies and translations: *A Translation of Faust* (1873); *Life of William Godwin* (1876); *Letters of Mary Wollstonecraft* (1879); *Biographical Sketches* (1883); *Maria Drummond* (1891); Huysmans's *En Route* (1896); and *Memories* (1899). In *Faith and Unfaith* (1891) Paul hinted at his own religious beliefs; he left the Church of England for Positivism, and in his last years entered the Roman Catholic Church.

PAUL, poul, HERMANN (1846—). A German philologist. He was born in Magdeburg; studied at Berlin and Leipzig, and in 1874 became professor in the University of Freiburg. In 1893 he

was appointed professor of German philology at the University of Munich. His publications include: *Gab es eine mittelhochdeutsche Schriftsprache?* (1873); *Zur Lautverschiebung* (1874); *Kritische Beiträge zu den Minnesingern* (1876); *Zur Nibelungenfrage* (1877); *Mittelhochdeutsche Grammatik* (5th ed. 1900). He is best known in the United States by his *Prinzipien der Sprachgeschichte* (1880; 3d ed. 1898), translated into English by Strong (1888), and retranslated with changes by Strong, Logeman, and Wheeler (1891). As editor of *Grundriss der germanischen Philologie* (1891-93; 2d ed. 1896 et seq.), he rendered valuable service to modern philology. After 1874 he with W. Braune edited the *Beiträge zur Geschichte der deutschen Sprache*.

PAUL, pâl, Lewis (?-1759). An English inventor, of whose life very little is known. About 1729 he invented a pinking machine, and his acquaintance with Dr. Johnson seems due to the fact that Mrs. Desmoulins had learned pinking from him. Paul's important patent dates from 1738, and it is the earliest machine for the spinning of wool or cotton by two pairs of revolving rollers. The factories established at Birmingham and Northampton met with no success. Two other patents taken out by Paul were a carding machine (1748) and a spinning machine (1758). They seem to have been no more successful than the first, which, however, was the basis of Arkwright's invention.

PAUL, poul, Oskar (1836—). A German writer on music, born at Freiwaldau, Silesia. He was a pupil of Klingenberg at Görlitz, then of Plaidy, Richter, and Hauptmann at the University of Leipzig, and after sojourns in different German towns he returned to Leipzig (1866), to give private lessons in harmony. Three years afterwards he began to teach musical history in the conservatory of that city, and in 1872 he was appointed professor extraordinarius at the university. He founded and edited the periodical *Tonhalle*, which was merged into the *Musikalische Wochenblatt;* published Hauptmann's *Lehre der Harmonik* (1868); wrote *Geschichte des Claviers* (1869); *Handlexicon der Tonkunst* (1871-73); and made the first German translation of *Boëthius* (1872).

PAUL, pôl, Vincent de. See Vincent de Paul, Saint.

PAUL, Vision of. See Apocrypha, section on *New Testament*.

PAUL AND VIRGINIA (Fr. *Paul et Virginie*, pôl-â-vêr'zhē'nē'). A well-known romance by Bernardin de Saint-Pierre (1788), the scene of which is laid in Mauritius, where the author had spent three years. It exhibits great powers of description and emotional force, with exaggerated sentiment and a not altogether healthy atmosphere. It is the story of two playmates whose affection develops into love, and ends with the drowning of Virginia and the death of her lover from grief.

PAUL CLIFFORD. A novel by Bulwer-Lytton (1833). It is the story of a chivalrous highwayman in the time of the French Revolution. Paul Clifford, of unknown birth, brought up in evil, is arrested for theft and becomes a highwayman. As Captain Clifford he loves Lucy Brandon, but is brought before her uncle, Judge Brandon, for a robbery. He proves to be Brandon's stolen child, is condemned to death by his father, but escapes with Lucy to America.

PAUL'DING, Hiram (1797-1878). An American naval officer. He was born in New York City, entered the United States Navy as a midshipman in 1811, participated in the battle of Lake Champlain (September 11, 1814), receiving a vote of thanks and a sword from Congress for his services, served under Commodore Decatur against the Barbary Powers in 1815, and in the following year was promoted to a lieutenancy. He accompanied Commodore Porter on an expedition against the West Indian pirates in 1822-23, acting as first lieutenant of the *Sea Gull*, said to have been the first steamer ever used for purposes of war; served on the *Dolphin* in 1826 when that vessel was sent to the Mulgrave Islands in search of the mutineers of the American whale ship *Globe;* cruised in the East Indies, in command of the *Vincennes*, from 1844 to 1847; was in command of the Washington Navy Yard from 1851 to 1854; and from 1854 to 1857 was commander of the home squadron, at the time the highest position in the navy. For arresting the filibuster Walker (see Walker, William) at Greytown, Nicaragua, in December, 1857, he was relieved from command by President Buchanan, though the Republic of Nicaragua, in recognition of his services, presented him with a sword and a large tract of valuable land, which latter Congress did not allow him to accept. On the outbreak of the Civil War he was ordered to Washington to assist Secretary Welles of the Navy Department, and in April, 1861, proceeded to Norfolk and destroyed the navy yard there. Having passed the age limit of sixty-two years, he was technically retired in December, 1861. In the following year he was promoted to the recently created grade of rear-admiral, on the retired list, and subsequently was commandant of the New York Navy Yard from 1862 to 1866, in which position he rendered important services to the Government by sending many vessels and thousands of men to the front; was Governor of the Naval Asylum in Philadelphia from 1866 to 1869, and was port admiral at Boston from 1870 to 1871. He published a *Journal of a Cruise Among the Islands of the Pacific* (1831). Consult a biographical sketch by Meade in *Harper's New Monthly Magazine*, vol. lviii. (New York, 1879).

PAULDING, James Kirke (1779-1860). An American author, born in Pleasant Valley, Dutchess County, N. Y. After a scanty education he went to New York, where, with William Irving, his brother-in-law, and with Washington Irving, he collaborated in *Salmagundi* (1807), the second series of the same (1819) being by Paulding alone. During the War of 1812 he published the *Diverting History of John Bull and Brother Jonathan;* and in 1814 the *United States and England*, a defense against British criticisms. This work attracted attention and caused him to be appointed secretary of the board of navy commissioners. In 1817 he published a defense of the Southern States and of slavery in *Letters from the South, by a Northern Man;* in 1822, *A Sketch of Old England, by a New England Man;* and in 1825 *John Bull in America, or the New Munchausen*, a satire on the writings of British tourists. Meanwhile he had published his first novel, *Koningsmarke* (1823); *Merry*

Tales of the Three Wise Men of Gotham (1826) [illegible], and other books, mainly humorous and satirical. In 1831 he produced *The Dutchman's Fireside*, a novel dealing with the old Dutch settlers. This, his best work, was followed by *Westward Ho!* (1832), a novel dealing with Kentucky. Next came a good biography of Washington (1835), and *Slavery in the United States* (1836). Meanwhile he had been navy agent at New York City since 1825, a position from which he was advanced in 1837 to the post of Secretary of the Navy in Van Buren's Cabinet. On his retirement in 1841 he went to a country residence at Hyde Park, where he wrote a few stories and plays, the novel, *The Puritan and His Daughter* (1849), being the most conspicuous. There he died, April 6, 1860. His select works appeared in four volumes (1867-68). Consult *Literary Life of James K. Paulding*, by his son William (New York, 1867).

PAULDING, John (1758-1818). An American Revolutionary soldier, born in New York City. He, together with Isaac Van Wart and David Williams, captured Major André near Tarrytown, September 23, 1780, and for this received from Congress a silver medal bearing the inscription "Fidelity" on one side, and "Vincit amor patriæ" on the other. He was a prisoner three times during the Revolutionary War, being released the second time only four days before André's capture.

PAULI, pou'lē, Karl (1839—). A German philologist. He was born at Barth, in Pomerania, studied at Erlangen and Greifswald, and, after teaching in various gymnasiums and spending several years in Leipzig, in 1893 became professor in the Lyceum of Lugano, in Switzerland. Pauli's especial study was on the languages of Italy, above all Etruscan. He published: *Etruskische Studien* (1879-80; completed in Deecke's *Etruskische Forschungen und Studien*); *Altitalische Studien* (1883-87); *Altitalische Forschungen* (1885-94); and, with Danielsson, *Corpus Inscriptionum Etruscarum* (1893 et seq.).

PAULI, Reinhold (1823-82). A German historian. He was born in Berlin, studied there and at Bonn, and lived for several years in England, in antiquarian research and as secretary to the Prussian ambassador, Bunsen. In 1866 he lost his professorship at Tübingen because of an attack on the policy of Württemberg. In the following year he was appointed professor at Marburg and in 1870 at Göttingen. His historical works are marked by a lucid style and by painstaking research. They include: *König Alfred und seine Stelle in der Geschichte Englands* (1851); a continuation of Lappenberg's *Geschichte von England* (1853-58), an able work; *Bilder aus Altengland* (1860; 2d ed. 1876); *Geschichte Englands seit den Friedensschlüssen von 1814 und 1815* (1864-75); *Simon von Montfort* (1867); and a sketch of Cromwell (1874). Pauli edited in 1856 Gower's *Confessio Amantis*.

PAULICIANS. An Oriental Christian sect, which flourished in the eighth and ninth centuries, although survivors are found much later. It has generally been represented as an offshoot of the Manichæans (see Manichæism), but recent investigations make it probable that it is of independent origin. In a work entitled *The Key of Truth*, dating in its present form probably from the ninth century, and representing the contemporary usages and beliefs of the Paulicians in Armenia, survivals of ancient baptismal and ordination forms are found, which indicate some connection between this Church and the older Adoptionists. The Adoptionists taught that Christ was a man who, at his baptism, became by adoption the Son of God, instead of being so by nature, or eternally (the Catholic doctrine). This type of Christology goes back to the end of the second century, when it was brought to Rome by Theodotus. (See Monarchians.) The origin of the name Paulicians is uncertain, but an eleventh-century opponent of the movement traces it to Paul of Samosata (q.v.), Bishop of Antioch in the latter part of the third century, the last great Adoptionist teacher, and this is the most plausible derivation yet suggested. Ancient writers like Petrus Siculus and Photius (ninth century) say that Paulicianism arose in Armenia some two hundred years before their time. Their leader was one Constantine (Sylvanus), and the sect stood in opposition to the Catholicus, or head of the National Church, on several points of doctrine and practice. They rejected the authority of the hierarchy, and chose religious leaders of their own, the 'elect ones,' wherein lies one resemblance between them and the mediæval Manichæan sects. These facts have led many writers to speak of them as 'Protestants.' In the ninth century the Paulicians enjoyed a vigorous ecclesiastical life, especially under a leader named Baanes, from whom they are sometimes known as Baanites, but they were subjected to severe and repeated persecution at the hands of the Church and of the Byzantine Emperors. Under such provocation they for a time joined forces with the Mohammedans against all Christian powers. In the eighth century, and again in the tenth, some of them were removed from Asia Minor to the upper part of the Balkan Peninsula, to serve as an outpost against the Slavic tribes of the north, and thus a considerable Paulician population was established in Europe. Their influence penetrated into Bulgaria, and here no doubt is one source of those mediæval movements generally classed as Manichæan, which include the Bogomiles, Cathari, and Albigenses (qq.v.). A few surviving Paulicians were discovered in Southeastern Europe in the eighteenth century, and larger numbers of them in Armenia in the nineteenth. Here was found their book, *The Key of Truth*, which has thrown new light on some obscure points of their history. Consult: Gibbon's *Roman Empire*, especially vol. vi., app. 6 (ed. by Bury, London, 1896 et seq.); Conybeare, *The Key of Truth* (Oxford, 1898); Newman, *Manual of Church History*, vol. i. (Philadelphia, 1900); Lynch, *Armenia, Travels and Studies* (London, 1901).

PAULINE EPISTLES. A group of New Testament letters, claiming in their superscriptions to have been written by the Apostle Paul and comprising the following thirteen writings: Romans, I. Corinthians, II. Corinthians, Galatians, Ephesians, Philippians, Colossians, I. Thessalonians, II. Thessalonians, I. Timothy, II. Timothy, Titus, Philemon.

PAULI'NUS, Meropius Pontius Anicius, Saint (353-431). He was born at Bordeaux, France, and became a pupil of the poet Ausonius, who secured him the favor of the Emperor Gratian. He attained the dignity of *consul*

suffectus, and married a wealthy Spanish lady named Therasia. Through the efforts of Saint Ambrose he was converted to Christianity, distributed most of his property among the poor, and continued for a time to reside in Spain. He was ordained a priest in 393, at Barcelona, but soon left Spain for Rome. In 394 he went to Nola, where he had an estate. Near the city was the tomb of the martyr Felix, over which a church had been built, with a few cells for pilgrims. Here Paulinus lived for fifteen years in a strictly monastic fashion, except that his wife seems to have been with him. In 409 he was made Bishop of Nola, a position which he retained till his death. He was present at the Council of Ravenna in 419. Of his works there have been preserved 50 epistles, 32 poems, and a tract called *Passio S. Genesii Arelatensis*. His name is of frequent occurrence in the letters of Augustine and Jerome. The works of Paulinus will be found in vol. lxi. of Migne's *Patrologia Latina* (Paris, 1861). Consult Lagrange, *Saint Paulin de Nole* (Paris, 2d ed., 1882).

PAULINUS, Saint (died 644). A missionary sent to England by Pope Gregory I. in 601, where he joined Augustine (q.v.). In 625 he was made bishop by Archbishop Justus of Canterbury, and went to Northumbria, in attendance on Ethelburga, daughter of Ethelbert, King of Kent, and wife of Edwin (q.v.), King of Northumbria. Edwin was still a pagan at the time, but in 627, through the influence of his wife and Paulinus, he caused himself to be baptized, together with many others. Soon afterwards Paulinus founded the cathedral at York. On the overthrow of King Edwin in 633 the Northumbrians relapsed into heathenism, and Paulinus fled to Kent, where he became Bishop of Rochester. He died October 10, 644. Consult Bright, *Early English Church History* (Oxford, 1878).

PAULISTS. The ordinary designation of the Congregation of Missionary Priests of Saint Paul the Apostle. This is a society founded in New York in 1858 by Father Hecker (see Hecker, Isaac Thomas) and some other priests. Their desire was to form a community of priests for missionary work in America, composed chiefly of those whose native tongue was English; Hecker had left the Redemptorists largely on the ground that the members of that Order working in America were mostly of German birth, and did not understand the needs of the country. The plan was approved by Archbishop Hughes, and received the Papal confirmation from Pius IX. The mother house of the community, most of whose members are converts from Protestantism, is in New York. The Paulists devote themselves especially to mission preaching, and have been the main promoters of the remarkable movement originating in the last years of the nineteenth century toward a systematized effort to extend their faith among the non-Catholics of America which has taken shape in the foundation of a central training house for such work at Washington. Their magnificent church in New York is noted for the perfection of its services, both in the direction of punctilious carrying out of the rubrics and of Gregorian music. They also carry on the Catholic Publication Society work, with a printing plant of their own, and publish a monthly magazine called *The Catholic World*.

PAULITES (ML. *Paulita*, from Lat. *Paulus*, Paul). An Order of hermits which arose in Hungary in the thirteenth century by the union of two earlier communities, those of Patach and Pisilia, under Eusebius of Gran, the founder of the latter, who united both of them in 1250 and became the first superior of the joint Order. Eusebius died in 1270; the rule of Saint Augustine was adopted in 1308, and the Order, which was confirmed by Pope John XXII., spread throughout Northern Europe, until it numbered 170 cloisters in Hungary alone, in which country many of its members filled the highest ecclesiastical offices. They were introduced into Portugal in 1420, and into France, where they were commonly known as Brothers of Death (see Death, Brethren of) and much favored by Louis XIII. The Order in France seems to have been suppressed by Pope Urban VIII. It has practically died out everywhere except in Cracow and Poland.

PAULITSCHKE, pou-lich'ke, Philipp Viktor (1854-99). An Austrian geographer and explorer of Northeastern Africa. He was born in Moravia, was educated in the universities of Gratz and Vienna, and in 1883 was appointed docent in the University of Vienna. His first trip to Africa was in 1880, when he made ethnological studies in Egypt and Nubia; but the expedition undertaken in 1844, starting from Harar and going south through Somaliland, was much more important, especially as it covered new territory in Galla. Paulitschke's writings include: *Die geographische Erforschung des afrikanischen Kontinents von den ältesten Zeiten bis auf unsere Tage* (1880); *Die Afrika-litteratur von 1500 bis 1750* (1881); *Leitfaden der geographischen Verkehrslehre* (2d ed., 1892); *Die geographische Erforschung der Adalländer und Harrars* (1884); *Die Sudanländer* (1885); *Beitrage zur Ethnographie und Anthropologie der Somal, Galla und Harrari* (1886); *Die Wanderungen der Oromo* (1888); and *Ethnographie Nordostafrikas* (1893-96).

PAULLINIA (Neo-Lat., named in honor of C. F. *Paullini*, a German botanist [1643-1712]). A climbing plant of the order Sapindaceæ, native in Brazil. A paste made of the crushed seeds and leaves of *Paullinia Sorbilis* or *Paullinia Cupana* is called guarana, and is used in medicine. The dried paste occurs in brown cakes or sticks, with an odor of chocolate and a bitter taste, partly soluble in water and in alcohol. As the preparation of this paste is a secret, the other ingredients are not known. It yields an alkaloid, *guaranin*, which is considered to be identical with *caffeine* (q.v.), and has the same therapeutic and physiological effects. A fluid extract of guarana is official, which has been used in migraine chiefly, but also in wasting diarrhœa and as a tonic.

PAULO AFFONSO, pou'lō åf-fōn'so, Falls of. See São Francisco.

PAUL OF SAMOS'ATA. Bishop of Antioch in the third century. Beyond the fact that he was born at Samosata, little is known of his early life. He was at first a sophist and obtained admittance among the clergy in some unknown way. He became Bishop of Antioch (260), probably through the influence of Zenobia, Queen of Palmyra. He was a Monarchian and his opponents do not give a good account of him. They assert that his character previous to his appointment

was in some respects unworthy of the episcopal office, and that after his elevation he was rapacious, arrogant, and vain. His heresies caused several councils to be convened to consider his case; by the last of these, held about 269, he was divested of his office and excommunicated. Trusting to the favor of both Queen Zenobia and the populace, he refused to vacate the episcopal residence, in which also the meetings of the Church were held. In 272 the Emperor Aurelian, having conquered Zenobia, referred Paul's case to the bishops of Rome and of Italy, and they decided against him. There is no notice either of the time or place of his death.

PAUL OF THEBES, Saint (c.235-c.347). The first well-known hermit in the Christian Church, called, by Saint Jerome, the founder of Monasticism. He was born at Thebes, in Upper Egypt, and at the age of fifteen fled to the desert to escape the Decian persecution. Here he lived about a hundred years in prayer and mortification, and trained Saint Antony to be his successor in the leadership of those who sought an ascetic life in retirement from the world. See Antony, Saint.

PAUL OF THE CROSS, Saint (1694-1775). The founder of the Order of Passionists (q.v.). His original name was Paolo Francesco Danei; he was born at Ovada, near Genoa. With a few companions, he began to live a hermit's life on Monte Argentaro, where he believed that God revealed to him that he should found a new Order, even showing him its destined habit. The Bishop of Alessandria, after careful investigation, clothed him with this habit, and allowed him even as a layman to preach repentance and conduct spiritual exercises. In 1727 he was ordained priest, and ten years later the first permanent settlement of Passionists was made on Monte Argentaro; from this time the founder took the name of Paul of the Cross. After a life of penance and labor, he died in Rome, October 18, 1775. He was canonized by Pius IX. in 1867. Consult his *Life* by the Passionist Father Pius (Dublin and New York, 1867).

PAULOWNIA, pą-lō'nı-ą (Neo-Lat., named in honor of Anne *Paulovna*, daughter of Paul I., Czar of Russia). The common and generic name of an ornamental Japanese tree of the natural order Scrophulariaceæ, which attains a height of 20 to 40 feet. It has somewhat the appearance of a catalpa, the heart-shaped leaves being similar, but much more downy. The flowers, borne in panicles in spring, are perfumed, violet-colored, two inches long, somewhat cylindrical, with rounded lobes at the mouth. The tree was formerly much planted in the United States, but, not proving equal to expectation, has lost in popular favor. It is not hardy north of New York, and even there and farther south it often fails to bloom for several seasons in succession. The branches are crooked, spreading, and nearly horizontal. Since the flower buds are carried over winter, a severe winter generally blights them. The growth of the tree in a favorable climate is very rapid and vigorous. When annually cut to the ground it is said to form a good hedge of young growths remarkable for the striking appearance of the leaves.

PAUL PRY. A successful comedy by John Poole, produced in 1825. The title character is an exceedingly curious, meddlesome person, who on trivial pretenses interrupts every interesting situation in the play.

PAULSEN, poul'sen, Friedrich (1846—). A German philosopher of the Neo-Kantian school. He was born in Langenhorn, Schleswig, and studied at Erlangen and at Berlin, where he became docent in 1875, and in 1878 professor of philosophy and pedagogy, and where his lectures were among the most widely attended in Germany. His chief works in the latter branch are "Gründung, Organisation und Lebensordnungen der deutschen Universitäten im Mittelalter," in Sybel's *Zeitschrift* (1881); *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (1885; 2d ed. 1896); *Realgymnasium und humanistische Bildung* (1889); and *Höhere Schulen und Universitätsstudium im 20. Jahrhundert* (1901). As a philosopher Paulsen ranks as a disciple of Fechner in metaphysics, holding his pan-psychic doctrine and agreeing with him as to the parallelism between physical and mental. In general, his agreement with Fechner is best seen in the widely known *Einleitung in die Philosophie* (1892; 7th ed. 1900), of which an English version appeared in 1895. Equally characteristic is the important genetic study of the Kantian system, *Versuch einer Entwicklungsgeschichte der Kantischen Erkenntnisstheorie* (1875), and the supplementary work, *Immanuel Kant* (1898; 2d ed. 1899). His other works are: *Kant der Philosoph des Protestantismus* (1899); *Schopenhauer, Hamlet und Mephistopheles* (1900), a series of essays; *Philosophia Militans* (1900) 2d ed. 1901), a reply to Haeckel's *Welträtsel;* and the excellent manual, *Ethik* (1889; 5th ed. 1899; partial English version, 1899), which is especially noteworthy for its historical sketch and for its practical treatment of the ethics of every-day life and of politics. The last topic is considered in *Parteipolitik und Moral* (1900).

PAULSEN, John (1851—). A Norwegian poet and novelist, born at Bergen. There he was for some time employed in the Portuguese consulate. Having entered literature with *Af Byliret* (1875; 2d ed. 1890), thanks to Ibsen's influence, he received a State stipend and spent several years abroad, returning to Norway in 1882 only temporarily, and spending most of his time in Denmark. Among his works are: *Moll og Dur* (1876), a volume of poems; *Margherita*, one of the first Norwegian problem-stories (1880); *En digters Ilustru* (1884) and *En Fremtidskvinde* (1887), both of which were translated into German, as was *Jödinden* (1892); *Nye Melodier* (1894); and a play, *Falkenström og son*, which met with success in Norway and in Germany.

PAULUS, pou'lus, Heinrich Eberhard Gottlob (1761-1851). A German theologian and one of the leaders of the Rationalist school. He was born at Leonberg, near Stuttgart, September 1, 1761. He studied Oriental languages at Göttingen, London, and Paris. In 1789 he was called to the professorship of Oriental languages at Jena, and in 1793 became professor of theology. Here he especially signalized himself by the critical elucidation of the Scriptures of the Old and New Testament, in so far as they presented Oriental characteristics. In 1811 he accepted the professorship of exegesis and

ecclesiastical history at Heidelberg. He died August 10, 1851. Among his numerous writings may be mentioned: *Clavis über die Psalmen* (1791); *Clavis über Jesaias* (1793); *Philologisch-kritischer und historischer Kommentar über das Neue Testament* (1800-04); *Sammlung der merkwürdigsten Reisen in den Orient* (7 vols., 1792-1803); *Leben Jesu, als Grundlage einer reinen Geschichte des Urchristentums* (1828); *Aufklärende Beiträge zur Dogmen-, Kirchen- und Religionsgeschichte* (1830); and *Exegetisches Handbuch über die drei ersten Evangelien* (1830-33). Consult: Paulus, *Skizzen aus meiner Bildungs- und Lebensgeschichte zum Andenken an mein 50-jähriges Jubiläum* (Heidelberg, 1829); and Reichlin-Meldegg, *H. E. G. Paulus und seine Zeit* (Stuttgart, 1853).

PAULUS, Julius. A distinguished Roman jurist, who lived in the latter half of the second century and the earlier decades of the third. He was an assessor or associate justice under Papinianus, when the latter was prætorian prefect or chief justice of the Empire, in the reign of Septimius Severus; was exiled by Elagabalus; was recalled and made prætorian prefect by Alexander Severus. Paulus was one of the most fertile of Roman legal writers. In addition to commentaries on the civil law (16 books) and on the prætorian or equity law (78 books), he published a great number of monographs on special topics, and 48 books of 'questions' and 'responses.' He published also a succinct presentation of the entire law, civil and prætorian, under the title of *Sententiæ* (5 books), and two books of 'institutes' for beginners. He was regarded by the later Romans as the equal of his contemporary, Ulpian, and as inferior only to Papinianus. His style, however, is less clear than Ulpian's. Excerpts from his writings make up more than one-sixth of the Digest of Justinian. A part of his *Sententiæ* has come down to us in the Breviary of Alaric (q.v.), and this text is included in Huschke, *Jurisprudentiæ Anti-Justinianæ quæ Supersunt* (4th ed., Leipzig, 1879). A fuller text, which includes the passages preserved in the Digest, may be found in Krüger, Mommsen, and Studemund, *Collectio Librorum Juris Antijustiniani* (Berlin, 1878-90).

PAULUS, Lucius Æmilius. A Roman general. See Æmilius Paulus.

PAULUS DIAC'ONUS (Lat., Paul the deacon) (c.720-c.800). The best historian of the Lombards. He was descended from a noble family, which had settled in Friuli. He received an excellent education either at Pavia or Friuli, and was at the former city while King Ratchis (744-49) ruled there, and became the tutor of Adelperga, daughter of King Desiderius. After the destruction of the kingdom at Pavia, if not earlier, he very likely took refuge at the Court of Duke Arichis, the husband of Adelperga. For the latter he wrote his *Historia Romana*, which was chiefly a compilation of works still in our possession, and was greatly used as a text-book for centuries after. About this time Paulus entered the monastery at Monte Cassino. In 782 Paulus journeyed to the Court of Charles the Great in order to obtain the release of his brother and other captive Lombards. His mission was successful, while he himself was induced by King Charles to remain and lend his aid in the reawakening of learning. It was here that he made his collection of homilies, known as *Homilarium*, which have been translated into many languages. At the request of Bishop Angilram of Metz, he also wrote *Gesta Episcoporum Mettensium* (History of the Bishops of Metz). Finally, after repeated petitions, Paulus was permitted to return to his beloved convent, probably accompanying Charles to Italy in 786. At Monte Cassino Paulus now wrote his most important work, *De Gestis Langobardorum* (History of the Lombards), which ends with the year 744. The work is remarkable on account of its pure Latin and the vast number of poetic legends of the early Germans it has preserved. Paulus was also the author of a number of theological works, and of some hymns and letters still extant. The best edition of his works is to be found in the *Monumenta Germaniæ Historica* (Hanover, 1878-79). For other editions and the like, consult Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii. (2d ed., Berlin, 1896); Wattenbach, *Deutschlands Geschichtsquellen*, vol. i. (6th ed., Berlin, 1893). There is an excellent German translation of the Lombard History with a serviceable introduction by Jacobi in *Geschichtsschreiber der deutschen Vorzeit. Achtes Jahrhundert*, vol. iv. (Leipzig, 1888).

PAULUS HOOK, Capture of. See Jersey City, N. J.

PAUL VERONESE. See Veronese, Paul.

PAUMOTA (pä'ụ-mō'tä) **ISLANDS.** A group of islands in the South Pacific. See Low Archipelago.

PAUNCEFOTE, pąns'fụt, Lord Julian (1828-1902.) A British diplomat, born in Munich, Germany, of English parents. He was educated at Marlborough College, in Paris, and in Geneva, and was called to the bar in 1852. Three years afterwards he became private secretary to Sir William Molesworth, British Colonial Minister, and on the death of his chief, the following year, Pauncefote went to Hong Kong, where he practiced law successfully, and in 1866 was made Attorney General of the colony. He was appointed the first Chief Justice of the federated British Leeward Islands in 1874, knighted and made Assistant Under-Secretary for the Colonies the same year, and in 1876 was given the corresponding position in the Foreign Office. He was made Permanent Under Secretary of State for Foreign Affairs in 1882, served as British Commissioner to Paris in the Suez Canal negotiations in 1885, and was appointed Minister to the United States in 1889. His title was changed to Ambassador when that office was created in 1893, and he was the first to bear that title in this country. Queen Victoria made him a Privy Councilor in 1894. In the Bering Sea, the Venezuelan, and other difficulties between Great Britain and the United States, Pauncefote's large experience, knowledge, and tact in dealing with international affairs were powerful upon the conciliatory side, and his friendliness to the United States was shown in his efforts to have the Clayton-Bulwer Treaty abrogated. He was a British delegate to the Peace Conference at The Hague in 1899, and for his services there was raised to the peerage as Baron Pauncefote of Preston.

PAUPERISM (from Lat. *pauper*, poor). The condition of those who are partly or wholly dependent upon private charity or public aid for

support. Technically, in law, a pauper is a person supported by the public authorities, at the expense of taxpayers. In its broadest meaning the term pauperism should not be used synonymously with poverty, or even with occasional acceptance of relief, but only to designate a state of chronic dependence. Pauperism is possible only in communities where extreme poverty and surplus wealth exist together, and in combination with a prevailing sentiment of pity. In primitive communities, where pity is lacking and the means of subsistence are often inadequate, the hopelessly ill and the aged as well as the irredeemably lazy starve or are put to death. In barbarian societies, where pity is still lacking, although some accumulations of wealth have appeared, weak or deformed children are commonly dispatched, while the aged receive scant consideration.

Chief among the more important causes of destitution in civilization are improvidence, sickness, accident, death of the head of the family, and old age. Charles Booth's investigations of English pauperism have shown that old age is, all in all, the chief cause. Destitution, however, may exist, and yet pauperism be averted through a wise administration of private agencies of relief. Destitution at one end of the social scale, abundant means in the hands of kindly disposed but thoughtless givers at the other end, and sentimentality in public administration being given, destitution is rapidly converted into pauperism. In general, we may say that improvidence, sickness, or other misfortune, and old age, are the causes of *destitution*, and that an unwise dealing with destitution is the great cause of *pauperism*.

History of Pauperism. On account of the simplicity of their economic life, great poverty was rare among the Jews. The care of the poor was left to custom and religion. The gleaning of the olive and vine orchards and of grain fields belonged to the widows and orphans. (Deut. xiv. 28-29; xxiv. 19-22; xxvi. 12-13.) Charity was, however, limited by racial lines, and there was little provision for the alien. Under Christianity there was a great development of charity. Men were to feed the hungry, give the thirsty to drink, clothe the naked, shelter the stranger, care for the sick, visit the prisoner. In the early Church the free gifts of the members were distributed by the bishops and deacons to those who were known by the members to be in need. Within the Church the situation seems to have been excellent.

Greece as early as Pisastratus provided for those wounded in battle. Later those unable to work (*ἀδύνατοι*), if they possessed property valued at less than about $60, received from 1 to 2 obols per day (10 obols = 5 cents). As wages were 2 to 3 obols a day, the amount received must have sufficed for support. In Athens poor persons found shelter in houses without doors. There were in many cities unions (*ἔρανοι*) which provided against poverty.

In Rome the donations of food and grain were for political effect, in part at least. Gaius Gracchus supplied Rome with grain at cost. Clodius gave it free to poor citizens, and in B.C. 33 the amount spent for grain was 10,000,000 sesterces, about $433,000, which rose in A.D. 46 to sevenfold. Cæsar found 301,000 persons receiving grain and limited the number to 150,000, but this figure was exceeded under Augustus. The conditions which entitled men to grain were full citizenship and residence in Rome. Under Aurelius the donations consisted of bread, oil, and meat. From the time of Nerva emperors as well as private citizens gave funds for the education of children, as Forax Antonius in honor of his wife, Faustina (Puellæ Faustinianæ).

After Constantine great churches replaced the small communions, with the result that the effectiveness of the earlier charity of the Church was impaired. The Church received vast wealth, and great sums were given for the poor. Large institutions arose for widows and children. Rome and other cities were divided into districts in charge of deacons who dispensed alms. In Rome one-fourth of the goods was set apart for the poor. But the old voluntary offerings disappeared and donations came from the Church funds. After the fifth century the decline of charity is obvious, and beggars increased to an enormous extent.

During the Middle Ages the Church taught that almsgiving was a means of obtaining grace, but pauperism became too extensive to be adequately met by private charity. Charlemagne brought pressure on the bishops and lords to support the poor. In 779, a year of special need, he imposed a poor tax and expressly forbade begging. He also made arrangements for caring for widows, orphans, and strangers, but the system went to pieces at his death. The benefactions of the Middle Ages were numerous and varied. There were hospitals of all sorts for the aged sick, the criminal, the homeless, and for pilgrims; free baths; houses for the poor. The charitable orders were also well developed. But no systematic attempt was made to diminish pauperism. There was no discrimination between worthy and unworthy, the least deserving often receiving most. Great swarms of beggars arose and threatened to overrun Europe. (See Mendicancy.) In the fifteenth century city authorities begin to take part in the relief of poverty. In 1437 Frankfort had city almoners. Cologne undertook some supervision of the poor in 1450, and Antwerp in 1458 had an Armenmeester. The city council became the guardian of orphans and the insane. But the measures taken to suppress mendicancy were regulative, in effect licensing it, and proved unsatisfactory.

Luther, in his letter to the German nobility, laid the foundations of a new policy. He advocated the control of poor relief by the cities. The relief should be limited to what was absolutely necessary, and should be given only after investigation; the worthy poor should be distinguished from tramps and impostors. In this scheme the idea of almsgiving as a means of salvation disappeared. Augsburg (1522), Strassburg, Breslau (1523), Regensburg, Magdeburg (1524), and other cities began a reorganization of poor relief. The question as to the relative spheres of Church and State at once arose, and was variously determined. In the main the old parishes formed the poor relief districts. Efforts were made to gather the various funds into one treasury controlled by deacons (in Hamburg there were three deacons, in Lübeck twelve), whose time of service was only one or two years. They were at first elected, but later on appointed, and they rendered yearly accounts. Alms were distributed to the poor at their homes,

or occasionally given out at the church. Necessaries of life were sold at low rates. Labor was secured when possible. But the charges were too great for continued success and there were other handicaps. The short term of the deacons made systematic effort impossible: the existence of old orders and institutions caused cross-currents, and the plans gradually failed.

The German development begins again after the Thirty Years' War. Edict after edict against begging came to naught, but some progress was made toward fixing the responsibility for support, and in the regulation of marriage. By the end of the seventeenth century poor-houses and houses of correction appear. The teaching of Thomasius and of Gallert and the Pietist movement strengthened humane feeling, and in the writings of Garve, Resewitz, Rochow, and others a literature of poor relief appeared. Many patriotic and benefit societies were founded. In Hamburg (1788) the general poor-house was created. Visitors (180) were appointed to gather information. The poor were given work, various trades were started at the poor-house, and deficient earnings were supplemented. At first results were favorable. In the first ten years the number of the poor in institutions sank from 9757 to 4751. In 1801, however, the institution had a deficit of $15,000, which increased from year to year. In Prussia poor associations (Armenverbände) were organized, and rules regarding the responsibility for support were adopted. Parishes had to support residents of three years' standing, those without legal residence being cared for out of special or general funds. Schools of industry appeared. Pestalozzi gave an impetus to special institutions for children, and institutions for the deaf and blind were founded. In Gotha and Weimar children were boarded in families. The schemes adopted were, however, at that time impracticable and many were even demoralizing. Wages below a certain minimum were made good, though it was obvious that employers would lower wages to take advantage of this fact. The period of the wars also had a depressing effect. During the first thirty years of the nineteenth century begging increased. New laws were promulgated in Saxony in 1840, and in Prussia in 1842. The general law of 1870 affecting the German States, with the exception of Bavaria and Alsace-Lorraine, opened the way for the development of the poor relief of the different States according to local conditions. The Elberfeld system (q.v.) has found general adoption. This is in essence a combination of public and private charity, with unpaid visitors assigned to special districts, who investigate each case, and the treatment is adapted to individual needs. There has likewise been a development of private associations. The Inner Mission (q.v.) has reintroduced the Church care for the poor and the churches are beginning to organize, as is shown by the proceedings of the Eisenach Conference of 1892. The Catholic Church has also been active, this Church in general opposing poor relief by the State or at most merely admitting the right of the State to supplement private efforts. Germany has taken steps to do away with pauperism by the introduction also of compulsory insurance and old-age pensions (q.v.).

In Catholic countries the State has never assumed the leading rôle in poor relief. At Ypres in 1525 reform measures were introduced which raised a storm of religious opposition and were never fully carried out, although the Sorbonne ratified them. The Council of Trent took the old attitude, but in spite of this some princes attempted the supervision of hospitals as within their executive rights. There was, however, a great development of charitable institutions under the Church. A Portuguese, Juan de Dio (1556), founded the Brothers of Charity and the modern hospitals, while Vincent de Paul is justly honored for his philanthropy and for the establishment of the Order of Sisters of Charity.

France has been the seat of the greatest development of the charity of the Church. The administration of relief has been largely through the Church, though some of the funds have been supplied by the State. Francis I. ordered each church to care for its poor, the poor relief to be in the hands of the pastors and assistants, the funds to be derived from free-will offerings. In Paris (1544) a general poor office was created with power to levy a tax, and this tax was extended to all communes in 1566, which plan was followed until 1791. Edicts against begging were numerous and the penalties often severe, but to no purpose. Under the influence of Francis de Sales and Vincent de Paul many institutions were founded, and Louis XIV. also was noted for his efforts in this direction. To supplement the hospitals, dépots de mendicité were established in 1774, and in 1808 these were extended to each province, but they have since largely disappeared. In these labor was compulsory. In spite of the 2185 hospitals with an income of 38,000,000 francs listed by the comité de mendicité, in 1790 pauperism was a live question in France. By the time of the Revolution there was a strong demand for a reform of the poor relief system. The Constitution of 1791 established the principle of State control, and that of 1793 proclaimed that "Society owes its unfortunate citizens support by offering work and by maintaining those incapable of providing for themselves." It was proposed to acquire the private institutions. Necker initiated new measures, opening, among other things, workshops in Paris, which but served to attract the poor from the country, and thus increased the trouble. During the following years many schemes were inaugurated, but the net result was rather to cripple the old system than to establish anything enduring in its place. The Church came again to control, subsidized by the State. The Sisters of Charity regained strength. In 1796 local boards (bureaux de bienfaisance) were established, but were not made compulsory. They exist to-day in only about one-third of the communes whose population is less than 500, and in perhaps two-thirds of those with a population of over 1000. Relief given is both at home ('secours à domicile') and in the institutions. Most of the relief is in the hands of the Church and the right to State relief is not admitted, though in recent years there are signs of opposition to management by the Church. The State has assumed charge of the work for children and for the insane. The Revolution found large numbers of foundling asylums (q.v.), and these increased until 1834, when restrictions were imposed, and instead of the reception through the 'tours' bureaus of admission were formed and the care of the children regulated. In 1869 a special department of the Gov-

ciement was set aside for this work, and in 1874 extensive regulations relative to the boarding of children in private families were adopted. Since 1895 the law regulating medical care of the poor has made some changes, though effective institutions are lacking. The cost of public charity has greatly increased, but this is largely accounted for by the improved care given the poor rather than by great increase in the number of the dependent.

In Italy the mediæval system is most pronounced. Begging is almost universal, and there is little State control of pauperism. The law of 1862 (legge della opere pie), modified in 1890, established some State supervision over charitable corporations, but further development has been checked by the political situation. There are numerous institutions and endowed charities with funds aggregating $4,000,000 or more.

In Austria poor relief is chiefly administered through the communes under the leadership of the priests. The system is known as the Pfarrarmen Institute (1782). The funds are obtained largely from private donations, and each commune supports its own poor, though there is no special tax for the purpose. In Lower Austria the Elberfeld system has been introduced since 1893, with some local taxation in case of emergency. Switzerland supports the helpless and provides work for the able-bodied pauper. After the freeing of the serfs Russia turned poor relief over to the local representative assemblies, which impose taxes for this purpose. In Norway and Sweden public charities are administered by the Established Church. Belgium has almshouses with compulsory labor. Holland has a system of pauper or labor colonies (q.v.), which has won general favor. There exist also over 4600 associations for poor relief, many orphan asylums, and other institutions. In addition there are large numbers of private organizations and institutions.

Long before the Reformation England had unsuccessfully forbidden begging. No provision was made for the destitute until 1388 (12 Richard II.). In 1536 (27 Henry VIII.) each parish was ordered to care for its poor and provide work for the able-bodied. It soon became necessary to induce the people to give money for this purpose, and at first the bishop was to use 'charitable ways and means' to persuade the unwilling donor. In 1563 it was decreed that the persistent refusal to give would bring one before the courts for punishment. A decade later a tax was levied for the poor, and public officials, overseers of the poor (q.v.), were created. In 1601 the famous law of Elizabeth (43 Eliz., c. 2) was enacted and became the basis of subsequent public poor relief in England and the United States. Emphasis is laid upon the 'setting to work' of the able-bodied. The overseers were given power to assess, collect, and distribute the 'rate,' as the tax was called. They cared for and apprenticed orphan children. The unwillingness of any parish to support the poor of other parishes led in time to the development of strict settlement laws (14 Charles II., c.12). Insistence upon 'setting to work' of the able led to the establishment of the workhouse (then called the industrial house). The first one was founded at Bristol in 1697. In 1722 a general act (9 George I., c. 7) authorized workhouses wherever needed. Any pauper refusing to go to the workhouse was denied assistance elsewhere. This gave rise to the distinction made in England and elsewhere between assistance given in an institution, technically called 'indoor relief,' and that given at the residence of the recipient or outside of any public institution, 'outdoor relief.' The introduction of the new institutions naturally gave rise to many abuses, and these, with the general humanitarian sentiment of the eighteenth century, tended toward a reaction. Under Gilbert's act of 1782 the workhouses were largely given over to the old, the infirm, and to children, others receiving assistance outside of the institutions. Various parishes were allowed to form workhouse unions. By an act of 1796 'outdoor relief' was again legalized. The famous Speenhamland Act, adopted in Berkshire in 1795, started the 'allowance system.' A certain minimum of wages was considered necessary, and the difference between this and the amount actually earned was to be supplied by the State. This was extended by the act of 1796. The expenditures for the relief of the poor rose from about £2,004,000 in 1775 to £4,267,000 in 1802, and to £7,890,000 by 1818. Such a rapid increase called for investigation. A commission authorized by Parliament, after a thorough investigation (1832-34), made a remarkable report (1833-34) showing a deplorable condition of affairs. Pauperism seemed to be contagious, and in some districts nearly all the able-bodied men were receiving allowances. In 1834 (4 and 5 William IV.) radical reforms were introduced. Outdoor relief was gradually withdrawn and limited as far as possible. Able-bodied men were refused assistance outside the workhouse. The population of the workhouses was classified. The sexes were separated and only plain necessaries of life were provided. The functions of overseers had already been restricted to the collection of rates, and the distribution of relief had been given to boards of guardians. This arrangement was continued. A central body of commissioners was created, which became in 1847 the Poor Law Board. This body was abolished in 1871 and its powers were lodged in the Local Government Board, which is now the body controlling the general execution of the Poor Law in England and Wales. The results have been satisfactory. New unions were formed. Conditions within the workhouses have improved. Many children have been educated in the special workhouse schools, but there is a growing tendency to send them to the regular parish schools. In many districts children are boarded out in private families. When children are ready to support themselves they are apprenticed in various trades. The workhouses of the first half of the nineteenth century have grown into numerous special institutions for the insane, blind, and deaf and dumb, so that the workhouse of to-day is not the general dumping place of the infirm and unfit. The following table, drawn from statistical reports, shows the expenses of the public relief and the number assisted.

The total sum raised by taxes during these three periods was £12,677,306, £15,087,258, £19,428,912 respectively, the sums actually given in relief rising from £7,747,947 to £8,316,411 and £9,249,724. The costs of administration have properly increased, and it is to be noted that more persons are assisted in institutions, fewer outside, while the total number has slightly increased.

ENGLAND

	Adult able-bodied poor		Other poor		Total assisted	Per cent. of population
	In institutions	Outside	In institutions	Outside		
1871–75*	23,639	116,525	131,753	647,049	918,966	3.93
1881–85*..	24,795	79,866	164,412	522,628	791,701	2.96
1891–95*	34,765	72,515	167,948	511,926	787,144	2.65

* Yearly average.

This means that those assisted probably receive better care than formerly.

England has also witnessed a great development of private charity, of which little mention can be made here. The Friendly Societies (q.v.), the Charity Organization Society, the Salvation Army, and Dr. Barnardo's great work for children deserve mention. Attempts to prevent pauperism have been made in cities by the destruction of slums, the building of tenements, and the opening of parks and playgrounds. Public attention has been directed to the question of old-age pensions (q.v.). The postal savings banks (q.v.) have been successful.

Scotland and Ireland have public relief patterned after that of England. In Scotland no relief is allowed to able-bodied adults. The relief is given by inspectors appointed by the parochial boards, which are under the oversight of the board of supervision.

Public relief of the destitute in the United States is based on the Elizabethan law of 1601. The public duty to give relief is recognized. How this relief shall be administered is a matter for each State to determine. There is little uniformity. At first the almshouse, or poorhouse, was the only institution for the pauper. This was maintained by the town in New England, the county elsewhere. Many of the larger cities had and still have their own institutions. Here have been intermingled the worthy poor, the sick, insane, feeble-minded, children, mothers with illegitimate children. The nineteenth century witnessed the gradual development of hospitals for the insane, which can now provide for about 75 per cent of the insane who are public charges; of institutions for children in such numbers that there is no longer any excuse for the presence of children in almshouses; of hospitals for the sick; of schools for the deaf and dumb and blind; of schools for the feeble-minded; and, in the last decade, of special institutions for the epileptic. Reforms have usually been initiated by private organizations and then been adopted by the State, which has sometimes subsidized private institutions. There is a growing tendency, however, for the State to own and manage all institutions which shelter public charges. Outdoor relief is administered by township trustees under the County Board of Supervisors (in New England the town is the unit) in rural districts. The large cities usually are independent of the county. Chicago is a notable exception. Many cities grant outdoor relief, but some, such as Philadelphia and New York, do not. Mendicancy and vagrancy are forbidden by laws and ordinances, but these are not always enforced. Little attention has been paid to settlement until recently. Now some States are beginning to make inquiries and to send home those who are not properly dependent on them. In most States there is a public body, known usually as the State Board of Charities, which oversees the working of the charitable institutions of the State. Its members, with the exception of the secretary, who devotes his entire time to the work, are usually unpaid. Recently a few States have established a Board of Control, a smaller body of paid agents, to supervise institutions, and sometimes to purchase their supplies. Destitute aliens are a State charge. Immigration of persons likely to become public charges is forbidden by Federal laws.

The United States has witnessed a great development of private beneficence. Most of the churches have funds for the relief of poor members, and there are large charitable institutions under denominational management. The growth since 1870 of the Charity Organization Society has helped to bring order out of the chaos in private relief. One of the chief aims of this society is to coördinate various agencies and to prevent a duplication of effort. Since 1874 the National Conference of Charities and Correction, composed of philanthropists and workers in charitable and correctional institutions, has held annual meetings for the study of pauperism and allied topics, and its publications are valuable. See CHARITIES AND CORRECTION, NATIONAL CONFERENCE OF.

There are no accurate statistics of paupers in the United States. The census of 1890 gave the number of inmates of almshouses as 73,045, but this is generally conceded to be at least 10,000 short of the actual number. To these 'indoor poor' would have to be added the much larger number of persons receiving help who are not in institutions, and the insane and other defectives who are cared for in public institutions, not to mention those supported by private associations.

No attempt has been made to give any comparative statistics of the extent of pauperism in the different countries. The conditions of relief are so diverse, and the census of paupers is so inadequate, that comparative statements are misleading.

Pauperism has no panacea. With every step in human progress a certain proportion of the population, discouraged or overwhelmed by misfortune through the breaking up of old industrial relations when new ones are established, falls behind in the race. Therefore each age and each nation must attack anew the problem of preventing an inevitable destitution from becoming a hopeless pauperism. Certain fundamental principles, however, have been well established by experience, and may thus be summarized:

(1) Indiscriminate almsgiving, without careful investigation of the situation and needs of the applicant, is a fruitful cause of pauperism instead of a remedy. (2) To remove the cause and to bring the individual to self-support, if possible, must be the aim of all efforts; and (3) to accomplish this doles are not sufficient, but

carefully worked out plans must be adopted and carried through. (4) This necessitates an endearing organization of experts (either private or public) to superintend and execute the chosen methods. If success is to be obtained, the various charities must work in coöperation with this central body to prevent imposture and duplication of efforts. (See CHARITY ORGANIZATION SOCIETY.) (5) The assistance given must be sufficient, but not enough to tempt the self-supporting workingman to surrender his independence. (6) In the words of Malthus: "It is in the highest degree important to the general happiness of the poor that no man shall look to charity as a fund upon which he may confidently depend." (7) Beggars should be put in institutions with labor adapted to their abilities. (8) Constructive efforts, such as the creation of family pride, assistance in securing work, removal of children from demoralizing surroundings, pay far better than any palliative measures. (9) The questions as to the sort of relief, in money or in kind; the agency, whether private or public; the place, whether at home or in institutions, are matters to be determined by local antecedents and local conditions. (10) For the physically or mentally feeble there must be furnished good care under decent surroundings—that which constitutes good care naturally varying from place to place and time to time. (11) It is recognized as desirable, no matter what system of relief prevails, that there should be voluntary, unpaid coöperators to lessen the danger of officialism.

BIBLIOGRAPHY. The books and articles treating of pauperism are almost numberless. Reference is made only to a few of the more important sources.

ANCIENT AND MEDIEVAL. Monnier, *Histoire de l'assistance publique* (Paris, 1866); Hirschfeld, *Die Getreideverwaltung in der römischen Kaiserzeit* (Göttingen, 1869); Moreau-Christophe, *Du problème de la misère et sa solution chez les peuples anciens et modernes* (Paris, 1881); Ratzinger, *Geschichte der kirchlichen Armenpflege* (Freiburg, 1884), written from a Catholic standpoint; Uhlhorn, *Die christliche Liebesthätigkeit in der alten Kirche* (Stuttgart, 1880; Eng. trans. Edinburgh, 1883); id., *Die christliche Liebesthatigkeit im Mittelalter* (ib., 1884); id., *Die christliche Liebesthatigkeit seit der Reformation* (2d ed., ib., 1895).

MODERN EUROPE. Emminghaus, *Das Armenwesen und die Armengesetzgebung in den europäischen Staaten* (Berlin, 1870; Eng. trans., London, 1873); Rocholl, *System des deutschen Armenpflegerechts* (Berlin, 1873); Reitenstein, *Die Armengesetzgebung Frankreichs* (Leipzig, 1881); Du Camp, *La charité privée à Paris* (Paris, 1886); Böhmert, *Das Armenwesen in 77 deutschen Städten* (Dresden, 1886); Hubert-Valeroux, *La charité avant et depuis 1789* (Paris, 1890); Bodio, *Atti della commissione reale per l'inchiesta sulle opere pie* (Rome, 1895).

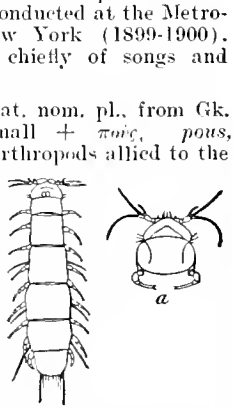
ENGLAND. Nicholls, *History of the English Poor Law* (London, 1854; vol. iii. by Mackay, ib., 1899); *Extracts from the Information Received by His Majesty's Commissioners as to the Administration and Operation of the Poor Laws* (ib., 1833); Ribton-Turner, *History of Vagrants and Vagrancy* (ib., 1887); Booth, *In Darkest England and the Way Out* (New York, 1890); Booth, *Life and Labor of the People* (London, 1891); id., *Pauperism and the Endowment of Old Age* (ib., 1892); id., *The Aged Poor in England and Wales* (ib., 1894); Rowntree, *Poverty* (New York, 1902).

UNITED STATES. Warner, *American Charities* (New York, 1894); *Report of the Special Committee on Outdoor Alms of the Town of Hartford* (Hartford, 1891). This account of American conditions is unique in the American literature of the subject and ranks in value with the *Report of the Poor Law Commission* of 1833-34. Dugdale, *The Jukes* (New York, 1888), a valuable history of one pauper family; National Conference Charities and Correction, *Annual Reports* (Boston, 1874 to date); Brace, *The Dangerous Classes of New York* (New York, 1880). Census of 1890, statistics regarding almshouses, etc.; also reports of various State conferences of charities.

GENERAL. Conrad, *Handwörterbuch der Staatswissenschaften* (Jena, 1898), articles under title "Armenwesen." The subjects treated by the various authors are Introduction; History of Public Poor Relief; Poor Laws of various countries; The Care of the Poor; Poor Rates; Statistics of Pauperism. Each section contains a good bibliography, and the articles here given form by all means the best and most complete study of the subject for the purposes of the general reader. See CHARITIES; MENDICANCY; OLD-AGE PENSIONS; POOR LAWS.

PAUR, pour, EMIL (1855—). An Austro-American musician and conductor, born at Czernowitz. After preliminary instruction under his father he became a student at the Vienna Conservatory, and subsequently held many important appointments. In 1876 he was kapellmeister at Cassel, and in 1880 principal Court kapellmeister and conductor of the Mannheim subscription concerts. He was director at the Leipzig Stadt Theater in 1891, and two years later was called to Boston, as the successor of Nikisch of the Boston Symphony Orchestra. He became conductor of the New York Philharmonic Society concerts in 1898, and the following year succeeded Dvořák in the directorship of the National Conservatory. He conducted at the Metropolitan Opera House, New York (1899-1900). His compositions consist chiefly of songs and chamber-music.

PAUROP'ODA (Neo-Lat. nom. pl., from Gk. *παῦρος*, *pauros*, little, small + *πούς*, *pous*, foot). A small group of arthropods allied to the 'thousand-legs' (Diplopoda.). The few species known are minute, the body behind the head composed of 12 segments, which on the back are represented by six plates. They differ from the Diplopoda in having but a single pair of legs to a segment. The order is represented by *Pauropus Lubbockii* in the Eastern United States and Chile, and by a flattened broad form, Eurypauropus, found in the United States and Europe. The species are cosmopolitan and represent an ancient type. Consult Kenyon, "Morphology and Classification of



PAUROPUS LUBBOCKII.
a, Front view of head.

the Pauropoda," in *Tufts College Studies*, No. 4 (Somerville, Mass, 1895).

PAUSA'NIAS (Lat., from Gk. *Παυσανίας*) (?-c.469 B.C.). A son of Cleombrotus, and regent of Sparta as guardian of his cousin, Plistarchus, the son of Leonidas. He commanded the Greeks in the battle of Platæa, B.C. 479, in which the Persian army under Mardonius was overwhelmed, and eleven days later, marching to Thebes, demanded of that city the surrender of all who had been traitors to the Greek cause. After a siege of twenty days, the Thebans yielded. In B.C. 477 there was put under his command a fleet of the confederate Greeks, wherewith to drive the Persians from the islands and coast-towns, and with this he took Cyprus and Byzantium. Elated by these victories and puffed up with pride and ambition, he entered into secret negotiations with the Persians, with the view of becoming ruler, subject to the Persian monarch, of the whole of Greece. Meanwhile, he treated the allies as though he were their lord and sovereign, adopted Persian dress and manners, protected his person with a bodyguard of Persians and Egyptians, and introduced into his household habits of Oriental luxury. Being recalled by the authorities at Sparta, he was acquitted on the main charge of treason, and again returned to the Hellespont to renew his intrigues with the Persians. He was a second time summoned home and arraigned, but was a second time acquitted. He now, while still continuing his negotiations with Xerxes, began also to intrigue with the Helots, promising them freedom and citizenship if they would rise and overthrow the government. At last he was betrayed by one Argilius, whom he had commissioned to carry a letter to the Persians. Argilius, noticing that no one of those previously sent on a similar errand had ever returned, opened the letter, found directions therein for his own death, and laid the matter before the ephors. Pausanias, finding his plot discovered and himself entrapped, took refuge in the temple of Athene Chalcioecus. Hereupon the people blocked up the entrance with a pile of stones, the first stone being laid by his aged mother, and left him to die of hunger. This was about B.C. 469. Consult the histories of Greece by Grote, Curtius, Abbott, Holm, Beloch, and Meyer.

PAUSANIAS. A Greek traveler and geographer, author of Ἑλλάδος Περιήγησις, *Hellados Periēgēsis*, or Guide-book to Greece. Of his early life little is known. He was probably a native of Lydia in Asia Minor, and was certainly at work on his book as late as A.D. 175, though the earlier part seems to have been published some years before. His work, in ten books, is a detailed description of what seemed to him the most important places and monuments in Greece, arranged by districts and in much of the work described in a most systematic fashion. His interest is largely religious, and while other buildings are mentioned, the chief space is devoted to temples and lesser shrines, often with interesting and curious details as to local traditions and ceremonies. In general, he pays little attention to recent art or buildings, reserving his admiration for the great works of the fifth and fourth centuries B.C. The dry details of topography are relieved by historical digressions, often of no great accuracy, anecdotes, and legends. The style is dry and often obscure, and the manuscripts are not infrequently defective. In spite of its undoubted weaknesses, the book is an invaluable source not merely for the topography and monuments, but for the local cults, and its value increases with new exploration. For his history Pausanias of course depended on his predecessors, and for traditions and descriptions he seems to have used earlier material: but there is no good reason to doubt that his work represents personal travel and investigation, and its general accuracy is confirmed by recent discoveries. There are a number of early editions of Pausanias, but the best complete text is that edited by J. H. C. Schubert (Leipzig, 1853-54, often reprinted); a new edition with critical and explanatory notes by Hitzig and Blümner is in course of publication (Leipzig, 1896 et seq.); the fullest commentary is by J. G. Frazer, *Pausanias' Description of Greece*, translated with commentary (6 vols., London, 1898); valuable for Athens is Jahn-Michaelis, *Arx Athenarum a Pausania Descripta* (3d ed., Bonn, 1901); Harrison and Verrall, *Mythology and Monuments of Ancient Athens* (London, 1890). For the criticism of Pausanias, consult: Kalkmann, *Pausanias der Perieget* (Berlin, 1886); Gurlitt, *Pausanias* (Gratz, 1890); Heberdey, *Die Reisen des Pausanias in Griechenland* (Vienna, 1894).

PAUSIAS, pâ'shi-as (Lat., from Gk. *Παυσίας*). A Greek painter of the first half of the fourth century B.C., a pupil of Pamphilus and a contemporary, if not a fellow-student, of Apelles. He was a great decorative artist, especially in encaustic, and was reputed the first to paint ceilings, setting within garlands and wreaths small genre pictures, especially of children. His famous painting of Glycera, a flower girl of his native city, Sicyon, and probably his mistress, showing her with a garland in her hair, or a copy, was sold to Lucullus for two talents. His skill in foreshortening made his work prized in Rome, where a black bull at the altar, head to the front, and with such clever perspective that the length is easily guessed, was one of the great pictures in the portico of Pompey's Temple.

PAUSINGER, pou'zing-ĕr, FRANZ VON (1839—). An Austrian landscape and animal painter, born at Salzburg. He studied at the Vienna Academy, then under Schirmer at Karlsruhe, and under Rudolf Koller at Zurich, where he developed that keen observation of animal life, especially of the larger kinds of game, which presently brought his faithful delineations of it into great favor with sportsmen. In 1881 he accompanied Crown Prince Rudolph of Austria on his trip to the East, and afterwards supplied the illustrations to the Prince's work describing that journey. His best known pictures include: "Beechwood in the Glow of Sunlight" (1873, Vienna Museum); "Stag Fighting Dogs" (1877); "Red Deer at Feeding-Trough in Winter" (1888); "Stag Attacked by Wolves" (1893).

PAUW, pou, CORNELIS VAN (1739-99). A Dutch author. He was born at Amsterdam and educated at Göttingen. He joined the Order of Franciscans and became canon of Xanten in the Duchy of Cleves; was afterwards appointed reader to Frederick II. of Prussia. He declined

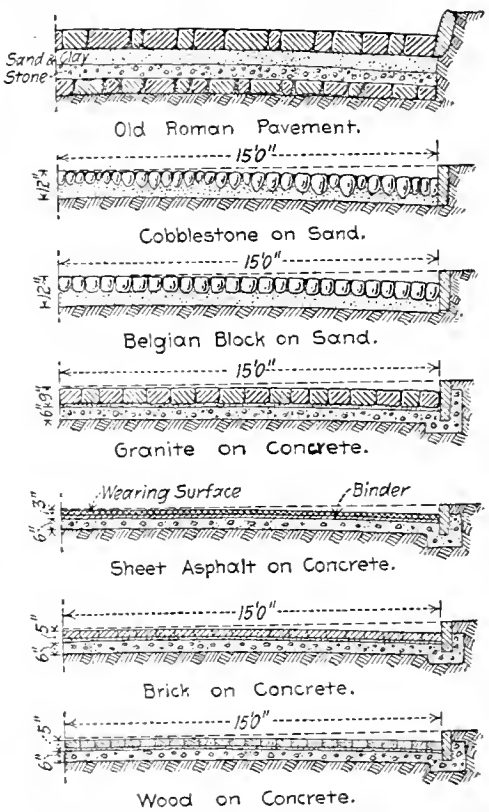
face of an academician of Berlin and a bishop at Breslau. He published *Recherches philosophiques sur les Americains* (1768-70; enlarged editions, 1770 and 1774); *Recherches philosophiques sur les Egyptiens et les Chinois* (1774); *Recherches philosophiques sur les Grecs* (1788). These works were translated into English (Rochdale, 1806; London, 1795, 1793 respectively). They contain curious information, but many unproved assertions made in a dogmatic spirit.

PAUWELS, pou'els, FERDINAND (1830—). A Belgian historical painter. He was born at Eeckeren, near Antwerp, April 13, 1830, and studied at the Academy of Antwerp, principally under Wappers. His first picture, exhibited in 1851, was the "Meeting of Baldwin I. with His Daughter Joan at Constantinople in 1206." His "Coriolanus" gained him the Roman prize. He remained four years at Rome. Upon his return to Antwerp he achieved fame with his "Widow of Jacob van Artevelde" (1857, Brussels Museum) and "Banished by Alva" (1861). From 1862 to 1872 he was professor in the Art School at Weimar, and painted, besides other pictures, the "Reception by Louis XIV. of a Deputation from the Doge of Genoa" (1864, Maximilianeum, Munich); "Queen Philippa of England Relieving the Poor of Ghent" (1866); and several mural paintings in the Wartburg, illustrating the history of Luther. He returned to Antwerp in 1872, and finished the historical cycle of wall paintings by Groux in the Cloth Hall of Ypres. In 1876 he became professor at the Academy of Dresden, which position he resigned in 1901. His later works include: "Count Philip of Alsace Visiting a Hospital at Ypres" (1877; Dresden Gallery); "Admonition" (Leipzig Museum); "Christus Consolator" (1893). His style is grandiose, his color luminous, and his figures are full of character.

PAVANE (It. *pavana*, probably a variant of *pavone*, *paone*, peacock; so called from the stately character of the dance; commonly derived, however, from It. *Padvana*, *Padovana*, Paduan, from *Padova*, Padua, as being supposed to be the place where the dance originated). An ancient Italian dance which spread from that country into Spain, thence to France, and eventually to England and Scotland. It was most popular during the sixteenth century, and was especially so in Spain, and at the Court of James V. of Scotland. It was a solemn, stately dance, generally accompanied by a song. The music was always written in even time and the steps were simple and slow, the performers alternately advancing and retreating. There were various modifications of the pavane, the most important being the Spanish, which introduced a number of elaborate figures.

PAVEMENT (OF. *pavement*, *pariment*, Fr. *pavement*, from Lat. *pavimentum*, pavement, beaten floor, from *pavire*, to beat, Gk. *ταίειν*, *paiein*, to beat, Skt. *pavi*, thunderbolt). This term, in its broader sense, includes any firm, hard covering for areas subjected to the wear and tear of human feet, or of hoofs and wheels, designed to keep the feet or wheels from the ground or earth, and to present a more or less dry, durable, and smooth surface. Under this definition would be included the paved floors of cathedrals and other public buildings often of an ornamental character (see TILES), as well as the surfaces of courtyards, walks, streets, and highways, on which stones or other durable materials are placed. In the modern and more restricted sense, pavements are generally limited to the wearing surface of that portion of improved streets lying between the curbs, thus excluding the sidewalks.

The early history of pavements is involved in obscurity. Strabo says Babylon was paved 2000 years B.C., and Livy relates that about B.C. 170 Rome was paved from the ox market to the Temple of Venus. Before the Christian Era the Romans had learned to construct solid and durable pavements, composed of several layers of stone, mortar, and cement, the upper surface being quite smooth. Portions of these early pavements are said to have been in use within comparatively recent times. Excavations at



TYPICAL STREET PAVEMENTS.

Pompeii reveal some of the old Roman streets just as they appeared when the city was destroyed A.D. 79. The stone blocks were large, many-sided, with their vertical edges carefully fitted, the whole resting on a solid foundation, composed of several layers. The material used was lava stone. It is said that the streets of Cordova, in Spain, were both paved and lighted as early as A.D. 950, under the Caliph Abderrahman III., but most mediæval cities were unpaved until about the twelfth century, and nearly all pavements from that time on until well into the nineteenth century were of rude construction, cobblestone being a common material.

Paris first had pavements, it is believed, about 1184, when its population was estimated at 200,000. In 1698 the pavements of Paris were described as being "of square stones of about eight or ten inches thick; that is, as deep in the ground as they are broad on top." Tillson says that the English Parliament ordered the London Strand paved in the fourteenth century, but adds: "It is said that the first regular pavements were laid in 1533, when the city had a population of 150,000. Holborn had some pavements in 1417. Square granite blocks were introduced by acts of Parliament for Westminster in 1761, and for London generally in 1766." In the United States, cobblestone pavements were laid as early as 1650, or thereabouts, in both Boston and New York.

During the second quarter of the nineteenth century the cities of both Europe and America began to look about for better pavements and to experiment with stone and wood blocks, and (in Europe) with asphalt. From 1850 to 1875 bricks were tried in America. During the period from 1875 to 1900, and more particularly from 1890 to 1900, the theory and practice of street paving was put on a more satisfactory basis than ever before, and thousands of miles of new pavements were laid.

Asphalt was first used in Paris in 1838, but not on a large scale until 1854. It was introduced in London in 1869. In both these cities the material was rock asphalt. What is believed to have been the first asphalt pavement in the United States was laid in Newark, N. J., in 1870, by E. J. de Smedt. In 1871 some asphalt was laid in New York and a little later in Philadelphia. The material in each of these three cases was Trinidad asphalt. In 1876-77 both rock and Trinidad asphalt were laid in Washington. The good results obtained in that city led to the rapid introduction of asphalt there and elsewhere, but comparatively little rock asphalt has been laid in America.

Brick was used to pave roads in Holland as early as the seventeenth century and has been used extensively for both roads and city streets since. Brick pavements are said to have been used in Japan for more than a hundred years. The first brick pavement on a roadway in the United States was laid at Charleston, W. Va., in 1870, and in 1873 the city adopted the system for certain streets. This example was followed by many Central Western cities, but Philadelphia was the first large city to make use of this material, laying some brick roadway pavement in 1887.

Wood blocks were laid in New York as early as 1835-36, and in 1839 wood pavements were already in use in both Philadelphia and Boston, being mentioned in a report made to the Franklin Institute (Philadelphia) by a committee on paving materials. London laid its first wooden pavement in 1839; Glasgow, in 1841; Paris, much later.

Stone blocks of the modern type, of 3 × 9 inches, granite, with mortar joints, were laid on Blackfriar's Bridge, London, in 1840. Glasgow laid granite blocks in 1841. A concrete foundation was used in London, the first in that city, in 1872, and tar and gravel joints were employed in both London and Liverpool about the same time, although used in Manchester, England, prior to 1869. Prior to 1849 scarcely any pavements but cobblestone were used in New York. About 1850 the Belgian blocks were introduced. Granite blocks similar to those now used were introduced in New York about 1876, succeeding some much larger blocks, known as the Guidet patent. Concrete foundations for stone pavements were not used regularly in New York until 1888. Large stone blocks were used in Saint Louis as early as 1818, being from three to 12 inches thick, 6 to 14 inches long, and 6 to 10 inches deep, set on 6 inches of sand. In 1842 stone blocks of about the present size and shape were used in Saint Louis.

In America the pavements now being laid are principally asphalt, brick, and stone block.

Rock asphalt is used to some extent in London, Paris, and other European cities, and stone blocks are common. Brick does not appear to have gained the footing in Europe that it has in America. There is still another sort of improved street surface which is very common on roads and on streets of light traffic throughout the United States, Canada, Great Britain, and at least the western part of Continental Europe, namely the compacted broken stone, known as macadam or telford. See ROADS.

Foundations are to pavements what floors are to carpets; or, conversely, the visible parts of pavements are but the wearing surfaces of streets. Failure to recognize the importance of good foundations has been the bane of most American and many foreign pavements. If the foundation yields, through deficient drainage or bad material and workmanship, the destruction of the pavement follows. In some soils natural drainage is ample. Where it is not, either a drain in the centre or at one or both sides of the street is required to remove the subsoil water. These drains may be of stone, tile, or sewer pipe, according to the relative cheapness of the several materials in the locality concerned and the character of the drainage work. Drainage provided, and the surface on which the pavement is to be laid shaped and compacted, the foundation is next put in place. For serviceability nothing surpasses concrete as a foundation. The chief argument against it is its cost, which may range from 50 cents per square yard upward. The thickness of the concrete should rarely be less than six inches, and may run as high as ten inches. Sometimes broken stone, alone, is used for foundation, and again stone, brick, or wood is laid directly on sand.

If the traffic is not heavy, sand, gravel, or broken stone may sometimes be used with a fair degree of success, particularly if the earth beneath is well compacted and thoroughly drained. Asphalt should always have a concrete foundation, except where laid on top of an existing pavement of some other material, which will form a good bed. The finished surface of the foundation should be brought to such a curve, or crown, crosswise of the street, as will shed the rainfall to the gutters. A four-inch crown on a street 30 feet wide is considered good practice. Greater widths should have more crown, but the increase is not necessarily proportional.

Cushion coats, composed of one to two inches of sand, are generally placed on concrete foundations for all materials save asphalt, and also on brick laid flatwise for foundations. They allow the separate blocks or bricks to be brought to a firm bed by ramming or rolling. They also pro-

vid for uneven depths in blocks or bricks, thus aiding in bringing the finished pavement to a true surface.

Fillers are employed to close the joints between blocks and bricks. They are often of some waterproof cement, thus rendering the pavement impervious, as well as binding it together. Where bituminous in character, like asphalt, coal tar, or the two combined, they also yield somewhat to contraction and expansion, without permanent rupture, as is the case with the Portland cement and other burnt stone fillers. *Portland cement filler* is a grout composed of 1 part cement and 1 or perhaps 2 parts fine sand, mixed with sufficient water to cause it to run easily, thus filling the interstices. *Murphy grout* is a patented filler composed chiefly of ground iron slag, carbonate of lime, and sand, mixed with water. *Bituminous* cements are many and variable, but may be classed as coal-tar pitch and asphalt. Residuum oil (obtained in the refining of petroleum) is generally, but not always, used with asphalt cements. (See ASPHALT.) Coal-tar pitch alone becomes brittle and cracks or breaks in winter, while in summer it becomes hot and flows. It is designated commercially by the degree of hardness to which it has been distilled. In and near New York it is common to mix 100 pounds of No. 4 coal-tar pitch (commercially known as paving cement), 20 pounds asphalt, and 3 pounds residuum oil. This last combination is used with hot gravel to fill the joints in block stone pavements. Where asphalt is used, some 10 per cent. of its weight in residuum oil is sometimes added. All the bituminous cements are poured hot. Sand alone is also used as a filler, but not where imperviousness is desired.

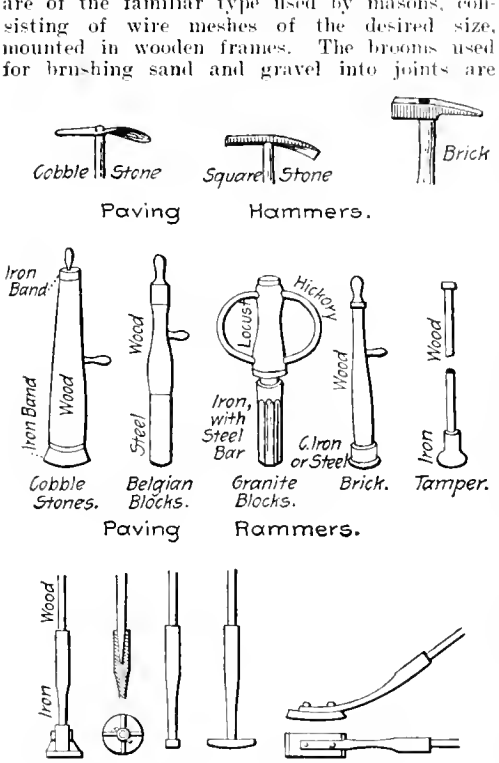
Ramming is employed on stone, wood, and brick pavements to bring the blocks or bricks to a firm bed and even surface. Rolling with steam or other rollers is a necessity with sheet asphalt and is sometimes done with other pavements.

CHOICE OF PAVING MATERIALS depends on a variety of factors, such as serviceability, durability, cost of construction, repairs, and maintenance, ease of cleaning, noiselessness, and other sanitary or related qualities. Under serviceability, the main factors are a minimum resistance to traction and a good foothold for horses, or absence of slipperiness. Asphalt fulfills the first of these conditions most admirably, and probably brick comes next. Asphalt is slippery, both in wet weather and on heavy grades. Brick is less slippery. Newly laid wood gives a smooth pavement, but it is liable to wear unevenly and to be slippery in wet weather. For durability, or long wearing powers, the best stone blocks cannot be excelled, and under heavy traffic they are very serviceable, although offering more resistance to traction than several other materials. In first cost, asphalt and the best stone blocks generally rank high; but this is largely offset by their durability and low cost of repairs. Brick pavements are very cheap in some localities, and if placed on good foundations they are sufficiently durable. Wood may be cheap also, but unless specially treated wood is used it generally proves expensive to keep in repair and requires frequent renewals. For ease of cleaning nothing can surpass asphalt, and it gives rise to less noise than either stone blocks or brick. Brick is also easily cleaned, and far quieter than stone blocks. The latter are not only noisy, but also hard to clean, and unpleasant to ride over, on account of their roughness. The smoothness of asphalt and brick, and the quickness with which their surfaces dry after a rain or a sprinkling, make them great dust-spreaders, but the ease and thoroughness with which they may be cleaned render an avoidance of this nuisance comparatively easy. The large joints of stone blocks collect and retain dirt, but, as it is next to impossible to clean all of it from between the stones, it dries and spreads when subjected to the sun and wind. The dampness of wood pavements is one of the chief objections urged against them. They absorb unclean water readily and tend to keep the streets in a slimy condition, particularly in moist climates and on streets not freely exposed to the sun and wind.

COST of pavements varies widely with local conditions, particularly the depth and character of the foundations, the kind and quality of the wearing surfaces, the inclusion (or absence) in the contract of maintenance guarantees, and the freight rates. The variations are even greater when the cost of grading is included. For comparative purposes the cost of grading, draining, and curbing should be omitted; and the maintenance guarantees, if any, should be described. In fact, without full details relating to the various factors involved, comparative figures of cost are often worse than useless. Roughly, the cost per yard of asphalt and granite was, in 1900, about $2.25 to $2.75; brick, $1.50 to $1.75; all for American cities, and excluding both extremes. With sand foundations and second or third class work the prices would be less, but the tendency is to insist on concrete foundations and good work generally for all three kinds of pavements, asphalt, granite, and brick ranking in the order named in this particular. The best wood pavements, on concrete, cost about the same as brick. The *life* of pavements, or the period for which they may be used without renewing the wearing surface, is given by Tillson as follows: granite blocks, 25 to 20 years; Belgian blocks, 20 years; asphalt and cobble, each 18 years; brick, 15 years; wood, 10 to 15 years; macadam, 8 years.

TOOLS for paving work include hammers, rammers, tamping irons, crowbars, sand and gravel screens, and brooms, besides special asphalt tools and machinery and a variety of tools and machines common to road and other work, such as rollers and concrete-mixers. The graders, scrapers, and other apparatus used in preparing the earth sub-grade, and also the rollers used to compact the natural earth and various classes of paving material, will be described under ROAD AND STREET MACHINERY. Concrete-mixers are described under CONCRETE. Pavers' hammers have a head at one end for pounding the blocks, and a sort of combination chisel and scoop at the other, to facilitate the preparation of the sand cushion and to pry out or loosen single blocks in the setting. Different-shaped hammers are used for cobble than for squared stones, and still different ones for brick. Rammers, also, vary in shape and weight, according to the character of the blocks for which they are designed. For stone, the weights are 40 to 45 pounds; for brick, 25 to 30 pounds; for earth, about 20 pounds. Several shapes of tamping irons are used for street asphalt, to facilitate work along curbstones and to meet other spe-

cial needs. These rammers have cast-iron heads and wooden handles. The smoothing irons are of the same materials, but are slightly convex to the pavement, and are mounted on handles curved at the lower end. Both the tamping and smoothing irons are heated in fire-boxes, mounted on wheels. Screens for sand and gravel are of the familiar type used by masons, consisting of wire meshes of the desired size, mounted in wooden frames. The brooms used for brushing sand and gravel into joints are



TOOLS USED IN STREET-PAVING.

short and stiff, of rattan, wood fibres, or wire. The Perkins *surface heater*, used in repairing sheet asphalt, is composed of gasoline burners, surrounded by wire and asbestos cement. The burners are supplied from a gasoline tank mounted on wheels, the same mounting also serving as a support to the burner frame and mat when the heater is being wheeled about. When in use, the burner frame rests on the asphalt pavement, with a small air space below the mat.

ASPHALT PAVEMENTS are divided into sheet and block. *Sheet asphalt* consists of a binder and a wearing surface, the binder serving to unite the foundation and the wearing surface. The binder is composed of small pieces of broken stone, united with asphaltic cement. The mixture is spread on the foundation in a layer sufficiently deep to give the requisite thickness after having been rolled. A final thickness of one inch is considered ample by some, but one and one-half and even two inches is not uncommon. The wearing surface is composed of sand, carbonate of lime (powdered limestone), and asphaltic cement, mixed hot in varying proportions. The object is to use enough powdered limestone to fill the voids in the sand as completely as possible, and enough asphaltic cement to bind the whole together. It is also desired to make the pavement impervious to water. The consensus of opinion is that the wearing surface should contain 9 to 10 per cent. of bitumen and have a final thickness of about two inches. It should be spread on the binder while the mixture is hot, say at a temperature of 250° F. The spreading is effected by men with rakes, who are followed by other men with hand rollers. Next hydraulic cement is scattered over the surface. After this comes first a five-ton and then a ten-ton steam roller. Thus, three rollers are used in succession, the lighter ones first, in order to prevent distortion of the asphalt while soft. Generally, the asphalt is laid clear up to each curb, special care being taken with the gutters, but sometimes brick or stone is used in place of asphalt in the gutters. The need of special precautions here is the danger from the water that gravitates to the gutters. It is claimed for the Alcatraz and Bermudez products that they may be laid in gutters without harm, but some conservative engineers did not regard this as proved up to the close of 1900. Cracks are liable to occur in sheet asphalt subjected to wide variations in temperature. Most of the asphalt pavements laid in America have been composed of Trinidad sheet asphalt, but in recent years both the Bermudez and Alcatraz products have been employed. See ASPHALT.

ASPHALT PLANTS, used to prepare the material for laying sheet asphalt pavements, include melting kettles, sand-heaters, mixers, and various accessories. The asphalt arrives at the plant in barrels. These are cut away and the asphalt and the residuum oil or other flux are heated and thoroughly mixed in the kettles. The mixing may be effected by revolving paddles, or by pumping in air at the bottom of the kettles. The sand is dried and heated in jacketed revolving cylinders, fitted with angle bars to keep the sand well agitated. The drum is set at a slight angle, so the sand will find its way out. It falls into elevators, which take it to a bin on or above the mixing platform. In case pulverized limestone cannot be had in the vicinity of the plant a limestone-grinding mill is provided. All the ingredients being ready, the asphaltic cement, sand, and limestone are admitted to the mixer. This is an iron box, with a capacity of 8 or 16 cubic feet. Two parallel revolving shafts, each fitted with steel blades, and revolving in opposite directions, are placed in the bottom of the box and effect a thorough mixing of the several materials. When mixed, the finished paving material is dumped from the mixer into a cart or wagon and hauled to the street.

ROCK ASPHALT PAVEMENTS are composed of crushed limestone or sandstone, naturally impregnated with bitumen. If the natural product does not have the desired proportion of bituminous matter this is rectified by mixing a richer or poorer rock with the first. The mixture is powdered, sifted, then kept heated for two hours at 300° to 325° F., after which it is carted to and spread upon the street. After a light rolling, followed by hand tamping, the surface is covered lightly with hydraulic cement and rolled with a steam roller. The European rock asphalt pavements are all made from bituminous limestone, but in America both sandstone and limestone bituminous rock are used,

sometimes mixed together. Little trouble from cracking arises with the rock asphalts; they are generally considered more durable and more slippery than the artificial asphalt mixtures. In Paris some of the asphalt pavements are prepared by adding enough bitumen to the rock asphalt to bring the total bitumen up to 15 or 18 per cent. The mixture is heated to such a consistency that it can be spread or floated into a layer about one and one-half inches deep. It is not rolled. Other asphalt pavements in Paris are compressed.

Block Asphalt is formed by mixing crushed trap rock and asphaltic cement at a temperature of some 300° F., and molding the mixture in machines, under a pressure of 120 tons to each block. The blocks measure 4 × 12 inches on the street surface, and are either 3 or 4 inches deep. They are laid much like brick. It is claimed for asphalt blocks that they are made of a uniform composition and at a uniform temperature, always under cover, thus yielding a product of constant quality; also that they are available for use in small places where the erection of a plant for the preparation of street asphalt would be out of the question.

Brick Pavements are composed of tough, hard, non-absorbent brick, designed to withstand the hammer-like blows and abrasive action of hoofs and wheels and to resist the action of water and frost. In size, shape, and general appearance they resemble ordinary building brick, but they are made and burned with more care. (See Brick.) Where feasible, brick should have a concrete foundation. On the latter a two-inch cushion of sand is laid. The bricks are set edgewise on the sand, their lengths running across the street and joints being broken. At street intersections each quarter of the area is laid diagonally, so the length of the brick will be at right angles to the direction of the traffic, when the latter is turning corners. The bricks are rammed to bed them firmly. Such bricks as sink below the surface are replaced with deeper ones. Although the bricks are set in as close contact with each other as is feasible, open spaces remain. Nearly all the fillers described above have been used for brick pavements. Sand is not suitable, as it quickly washes out. There is great difference of opinion as to the relative merits of Portland cement grout and the bituminous fillers. Both kinds of filler are poured over the surface of the pavement and swept into the joints with brooms. After this has been done the pavement is covered with a thin layer of sand. Expansion joints are sometimes provided, both lengthwise and crosswise the streets, the former at each curb line, and the latter at intervals of 25 to 50 feet. They are made by filling a narrow space or spaces between bricks with some form of bituminous cement.

Wood Pavements are composed of blocks of wood, either round or rectangular, laid with the grain or fibre perpendicular to the foundation. The rectangular blocks are most commonly 3 × 9 inches × 4 to 6 inches deep. The round blocks are 4 to 8 inches in diameter, and about 6 inches deep. Blocks of hexagonal and other special shapes have been tried, but experience has shown that the special forms have no advantage commensurate with their cost. The round and the rectangular blocks are sawed to the desired lengths from logs or from plank, respectively, gang saws sometimes being used. The bark, and in some cases the sap-wood, is cut from the round blocks by machinery. The blocks are sometimes treated chemically with creosote or some other wood preservative. Unless this is done it is questionable whether wood should be used for paving purposes. The round blocks necessarily have large spaces between them to be filled; the rectangular blocks are sometimes laid close together and sometimes with spaces. Various fillers are used. Expansion joints are often, but not always, inserted at the curb, of sand, and covered with bituminous cement or other materials. Probably round cedar blocks have been more freely used in America than any other wood. In Europe pine, fir, and more recently Australian hard woods, known as Karri and Jarrah, have been employed. For the best results, wood should be laid on a concrete foundation, but this has seldom been done in the United States. In Chicago round cedar blocks are laid as follows: Not less than two inches of sand is spread over the surface to be paved. On this a flooring of two-inch hemlock plank is laid, supported also at the centre and each end by 1 × 8-inch boards, laid flatwise in the sand. The blocks are set on end on the plank. The spaces between the blocks must be at least three-quarters of an inch, but not more than one and one-half inches in size. The joints are filled with clean, screened dry gravel, thoroughly rammed in, after which the whole pavement is covered with hot coal-tar pitch, and this in turn is covered with three-quarters of an inch of roofing gravel. At Indianapolis rectangular red cedar blocks were laid in 1894 and 1896, and heart-wood Southern yellow pine later on. The first blocks were not treated, but the later ones were creosoted. The blocks were laid on a concrete foundation, with a one-inch sand cushion, and latterly with expansion joints at the curb. The joints were partially filled with fine sand, after which the pavement was rolled, then covered with hot paving pitch and fine gravel. The cedar blocks were five inches, and the pine blocks four inches deep. Since 1900 creosoted wood blocks have been gaining in favor in the United States. Some of the London hard-wood pavements have been of blocks 3 × 9 × 5 inches deep, laid close. At the gutters three courses were laid parallel to the curbs, the blocks having been dipped in a boiling mixture of four parts of tar and one part of pitch, and there being a one-inch sand filled expansion joint at each curb. The main part of the street was covered with blocks laid crosswise. The filling is effected with boiling tar and pitch, first covering the entire surface, then worked into the joints; after which cement grout is floated over the pavement, then sand thrown over all. Soft-wood pavements of the same period in London were not less than six inches deep, creosoted, and had their joints filled with a grout of blue lias lime and sand.

Stone Block Pavements are most commonly of granite, some of the harder and tougher sandstones, and trap rock, the latter being the least satisfactory of the three. The lengths and depths are quite variable in different cities, but in the best work the widths range from 3 to 4 or 4½ inches, with a tendency to 3½ inches in American cities. The governing condition of width is the foothold for horses. Depths should be at

least one and one-half times the narrow and medium widths, to give a firm setting that will prevent rocking on the base. In American cities common dimensions are as follows: Widths, 3½ to 4 inches; lengths, 9 to 12 inches; depths, 6 to 8 inches. In a number of European cities there is a tendency to square or nearly square blocks, approximating 6 inches on a side, with depths of 6 to 8 inches. Square blocks (or Belgian; see below) are also used in the United States, but not frequently of granite, as is the case abroad. The blocks should be as nearly rectangular and flat as is possible on the tops, sides, and ends. The blocks are generally laid crosswise of the street, and diagonally at intersections. A sand cushion is used when the blocks are laid on concrete, as they should be almost invariably, since stone blocks are generally used where the traffic is heavy. The filler most commonly employed for the joints is first gravel, then hot paving cement. Medina sandstone is sometimes laid as close as possible, and filled with asphaltic cement, Portland cement, or Murphy grout. *Belgian blocks*, so named from their use in Belgium, have tops five or six inches square, bottoms somewhat less, but generally not more than one inch smaller each way, and depths of seven to eight inches. These blocks have been extensively used near New York, and trap rock, being plentiful and cheap in that vicinity, has been employed for the purpose. The trap does not break to a true surface readily and is not easily worked, so it is difficult to get good surfaces with Belgian block of this material. It is very durable, but wears smooth and slippery. Belgian blocks are almost if not quite always laid on a sand or earth base, since one of the objects in their selection is cheapness; their joints are filled with sand. Trap-rock blocks are also got out and laid in oblong form, much like granite and sandstone in general outline, but with far less regular surfaces. Limestone has been used for block pavements, but to a small extent, as it is too soft to be durable.

All blocks should be laid diagonally at street intersections, as is done with brick. The securing and dressing of stone blocks does not differ materially from the quarrying and working of other dimension stone. *Cross-walks* are laid at street intersections. They are composed of two parallel rows of bluestone, granite, or sandstone, according to the locality and the kind of pavement, with a row of blocks between. The crosstones are 1½ to 2 feet wide, 4 to 6 feet long, and 6 to 8 inches thick. In the best modern work they are laid with a keystone at the centre of the street, and with diagonal joints each way, at right angles to the direction of the traffic in turning corners.

Cobblestones are seldom used now. Their only merit is low first cost. They are laid with best results on a base of six inches of loamy sand, which gives a firm bedding and tends to hold them tightly in place. They are set on end. The stones should be not less than four inches nor more than eight inches in diameter at the head, not under five inches nor over ten inches deep, and only rounded stones should be used.

Maintenance. The greatest enemy to good pavements is the frequent street openings so common, and often so necessary where subways for pipes and wires are not provided. (See Subways.) All street openings to gain access to pipes and wires should be under the control of the city department responsible for the maintenance of the pavements. Great care should be taken in refilling all trenches, the dirt being thoroughly tamped to prevent future settlement. In America maintenance for a period of years is sometimes included in contracts for pavements, but chiefly for asphalt. The periods are of varying lengths, but generally five to ten years. Maintenance guarantees amount, of course, to a higher contract price for what on its face is original construction, but is really maintenance as well. When the guarantees expire, a contract for maintenance only is sometimes made with the original or a new contractor. See articles on Asphalt; Brick; Concrete; Quarrying; Road and Street Machinery; Roads; Streets.

Bibliography. For American treatises, consult: Byrnes, *Highway Construction* (4th ed., New York, 1900); Tillson, *Street Pavements and Paving Materials* (ib., 1900); and for a briefer and more elementary work, Spaulding, *Roads and Pavements* (ib., 1895). British treatises available are Aitken, *Road Making and Maintenance* (London and Philadelphia, 1900); Maxwell, *Construction of Roads and Streets* (London, 1899).

PAVEMENT ANT. See House-Ant.

PAVET DE COURTEILLE, pȧ'vȧ' de kōōr'tȧ'y', Abel (1821-89). A French Orientalist, born in Paris. He was a grandson of De Sacy and studied under him in the Ecole des Langues Orientales. After four years as instructor in the Ecole Jeunes, in 1854 he became professor of Turkish in the Collège de France. It was in Turkish especially that he made important research. He published: *Conseils de Nabi Efendi à son fils Aboul Khair* (text and translation, 1857); *Histoire de la campagne de Mohâcz, par Kémal Pacha Zadeh* (1859); *Les prairies d'or de Maçoudi* (with Barbier de Meynard, 1861-64); *Mémoires de Baber* (1871); *Miradj Namèh* (1882); *Tezkéreh-i-evliyâ* (1889); and, most important of all, the *Dictionnaire turc-oriental* (1870).

PAVIA, pȧ-vē'ȧ. The capital of the Province of Pavia, Italy, situated on the left bank of the Ticino, two miles above its confluence with the Po, 18 miles south of Milan, with which it is connected both by river and canal (Map: Italy, D 2). An ancient covered granite bridge of seven arches and an iron railway bridge connect the city with the suburb of Ticino, on the right bank of the river. Through the town with its narrow streets runs the Corso Cavour. The city is still mostly surrounded by its old walls, and has an imposing appearance, but bears a sombre impress of antiquity. In former times it was called the 'city of a hundred towers,' but few of these now remain. Some of the edifices are by Bramante. The oldest church is San Michele, a fine example of the Lombard-Romanesque style. The cathedral, containing some good paintings, was commenced in 1486, but was never finished. It is now being restored. In a beautiful chapel attached to it are the ashes of Saint Augustine in a magnificent Gothic sarcophagus. The Certosa di Pavia (q.v.), the most splendid monastery in the world, lies five miles north of the city. Pavia has a famous university with an imposing and interesting building. (See Pavia, University of.) The Palazzo Malaspina contains a museum with a collection of paintings and an-

squares and is associated with the lives of Boethius and Petrarch. The other chief objects of interest are two theatres, an old castle built by the Visconti and now converted into a barrack, a huge bronze statue of Pope Pius V., a marble statue of Italia, and monuments to Garibaldi and to Volta. The Collegio Borromeo was founded in 1563 and the Collegio Ghislieri in 1569. Both offer scholarships. There are also an episcopal seminary, a lyceum, a technical school, an art and industrial school, and a Deaf and Dumb Institute. Pavia has manufactures of machines, hats, organs, chemicals, and leather. There are also important marble works. The yearly fair is largely attended, and the chief trade is in wine, rice, oil, silk, and cheese. Population (commune), in 1881, 34,826; in 1901, 35,447.

Pavia, the ancient *Ticinum*, was founded by the Ligurii. It became a place of considerable importance after the fall of the Roman Empire. It came into the possession of the Goths and Lombards, and the latter made it the capital of their Italian Kingdom, which was conquered by Charles the Great in 774. In 924 the city was taken and destroyed by the Hungarians. It became independent in the twelfth century. After having been weakened by civil wars, it was conquered by the Visconti of Milan in 1359. From this time its history is merged in that of the Duchy of Milan and of Lombardy. Here, on February 24, 1525, the forces of Charles V. defeated the French and captured Francis I. The city was stormed and pillaged by Napoleon in 1796.

PAVÍA. A town of Panay, Philippines, in the Province of Iloilo, situated six miles northwest of Iloilo. Population, 10,220.

PAVIA, UNIVERSITY OF. One of the oldest universities of Europe. It had its inception in a law school that flourished before the twelfth century, and even in the first half of the fourteenth century there still existed traces of the older institution. Galeazzo II. Visconti obtained from Charles IV. a charter for a Studium Generale in 1361, which conferred upon it all university privileges, and in 1389 it received the same privileges from Pope Boniface IX. In 1398 it was removed to Piacenza. With the death of Galeazzo it declined and by 1404 it ceased to exist. In 1412 it was restored by Filippo Maria Visconti, and it soon vied with the leading Italian universities, particularly in Roman law. It had a large attendance of foreigners. In the sixteenth and seventeenth centuries its fame declined, but after its reorganization in 1770 by Maria Theresa and in 1817 by Emperor Francis I. it again assumed considerable importance among European universities. In 1902 it consisted of the faculties of law, medicine, and surgery, mathematics and natural science and philosophy, and the School of Pharmacy. The attendance was over 1300. The Collegio Ghislieri, founded in 1569, prepares students for the university. The library contains 160,000 volumes, 100,000 pamphlets, and 1100 manuscripts.

PAVIE, pä'vē'. THÉODORE-MARIE (1811-96). A French Orientalist. He was born at Angers. Early travels in the United States, Central America, and Canada resulted in the publication of his *Voyage aux États-Unis et au Canada* (2 vols., 1828-33); and subsequent travels through Asia, and the study of Asiatic languages, especially Sanskrit and Chinese, formed the foundation of valuable historical and literary contributions to the *Revue des Deux Mondes*, the *Journal Asiatique*, and the *Bulletin* of the French Geographical Society. They also led to appointments as professor of Sanskrit literature in the Collège de France from 1853 to 1857, and as professor of Oriental literature in the university of his native town, where he died May 12, 1896. His principal work is the *San-kouĕt-chi* (2 vols., 1845-51), a history of China in the thirteenth century; other works are: *Fragments du Mahābhāratæ* (1844); *Les trois religions de la Chine* (1845); *Bhodjaprabandha* (1855), a History of Bhoja, King of Malwa; and numerous books of travel.

PAVILION (OF. *pavillion*, *paveillon*, Fr. *pavillon*, tent, from Lat. *papilio*, butterfly, tent, pavilion). A portion of a building, under a separate roof, originally of a tent-like form, with the slope of the roof either straight or curved. The term is used generally to describe a wing or dependency of a large structure, usually of lighter construction or greater height. This form is much used in France. The higher parts of the new buildings at the Louvre are good examples of pavilions.

PAVING. See PAVEMENT.

PAVLOGRAD, päv'lō-gräd'. A town in the Government of Ekaterinoslav, Russia, situated on a tributary of the Samara, 50 miles east of Ekaterinoslav (Map: Russia, E 5). It has a gymnasium and carries on a large trade in flour and grain. The town was founded in 1779, and is settled by Zaporogian Cossacks. Population, in 1897, 17,188.

PAVLOVO, päv'lō-vō. An industrial town in the Government of Nizhni-Novgorod, Russia, situated on the Oka, 40 miles southwest of Nizhni-Novgorod. It has steel works and match factories. There are a museum of cutlery and models, and a library. Population, in 1897, 12,200.

PAWNBROKING (from *pawn*, OHG. *pfant*, Ger. *Pfand*, pledge, from OF. *pan*, pawn, pledge; usually considered identical with OF., Fr. *pan*, piece of a garment; more probably from OF. *paner*, Sp. *apandar*, to plunder, *apañar*, to take away + *broking*: connected with AS. *brūcan*, OHG. *brūhhen*, Ger. *brauchen*, to use, need, Lat. *frui*, to use, enjoy). The business of lending money on the security of personal effects left in the possession of the lender. Pawning has existed in some form in all ages and among all peoples. It is much older than banking, with which it was originally connected. The Chinese, Greeks, and Hebrews borrowed on pledges. In mediæval times pawnbroking was synonymous with usury. In Europe the business was carried on at first by Jews and later by Lombards. Pawnbroking is a legitimate business, but since the expense of administering small loans is very great, the pawnbroker has often been allowed to charge as high as 100 per cent. where the regular rate of interest is only 6 per cent. Recognizing the great disadvantage under which the poor borrower labors, efforts have been made to carry on the business in the interest of the borrowers. This effort has taken the form of monts de piété on the Continent. France is especially successful in maintaining these institutions. They are associated with the town councils, hospitals, and charity bureaus. When endowed they charge no

interest, and the highest interest is 12 per cent. The Paris institution acts as the poor man's safe deposit, as it has excellent facilities for storage and makes a practice of disinfecting goods. The objections to its methods are: (1) the amount of time the system takes; and (2) the undervaluation of goods. Belgium follows French methods. The pawnbroking business has been controlled since 1618. The monts de piété are managed by councils and charity administrators, while their funds are borrowed from the charity department.

Germany has royal, municipal, and private pawn shops. The private pawn shops are regulated and any city may prohibit them. The municipal pawn shops are usually in connection with the savings-bank and are self-supporting. In Austria-Hungary the private pawn shops are in the majority. The Imperial Pawn Shop of Vienna, founded in 1707 by Joseph I., is now self-supporting, but, because of the origin of its capital, one-half of its profits go to the poor. The remainder is used in extending the business. In Spain the mont de piété is connected with the savings-bank. Denmark regulates its pawn shops. Sweden has had successful private companies since 1880. Few pawn shops are found in Switzerland, only one in Berne. Saint Petersburg and Moscow are the only cities of Russia maintaining municipal pawn shops.

The charter of the Bank of England gives that institution power to lend on plate and non-perishable commodities at 5 per cent. In 1695 the directors seriously considered establishing pawn shops. Pawnbroking was first regulated by James I., then under George III. The law of 1872 is very favorable to pawnbrokers, but since 1894 there has been an increased interest in plans for improving the position of those who borrow money on pledges. General Booth proposed a scheme, but the funds were not at hand to develop it.

In the United States the business has until recently been entirely in the hands of private pawnbrokers, who do business under State regulations or municipal ordinances. The State regulations may provide for a license, a bond, regulation of interest charges, methods of sale, and the disposition of the surplus. The city ordinances usually place the pawn shops under police control, providing for daily inspection or daily reports. The laws are generally inadequate. Only a few States forbid a charge above the legal rate of interest. Where a sale of goods requires an advertisement and by auction, the law is frequently evaded or not enforced. It is very seldom, if ever, that the borrower receives any surplus from the sale of his goods. The difficulties in regulation arise from the character of the business and the lack of ordinances. Since pawnbroking can exist only in large centres of population, the problem of regulation has been one of local rather than general interest. The ignorance or pride of the borrowers prevents them from making necessary complaints to the authorities. Low licenses invite a motley crowd of pawnbrokers. Where the regulations permit only four or five pawn shops to exist, as in Providence, Washington, or Baltimore, they are respectable, but the large number of shops in Boston and Philadelphia cannot be easily controlled. Some of the maximum charges are: Baltimore, 30 per cent.; Boston, 132 per cent.; Buffalo and Chicago, 120 per cent.; Cleveland, 300 per cent.; Pittsburg, 240 per cent.; and Providence, 180 per cent. The smallest pawns do not pay pawnbrokers even at 100 per cent. Municipal pawn shops were proposed for Philadelphia in 1816 by Dr. Mease. The oldest philanthropic concern in the United States is the Pawners' Bank of Boston, started in 1859, which underwent many losses and discouragements. It is now the Collateral Loan Company, and pays a regular dividend. In 1894 Dr. Greer of Saint Bartholomew's Protestant Episcopal Church in New York City started a pawnbroker's shop in his parish. Out of this developed the Provident Loan Company, which opened its doors May 21, 1894, at 279 Fourth Avenue. The company is incorporated, with a board of fifteen directors, and has a subscribed capital of $100,000. Only jewelry and articles of considerable value, but small in bulk, are received. Bedding and furniture are barred because of lack of room. As a result the people reached are independent workers, who need money to tide over a period of sickness or lack of work. One per cent. a month, or one-third the legal rate, is charged. In competition with the Provident Loan Society, pawnbrokers have reduced their charges, sometimes even lower, or they have advertised that they will lend at the same rate as the Provident Loan Society. The report for 1902 states that $3,866,325 was lent on 130,158 pledges; the average amount of each loan was $29.70; and the average amount lent per day was $12,942.70. The average loan of the pawn shops is much lower, sometimes being as low as $1.41 in one month. More than 99 per cent. of the pledges were redeemed. This enterprise pays 6 per cent. on the capital.

After opposition from the pawnbrokers, who were well organized, Illinois passed a compromise measure, authorizing lending societies, but only permitting loans on personal property and limiting the capital to $50,000. The State Pawners' Society opened its office in Chicago November 1, 1898. The society has a board of directors elected by the stockholders, with two additional members selected respectively by the Governor and the Mayor. The maximum interest charged is one per cent. per month, with an additional charge of one-half per cent. for storage and insurance. The pressure for loans has been heavy. The society pays 6 per cent. dividends. At the time the office opened there were 67 pawn shops in Chicago. The Chattel Loan Association of Baltimore, established May 12, 1898, expects ultimately to do a pawnbroking business. The Worcester Collateral Loan Association, the Workingmen's Loan Associations of Boston and Providence, the Provident Loan Company of Buffalo, and the Hebrew Free Loan Association of New York deal with chattel mortgages and indorsed loans.

BIBLIOGRAPHY. *United States Bulletin of Department of Labor*, No. 21 (1899). For Great Britain, *Report of Her Majesty's Representatives Abroad on Systems of Pawnbroking in Various Countries* (1894). See MONTS DE PIÉTÉ.

PAWNEE, pą-nē'. The most important tribe of the Caddoan stock (q.v.) of North American Indians. They formerly claimed a large territory upon the Platte River, in what is now Nebraska, ranging from the Niobrara on the north to the Arkansas on the south, and occasionally extending their forays far down into Texas or New Mexico. They were in chronic

warfare with every surrounding tribe with the exception of the Omaha, Ponca, and Oto, whom they treated as wards and dependents. The few remaining are now associated with the Ponca, Oto, and Tonkawa upon Oakland Reservation, Oklahoma.

The Pawnees call themselves *Skihiksihiks*, 'men of men,' or 'super-excellent men.' The popular name appears to be derived from the Pawnee *pariki*, 'a horn,' referring to their peculiar scalplock, which was dressed to stand nearly erect. This mark indicates a Pawnee in the pictographs of the plains tribes and undoubtedly also gave origin to the tribal sign, now interpreted to mean 'Wolf People.' They have four bands or grand divisions, viz, *Shau-i*, or Grand (i.e. 'principal'), *Kitkehaki*, or Republican, *Pitahauerat*, or Tapage ('noisy'), and *Skidi*, or Loup ('Wolf'). The Skidi were originally a distinct and hostile tribe, which had preceded the Pawnee proper, by whom they were conquered and incorporated. Traditional and historic evidence shows that the Pawnee and Arikara migrated from the south, probably from about the middle Red River, adjoining the cognate Caddo tribes. The Skidi and Arikara may have preceded the others by perhaps a century, the latter continuing up the Missouri, while the Skidi halted at the Platte, where they were overtaken by the Pawnee proper. The dialects of the Pawnee, Skidi, Arikara, and Wichita are all so closely related as to constitute but one language. The Pawnee appear to have been known to the Spaniards as early as 1626. They are noted upon Marquette's map of 1673 about where they were found in 1804 by Lewis and Clark, viz, the lower Platte near its confluence with the Missouri. By treaty in 1833 they ceded their lands south of the Platte and came under the supervision of an agent. Some civilizing work was started among them, which prospered for a little time until the hostile Sioux drove them south of the river, compelling them to abandon their fields and villages. About the same time, in 1838, the great smallpox epidemic carried off at least 2000 of their number. In 1849 probably a greater number perished by cholera. Since then their history has been one of swift and certain decline from disease, removal, and unceasing warfare in which the Pawnee found every man's hand against him. They have never, however, as a tribe been at war with the whites, but, on the contrary, have frequently furnished a contingent of scouts in our various difficulties with the Northern plains tribes. One main factor in the introduction of disease has been the great overland trail, which passed directly through their territory. In 1858 they ceded all their remaining original territory except a strip 30 miles long by 15 wide upon the Loup River. In 1874 they sold this and removed to their present location in Oklahoma.

Like all the tribes of Caddoan stock, the Pawnee were principally agricultural and sedentary, building large circular houses of logs covered with earth, and raising abundant crops of corn, pumpkins, and other Indian vegetables, which they dried or cached for winter use. The skin tipi was used only for temporary purposes when upon the buffalo hunt, away from their permanent villages. They are of good physique, somewhat more robust than the regular hunting tribes, and were noted for their running and walking powers. It is said that their warriors could cover one hundred miles in twenty-four hours on a foot trot without stopping to eat or sleep. They were devoted to religious ceremonials, the Skidi being particularly noted for their bloody rite of human sacrifice, offered to the Morning Star, as the spirit of fertility on the occasion of the annual corn planting, the victim being a captive girl. See PETALESHARO.

The best early estimate of their population is that by the missionaries Dunbar and Allis in 1835, who give them 10,000. In 1840, after the smallpox, the same authorities estimated them at about 7500. In 1847 they were about 8400, but were again terribly reduced by the great cholera epidemic in 1849. Later official estimates are 4686 in 1856; 3416 in 1861; 2376 in 1874 (just before removal to Oklahoma); 1440 in 1879; 824 in 1889; 629 in 1901.

PAWNEE CITY. The county-seat of Pawnee County, Neb., 75 miles south-southeast of Lincoln, on the Chicago, Rock Island and Pacific and the Burlington and Missouri River railroads (Map: Nebraska, II 3). It is chiefly important as the commercial centre of a productive section engaged in farming and stock-raising. Population, in 1890, 1550; in 1900, 1969.

PAWTUCK'ET. An important manufacturing city in Providence County, R. I., 4 miles north of Providence, on both sides of the Pawtucket River, at the head of navigation, and on the New York, New Haven and Hartford Railroad (Map: Rhode Island, C 2). Pawtucket covers an area of nearly nine square miles. It has Daggett Park, Collyer Monument, and a Soldiers' Memorial Monument, several interesting bridges of various types, Sayles Memorial Library, Home for Aged Poor, Emergency Hospital, and a State armory. Among the more prominent business structures are the Safe Deposit Building, Industrial Trust Building, Providence County Savings Bank, Taylor Building, and Kinyon Block. Other points of interest are Ten-Mile River and Pawtucket Falls, 50 feet in height, noteworthy alike for beauty of scenery and as the source of great water power.

Pawtucket is well known for the extent and variety of its manufactures, which include cotton, silk, and woolen goods, plush, velvet braid, webbing, various kinds of machinery, foundry products, gymnasium supplies, electrical supplies, thread, hair-cloth, yarns, and wire. There are also numerous dyeing, bleaching, and finishing establishments. The government is vested in a mayor annually elected, a bicameral council, and in administrative officials, the majority of whom are elected by the council. The school committee is independently chosen by popular vote. Pawtucket spends annually in maintenance and operation over $700,000, the municipal budget balancing at nearly $1,325,000. The principal items of expense are $135,000 for the operation of the water-works, $135,000 for schools, $50,000 for the police department, $40,000 for the fire department, and $38,000 for municipal lighting. The water-works, which were built in 1878 by the city at a cost of over $1,840,000, are owned and operated by the municipality. Population, in 1890, 27,633; in 1900, 39,231.

The portion of the city of Pawtucket on the

west side of the river was originally the principal village in the town of North Providence, which was incorporated in 1765. This town was divided in 1874, and the village of Pawtucket was consolidated with the town of Pawtucket on the east side of the river as the town of Pawtucket, which in 1886 was incorporated as a city. The portion of Pawtucket on the east of the river was originally in Massachusetts, and was incorporated as the town of Pawtucket in 1828, having been set off from the parent town of Seekonk. In 1862 the town of Pawtucket, Mass., was ceded to Rhode Island, and remained a separate town until its consolidation with the village of Pawtucket in North Providence in 1874. The first cotton factory in the United States was established here in 1790 by Samuel Slater. This mill is still standing. Consult Greene, *The Providence Plantations* (Providence, 1886).

PAX (Lat., peace), called also PACIFICALE and OSCULATORIUM. The 'kiss of peace,' and also a sacred utensil, employed in some of the solemn services of the Catholic Church in the ceremony of giving the so-called 'kiss of peace' during the mass. The practice of saluting each other—the men, men, and the women, women—during public worship, and particularly in the *agape*, or love-feast, is frequently alluded to by ancient writers, as Cyril of Jerusalem, and Augustine. All the ancient liturgies, without exception, refer to it as among the rites with which the eucharist was celebrated; but they differ as to the time and the place in the eucharistic service in which it is introduced. The ceremony commences with the celebrating bishop or priest, who, after kissing the altar, salutes the deacon, not (in modern times) by an actual kiss, but by placing the hands upon his shoulders and slightly inclining the head toward him. By the deacon the salute is tendered to the other clergy assisting. Originally, the laity also were included, but this has long since been abandoned. It is when the mass is celebrated by a high dignitary that the utensil called the pax is used. The pax is sometimes a crucifix, sometimes a reliquary, sometimes a tablet with a figure sculptured or enameled upon it. Having been kissed by the celebrant, and by him handed to the deacon, it is carried by the latter to the rest of the clergy. The pax is omitted in the mass of Maundy Thursday (q.v.), to express horror of the treacherous kiss of Judas.

PAXOS, pāk'sŏs, or **PAXO**. One of the Ionian Islands (q.v.). It lies nine miles south of Corfu, and about the same distance from Acarnania, Greece (Map: Greece, B 2). It is about five miles long and two miles broad, and is mainly a hilly mass of limestone with an absence of potable water. It is noted for its fruit and the fine quality of its olive oil. Goats and mules are raised. Population, in 1896, 3814.

PAX'TON. A city and the county-seat of Ford County, Ill., 103 miles south-southwest of Chicago, at the junction of the Lake Erie and Western and the Illinois Central railroads (Map: Illinois, D 3). It is the seat of the Rice Collegiate Institute. Among its industrial establishments are hardware manufactories, machine shops, flour mills, carriage works, brick and tile plants, etc. The water-works are owned by the municipality. Population, in 1890, 2187; in 1900, 3036.

PAXTON, JOHN RANDOLPH (1843—). A Presbyterian clergyman. He was born at Canonsburg, Pa., graduated from Jefferson College in 1866 and from the Western Theological Seminary, Allegheny, in 1869. He served in the 140th Pennsylvania Regiment from 1862 until the end of the war, rising to the rank of second lieutenant. His first pastorate was at Churchville, Md., from which he proceeded to the Pine Street Church, Harrisburg, Pa., then to the New York Avenue Church, Washington, D. C., and in 1882 he became pastor of the West Presbyterian Church, New York City. In 1893 he resigned his charge because of ill health, but resumed preaching at the New York Presbyterian Church in 1898.

PAXTON, Sir JOSEPH (1801-65). An English architect and horticulturist, born at Milton-Bryant, near Woburn, Bedfordshire. As superintendent of the gardens of Chatsworth, in the employ of the Duke of Devonshire, he designed the large conservatory of Chatsworth (1836-40). This experience led him to propose a crystal palace of glass and iron for the great London Exhibition of 1851. It was the first time these materials had been employed on so extensive a scale. His design obtained for him great popularity and the honor of knighthood. The Crystal Palace of 1851 was removed from Hyde Park, but became the germ of the nobler and more splendid palace at Sydenham, the construction of which he superintended; the grounds were also laid out by him.

PAXWAX. See FAXWAX; LIGAMENT.

PAY AND ALLOWANCES. A military term used to denote the rate of pay and allowances granted to officers and enlisted men of the military and naval services of the United States.

ALLOWANCES to officers and enlisted men are made on a basis of requirement and rank; and may be either in kind, or in lieu of the amount to which such officer or soldier by regulation is entitled. The money allowance of clothing is allotted half-yearly for the first year, estimates for clothing being made quarterly as follows: On January 1st, for a supply to last until June 30th; on April 1st, until September 30th; on July 1st, until December 31st; on October 1st, until March 31st. Commanding officers settle the clothing accounts of their men six months after enlistment and afterwards on June 30th and December 31st of each year. (For allowances of forage, see FORAGE.) Soldiers receiving allowance or commutation in lieu of food (ration) are paid according to a scale, which varies in amount from 25 cents per diem, allowed enlisted men on conclusion of furlough; 40 cents per diem to sergeants of post non-commissioned staff, on duty at stations where there are no other troops; 75 cents per diem to a soldier on detached duty, to $1.50 per diem to a soldier traveling under orders from a station, where his rations have been regularly commuted —which is the maximum allowance in lieu of rations for enlisted men. The allowance of baggage permitted officers and men will be found under BAGGAGE.

Whenever there are sufficient quarters in a barracks or station, permanent quarters are assigned to the field and staff officers of the garri-

son. Regimental officers are provided with quarters according to convenience of location and the rank of the recipient. Bachelor quarters are assigned to officers without families. On the arrival of a command at a new station the original assignment of quarters is made by a board of officers consisting of the commanding officer, the two senior line officers present, the senior surgeon, and the quartermaster. Allowances in lieu of quarters are according to rank and circumstances.

Retired officers detailed for duty at colleges are entitled to full pay, but not commutation of quarters. The maximum pay of a colonel is established by law at $4500 per annum, and that of a lieutenant-colonel at $4000. An aide-de-camp to a major-general is allowed $200 per year in addition to the pay of his rank; an aide-de-camp to a brigadier-general is allowed $150 per year additional; and an acting commissary

TABLE OF PAY OF COMMISSIONED OFFICERS UNITED STATES ARMY

GRADE	Pay of officers in active service					
	Pay of grade		Monthly pay			
	Yearly	Monthly	After 5 years service	After 10 years service	After 15 years service	After 20 years service
			10 per cent.	20 per cent.	30 per cent.	40 per cent.

Chaplain	1,350	112.50	123.75	135.00	146.25	157.50

For allowances of food and ration, see RATION. The use of public horses by officers receiving mounted pay is regulated by department commanders, according to local exigencies. A captain or lieutenant of artillery is allowed the use of a battery horse if serving with a light or mounted battery. The sum of $100 is allowed for the transport of each horse entitled to forage, and an attendant to accompany them. If such sum does not cover the actual cost, the excess must be prepaid by the owner, who is also required to pay all the expenses of the attendant other than his transportation. Commutation of quarters of commissioned officers is at the rate of $12 per month per room. When traveling an officer is allowed mileage at certain fixed rates, and actual expenses only for sea travel to, from, or between Cuba, Hawaii, and the Philippines by the shortest regularly traveled routes.

Retired officers detailed for duty at colleges are entitled to full pay, but not commutation of quarters. The maximum pay of a colonel is established by law at $4500 per annum, and that of a lieutenant-colonel at $4000. An aide-de-camp to a major-general is allowed $200 per year in addition to the pay of his rank; an aide-de-camp to a brigadier-general is allowed $150 per year additional; and an acting commissary of subsistence $100 per year additional. Assistant surgeons are entitled to pay of captain after five years' service; and an acting judge advocate, detailed by the Secretary of War, to the pay and allowances of a captain of cavalry. Retired officers receive 75 per cent. of pay (salary and increase) of their rank, a retired chaplain receiving 75 per cent. of the pay (salary and increase) of his rank (captain, not mounted).

After five years' service the soldier's pay is increased by two dollars per month, and after ten years an additional dollar per month is granted for every five years of his service up to thirty years.

In the British army, where the rates of pay are lower than in the United States, service in India is made more attractive by the numerous

TABLE OF MONTHLY PAY OF ENLISTED MEN OF THE UNITED STATES ARMY.

RANK AND SERVICE	First two years	Third year	Fourth year	Fifth year and re-enlisted pay

Private	13	14	15	16

opportunities it offers for extra pay, originally commonly described as "Batta." Allowances, also, are paid at a higher rate than at home.

Half Pay is practically any form of reduced pay, and the term is still frequently used to describe the rate of pay of a retired or disabled officer.

PAYER, pī'ẽr, JULIUS VON (1842—). An Austrian Polar explorer and painter. He was born at Schönau, near Teplitz, Bohemia, was educated in the military academy at Wiener-Neustadt, and entered the army in 1859. Subsequently attached to the general staff, he was intrusted with the survey of some of the most inaccessible regions in the Alps. In 1869-70 he took part in the second German expedition to the North Pole, and contributed much to the knowledge of the eastern coast of Greenland. In 1872 he was appointed with Weyprecht to lead the Austrian expedition to the North Pole, which resulted in the discovery (1873) and exploration (1874) of Franz Josef Land, and which was described by him in *Die oesterreichisch-ungarische Nordpolexpedition in den Jahren 1872-74* (1876). Upon his return he retired from the military service to devote himself entirely to painting, studied for two years in Frankfort under Hasselhorst, three years in Munich under Wagner, and four years in Paris. From the first he worked on large canvases, painting stirring episodes from his Arctic experience. In 1883 he was awarded the great gold medal in Munich for "The Bay of Death," the best of four pictures illustrating the Franklin expedition. In 1884 he lost the sight of one eye, and this delayed the completion of the other pictures in the series, of which "Leaving the Ships" was exhibited in 1886, and "The Death of Franklin" in 1889. For the Museum of Natural History in Vienna he executed mural paintings of "Views in Franz Josef Land," and "Never Retreat" (1892). He won gold medals also in Berlin (1886) and Paris (1889).

PAYMASTER. An officer in the military or naval service charged with the payment of troops and other duties involving the receipt and disbursement of public funds. The pay department of the United States Army is under a paymaster-general, with the rank of brigadier-general, who under the direction of the Secretary of War has charge of the payment of the army. There are two assistant paymasters-general with the rank of colonel; three deputy paymasters-general, with the rank of lieutenant-colonel; and twenty paymasters, with the rank of major. The chief paymaster of a department, under the direction of its commander, has control of all paymasters in the command, and is responsible for them so far as the payment of troops is concerned.

In the United States Navy a paymaster has charge of the public funds carried on board ship (or at a navy yard or shore station), also of the clothing and provisions for the enlisted men. Under directions of his commanding officer, he makes such purchases as may be necessary from

time to time. At shore stations paymasters are also keepers of the 'general store,' from which all departments of the station draw supplies. In May, 1902, the number of officers of the different ranks of the pay corps was 136. They receive the same pay as the officers of the line with whom they rank.

PAYMASTER-GENERAL. An officer of the British Ministry, but not of the Cabinet, charged with superintending the issue of all moneys voted by Parliament. He has no control over the sums issued, paying merely on the order of the department concerned. He is always either a peer or a member of the House of Commons, and changes with the Ministry. The paymaster-general is assisted by a deputy and a staff of clerks, the annual cost of the whole department amounting to about £25,000.

PAYMENT. In law, the satisfaction or discharge of a legal obligation by the delivery of money, or something which the creditor accepts in lieu of money. Payment is, therefore, employed in a more limited sense than performance, which implies the fulfillment of any legal obligation, as carrying out the provisions of an agreement or contract to do work or furnish materials to another. In order to be effectual, payment must be made to the proper party, that is, either to the one to whom it is due, personally, or to some other person lawfully authorized by him to receive it, and it must be of the exact amount due. It should be made at the exact time and place agreed upon, or implied by law, in order to avoid a claim for interest from that time, or the commencement of an action. In general where no place for payment has been previously agreed upon by the parties, the debtor must seek the creditor, or he may be considered as in default. The chief consequences which may ensue on a default of payment are, in general, to give the creditor the right to have immediate recourse to any security, as to sell an article pledged as security, or to foreclose a mortgage or other lien, and if the contract is a continuing one and payments become due in installments to rescind the contract, refuse to proceed further, and sue the debtor for the amount then due and unpaid. Where payment is made to one of several joint creditors, the debtor is discharged, even though the one to whom he paid it does not account to his fellow creditors. The effect of a valid payment is to discharge the debtor from his obligation. See CREDITOR; DEBTOR; LEGAL TENDER; NEGOTIABLE PAPER. Consult the authorities referred to under CONTRACT.

PAYN, JAMES (1830-98). An English novelist. He was born in Cheltenham; graduated at Cambridge in 1852, and adopted literature as a profession. He contributed largely to periodicals; became coeditor with L. Ritchie of *Chambers's Journal* in 1858, and in the following year was made sole editor, which position he held until 1874. From 1883 to 1896 he was the successor of Leslie Stephen as editor of the *Cornhill Magazine*. The novel *Lost Sir Massingberd* (1864) was the first of his works to attract attention, and after its appearance he published more than one hundred novels, among which are *Cecil's Tryst* (1872); *Fallen Fortunes* (1876); *By Proxy* (1878); *A Grape from a Thorn* (1881); *The Heir of the Ages* (1886); *The Eavesdropper* (1888); *Gleams of Memory* (1894); and *In Market Overt* (1895), *Another Burden* (1897), and a collection of essays, *The Backwater of Life* (1899), published posthumously with an introduction by Leslie Stephen.

PAYNE, HENRY B. (1810-96). An American politician and capitalist, born at Hamilton, N. Y. He graduated at Hamilton College in 1832, and two years later began to practice law at Cleveland, Ohio. In 1849 he was elected to the State Senate by the Democrats, and was their candidate for United States Senator in 1851 and for Governor in 1857. At the Charleston convention in 1860 he exerted his influence to check the secession movement and during the Civil War remained a strong Union man. In 1872 he led the Ohio delegation at the Baltimore convention which nominated Horace Greeley for the Presidency. Two years later he was elected to Congress by a fusion of Democrats and Liberal Republicans, and was one of the representatives of the House on the Electoral Commission in 1877. He was elected United States Senator in 1884 and served from 1885 until 1891. He was for many years interested in various industrial, railroad, and mining projects, and accumulated a large fortune.

PAYNE, HENRY CLAY (1843—). An American politician and Cabinet officer. He was born in Ashfield, Mass., was educated at Shelburne Falls Academy, and in 1859 began a business career in Northampton. In 1863 he removed to Milwaukee, Wis., where he successfully engaged in mercantile business. From 1875 to 1885 he was postmaster of Milwaukee. Subsequently he became largely interested in electric railway and lighting companies, effected a consolidation of various competing companies, and became president of the combined corporation. From 1887 he was for several years president of the Milwaukee and Northern Railroad, and in 1893 was appointed one of the receivers for the Northern Pacific Railroad. Meanwhile he was remarkably successful as a political manager; served for many years as chairman of the Republican State Central Committee in Wisconsin; in 1880 became a member of the Republican National Committee, and of its executive committee, and in the Presidential campaigns of 1896 and 1900, as vice-chairman, conducted the Republican campaign in the West. In 1897 he was offered the post of Ambassador to Germany by President McKinley, but declined. In January, 1902, he succeeded Charles Emory Smith as Postmaster-General in President Roosevelt's Cabinet.

PAYNE, JOHN (1842—). An English poet and translator, born August 23, 1842. He was a solicitor by profession, and lived a retired life. He was one of a cluster of Neo-Romantic poets inspired by Rossetti, Morris, and Swinburne. Others of the group are Théophile Marzials (q.v.) and Arthur O'Shaughnessy (q.v.). Payne's verse comprises: *A Masque of Shadows* (1871); *Intaglios*, a sonnet sequence (1871); *Songs of Life and Death* (1872); *Lautrec*, a vigorous narrative poem (1878); and *New Poems* (1880). For the Villon Society he translated Villon's *Poems* (1878); the *Arabian Nights* (9 vols., 1882-84); *Tales from the Arabic* (1885); *Aladdin and the Enchanted Lamp* (1885); Boccaccio's *Decameron*; *Quatrains of Omar Khayyam* (1898); and *Poems of Shemseddin Mohammed Hafiz of Shiraz* (3 vols., 1901).

PAYNE, JOHN HOWARD (1791-1852). An American actor and playwright; best known, however, as the author of *Home, Sweet Home*. Born in New York, he lived in childhood at East Hampton, L. I. Payne showed great precocity. At thirteen years of age, while a clerk in a mercantile house in New York, he secretly edited a weekly paper, *The Thespian Mirror*. He was a student of Union College, when the bankruptcy of his father interrupted his education, and he decided to go on the stage, as the best means of supporting the family. He made his début at the Park Theatre, New York, February 24, 1809, as Young Norval in *Douglas*. This enterprise proved an artistic and pecuniary success, and he subsequently appeared before large and enthusiastic audiences in Boston, Philadelphia, and Baltimore. In 1813 he sailed for England, and made his appearance in London at Drury Lane Theatre as Master Payne, 'the American Roscius,' in his original part of Young Norval. His performances were well received by the public. After this he supported himself in England as actor, manager, and playwright, but, owing to his lack of business ability, was often in financial embarrassments. In 1815 Payne published in London a selection of poems called *Lispings of the Muse*. His fugitive writings, besides verse, include many articles in criticism, one of the best known being an essay on "Our Neglected Poets," published in the *Democratic Review* in 1838.

Payne adapted many plays from the French and produced a number of original ones, among them *Brutus, or the Fall of Tarquin*, *Thérèse*, *Virginia*, and the comedy of *Charles II*. The song *Home, Sweet Home*, occurs in his opera of *Clari, or the Maid of Milan*, which was produced at the Covent Garden Theatre in May, 1823. The music was adapted by Henry R. Bishop from an old melody which Payne had heard in Italy. The publishers of this song are said to have cleared 2000 guineas by it within a year, and the opera was very successful; by all this, however, Payne himself profited but little. In 1826-27 he edited in London a periodical called the *Opera Glass*. In 1832 he returned to America. He was appointed American consul at Tunis, Africa, in 1842; was recalled in 1845; and reappointed in 1851. He died there April 9, 1852, and was buried in the Cemetery of Saint George at Tunis. In 1883 his remains were brought to Washington. Consult: Harrison, *John Howard Payne* (new ed., Philadelphia, 1885); Brainard, *John Howard Payne: A Biographical Sketch* (Washington, 1885).

PAYNE, JOSEPH (1808-76). An English educator, born at Bury Saint Edmunds. He was chiefly self-educated, and in 1830 founded a school that developed into the successful Denmark Hill Grammar School for boys. In 1845 he and his wife founded the Mansion House School at Leatherhead and stayed there up to their retirement to Bayswater, London, in 1863. Payne's educational ideas were founded upon those of Jacotot, and he wrote in condemnation of the Eton system. In 1872 he was made the first professor of education at the College of Preceptors. His works were edited by his son, Dr. J. F. Payne, and published in two volumes: *Lectures on the Science and Art of Education* (1883) and *Lectures on the History of Education, with a Visit to German Schools* (1892).

PAYNE, PETER (c.1380-1455). An English Lollard; born near Grantham in Lincolnshire. He studied at Oxford, where he learned Wicliffite doctrines, was principal of Saint Edmund Hall (1410-14), and in 1416 was excommunicated, having failed to appear for trial on the charge of heresy. He fled from England to Prague, where Queen Elizabeth protected him, and where he became a prominent member of the Taborite Party. As such, he appeared in many religious conferences and by his extreme views did much to block a union of quarreling sects. The story of the latter years of his life, which were passed in Bohemia, is full of confusing detail, and it is uncertain whether Payne submitted after the defeat of the Taborites. All of his writings dealt with the defense of Wiclif's teachings. Consult Baker, *A Forgotten Great Englishman* (London, 1894).

PAYNE, WILLIAM HAROLD (1836—). An American educator, born in Farmington, Ontario County, N. Y. In 1858 he was appointed principal of a school in Three Rivers, Mich., and he held the same position in other schools of that state, concluding with Adrian, where he remained ten years, and was then elected to the newly created chair of pedagogy in the University of Michigan (1879). He was chancellor of the University of Nashville, Tenn., and president of the Peabody Normal College from 1888 until 1901, when he returned to the University of Michigan. He wrote: *School Supervision* (1875); *Educational Doctrine* (1882); *Contributions to the Science of Education* (1887); and translated three of Compayré's works: *History of Pedagogy* (1886); *Lectures on Teaching* (1888); and *Elements of Psychology* (1890).

PAYNE, WILLIAM MORTON (1858—). A critic and educator, born in Newburyport, Mass. He was assistant librarian of the Chicago Public Library (1874-76), teacher in Chicago high schools after 1876, literary editor of the Chicago *Morning News* (1884-88), of the Chicago *Evening Journal* (1888-92), and afterwards associate editor of the *Dial*. He is known especially for his criticism of modern literature—English, French, German, Italian, and Scandinavian. His essays are in part gathered in *Our New Education* (1884), *Little Leaders* (1895), and *Various Views* (1902).

PAYNE SMITH, ROBERT (1819-95). An English theologian and Orientalist. He was born at Chipping Campden, Gloucestershire, and entered Pembroke College, Oxford, where he pursued Oriental studies, and took the Sanskrit scholarship in 1840 and a Hebrew scholarship in 1843. After his ordination he spent three years in pastoral work at Crendon, Long Wittenden, and Thame, then became classical master at the Edinburgh Academy and later preached also at Trinity Chapel. In 1853 he went to London as head master of the Kensington proprietary school, and pursued his favorite Oriental studies at the British Museum. In 1857 he became sub-librarian at the Bodleian Library, and here he began his great work, the *Thesaurus Syriacus*, the first part of which was published in 1868. From 1865 to 1870 he was regius professor of divinity at Oxford, and in 1869 he delivered the Bampton lectures, published as *Prophecy a Preparation for Christ* (1869). In 1870 he became Dean of Canterbury. His posi-

tion in the Church was one of sympathy with the evangelicals and his popularity extended widely, even in Non-Conformist bodies. For fifteen years he was a member of the Old Testament revision committee. Besides the Syriac lexicon and the Bampton lectures, he published: *S. Cyrilli Alexandrinæ Archiepiscopi Commentarii in Lucæ Evangelium Quæ Supersunt Syriace* (1858); *Saint Cyril's Commentary on Saint Luke's Gospel*, in English (1859); *The Third Part of the Ecclesiastical History of John, Bishop of Ephesus, now first Translated from the Original Syriac* (1860); *Catalogi Codicum Manuscriptorum Bibliothecæ Bodleianæ Pars Sexta, Codices Syriacos, Carshunicos, Mendaos Complectens*, and commentaries on Daniel, Jeremiah, Samuel, and Genesis.

PAYSANDÚ, pī'sän-dōō'. A port of Uruguay, situated on the Uruguay River, 170 miles north of Buenos Ayres (Map: Uruguay, F 10). The city has handsome public buildings, a good system of public schools, a library, and several scientific and benevolent societies. Its principal industry is the preservation of beef for the foreign market, especially ox-tongues, to a brand of which it gives its name. It has regular communication by steamer with Buenos Ayres and Montevideo and is the station of a United States commercial agent. The city is the largest in the country next to Montevideo, and had a population in 1898 of 26,000. Paysandú was founded in 1782. It has played an important part in the civil and foreign wars of the Republic.

PAYSANS, pā'zäN', Les (Fr., The Peasants). A gloomy tale by Balzac (1844), of which only the first part appeared before his death. In it he traces the effect produced on economic conditions by the transfer of land-ownership to the peasant class, brought about by the revolutions of 1789 and 1830, and the despoiling of the peasants in turn by the shrewd bourgeois. The strongest character is the usurer Rigou, who is depicted as a scheming, silent, and finally successful sharper.

PAY'SON, Edward (1783-1827). A Congregational minister. He was born at Rindge, N. H.; graduated at Harvard College in 1803; studied theology with his father, the Rev. Seth Payson, pastor at Rindge; and from 1807 till his death was pastor of the Congregational Church at Portland, Maine. His sermons, published at various times, were much read and gave him a wide reputation. His complete works were published with a memoir by Asa Cummings (3 vols., Philadelphia, 1859).

PAYTA, pī'tä. A seaport of Northern Peru, situated at the head of a bay south of Cape Blanco (Map: Peru, A 5). It is a wretched village of 4000 or 5000 inhabitants, but as a port it is the second in importance in the country, and the harbor is one of the best on the Pacific Coast. It is connected by rail with Piura, the capital of the department, and has an important trade with Guayaquil, the exports amounting to over $2,500,000 annually. The chief exports are cotton, tobacco, Panama hats, hides, and salt. The town has a United States consular agency.

PAZ, päs, La. The name of several places in Spanish America. See La Paz.

PAZ, päth, Enriquez de. A Spanish dramatist, commonly called Enriquez Gomez (q.v.).

PAZAND, pä-zänd', or **PAZEND**. See Pahlavi Language and Literature.

PÁZMÁNY, päz'mä-ny', Peter (1570-1637). A Hungarian cardinal and author. He was born at Grosswardein of Protestant parents, but went over to the Roman Catholic Church in 1583, and entered the Society of Jesus. He was an ardent Catholic and carried on almost single-handed the work of the Counter-Reformation in Hungary. In 1629 Urban VIII. made him cardinal. For Catholic education in Hungary he did much by the foundation of the Pazmaneum (1623) in Vienna and of several other schools. His published works were edited by Bognár (Budapest, 1894 et seq.). Consult Schwicker, *Peter Pázmány* (Cologne, 1888).

PAZ SOLDÁN, päs sôl-dän', Mariano Felipe (1821-86). A Peruvian historian and geographer. He was born in Arequipa, studied law there and at Lima, and practiced in both cities. He held high judicial offices in Lima, and was sent to the United States in 1853 to report on penal systems. This mission resulted in the foundation of a detective bureau in Peru and of great improvements in the prisons of the country. Paz Soldán held for many years the post of director of public works. He wrote: *Atlas geográfico del Perú* (1861); *Historia del Perú independiente* (1866); *Diccionario geográfico estadístico del Perú* (1877); and *Historia de la Guerra del Pacífico* (1884).

PEA (modern singular of *pease*, AS. *pise, piose*, pea, from Lat. *pisum*, Gk. *πίσος, pisos, πίσον, pison*, pea), *Pisum*. A genus of plants of the natural order Leguminosæ. The common pea or garden pea (*Pisum sativum*) and the field pea (*Pisum arvense*) are natives of the south of Europe and of Asia. They are both climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet. Peas have been cultivated in the East from time immemorial, and were apparently introduced into Europe very early in the Middle Ages. Their cultivation extends from warm climates, as India, to the cooler regions of the North. The seeds of the garden pea are used for culinary purposes both in a green and in a ripe state. There are two main types of garden peas, those having smooth round seeds, and those with wrinkled seed. The former are the earlier and hardier. The wrinkled varieties are better in quality. Some varieties have edible pods. The green succulent pods of these are eaten in much the same manner as green beans. These are grown to a considerable extent in Europe and offered by seedsmen in America, but are not popular. There are innumerable varieties both of the field pea and of the garden pea. Some of the latter have long stems, and require for their support stakes of six or eight feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about four feet apart. A calcareous soil is desirable, but good crops are secured on almost any good wheat or maize soil. Peas are cultivated to a considerable extent as a field crop in the Northern United States and Canada, and both the grain and

straw are used in feeding stock. The plant withstands light frosts, and may therefore be grown as early in spring as the ground can be worked. Semi-dwarf varieties are preferred for field culture, since they lodge less and the crop is more easily harvested.

A plant found on some parts of the shores of Great Britain, as well as of Continental Europe and North America, known as the sea pea, has been commonly referred to the genus Pisum, and called *Pisum maritimum*, although botanists now generally refer it to Lathyrus. It much resembles the common pea; has large reddish or purple flowers on many-flowered stalks; and its seeds have a disagreeable bitter taste. The other species of Pisum are few. But the name pea is often given to species of other papilionaceous genera. The sweet pea (q.v.) and everlasting pea are species of Lathyrus. The chick pea (q.v.) is a species of Cicer.

Food and Feeding Value. Both green and dried peas are much used as articles of diet. The shelled green pea has the following average percentage composition: water, 74.6; protein, 7.0; fat, 0.5; total carbohydrates, 16.9; and ash, 1.0. Dried peas have the following percentage composition: water, 9.5; protein, 24.6; fat, 1.0; total carbohydrates, 62.0; and ash, 2.9. Dried peas are used for soups and purées, cooked in other ways, and sometimes baked like beans. They are rich in protein, and, being readily digested if cooked soft, are a valuable food. As food, green peas are especially prized for their delicate flavor, which is retained when they are properly canned. The varieties with edible pods (pods and seeds) have the following percentage composition: water, 81.8; protein, 3.4; fat, 0.4; total carbohydrates, 13.7; ash, 0.7. Pea meal is too sodden to be fed alone, and should always be mixed with bran, ground oats, or corn meal. Pea vines have the following percentage composition: water, 15.0; protein, 13.7; fat, 2.3; nitrogen-free extract, 37.6; crude fibre, 24.7; and ash, 6.7. In Northern regions peas, especially when ground, replace corn to some extent, and, on account of the large amount of protein they contain, have a high feeding value. See Pea Insects. See Plates of Flowers; Useful Legumes.

PEA'BODY, A town, including several villages, in Essex County, Mass., two miles west of Salem; on the Boston and Maine Railroad (Map: Massachusetts, F 2). It has the Peabody Institute, with a library of 37,000 volumes, established in 1852 by George Peabody, and the Eben Dale Sutton Reference Library. There is a public park (Emerson). The Essex County Agricultural Society is permanently established in Peabody. The city is a manufacturing centre of considerable importance, its products including leather, morocco, shoes, gloves, leather-working machinery, thermometers, electrical supplies, marine hardware, glue, etc. The government is administered by town meetings. There are municipal water-works and a municipal electric light plant. First a part of Salem and then of Danvers, Peabody became a separate town under the name of South Danvers in 1855. In 1868 its present name was adopted in honor of George Peabody, who was born here and lived here for some years. Population, in 1890, 10,158; in 1900, 11,523.

PEABODY, Andrew Preston (1811-93). A Unitarian clergyman. He was born at Beverly, Mass., graduated at Harvard college in 1826, studied in the divinity school, and was tutor in mathematics there. In 1833 he was settled over a Unitarian church in Portsmouth, N. H., where he remained till 1860, when he became Plummer professor of Christian morals and chaplain of Harvard University, retaining this position till 1881. He edited the *North American Review* (1854-63). Among his numerous works are *Lectures on Christian Doctrine* (1844); *Reminiscences of European Travel* (1868); *Manual of Moral Philosophy* (1873); *Christianity and Science* (1874; new ed. 1890); *Christian Belief and Life* (1875); *Moral Philosophy* (1887); *Harvard Reminiscences* (1888); *Harvard Graduates Whom I Have Known* (1890). Consult the memorial sermon by James De Normandie (Boston, 1893).

PEABODY, Cecil Hobart (1855—). An American mechanical engineer, born in Burlington, Vt. He graduated in the department of mechanical engineering at the Massachusetts Institute of Technology in 1877, and in 1893 became professor of marine engineering and naval architecture there. In the interval he had been professor of mathematics in the Sapporo Imperial Agricultural College of Japan (1878), and assistant professor of mechanical engineering in the University of Illinois, and of steam engineering in the Boston Institute. His publications include: *Thermodynamics of the Steam Engine* (1889); *Valve Gear for Steam Engines* (1892); *Steam Boilers* (with Miller, 1897); and *Manual of Steam Engine Indicator* (1900).

PEABODY, Elizabeth Palmer (1804-94). An American educator, born at Billerica, Mass. She was for a time connected with the school of Amos Bronson Alcott, in Boston, of which she wrote an account entitled *A Record of Mr. Alcott's School* (3d ed. 1874); but later she came under the influence of Friedrich Fröbel (q.v.) and was one of the most active in introducing the kindergarten system into the United States. She published a number of works, including: *Crimes of the House of Austria* (1852); *Kindergarten Culture* (1870); *Kindergarten in Italy* (1872); *Reminiscences of Dr. Channing* (1880); and *Letters to Kindergartners* (1886).

PEABODY, Ephraim (1807-56). A Unitarian divine. He was born at Wilton, N. H.; graduated at Bowdoin College 1827, and at the Harvard Divinity School 1830; was settled over a Unitarian church in New Bedford (1838-46), when he became pastor of King's Chapel, Boston, where he remained till his death. He was the founder of the Boston Providence Society. His sermons, with a memoir, appeared in Boston in 1857, and a selection from his writings in 1858 entitled *Christian Days and Thoughts*.

PEABODY, Francis Greenwood (1847—). An American clergyman and theologian, born in Boston. He graduated at Harvard in 1869, and in divinity three years later, was pastor of the First Parish Church in Cambridge, Mass., from 1874 until 1881, when he became Parkman professor of theology in the Harvard Divinity School. Five years afterwards he was appointed Plummer professor of Christian morals at Harvard University. His publications include:

Short Addresses to Young Men on Personal Religion (1896); *Afternoons in the College Chapel* (1898); and *Jesus Christ and the Social Question* (1900).

PEABODY, George (1795-1869). An American merchant and philanthropist, born February 18, 1795, in a parish of Danvers, Mass. (now known as Peabody). Dependent upon himself for support, he went at the age of sixteen or seventeen to Georgetown, D. C., where, in 1813, he became associated with Elisha Riggs, a wholesale dry goods merchant in Georgetown. Twice during the War of 1812 he was a volunteer in the defense of his country. The firm removed to Baltimore in 1815, and afterwards established branches in New York and Philadelphia. In 1829 Peabody became the head of the firm and continued to reside in Baltimore during the next few years. In 1835, as one of three commissioners of the State of Maryland, he negotiated in London a loan of $8,000,000 and declined to receive the large commission to which he was entitled. Later (retaining a branch in Baltimore) he founded the house of George Peabody and Company in London, and there he remained until his death. During his long absence from the United States he maintained the liveliest interest in his native land. This was shown by a liberal gift to promote the American exhibit in the World's Fair of 1851; by a contribution for the second Kane expedition to the Arctic seas; and by a series of banquets on Independence Day, which were attended not only by his countrymen, but by Englishmen of official rank and of other distinctions. During the latter years of his life his gifts increased in amount and were devoted to a great variety of purposes. To his native place he gave about $200,000 to found the Peabody Institute and Library, and to North Danvers $50,000 for a like institution. To the publication funds of the Massachusetts Historical Society and the Maryland Historical Society he contributed $20,000 each, and to the Peabody Academy of Sciences in Salem, Mass., $140,000. To Harvard and to Yale he gave $150,000 each, for the establishment in Cambridge of a museum of archæology, and in New Haven of a museum of natural history. Phillips Academy at Andover, and Kenyon College, in Ohio, received $25,000 each. During the Civil War he gave $10,000 to the United States Sanitary Commission. Three other gifts transcended those which we have already named. As a token of affection to the city of Baltimore, where he laid the foundation of his fortune, he gave more than a million and a quarter of dollars to found the Peabody Institute, which comprises a library, an art gallery, a conservatory of music, and arrangements for the delivery of public lectures and for the bestowal of prizes in the public schools. To the city of London he gave two and a half millions of dollars for the construction of lodging houses—a fund which has since increased enormously. To a separate board, known as the Trustees of the Peabody Educational Fund, he gave more than $3,000,000 to promote education in the Southern States. This is perhaps the most influential of all his gifts. Such munificence, then without parallel, brought him gratitude and honor from England and the United States. The Queen offered to make him a baronet, or to give him the Grand Cross of the Bath; but he declined both honors, and expressed a preference for a letter from the Queen, which he presently received and placed in the Institute at Danvers. Congress caused a gold medal to be struck in acknowledgment of his gifts for education, which had aggregated about $7,000,000. Oxford made him a D.C.L. in 1867.

George Peabody was never married. His death occurred in London, November 4, 1869. His body was brought to the United States by H.M.S. *Monarch*, convoyed by a French and an American vessel, and received by an American squadron. Many eulogies were delivered, of which the most important are those of Robert C. Winthrop (Boston, 1870), S. T. Wallis (Baltimore, 1870), Edward Everett (*Orations*, vol. iii., Boston, 1869), and H. W. Foote (Boston, 1869). A biography has also been published by Phoebe A. Hanaford (Boston, 1870), and a *Brief Sketch* by J. L. M. Curry (Cambridge, 1898). A bronze statue of Peabody, by William W. Story, stands near the Royal Exchange in London and a replica of it in front of the Peabody Institute in Baltimore.

PEABODY, Selim Hobart (1829-1903). An American educator, born at Rockingham, Vt. He graduated at the University of Vermont in 1852, and during the following years held professorships of mathematics, physics, and engineering at several colleges. From 1880 until 1891 he was president of the University of Illinois, and in 1893 was chief of the department of liberal arts at the World's Columbian Exposition. In 1899-1900 he was editor and statistician of the United States Commission to the Paris Exposition, and in 1900 superintendent of the division of liberal arts at the Pan-American Exposition. From 1892 to 1895 he was president of the Chicago Academy of Sciences, and from 1889 to 1891 president of the National Council of Education.

PEABODY-BIRD (named from the *Peabody* Glen in the White Mountains). A local name in New England for the white-throated sparrow (*Zonotrichia albicollis*). It is one of the largest and handsomest sparrows of North America, second in size only to the fox-colored sparrow, from which it differs markedly in color. The peabody-bird is variegated brown, black, and white above, clear gray beneath, with a pure white throat, and prominent black, white, and yellow stripes on the head. It breeds from northern Michigan and New England northward to Labrador, and winters from New England to Florida. It is most remarkable for its very agreeable, though brief, song, consisting of two low soft notes followed by a thrice-repeated triple note clearly whistled. In Massachusetts it is usually interpreted as *I—I, Pea-bod-y, Pea-bod-y, Pea-bod-y;* in Maine, *All day, whit-tle-ing, whit-tle-ing, whit-tle-ing;* in Canada, *Swe-eet Can-a-da, Can-a-da, Can-a-da.*

PEABODY NORMAL COLLEGE. A co-educational training school in Nashville, Tenn., founded in 1875 through a benefaction of $1,000,000 by George Peabody, planned to foster the cause of intellectual development in the South. Dr. Barnas Sears, president of Brown University, became the agent for putting the plan into practical operation, and soon realized the necessity of establishing a college for the specific purpose of training teachers for the

public schools. Nashville was selected as the most favorable location, and upon the offer of the trustees the buildings and endowment of the University of Nashville were accepted as a foundation. The college was opened with thirteen students, under the presidency of Dr. Eben S. Stearns, who was succeeded in 1887 by Dr. William H. Payne. James Davis Porter became president in 1901. The development of the institution has been rapid, as shown by the increase in students from 178 in 1887 to 607 in 1901, when there were 36 instructors. The degree of licentiate of instruction is conferred by the college, and makes the holder eligible without examination for any teaching position in the State. The university confers the degrees of bachelor and master of arts, sciences, and letters. The college is supported by the State, the University of Nashville, and the Peabody Board, which maintains nearly two hundred scholarships, distributed by the general agent of the Peabody Fund. The holder of a scholarship, which is good for two consecutive years, receives $100 per year, and railroad fare to Nashville and return. The college is equipped with well-arranged studios, laboratories, a gymnasium, and a library containing, in 1903, 20,000 volumes. The Winthrop Model School affords opportunity to the students to observe methods of teaching in actual application. In 1902 the building and grounds were valued at $200,000, and the income was about $80,000.

PEABODY EDUCATIONAL FUND. A fund founded in 1867 by George Peabody (q.v.) for the purpose of promoting "intellectual, moral, and industrial education in the most destitute portion of the Southern States." The gift of foundation consisted of securities to the value of $2,100,000, of which $1,100,000 were in Mississippi State bonds, afterwards repudiated. In 1869 an additional $1,000,000 was given by Mr. Peabody, with $384,000 of Florida bonds, also repudiated later. The trustees, chosen from the most prominent public men in the United States, had authority to expend forty per cent. of the principal during the first two years, after which the amount was to remain unchanged for thirty years, when the fund might be used and distributed for educational purposes. The main purpose of the fund was to aid elementary education, and that by strengthening existing schools rather than by founding new ones. Only schools having an attendance of more than 100 and a school period of ten months were to be aided. To such schools $300 was to be given; to those having an attendance of 200, $600 was given; and to those having an attendance of 300, $1000 was given. All grants were made on condition that the district contributed twice as much as the Peabody Board, and in all cases the board worked in unison with State and local school authorities. Especial attention was given to the support of normal schools, particularly those on independent foundations. Scholarships were granted to numerous students of $200 in value, later of $100 and traveling expenses. In 1875 the Peabody Normal School was established at Nashville, Tennessee. The annual distribution of the products of the funds averages about $75,000 per year, and in the thirty years of the Fund, terminating in 1898, a total of more than $2,500,000 was distributed. The States benefited were Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas, Tennessee, Virginia, and West Virginia.

Consult: *Reports of the Peabody Educational Fund* (1867 to date), and Dr. J. L. M. Curry's *History of Peabody Educational Fund* (Cambridge, Mass., 1898).

PEACE (OF. *pais, pait*, Fr. *paix*, from Lat. *pax*, peace; connected with *pangere*, Gk. πήγνυναι, *pēgnynai*, to fasten, Skt. *pāśa*, bond, and perhaps with Goth., OHG. *fāhan*, AS. *fōn*, Ger. *fangen*, to seize, take). In law, in a general sense, the internal good order of a community that is violated by the commission of offenses against the law. This general sense is expressed in England by the phrase the 'King's peace,' and in the United States it is commonly called the 'peace of the State or Commonwealth.' It is also sometimes called the 'public peace.' Originally the expression 'the King's peace' was used in a narrower sense with reference to the sanctity of the King's house, or to the special protection of the King's servants, or those to whom he had accorded the same protection.

This general good order or peace was in the earlier days protected only by the hundred court and the ealdormen; but the present special peace officers are the conservators of the peace (in England), justices of the peace, constables, and sheriffs (qq.v.).

Offenses against the public peace are criminal offenses, also known as breaches of the peace, the wrongfulness of which consists either in an act by the offender which is an actual disturbance of public peace and order, as in the case of riot or affray, or an act which is a constructive rather than an actual disturbance of the peace in that it has a tendency only to cause public disturbance or disorder, as unlawful assembly, or seditious libel.

The more common forms of offenses against the peace are riot, affray, forcible entry and detainer, unlawful assembly, challenge to fight, and seditious libel. In addition to these well-defined offenses, there are other offenses against the peace, having no specific name, which are punishable as misdemeanors. Thus, in some States the malicious killing of another's horse and the causing of a disturbance in the home of another have been held to be offenses against the peace.

Forcible entry and detainer is strictly not an offense at common law. It was made so, however, by an early English statute, and is now regarded as a common-law offense.

Seditious libel is an offense against the peace as tending directly to a breach of the peace by giving affront to public opinion, as by libels vilifying officers of the Government, the courts of justice, or even the sovereign or chief officers of a foreign government.

Ordinary libels are also sometimes classified as offenses against the public peace, but they are more properly considered as an independent class of offenses. Consult the authorities referred to under CONSTABLE; CRIMINAL LAW; also Inderwick, *The King's Peace* (London, 1895); Pollock, *The King's Peace*; Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899). See AFFRAY; BREACH (of the Peace); FORCIBLE ENTRY AND DETAINER; CONSTABLE; JUSTICE OF THE PEACE, etc.

PEACE CONFERENCE. See HAGUE PEACE CONFERENCE.

PEACE CONVENTION. The name given to a convention held in Washington, on the invitation of Virginia, in February, 1861, just before the outbreak of the Civil War, for the purpose of arranging a peaceful settlement of the difficulties between the North and the South. Fourteen free States and seven slave States were represented, and each State was allowed only a single vote. Ex President Tyler presided over the convention. A committee, upon which each of the twenty-one States was represented, submitted a report, which was adopted, recommending the adoption of certain specified amendments to the Federal Constitution. These amendments generally favored the South, but were not wholly satisfactory to either section, and were not favorably received by either House of Congress. A number of prominent political leaders of the time were members of the convention.

PEACE OF GOD. An attempt of the Church in the latter part of the tenth century and early part of the eleventh century to do away with private warfare. Various synods in France sought to compel persons who were accustomed to bear arms to agree not to use them, but to submit their differences to the judgment of regular tribunals. The method of enforcing these decrees was by spiritual penalties. The whole scheme proved a failure, partly because the nobles loved fighting too well, partly also because there were no tribunals suited to judge differences arising between the nobles. The Church thereupon substituted the so-called Truce of God (q.v.).

PEACE RIVER. One of the largest tributaries of the Mackenzie system, in Western Canada (Map: Canada, F 5). It rises in the north central part of British Columbia, and flows east through the Rocky Mountains, then northeast through Athabasca Territory until it joins by several arms the Great Slave River at the western end of Lake Athabasca. Its length is about one thousand miles, but, though of navigable depth through most of its course, it is obstructed by a number of rapids. Its valley is fertile.

PEACH (OF. *pesche*, Fr. *pêche*, It. *pesca*, *persica*, from Lat. *persicum*, from Gk. *περσικόν*, *persikon*, peach, neu. sg. of *Περσικός*, *Persikos*, Persian, from *Περσίς*, *Persis*, OPers. *Pārsa*, Persia; so called because the first peaches known to the Greeks came from Persia). A deciduous orchard fruit believed to have originated in China, where it has been cultivated from very remote times. It was early introduced into Europe by way of Persia, hence its specific name, *Prunus Persica* (order Rosaceæ). The peach is a small, much branched tree, 15 to 20 feet high, with lanceolate leaves, triplicate buds usually at each node, the two outer of which are flower buds and the middle one a leaf bud, and flowers which usually blossom before the leaves appear. The fruit is a drupe, varying much in size and color of flesh and downy skin. Peaches have been variously classified. Popularly they are separated into two groups—clingstones and freestones. These two classes gradually merge into each other in the different varieties, and even the same variety may be a clingstone or a freestone in different seasons. Price has classified the nearly 300 varieties of peaches grown in North America into the following five races: (1) Peen-To, a flat, medium-sized, greenish white, very early peach, suited for commercial culture only in Florida and some of the Gulf States. (2) South China race. Rather small, oval, somewhat flattened fruit, with an extended recurved apex. (3) Spanish or Indian race. Fruit late, nearly always yellow, with a hairy down. (4) North China race. Fruit large, oval, with slightly recurved beak. (5) The Persian race, which includes the great majority of large, yellow or white fleshed varieties grown in the Northern United States. Certain smooth-skinned peaches are popularly called nectarines. They may originate as seedlings or bud variations ('sports'), and may be propagated and cultivated like other varieties of the peach.

PEACH BLOSSOMS AND LEAVES.

In America peaches are grown in orchards like apples; in England and Middle Europe they are usually trained against walls, or other protection, cultivated in pots and under glass. The tree is hardy, withstanding a winter temperature of —12° to —18° F. Should a few warm days occur in winter and the fruit buds start into growth, they may be easily killed at a much higher temperature. The chief difficulty in peach-growing arises from the danger from late spring frosts. The peach, like the almond, blossoms early unless held in check by cool spring weather or some artificial means; hence, there is often more difficulty in growing peaches in the South than in the North. These facts tend to confine the commercial culture of peaches to particular localities. In America the peach regions include certain more or less continuous areas from Connecticut to Georgia, the eastern and southern shores of the Great Lakes, much of southern Illinois, parts of Missouri, Kansas, and eastern Texas, and nearly the whole of California. Of these different peach areas the most widely known are those located in Maryland, Delaware, Georgia, and Michigan.

Peaches are propagated from seed, which is usually stratified with moist sand in the fall, and left exposed to the freezing and thawing of winter, which softens and cracks the pits. In spring the pits are planted 6 to 8 inches apart in rows wide enough to admit of horse cultivation, and the following August or September the seedlings are budded with improved varieties, since the

peach does not, except in a few instances, reproduce true to seed. (See BUDDING.) In the Southern States the seedlings are often budded in June, and the budded trees are set in the orchard in the fall or following spring. In the North trees budded one fall are allowed to grow the following season before transplanting to the permanent orchard. Peaches thrive best on light, sandy, gravelly, or shaly soils, though larger trees are grown on heavier soils. High or rolling lands are desirable to insure good soil and air drainage, for the peach must be planted in protected localities free from late spring frosts. Early blooming is sometimes delayed by planting on northern or northeastern slopes. Thoroughly whitewashing the trees in fall or winter also has a tendency to delay blossoming. The trees are usually set in the orchard about 20 feet apart each way, though where careful attention is given to pruning and fertilizing, as in some commercial orchards, they may be set as close as 15 feet apart each way. The peach is not a long-lived tree, even under the most favorable conditions, seldom exceeding thirty years. The life of a commercial orchard is seldom more than seven to nine years. The trees come into bearing about the third year after setting in the orchard. The best peach-growers advocate clean cultivation in the orchard up to about the middle of summer, when a cover crop is sown and cultivation stopped. Trees thus treated ripen up their wood better and are less likely to winter-kill than if cultivated longer in the season. Potash and phosphatic fertilizers are most in demand in the peach orchard. By planting leguminous cover crops and turning these under each spring other nitrogenous fertilizers will seldom be required. Barnyard manure is not considered desirable in the peach orchard unless the land is very poor. It affects the quality of the fruit unfavorably and is likely to produce a rank unripened growth of wood.

Commercial peach-growers quite generally thin their peaches to stand 5 or 6 inches apart after the usual 'June drop' occurs. Peaches are borne only on wood of the preceding season's growth; hence by carefully heading back this new growth each spring they are really thinned in part at the same time. In heading in it is customary to remove about one-half of the new wood growth of the previous season. In harvesting, the fruits are gathered when full grown and well colored, but before they begin to soften, graded according to size, and marketed in various forms of small packages. Besides being extensively used as a dessert fruit, peaches are canned in enormous quantities, evaporated, and sold as dried peaches, and also used to some extent in the manufacture of peach brandy.

PEACH DISEASES. Among the most serious fungous troubles of the peach are the black spot and the brown or fruit rot. The black spot (*Cladosporium carpophilum*) causes dusky brown or black spots on the side of the fruit. These spots are individually seldom more than $\frac{1}{8}$ inch in diameter, but by coalescence often injure a large area. The tissues underneath become affected and hard, and the peach lop-sided, often cracked. The brown rot (*Monilia fructigena*), which also attacks cherries and plums, causes the rotting of all these fruits as they are ripening, and is one of the most serious diseases to which they are subject. The affected fruits, which turn brown and appear decayed, soon become covered by an ash-colored coating of spores. The disease spreads rapidly, especially among early varieties. The twigs are also likely to be destroyed, and where the flowers are attacked, which evidence seems to show may happen, no fruit is set. These diseases may be largely prevented by thorough spraying with Bordeaux mixture. (See FUNGICIDE.) The fungicide should be diluted about one-third, because the foliage of the peach is very subject to injury from the copper compounds used in spraying. One of the most injurious fungous diseases of the peach tree and foliage is the leaf-curl, due to *Exoascus deformans*. This fungus attacks the leaves, defoliating the tree. Its presence may be ascertained by the occurrence of reddish or yellowish blisters upon the leaves, which become curled or crumpled. This disease is more prevalent in damp, foggy regions than in dry, airy ones. It can be prevented by applying Bordeaux mixture of full strength to the trees before the buds begin to swell, followed after the leaves appear with a single application of the same fungicide, diluted as above. Two diseases of unknown cause are peach rosette and yellows. In rosette the twigs are stunted and the leaves bunched in rosettes. It is mostly confined to the South. The yellows is also shown in the appearance of the leaves. They are narrow, tufted, and of a yellowish color. The fruit ripens prematurely and is streaked through the flesh with red. Both of these diseases are contagious, and diseased trees should be dug out and burned as soon as discovered. Badly infested regions have been rid of the disease in this way.

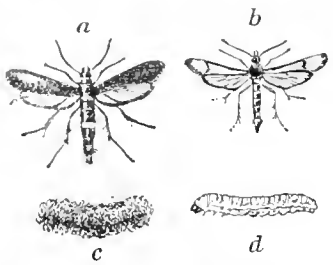
PEACH'AM, HENRY (c.1576-c.1643). An English author, born at North Mimms, Hertford, and educated at Trinity College. In 1606 he published his first volume, *Graphice, or the . . . Art of Drawing with the Pen and Limming in Water Colors*. That he was a fair draughtsman is clear from his illustrations in *Minerva Britannica* (1612), a work on heraldry. After two years of foreign travel, he settled in London, made the acquaintance of Ben Jonson and John Selden, and became well known in literary circles. His best known works are: *The Complcat Gentleman* (1622), of which many editions were published; *The Art of Living in London* (1642); and *The Worth of a Penny, or a Caution to Keep Money* (1641, with imprint, 1647).

PEACH INSECTS. The principal enemy of the peach in the United States is the peach-tree borer, which is the larva of a sesiid moth (*Egeria exitiosa*). The moth, which has partly transparent wings and closely resembles a wasp, is a day flier. It appears in the Northern United States and Canada from about the middle of



PEACH-TREE BORER.

Stages of *Egeria exitiosa*: *a*, adult female; *b*, adult male; *c*, cocoon; *d*, caterpillar.

July to August; in the South, much earlier. Its eggs are laid on the bark of the peach-tree near the surface of the ground. As soon as the larva has hatched it works downward in the bark to the root, forming a tunnel which soon becomes filled with gum. As the larva increases in size, it devours the bark and sap-wood, causing an exudation of gum which ultimately makes a thick mass about the base of the tree. Larvæ of different sizes may be found all through the fall and winter months, and the full-grown ones transform into pupæ within pod-like cases made from the castings mixed with gum and threads of silk. The pupa state lasts about three weeks or more. This insect is not confined absolutely to peach, but sometimes occurs upon plum, and the presence of the larvæ is readily detected by the exudation of gum, when they may be either removed by hand or, after some scraping, the application of hot water is effective to some degree. The best remedy, however, consists in protecting the lower part of the trunk of the tree by a band made of stiff paper or straw.

PEACH-TWIG BORER.

a, a new shoot of peach withering from attack of larva of *Anarsia lineatella*; *b*, the larva (enlarged).

The peach-twig borer (*Anarsia lineatella*) is a moth whose hibernating larvæ injure the trees in early spring, when they bore into the shoots of new leaves, killing the growing terminals and preventing the development of the branch. It is an Old World insect, which has done vast damage on the Pacific coast, and somewhat in the East. It also attacks related fruit trees.

The fruit-tree bark-beetle (*Scolytus rugulosus*) frequently damages the peach, making small holes like shot-holes through the bark. The beetles will lay their eggs by preference in devitalized trees, but will occasionally attack healthy trees. Where this insect is abundant it will be well to girdle one or more trees to be used as traps. The issuing beetles will lay their eggs by preference in the trees thus injured and later they may be cut down and burned.

The San José scale is a serious enemy to the peach (see SAN JOSÉ SCALE), while the peach-tree bark-louse (*Lecanium persicæ*) is another scale-insect enemy of this tree. The leaves are attacked by the New York weevil (*Ichthyocerys Novcboracensis*) and by the peach-tree leaf-roller (*Ptycholoma persicana*), as well as by the larva of *Callimorpha Lecontii*. Spraying with an arsenical poison is a remedy against these insects. The peach-tree aphis (*Myzus persicæ*) and the black peach-aphis (*Aphis persicæ-niger*) are the only other enemies of any importance. These are combated by kerosene emulsion.

Consult Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889), and the various circulars and bulletins of the Division of Entomology, United States Department of Agriculture, especially *Farmers' Bulletin No. 80*.

PEACH TREE CREEK, BATTLE OF. A battle fought on July 20, 1864, near Atlanta, between a part of the Federal Army, under General W. T. Sherman and a part of the Confederate Army of the Tennessee, under Gen. John B. Hood. General Joseph E. Johnston had foreseen that General Sherman would probably divide his army in the neighborhood of Atlanta, and had planned to attack at Peach Tree Creek, less than ten miles north of Atlanta, and, if repulsed, to fall back to intrenchments nearer the city. When General Hood succeeded General Johnston, on July 18th, he adopted the plan and ordered General Hardee and General A. P. Stewart to attack the Federal right, consisting of the Army of the Cumberland, under General George H. Thomas, while crossing the stream, July 20th. General Cheatham was to prevent General McPherson from coming to the aid of General Thomas. The attack was ordered to be made at 1 P. M., but was delayed until 4 P. M., by which time the Federal troops had crossed and thrown up rough intrenchments. The artillery was well handled and a furious attack was repulsed with great slaughter. Meanwhile General McPherson had advanced more rapidly than was expected, and General Hood withdrew General Cleburne's division from General Hardee to oppose him, and a further attack was useless. The Federal troops engaged amounted to 21,655 and the Confederate to 20,250. The Federal loss in killed, wounded, and prisoners was 1600; the Confederate, 2500. The result of this battle was to hasten the fall of Atlanta. Consult Johnson and Buel (ed.), *Battles and Leaders of the Civil War*, vol. iv. (New York, 1887).

PEACOCK (from *pea*, AS. *pawa*, from Lat. *pavo*, peacock, connected with Gk. *ταώς*, *taos*, Pers., Ar. *tawus*, *taus*, peacock + *cock*, AS. *coc*, Bret. *kok*, Alb. *cocos*, Skt. *kukkuta*, cock, onomatopoetic in origin), or PEAFOWL. A kind of pheasant of which only two species are known, natives of the East Indies; birds of a large size, and somewhat remarkable for magnificence of plumage. The bill is of moderate size, somewhat arched toward the tip; the cheeks nearly naked; the head crested; the tarsi rather long, and armed with a single spur; the wings short; the upper tail-coverts prolonged far beyond the tail and forming a splendid train capable of being erected and spread out into a great disk, the true tail being at the same time erected to sup-

PEACOCK, TURKEY & GUINEA-FOWL

4 DOMESTIC TURKEY
5 WILD TURKEY MELEAGRIS GALLOPAVO

port it. The common peacock (*Pavo cristatus*) has for crest an aigrette of 24 upright feathers, with slender almost naked shafts and broad tip. The tail consists of 18 brown stiff feathers, and is about six inches long. The train derives much of its beauty from the loose barbs of its feathers, while their great number and unequal length contribute to its gorgeousness, the upper feathers being successively shorter, so that when it is erected into a disk the eye-like or moon-like spot at the tip of each feather is displayed. The blue of the neck; the green and black of the back and wings; the brown, green, violet, and gold of the tail; the arrangement of the colors, their metallic splendor, and the play of color in changing lights, render the male peacock an object of universal admiration—a sentiment in which the bird himself seems to participate, as he struts about to display himself. When the disk is erected, the peacock has the power of rattling the shafts of its feathers against one another in a very peculiar manner, by a strong muscular vibration. The peahen is much smaller than the adult male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. Individuals with white plumage not infrequently occur, in which even the eye-like spots of the tail are but faintly indicated; and pied peacocks have the deep blue of the neck and breast contrasted with pure white. The 'japanned peacock' (*Pavo nigripennis*) is probably a variety; it has deep blue wing-coverts and the female is grayish white.

The peacock is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated 'peacocks' in the account of Solomon's importations from Tarshish (II. Chronicles ix. 21) does not signify *parrots*. It is commonly stated that it first became known to the Greeks on the occasion of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. It has taken a considerable part in the folk-lore and religious history of most peoples familiar with it. It is regarded as sacred by various Indian castes, was made the emblem of certain classic divinities, and its plumes are still thought 'unlucky' by many persons. The peacock became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the Middle Ages, also, a peacock was often presented at the tables of the great, on state occasions, the skin with the plumage being placed around the bird after it was cooked.

The peacock is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry yard, and is fond of buds and succulent vegetables. It is hardy enough even in cold climates, except that few eggs are laid and the young are difficult to rear. The adult birds sit on trees or on the tops of houses or stacks during the keenest frosty nights, never, if they can avoid it, submitting to the confinement of a house. A sketch of its history in civilization will be found in Stallybrass's English translation (London, 1891) of Hehn's work entitled *Cultivated Plants and Domestic Animals in Their Migrations*. Peacocks are found wild in almost all parts of India and Siam. In general habits they resemble other pheasants. They roost at night in trees, for safety, but find their food and make their nests on the ground. When alarmed on the ground the bird cannot readily take wing, and is sometimes run down by dogs or by horsemen. The female lays about ten eggs, dirty brown in color.

The other species is the Javanese peacock (*Pavo muticus*), a native of some of the southeastern parts of Asia and neighboring islands. It is nearly equal in size to the common peacock, but of perhaps more brilliant although very similar plumage. The cheeks and around the eyes are yellow; the neck, and other fore parts, greenish with golden reflections. The crest is longer than that of the common peacock, its feathers less equal, and webbed along their whole length. Consult the works of Jordan, Hume, Oates, Legge, Seebohm, Blyth, and other writers on East Indian ornithology; Darwin, *Variation of Animals and Plants Under Domestication* (2d ed., London, 1875); Gubernatis, *Zoological Mythology* (ib., 1872); De Kay, *Bird Gods* (New York, 1898). See Plate of PEACOCKS, ETC.

PEA'COCK, EDWARD (1831—). An English antiquary, born at Hemsworth, in Yorkshire, December 22, 1831. He was educated by private tutors. In 1857 he was elected fellow of the Society of Antiquaries. His antiquarian works comprise mainly the *Army List of Roundheads and Cavaliers* (1863; enlarged 1874); *Instructions for Parish Priests, by John Myre* (Early English Text Society, 1868); *A List of the Roman Catholics in the County of York, in 1604* (1872); *Index to English-Speaking Students Who Have Graduated at Leyden University* (Index Society, 1883); *The Monckton Papers* (Philobiblon Society, 1885). Between 1870 and 1874 he published three novels.

PEACOCK, GEORGE (1791-1858). An English mathematician and divine, born at Thornton Hall, Denton. He was educated at Richmond, and at Trinity College, Cambridge, where he became second wrangler (1813), fellow (1814), and tutor and lecturer (1815). He was a fellow student with Herschel, Babbage, and Woodhouse. These four translated Lacroix's *Differential and Integral Calculus* (1816), and were instrumental in the introduction of the Continental notation of the calculus into Cambridge. In 1836 he was elected Lowndean professor of astronomy at Cambridge, which office he retained until his death, although he soon treated it as a sinecure. In 1839 he became Dean of Ely and removed thither. Peacock was one of the founders of the Cambridge University Philosophical Society (1819), Fellow of the Royal Astronomical, Geological, and other societies. In 1838 and 1843 he was member of the commission for standard weights and measures, and advocated a system of decimal coinage. In 1850 he was member of the royal commission and in 1855 of the Parliamentary commission for drawing up new statutes for the university and colleges. His principal mathematical works are: *Collection of Examples of the Application of the Differential and Integral Calculus* (1820); contributions to the *Encyclopædia Metropolitana* (1825-26); *Treatise on Algebra* (1830; 2d ed., 2 vols., 1842-

45); *Report on the Recent Progress of Certain Branches of Analysis* (British Association Reports, 1834); *Remarks on Decimal Nomenclature of Coins, Weights, and Measures* (1841). He also wrote the *Life of Thomas Young* (1855).

PEACOCK, Thomas Love (1785-1866). An English novelist and poet. He was born at Weymouth, October 18, 1785, and, his father dying soon afterwards, was educated in a somewhat desultory fashion at home and at a private school until he was thirteen. He made his first publication, in poetry, before he was twenty, but his independent poems have not added much to his fame. In 1812, on one of his tours in Wales, he made the acquaintance of Shelley and his wife, Harriet, and for several years the friendship then begun is the most notable thing in his life. Shelley made him his executor, with Byron, and it is to him that we owe our best materials for the poet's biography. In 1816, by the publication of *Headlong Hall*, he 'took his station and degree' in literature, which was not to be materially altered in the course of a long life. At the beginning of 1819, by the happy custom of the times, he obtained an important position under the East India Company because he was a clever novelist and a good Greek scholar. With James Mill, he was appointed one of the examiners of Indian correspondence, a post demanding statesmanlike qualities and business ability not always found in a poet and novelist. He continued at India House for thirty-eight years, succeeding Mill as chief examiner in 1836, and finally retired on an ample pension, to live thenceforth quietly with his books and his garden, at Halliford, on his beloved Thames, until his death, January 23, 1866.

Though the charming ballads scattered throughout his books show undoubted poetic ability, it is as a satirist that Peacock will be principally remembered. He describes *Maid Marian* (written 1818, published 1822) to Shelley as "a comic romance of the twelfth century, which I shall make the vehicle of much oblique satire on all the oppressions that are done under the sun"—a phrase which, if we widen it to include the oppressions of cant and ignorance, is not a bad summary of the most of his work. In the ordinary qualifications of the novelist—plot-construction, human interest, character-drawing—he is deficient. But in genial satire (aided by a real passion for beauty and a singularly pure and elegant style) he has had few equals in recent literature; in fact, his fiction has been called by a good judge the best modern representative of the Aristophanic comedy. His characters, despite their suggestion of Shelley or Coleridge or Canning, are rather types than real people; like Ben Jonson and his school, he presents 'humors' in preference to men. His other books are: *Melincourt* (1818); *Nightmare Abbey* (1818); *The Misfortunes of Elphin* (1829); *Crotchet Castle* (1831), which contains his highest comedy; and *Gryll Grange* (1861), the mellow product of his old age. His principal works were published in collected editions in 1875 (ed. Sir Henry Cole) and 1891 (ed. Garnett), with valuable critical and biographical matter. Consult also Saintsbury, in *Essays in English Literature, 1780-1860* (1st series, London, 1890).

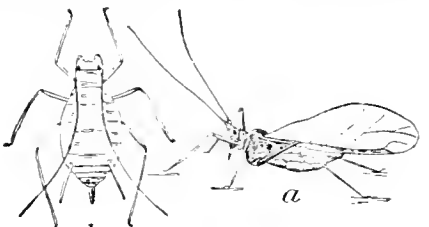
PEACOCK-FISH. A gorgeous European wrasse (*Ctenilabrus pavo*).

PEACOCK-PHEASANT. A pheasant, closely allied to the peacocks, of the genus Polyplectron, of which several species inhabit the Indo-Chinese region and the neighboring islands. The best known species is *Polyplectron Chinquis*, which is brown with a black head, and has the upper plumage adorned with large ocelli resembling those of a peacock's tail. They frequent the forests of hilly regions. The female has the peculiar habit of using her large tail as a shelter for her young. These birds have two great spurs upon the heel, which are especially strong in *Polyplectron bicalcaratum* (see Plate of Pheasants) of the Malay Peninsula.

PEA INSECTS. The pea in Europe is attacked by seven species of weevils, by the larvæ of seven species of moths, and by two species of flies. In the United States there are probably twenty species of insects which are especially injurious to this crop. The pea-weevil (*Bruchus pisorum*) is very abundant. It probably originated in Oriental regions, is scarcely known in the colder countries of Europe and Canada, but is very abundant throughout the United States—so abundant, in fact, that in eating green peas we consume a larva or grub with nearly every pea. The beetles appear on the vines when the peas are in blossom, and the eggs are deposited singly upon the surface of the pods. The larva bores through the pod into a pea, and when full-grown transforms to pupa, the adults issuing at varying periods from the end of July until late in the autumn, frequently in the Northern States remaining in the pea until the following spring, when many are planted in the seed. The insect hibernates in the adult condition and has only a single generation each year. It does not breed in dried peas, and the new generation for another year is dependent upon the beetles which are contained in planted seed or which escape from the store-room. The simplest and most effective remedy consists in holding seed peas in a closed receptacle over one year; the beetles which issue die without being able to lay their eggs in the field. Late planting is also frequently effective, and weevilly peas may be made safe by fumigation with bisulphid of carbon.

Certain of the blister-beetles are frequently injurious to both beans and peas by devouring the leaves, particularly the ash-gray blister-beetle (*Macrobasis unicolor*), which also feeds upon other leguminous plants. The beetles are abundant in June and July, and are handled by spraying with Paris green or by driving them, in the early morning, into windrows of straw or hay, where they are burned. In their early stages these insects are beneficial by destroying the egg-pods of grasshoppers. The maturing pods of peas and cowpeas and other leguminous plants are frequently damaged by the boll-worm or corn-ear worm (larva of *Heliothis armiger*); and the young plants as they come from the ground are frequently damaged by cutworms. (See Cutworm and Owlet Moth.) The European pea-moth (*Semasia nigricana*) has been introduced into Canada, where it has injured peas for a number of years. It is probably only a question of time when it will make its appearance in the Northern United States. A plant-bug (*Halticus Uhleri*) damages peas and beans in some of the Central States, and several species of leaf-hoppers infest the plant.

The most serious enemy to the pea crop of recent years has been the destructive green pea-louse (*Nectarophora destructor*), which caused a loss of many hundreds of thousands of dollars to pea-growers in the United States during 1899 and 1900. During the first season of its abundance it overran and laid waste fields of peas from Nova Scotia and Maine to Virginia and Maryland, as well as in neighboring States, destroying about 50 per cent. of the crop. The loss during 1899 was estimated at $3,000,000, and during 1900, as early as June 15th, at $4,000,000. The insect multiplies with great rapidity, and in favorable seasons is always likely to do enormous damage. The remedies which have been employed are spraying with kerosene soap emulsion and the use of the brush and cultivator method. In the latter case, the peas have been grown in rows sufficiently wide apart to admit of a one-horse cultivator, and the lice are brushed from the plants with boughs of pine, the cultivator following immediately afterwards and burying the lice. Early planting and



GREEN PEA-LOUSE.

a, Winged female of *Nectarophora destructor* in feeding position; *b*, wingless female.

very late planting have also been advised, but rotation of crops by which no leguminous crop immediately follows another one offers apparently the best chance of immunity. Consult: Chittenden, *Insects Injurious to Beans and Peas;* and *The Destructive Green Pea Louse* (Department of Agriculture, Washington, 1901).

PEALE, pēl, Charles Wilson (1741-1827). An American portrait painter and author. He was born at Chesterton, Md., April 16, 1741. In 1768-69 he lived in Boston, where he studied with Copley, and in 1770 went to London, where he was a pupil of Benjamin West. In 1774 he returned to America and practiced portrait painting at Annapolis, and two years later settled in Philadelphia. He fought in the Revolution, commanding a company at Trenton and Germantown, and painted the portraits of many prominent Revolutionary officers. He painted fourteen likenesses of Washington, the earliest of which represents him in the uniform of a Virginia colonel, and is the only one surviving of those painted before the Revolution. The most notable one, ordered by Lafayette for the French King, was purchased during the French Revolution and presented to the National Institute, where it is still preserved. Another portrait of Washington was painted in 1780 for Princeton College. Other portraits include those of Lincoln, Greene, Rochambeau, Reed, Gates, De Kalb, Jefferson, Jackson, and Clay. There is a portrait of Hamilton in the New York Historical Society. At eighty-one years of age he painted "Christ Healing the Sick," and two years later a portrait of himself, which is now in the Philadelphia Academy. He died in Philadelphia, February 22, 1827. Consult: Dunlap, *History of the Arts of Design in the United States* (New York, 1834); Johnston, *Original Portraits of Washington* (Boston, 1882).

PEALE, Patrick. The pseudonym of the German poet and novelist Gustav Anton von Seckendorff (q.v.).

PEALE, Rembrandt (1778-1860). An American portrait and historical painter and author. He was born in Bucks County, Pa., February 22, 1778, the son and pupil of Charles Wilson Peale. From 1796 to 1801 he practiced portrait painting in Charleston, S. C., and then went to London, where he studied under West, returning to the United States in 1803. In 1807 and again in 1809 he visited Paris, where he painted the portraits of distinguished Frenchmen. In 1810 he returned to America and practiced portrait painting at Philadelphia, New York, Charleston, and at Baltimore, where he established a museum and picture gallery. In 1829 he went abroad again, visiting France and Italy, and in 1833 he established himself in London. Peale painted several portraits of Washington, the most notable of which, executed in 1823, was exhibited in Rome, Florence, and London, and was bought by Congress upon his return to America in 1832. His other works include the "Court of Death" (1820), in private possession, Saint Louis; the "Roman Daughter" (1810), Boston Museum; and the "Ascent of Elijah;" portraits of Gilbert Stuart, Thomas Jefferson, and Mrs. Madison, New York Historical Society; of Cuvier and Houdon, Pennsylvania Academy; and an equestrian portrait of Washington, Independence Hall, Philadelphia. He was also a skillful lithographer, and in 1827 won a silver medal at the Franklin Institute, for a portrait of Washington. He lectured on natural history, and is the author of *An Account of the Skeleton of the Mammoth* (London, 1802). His other publications include: *Notes on Italy* (Philadelphia, 1831); *Graphics* (1841); and *Reminiscences of Art and Artists* (1845). He died in Philadelphia, October 3, 1860.

PEAN, pēn (OF. *pane, panne*, Fr. *panne*, skin, fur, from ML. *panna, pannus*, skin, from Lat. *pannus*, cloth, or *penna*, feather). One of the furs borne in heraldry (q.v.).

PEANUT (*Arachis hypogæa*). An annual plant of the order Leguminosæ, also called groundnut, earthnut, ground pea, goober, and pindar in various localities. It grows from one to two feet high with thick, greenish, hairy stems and spreading branches. After the flower has fallen the peduncle bends downward and pushes into the ground, where the fruit or pod develops. The pods are pale yellowish, wrinkled, slightly curved, often contracted in the middle, and contain from one to three seeds. The peanut is thought to be a native of Brazil, where a number of species of the genus are indigenous. Soon after the discovery of South America it was introduced into the Old World and is now grown in all the warm regions of the globe. Only since 1866 has it been an important crop in the United States, where it is mainly grown in the Southern and Southeastern States, particularly Virginia, North Carolina, Georgia, and Tennessee. The conditions best suited to the culture of the peanut are an early and warm spring, a hot and moist summer, and a limy, sandy, friable loam. Lime in some

form must be added to soils deficient in this element. The soil is finely pulverized from four to five inches deep and the seed planted about one inch deep in rows from 28 to 36 inches apart and from 12 to 16 inches in the row, when danger of late spring frosts has passed. About two bushels of nuts in the pod are required to plant an acre. After planting and during the growing period of the crop the soil is kept loose and open and free from weeds. The crop is harvested before frost in the fall, the plants being loosened by means of a special plow, then taken up and put into shocks. After drying from fifteen to twenty days the pods are picked. Fifty bushels of pods and from one to two tons of hay or straw per acre is considered a good yield. In special establishments known as recleaners or factories the pods are polished and sorted before being put upon the market.

Feeding Value. Peanuts are used as a forage crop and as hay. The ripe nuts and the cake which remains after the oil is expressed are also fed. The percentage composition of a number of peanut products follows:

Composition of Peanut Kernels, Forage, etc.

	Water	Protein	Fat	Nitrogen free extract	Crude fibre	Ash
Peanut kernels	7.9	27.2	45.3	13.1	3.9	2.6
Peanut vines (green)	31.9	7.4	3.4	27.1	22.0	8.2
Peanut hay	7.8	10.8	1.7	43.6	20.4	15.7
Peanut hulls (shells)	12.9	6.3	2.3	16.9	58.6	3.0

Peanut kernels resemble other leguminous seeds in being rich in protein. The fat content is also high. Since peanut hay is apt to contain considerable dirt, it should be fed from low mangers or troughs. If immature pods are left on the vines, no other food is necessary during the winter. It has been estimated that pigs under 100 pounds would make from $12 to $20 worth of pork from an acre of peanuts if fed a moderate allowance of corn or corn meal in addition. Pasturing pigs has the advantage that the animals gather the crop and save the cost of harvesting. Peanuts make a soft pork and lard, a disadvantage that may be overcome by feeding corn exclusively for a month before slaughtering. Peanut cake mixed with less concentrated feeds has been found to be a useful cattle food. A material called 'peanut meal' is made by grinding peanut hulls, immature peanuts, and those of an inferior grade.

Peanuts as Food. Of the 4,000,000 bushels of peanuts raised yearly in the United States, 3,000,000 bushels are used as roasted peanuts. Many nuts are used in the manufacture of confectionery and peanut butter. The latter is prepared by grinding the nut and generally mixing it with a little water. Peanut oil is made in large quantities in Europe from African-raised nuts. The shelled nuts contain 30 to 50 per cent. of oil, which, if carefully made, is of good flavor, and is used for various culinary purposes and in the arts. The peanut is at present used more as a luxury or for eating at odd times than as a staple article of diet. It is, however, wholesome, nutritious, and cheap. Little is definitely known concerning its digestibility. It is apparently more easily digested if eaten with other foods than if eaten alone. Attempts to introduce peanut soups, cakes, etc., into the diet have not proved very successful. See Plate of Useful Legumes.

PEA ORE. A form of compact brown or red hematite, consisting of round smooth grains, from the size of mustard-seed to that of small pease. Sometimes the grains are still smaller and flattened. The Clinton iron ore, found in the Silurian of the Eastern United States, is often of this nature.

PEAR (AS. *peru, pere*, from Lat. *pirum*, pear, *pirus*, pear-tree; connected with Gk. *ἄπιος, apios*, pear). A deciduous orchard fruit (*Pyrus communis*) of temperate climates, belonging to the rose family, a native of Europe, early introduced into America. This species is the parent of thousands of cultivated varieties. The small apple-shaped, gritty sand or Chinese pear (*Pyrus Sinensis*) is seldom grown except for ornament and as a stock, the fruit being inedible unless baked or preserved. Some hybrids between these two species have arisen, two of which, Le Conte and Kieffer, are among the most important commercial varieties grown in America. Pear orchards resemble apple orchards in appearance except that the trees naturally grow much more pyramidal. When left to themselves they frequently grow to a height of 60 feet or more. Pear flowers are usually white and borne on spurs that continue to bear fruit and to branch for years. The fruit is a pome, more juicy and melting or buttery than the apple, and less tart. It is one of the best dessert fruits, and is extensively used for canning, preserving, etc., and in some parts of Europe large quantities are used in the production of cider or perry.

While pears are grown over a wide territory in the temperate zones, the countries of largest production are France and the United States. In America they stand fourth in importance among the orchard fruits. The best American pear districts are found in the Northeastern States, from New England west to the Great Lakes, and in California and parts of Oregon and Washington. Blight seriously interferes with pear-growing in the South, while in the Northwest only the inferior Russian sorts are hardy enough to thrive. The pear is grown in orchards, either as a standard or dwarf. Standard trees are produced by grafting or budding the variety which it is wished to grow upon a seedling pear; the best stock for the purpose is obtained by growing the seed of the wild pear of Europe. Dwarf trees are produced by grafting or budding on quince stock. Pears thus treated seldom grow more than 12 to 15 feet high. They come into bearing earlier than standard trees, usually within four years from planting in the orchard, and are especially valuable where land is expensive or for planting between other trees. Frequently dwarfing increases the size of the fruit and improves its quality.

The best soil for standard pears is a well-

drained heavy clay loam. Dwarf pears will do well on lighter soils. Rapid growth is not sought for in pear culture, since it is believed to favor the attacks of blight. For this reason, also, stable or other nitrogenous manures are not advocated for the pear orchard except on very poor soils. Trees are set in the orchard when two or three years from the bud, standard trees from 18 to 25 feet apart each way, and dwarfs 10 to 16 feet. Dwarf trees are set deep, 4 to 6 inches below the union, to prevent growth of the stock and to lessen the danger from breaking off in storms. Cultivation is practiced only during the spring and early summer in order to prevent a late, sappy wood growth. Recent investigations have clearly shown that many varieties of pears are self-sterile and must be planted with other varieties to cross-pollenize them in order to produce fruit. Such varieties should therefore never be planted in orchards alone. It is probable that almost any variety blossoming at the same time as these self-sterile sorts may be used as pollenizers. In the orchard one or two rows of one variety should be alternated with one or two rows of another variety blossoming at the same time.

Pears are harvested before they are fully ripe and while they are still hard. Thus handled they acquire a better color and flavor, develop less grit in the flesh, and are less likely to decay at the core than when allowed to ripen on the tree. After picking they are stored in shallow boxes or racks in a cool room away from all draughts of air, which tend to shrivel up the fruit. Late winter pears may be left on the trees as long as practicable before frost. Pears grown for market are gathered and placed in barrels or boxes at once. European and California fancy pears are wrapped in paper like oranges before marketing.

PEAR DISEASES. The pear and its fruit are subject to the same diseases as the apple, for the description and prevention of which see APPLE, paragraph *Diseases*. In addition there are two diseases which, although occurring upon the apple and quince, are so much more frequent upon the pear as to be generally associated with it. The first is the leaf-spot, due to the fungus *Entomosporium maculatum*, which occurs upon the leaves, fruits, and young twigs; upon the leaves as reddish brown spots which coalesce more or less, and destroy the leaf, sometimes defoliating the tree; upon the stems black, as dead spots; upon the fruit reddish spots beneath which the tissues become hard and cork-like, the fruit often cracking and rotting as a result of the attack. This disease may be easily controlled by the application of Bordeaux mixture or other fungicide (q.v.). The second is pear-blight or fire-blight (q.v.).

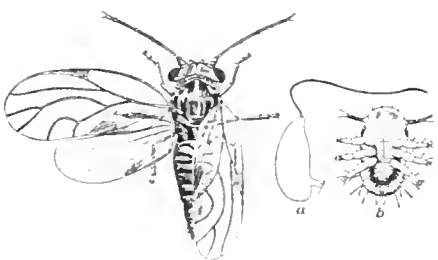
Consult: Quinn, *Pear Culture for Profit* (New York, 1889); Waite, *Pollination of Pear Flowers*, United States Department, Agricultural Division Vegetable Pathology, Bulletin No. 5 (1895); Field, *Pear Culture* (New York, 1863); Bailey, article "Pear," in *Cyclopedia of American Horticulture* (New York, 1900-02); Jordan, *Pear Growing in New Jersey* (New Jersey Experimental Station, Bulletin 142). See PEAR INSECTS; Plate of FLOWERS.

PEAR, PRICKLY. A species of cactus. See PRICKLY PEAR.

PEARCE, pērs, CHARLES SPRAGUE (1851—). An American figure painter, born in Boston, Mass. He studied under Bonnat in Paris, and was a frequent exhibitor at the Salon. Afterwards he lived many years in France. He was one of the first members of the Society of American artists. In 1891 he was awarded the Grand Diploma at the Berlin Exhibition, and in 1894 was made an officer of the Legion of Honor. His work is in the realistic French manner, quiet in tone, with notable technical qualities and skill in composition. Among his best known pictures are: "Death of the First Born" (1877); "The Shepherdess" (1866); "Fantaisie" (in the Pennsylvania Academy of Fine Arts); and "Meditation" (in the Metropolitan Museum, New York City). He did some mural painting in the north hall of the Congressional Library in Washington.

PEA RIDGE, BATTLE OF. A battle of the Civil War in America, fought at Pea Ridge, in northwest Arkansas, near the Missouri boundary, March 7 and 8, 1862. In January, 1862, Gen. S. R. Curtis with 10,500 Federal troops, composing the Army of the Southwest, moved against Gen. Sterling Price, commanding Missouri State troops at Springfield. General Price retired into Arkansas, where he was joined by Gen. Benjamin McCulloch with his division, and General Van Dorn took chief command. General Curtis followed and took a strong position at Pea Ridge, on an eminence in the Ozark Mountains, and awaited an attack. General Van Dorn advanced with 14,000 men and was joined by Gen. Albert Pike with a brigade of Indians, which had been recruited in Indian Territory. His plan was to strike the rear of the Federal army and cut off its communications. General Curtis had changed front, but the Federal right was driven back two miles on March 7th. The attack by the Confederates on the Federal left was repulsed with great slaughter, Generals McCulloch and McIntosh being among the killed. The Indians were entirely useless, and scattered at the beginning of the artillery fire. The next morning General Van Dorn retreated under cover of his artillery, but General Curtis drew his men into an arc of a circle and poured in a destructive cross fire. The Federal loss was 1384 killed, wounded, and prisoners; the Confederate was given at 800 exclusive of Indians, but was undoubtedly larger. The result of this first victory west of the Mississippi saved Missouri to the Union cause.

PEAR INSECTS. The insects attacking the pear are identical in many instances with those which attack the apples, the apple-borers, the



PEAR PSYLLA.

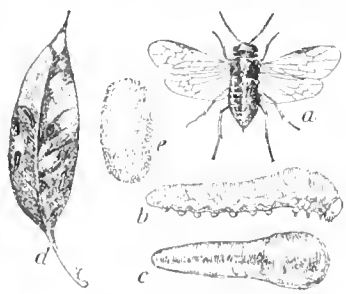
Psylla pyricola: adult; an egg (*a*); and larva (*b*) from beneath. Greatly enlarged.

San José scale, the oyster-shell bark-louse, and the codling moth all being found to attack the pear. The pear-tree psylla (*Psylla pyri*) is con-

fined to the pear, and is common and rather destructive in the Northern United States, extending westward as far as Michigan and southward to Maryland and Virginia. It was probably imported about 1832 from Europe, where it occurs abundantly, especially in Austria. The orange-yellow eggs are laid by the adult insect upon the leaves of the trees, and the young insects, yellow in color, with crimson eyes, begin immediately to suck the sap from the leaf. It grows rather rapidly and has several generations (four or five) in the course of summer. It hibernates in the adult condition. It is preyed upon by a large number of natural enemies, principally by the golden-eyed lace-wing flies and the larvæ of coccinellid beetles. The best remedy is a spring application of kerosene emulsion spray when the leaves are first unfolded. A combination of kerosene emulsion and Bordeaux mixture is recommended where pear-blight occurs in the same orchard.

A bark-boring beetle, known as the pear-blight beetle (*Xyleborus pyri*), frequently causes the death of many twigs of the pear tree by making small perforations at the bases of the buds. The adult beetle deposits its egg on the bud and the young larva bores down, following the course of the eye of the bud, toward the pith, around which it passes, consuming the tissues in its course, thus interfering with the circulation, and causing the twig to wither. The adult insect issues in June or July and deposits its eggs during August. The only remedy which has been suggested is to cut off the blighted limbs below the injured part and burn them before the beetle has escaped. Another borer, the sinuate pear-borer (*Agrilus sinuatus*), has been introduced into the United States from Europe within recent years. This borer in the larval condition feeds between the bark and wood in pear trees, especially in the trunk and larger branches, making long zigzag galleries, finally girdling the tree and killing it. It lives two years in the larval condition.

Among the numerous insects which attack the leaves of the pear is the so-called 'pear slug,' which is the larva of a sawfly (*Eriocampoides limacina*). The adult is a small insect, smaller



PEAR SLUG.

a, adult saw-fly, female; *b*, larva with slime removed; *c*, larva in normal state (the 'slug'); *d*, an affected leaf; *e*, cocoon.

than the house-fly, and glossy black in color. It was probably introduced into the United States from Europe toward the close of the eighteenth century. The eggs are laid under the surface of the leaf, and the young larvæ hatch and grow rapidly, covering themselves with a slimy secretion. There are two generations each year, and the larvæ when abundant skeletonize nearly all the leaves on large trees. The best remedy is to spray with an arsenical wash or with a soap solution, or hellebore may be used either as a dry powder or as a wet spray. Heavy rains will often destroy them, and a forcible water spray will wash them from the leaves.

Among caterpillars which feed upon the pear are the white-marked tussock-moth (*Orgyia leucostigma*), the red-humped apple-tree caterpillar (*Notodonta concinna*), the fall webworm (*Hyphantria cunea*), the cecropia moth (*Attacus cecropia*), the eye-spotted bud-moth (*Tmetocera ocellana*), and others. The plum curculio and the quince curculio (qq.v.) injure pears, as well as plums and quinces, although not so extensively. Consult: Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889); Smith, *Manual of Economic Entomology* (Philadelphia, 1896).

PEARL (from ML. *perula*, *perulus*, *perla*, pearl, probably variants of *pirula*, diminutive of Lat. *pirum*, pear). A morbid product formed from the pearly nacre of the interior of the pearl mussel (*Meleagrina margaritifera*) and other bivalves. It is often due to the irritation caused by the presence of a grain of sand or some other foreign body lodged between the mantle of the animal and the shell; an extra amount of pearly matter is thus secreted and forms roughnesses or projections on the inside of the shell, which, if becoming free and regularly spherical, form one or more pearls. Recent authorities state that pearls are also due to the presence of distomæ. It has been noticed that when the pearl oyster (Meleagrina) is large, well formed, and with ample space for individual development, pearls scarcely occur at all, but when the shells are crowded together, and become humped and distorted, as well as affording cover for all kinds of marine worms and parasitic creatures, then pearls are sure to be found (Cooke). The pearl-oyster fishery is carried on in the Aru Islands, the Sulu Archipelago, the Philippine Islands, Burma, the Persian Gulf, the Red Sea, at Ceylon, along the coasts of North Queensland, Northeastern Australia, and of West Australia, at New Guinea, and at the Pearl Islands on the Bay of Panama. This species also occurs along the coast of Lower California, and in the South Pacific in the Paumota, Gambier, and Navigator Islands, and also at Madagascar. The shell is very large, about eight to ten and even fifteen inches in diameter, while the valves are very thick and heavy, and in young individuals the outer surface is very rough and corrugated. The largest pearl known is said to measure two inches long, four inches round, and to weigh 1800 grains.

The 'mother-of-pearl' is the internal nacre or nacreous lamina of this oyster. It is utilized in the manufacture of buttons, studs, knife-handles, fans, card-cases, brooches, boxes, and all kinds of inlaid work.

Pearls may be formed in almost any bivalve, and some of the most valuable are taken from the shells of fresh-water mussels, but these are usually small and called 'seed-pearls;' they also occur in tolerable abundance in the common mussel of our coast (*Mytilus edulis*), very fair specimens at times being found; also in oysters, in *Placuna placenta* of the Pacific, in many species of Pinna,

and in the giant clam (Tridacna). Pearls are sometimes formed in univalve shells; thus pink pearls have been taken from the giant conch-shell (*Strombus gigas*) of the West Indies, as well as from certain species of Turbinella.

Pearl Fisheries. The average annual value of the pearl fishery of Northern Australia is $296,000, the industry having been founded at Thursday Island. It appears that the profits of the fishery are made out of the pearl shell only, because so many pearls, and often very valuable ones, are stolen by divers. Saville Kent distinguishes two species of pearl shells; viz. the large white shell (*Meleagrina margaritifera*) and a smaller black-edged form which he names *Meleagrina nigro-marginata*. Kent has proved that it is possible to transplant living pearl oysters. Under favorable conditions the shell is supposed to attain in three years the marketable size of eight or nine inches in diameter, while in five years a pair of shells may weigh five or six pounds, the extreme weight being ten pounds. The centre for labor and supplies of the Queensland fishery is Singapore, this port being an excellent market for the shells, while more pearls probably change hands here than in any other place in the world, large quantities being purchased for the Chinese market, where there is an extensive demand for second-class pearls.

The pearl oysters live at depths of from eight to twenty or more fathoms. For collecting the oysters small vessels of from 12 to 15 tons are most convenient. Two or more such boats are usually accompanied by a larger vessel as a storeship. The best divers are Japanese; Filipinos are also good, and Malays are employed. The diver takes with him a netted bag made of rope. When the depth is from eight to fifteen fathoms the diver can work at the bottom for two or more hours, but at a greater depth he cannot remain on the bottom more than fifteen minutes. The shells usually live in strong currents and in narrow channels between groups of islands, where they lie on a hard bottom.

The pearl fishery of the Mississippi and its tributaries is of much greater importance than is generally known. During recent years a thousand persons have been engaged in this industry on the Mississippi River alone. In 1901 a single firm is stated to have bought from these fishermen $100,000 worth of pearls, besides the clam or mussel shells from which pearl buttons are made. It is said that the supply of pearls is not being exhausted, but that the demand has increased so rapidly in the last fifteen years as to treble prices. The centre of the industry is Muscatine, Iowa.

In the United States the fresh-water pearl industry dates back to 1857, when the 'Queen Pearl' was found in New Jersey. It was sold to the Empress Eugenie for $2500 and is said to be worth now four times that sum. Tennessee, Kentucky, and Wisconsin are the leading States in the pearl industry, and in the ten years succeeding 1889 it is said that more than $25,000 worth of pearls were collected in Wisconsin alone. So great has been the destruction of the mussels there that in many places they are nearly if not quite exterminated.

PEARL. A beautiful English poem belonging to the second half of the fourteenth century. It is a lament of a father for a lost child, symbolized by a pearl. The poet possessed a spotless pearl. One day as he was in an arbor it slipped from his hand down through the grass and the flowers into the earth. Wandering afterwards into the arbor in search of the lost gem, he fell asleep amid the flowers, and in vision saw his lost child by the shimmering cliffs of the new Jerusalem. The poem consists of 101 twelve-line stanzas. The dialect is West-Midland. That the poet lived in the West of England near the Welsh borders is all that is known of him. Consult *Pearl*, edited, with a modern English version, by Israel Gollancz (London, 1891).

PEARL ASH (so called on account of the color), or Potashes. Crude potassium carbonate obtained from wood ashes. The commercial product is made in Canada, as follows: Wood is burned in pits and the resulting ash spread on a stone floor, sprinkled with water, and worked till it is damp, frequently with the addition of a little lime. The damp ash is then placed in casks containing false bottoms, covered with straw and hot water poured over them. The liquid, which is drawn off from a plug hole at the bottom, is boiled down, and finds some use in this condition as a manure owing to the soluble potash that it contains. The crude pearl ash thus obtained may be purified by heating and then cooled, during which the sulphate and chloride, together with the insoluble matter, are separated out, while the clear supernatant liquid is drawn off and boiled down until it crystallizes. When sufficiently pure this product finds use in the manufacture of flint glass. Ordinary pearl ash is used principally, however, in the manufacture of soap.

PEARL HARBOR. An inlet on the south coast of Oahu, Hawaii, six miles west of Honolulu (Map: Hawaii, C 2). It consists of several land-locked basins with a narrow entrance inside of which there is a depth of 60 feet. Outside, however, a coral reef prevents the entrance of large vessels. In 1884 the United States obtained the right from the Hawaiian Government to establish here a coaling and repair station, and several surveys were made by the United States Government. The harbor, however, was not utilized, and the acquisition of the harbor of Honolulu in 1898 rendered its improvement unnecessary.

PEARLITE (so called on account of the pearly lustre). A glassy or once glassy rock which exhibits a ready separation by cracks into spherical or spheroidal forms. These so-called pearlitic cracks may arise from stresses set up during the cooling of the magma, or from differential expansion and contraction about spherulitic masses of feldspar.

PEARL MILLET. A cereal grain. See Guinea Corn.

PEARL OYSTER. A tropical bivalve (*Meleagrina margaritifera*) noted for producing precious pearls and mother-of-pearl. See Pearl.

PEARL RIVER. A river of Mississippi. It rises in Winston County in the east central part of the State, and flows southward, emptying into the Mississippi Sound after having formed for some distance the boundary between Mississippi and Louisiana (Map: Mississippi, F 8). It is about 300 miles long, but its navigation is impeded by shoals and sand bars.

PEARL WEDDING. See WEDDING ANNIVERSARIES.

PEARL WOOD-NYMPH. See WOOD-NYMPH.

PEARSE, pērs, MARK GUY (1842—). An English clergyman and author. He was born in Camborne, studied medicine and then theology, and in 1863 entered the Wesleyan ministry. After holding various charges in Leeds, Ipswich, Bristol, Westminster, and elsewhere, on the motion of Hugh Price Hughes in 1889 he was chosen to take charge of the West London Mission, from which he retired after twelve years of service. His writings, numbering more than 25 volumes, include devotional works and semi-religious tales, especially of Cornish life. The best known are: *Daniel Quorm and His Religious Notions* (1874-79), of which hundreds of thousands have been printed in many languages; *Elijah, the Man of God* (1891); *The Gentleness of Jesus* (1898); *The Story of a Roman Soldier* (1899); and *West Country Songs* (1902).

PEARSON, pēr'son, CHARLES HENRY (1830-94). An English educator and historian, born at Islington. He studied at King's College, London, and at Oxford, receiving a B.A. in 1853 and an M.A. in 1856. He was appointed professor of modern history in King's College; but in 1871 he went to Australia, where he soon resumed teaching and became Minister of Education in Victoria. In 1892 ill health compelled him to return to England. His principal works are: *Russia, by a Recent Traveler* (London, 1859); *History of England During the Early and Middle Ages* (2 vols., London, 1867); *English History in the Fourteenth Century* (London, 1876); *Historical Maps of England During the First Thirteen Centuries, With Explanatory Essays, etc.* (London, 1869); *National Life and Character: A Forecast* (London, 1893); *Report on the State of Public Education in Victoria* (Melbourne, 1878); *Reviews and Critical Essays*, ed. by Strong (London, 1896). Consult Stebbing, *Charles Henry Pearson* (London, 1900).

PEARSON, JOHN (1613-86). An English prelate of high celebrity. He was born on February 28 at Great Snoring, in Norfolk. He was educated at Eton and King's College, Cambridge, where he took the degree of M.A. in 1639, and in the same year took orders, and was collated to a prebend in Salisbury Cathedral. In 1640 he was appointed chaplain to Sir John Finch, Lord Keeper of the Great Seal, and on the outbreak of the Civil War became chaplain to Lord Goring, and afterwards to Sir Robert Coke, in London. In 1654 he was appointed minister of Saint Clement's, Eastcheap, London; and in 1659 published the great work by which he is now remembered, *An Exposition of the Creed* (new ed., 2 vols., 1890-91). During the same year Pearson published *The Golden Remains of the Ever Memorable Mr. John Hales of Eton*. At the Restoration honors and emoluments were lavishly showered upon him. Before the close of 1660 he received the rectory of Saint Christopher's, in London; was created D.D. at Cambridge; installed Prebendary of Ely and Archdeacon of Surrey; and made master of Jesus College, Cambridge. In 1661 he obtained the Margaret professorship of divinity, and was one of the most prominent commissioners in the Savoy Conference; in 1662 he was made master of Trinity, Cambridge, and in 1673 was consecrated Bishop of Chester. In 1672 he published his *Vindiciæ Epistolarum S. Ignatii*, in answer to Daillé, who had denied the genuineness of the Epistles. In 1684 appeared his *Annales Cyprianici*. He died at Chester, July 16, 1686. Pearson's *Opera Posthuma Chronologica* were published by Dodwell (London, 1688, 3 parts), and his *Orationes, Conciones et Determinationes Theologicæ* contain much valuable matter. Consult Churton's memoir prefixed to Pearson's *Minor Theological Works* (2 vols., Oxford, 1844).

PEARSON, JOHN LOUGHBOROUGH (1817-97). An English architect, born in Brussels. He studied under Bonomi in Durham, and in London with Salvin and Hardwick; entered practice for himself in 1843; and built churches in Yorkshire (1843-46). A second period, following the construction of Trinity for Bentinck (1850), was largely devoted to restorations and especially to regroining old churches. In 1870 Pearson was employed in extensive repairs to the cathedral at Lincoln, and in 1879, having received a gold medal and the cross of the Legion of Honor at Paris in the previous year, he was intrusted with the plans for the new cathedral at Truro, which, completed in 1887, may be reckoned his greatest opportunity, and his best work. His most widely known work of restoration was that of the north transept of Westminster Abbey. Besides, he made important repairs at Canterbury, Rochester, Peterborough, Chichester, Bristol, and Exeter. For the most part his architectural type was ecclesiastical and Gothic, but he essayed some country houses and office buildings and at times used the Tudor, Jacobean, or Free Renaissance.

PEARSON, KARL (1857—). An English mathematician and author. He was educated at King's College, Cambridge, studied at Heidelberg and Berlin, and was called to the bar in 1882. After two years (1882-84) as professor of geometry, in 1885 he was appointed to a chair of applied mathematics and mechanics in University College, London. Pearson received the Darwin medal from the Royal Society in 1898. He wrote: *History of the Theory of Elasticity and Strength of Materials* (1886-93); *The Ethic of Freethought* (1888; revised 1901); *The Grammar of Science* (1892 and 1899); and *The Chances of Death, and Other Studies in Evolution* (1897).

PEA'RY, ROBERT EDWIN (1856—). An American Arctic explorer and civil engineer in the United States Navy, born at Cresson, Pa., May 6, 1856. He was graduated from Bowdoin College, Maine, in 1877, became a civil engineer in the navy in 1881, and in 1884-85, under Government orders, he was assistant engineer on the route of the proposed Nicaragua Ship Canal. In 1887-88 he was engineer-in-chief of the Nicaragua Canal survey. He had made a reconnaissance in 1886 of the Greenland inland ice-cap east of Disco Bay, in latitude 70° N. From this time until he sailed in 1891 on his first expedition to Northwest Greenland all his leisure was given to the most minute studies and preparations for his participation in Arctic research. During his first expedition (June, 1891-September, 1892) he made a brilliant record of achievements, not the least of which were the results of his studies and minute experimentation in the field cover-

ing every phase of the equipment for Arctic work. His journey over the inland ice, from 5000 to 8000 feet above the sea, from McCormick Bay to the northeast angle of Greenland (Independence Bay, latitude 81° 37′ N.), a round trip of 1300 miles including land travel on the northeast coast, was one of the most brilliant feats of polar sledge work ever accomplished. He proved that the northern extension of the great interior ice-cap ends below latitude 82° N. He also established the insularity of Greenland and ascertained the existence of detached ice-free land masses north of the mainland and the fact that the east and west coasts rapidly converge north of the seventy-eighth parallel. His ethnological work among the Eskimos known as the Arctic Highlanders (from Cape York to Smith Sound) was the most thorough and noteworthy that has been done in that region. The auxiliary expeditions in which well-known men of science participated gave opportunity for fruitful researches as to glacial and other Arctic phenomena. In 1893-95 he made another voyage to the same region, completed his study of the Arctic Highlanders, made another journey across the ice-cap to Independence Bay, and discovered the famous meteorites of the Eskimos near the coast of Melville Bay. They were later removed to New York, and one of them, weighing 90 tons, is the largest known to exist. After summer voyages to the Melville Bay regions in 1896 and 1897, he started north again in 1898 for the purpose of outlining the northern extension of the land masses above Greenland and of reaching the North Pole, if possible. His work covered four years, during which he made resurveys of a considerable extent of coast line in the neighborhood of Smith Sound, surveyed new coast lines on the west side of Grinnell Land and north of the Greenland mainland, and made a number of notable and very difficult sledge journeys along the northern channels leading to Lincoln Sea. Passing Lockwood's Farthest, he traced the northern limit of the land masses north of Greenland to its highest point, 83° 39′ N., and then followed the southerly trend of the coast for many miles toward Independence Bay on the east coast.

In the spring of 1902 he started over the frozen Arctic Ocean from Cape Heela, on the north coast of Grant Land, in his attempt to reach the North Pole. Each day's march was very arduous on account of the broken condition of the ice and the vast pressure ridges crossing his path. His general course was deflected to the west by the character of the ice. At his farthest camp in latitude 84° 17′ N. the polar pack became impracticable and further efforts to advance were given up. He had attained the nearest approach to the pole in the American Arctic. Commander Peary was elected president of the American Geographical Society in December, 1902.

PEARY LAND. A name given to the northern coast region of Greenland, which was first explored by Peary in 1892.

PEASANT WAR (OF. *paissant*, Fr. *paysan*, from OF. *pais*, *pays*, Fr. *pays*, country, from Lat. *pagus*, district, province, from *pangere*, to fix, to fasten; connected with *pax*, peace, Gk. πηγνύναι, *pēgnynai*, to fasten; and perhaps with Goth., OHG. *fahan*, AS. *fon*, Ger. *fangen*, to seize, take). The name given to the insurrection of the peasantry in Central and South Germany in the year 1524-25. With the decline of the feudal system the lot of the peasantry throughout Germany had greatly deteriorated. They were still subject to the oppressive exactions of their feudal masters, but the ancient service of protection from master to man had gradually disappeared. The example of Switzerland encouraged the German peasants to hope that the yoke of the nobility might be thrown off, and after 1475 there were risings here and there among the peasants of South Germany. A peasant league, called from its cognizance, a peasant's clog, the *Bundschuh*, rose in the Rhine countries in 1502, and another, called the 'League of Poor Conrad,' was organized in Württemberg in 1514; but both were put down. The great insurrection finally broke out in Swabia in June, 1524. Many of the secular nobility at first regarded the insurrection with some measure of complacency, because it was directed primarily against the ecclesiastical lords. An irregular warfare ensued, attended by the most revolting cruelty on both sides. In spite of the disadvantage under which the ignorant and poorly organized peasants labored, the insurrection spread through Alsace and the Palatinate, Franconia, Bavaria, Tyrol and Carinthia. The rising of the peasants was accompanied by insurrections among the lower classes in many cities. The movement in many parts took on a religious character, and was merged with the agitation of the Anabaptists (q.v.), Thomas Münzer (q.v.) becoming one of the principal leaders of the peasantry. The demands of the peasants were set forth in a manifesto issued about Easter, 1525, by the insurgents of Swabia, known as the Twelve Articles. These embraced the free election of their parish clergy; the appropriation of the tithes of grain, after competent maintenance of the parish clergy, to the support of the poor and to purposes of general utility; the abolition of serfdom, and of the exclusive hunting and fishing rights of the nobles; the restoration to the community of forests, fields, and meadows, which the secular and ecclesiastical lords had appropriated to themselves; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles, murdered, pillaged, and were guilty of the greatest excesses, partly in revenge for the cruelties practiced against them. A number of princes and knights were forced to make common cause with them and even to join their ranks, the most noted of these being Götz von Berlichingen (q.v.). Luther denounced the excesses of the peasants, and called upon the princes of Germany to stamp out the insurrection. The peasant army in Central Germany, under the command of Münzer, was overwhelmed at Frankenhausen, on May 15, 1525, by the Landgrave Philip the Magnanimous of Hesse, at the head of the forces of Hesse, Saxony, and Brunswick. By June disorderly bands in South Germany had been mostly annihilated or dispersed. The peasants, after they had been subjugated, were everywhere treated with terrible cruelty. Multitudes were hanged in the streets, and many were

[illegible] the greatest tortures. Weinsberg, Heilbronn, Würzburg, and other towns that had forced them suffered the vengeance of the victors, and torrents of blood were shed. It is supposed that more than 100,000 persons lost their lives in the Peasant War. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and many burdens of the peasantry originated at this period. Consult: Fries, *Geschichte des Bauernkriegs in Ostfranken* (Würzburg, 1884); Cornelius, *Studien zur Geschichte des Bauernkriegs* (Munich, 1862); Schreiber, *Der deutsche Bauernkrieg* (1864); Zimmermann, *Allgemeine Geschichte des grossen Bauernkriegs* (new ed., Stuttgart, 1891); Baumann, *Die zwölf Artikel* (Kempten, 1896); Janssen, *Geschichte des deutschen Volks seit dem Mittelalter* (Freiburg, 1877-94).

PEASE, Ernest Mondell (1859—). An American Latinist, born at West Union, Iowa. He graduated from the University of Colorado in 1882, and was fellow at Johns Hopkins University from 1884-86. He was instructor in Latin at Smith College 1885-86, professor of Latin at Bowdoin College, 1886-91, and at Leland Stanford Junior University, 1891-1902. With Prof. H. T. Peck, of Columbia University, he is editor of the *Students' Series of Latin Classics*, published in Boston. He is also the author of various philological papers and reviews.

PEAS'LEE, Edmund Randolph (1814-78). An American physician, known as an obstetrician and gynecologist. He was born in New Hampshire, and graduated from Dartmouth College in 1836, where he remained for two years as tutor. After taking his medical degree at Yale, he began practice in Hanover, N. H., in 1841. In 1842 he became professor of anatomy and physiology at Dartmouth. He was made professor of physiology and pathology in the New York Medical College in 1851, and in 1858 he assumed the chair of obstetrics and removed to New York City. This college became extinct in 1864. In 1874 he was made professor of gynecology in Bellevue Hospital Medical College. He published *Human Histology* (1857), and *Ovarian Tumors and Ovariotomy* (1872).

PEAT (possibly a variant of *beat*, sod, from *beet*, AS. *bētan*, to mend, from *bot*, Goth. *bōta*; OHG. *buoza*, Ger. *Busse*, reparation). The product resulting from the partial decay of vegetable matter—mosses and other marsh plants—which grows and dies in boggy places where water stands. The remains of the plants are often so well preserved that the species can be easily distinguished. Reeds, rushes, and other aquatic plants may usually be traced in peat, and stems of heath are often abundant in it; but it chiefly consists, in the northern parts of the world, of various species of Sphagnum (q.v.), or bog-moss. The plants are so well preserved in many bogs that attempts have been made with some success to utilize the fiber prepared from peat as a textile. Peat passes by insensible degrees into lignite (q.v.). The less perfectly decomposed peat is generally brown; that which is more perfectly decomposed is often nearly black. Moist peat possesses a decided antiseptic property which may be due to tannin, organic acids, or iron, and other salts present. This property is manifested not only in the perfect preservation of ancient trees and of leaves, fruits, etc., but sometimes even of animal bodies. For this reason peat is not well suited for use as a fertilizer in the raw state, but should be allowed to weather before being so used. In warm regions the decay of vegetable substances is, as a rule, too rapid to permit the formation of peat. But in the colder parts of the world the deposits are very extensive. In the Southern Hemisphere no moss seems to enter into their composition, and South American peat is said by Darwin to be formed of many plants, but chiefly of Astelia pumila, a phanerogamous plant of the rush family. The rate of growth is variously estimated at from two to four inches a year. Many thousands of acres are known in the North German lowlands; in Ireland estimates place the lowland bog area at 1,576,000 acres and the highland at 1,254,000 acres. Russia is said to have 6700 square miles of peat. Several million acres occur in Norway and Sweden, France and Holland. The United States and Canada have also extensive tracts, but only in the latter country have attempts been made to utilize them. For the physical characters, and the mode of reclaiming and converting peat bogs into arable land, see Bog.

Mere peat is not a good soil, even when sufficiently drained, but requires the application of lime, marl, etc., and other soil amendments to convert it into good soil. Peat bogs even when well drained are not at first productive. The peat must undergo a certain amount of decomposition to supply the nitrogen required by plants, and usually certain of the mineral constituents necessary to plant growth are deficient. Barnyard manure is frequently beneficial, probably because it not only furnishes a certain amount of available fertilizing matter, but promotes fermentation of the peat and thus renders its inert nitrogen available. Lime, marl, wood ashes, etc., are also used with benefit on peat bogs, for similar reasons and because they correct acidity and promote nitrification. Peat was formerly extensively used as a fertilizer, particularly in the form of compost (q.v.), but its use has declined since the general introduction of the more convenient and efficient commercial fertilizers. (See Manures and Manuring.) Dried peat is an excellent absorbent and is used to a considerable extent as a litter in stables. It has also been used in the manufacture of the so-called 'peat molasses,' a cattle food prepared by mixing the crude molasses from sugar factories with dried ground peat.

Peat is extensively used for fuel. The more perfectly it is decomposed, and therefore the more consolidated it is, the better. It is the ordinary fuel of the greater part of Ireland, where it is usually called turf, although the term turf in its ordinary English sense is utterly inapplicable to it. To procure peat for fuel, the portion of bog to be operated upon must first be partially dried by a wide open drain; its surface is then pared off with the spade, to the depth of about six inches, to remove the coarse undecomposed vegetable matter; the peat is afterwards cut out in pieces (peats) like bricks, by means chiefly of a narrow, sharp spade, the blade of which is furnished on one side with a tongue set at a right angle to it. The soft peats are set up on end in little clusters to dry. When sufficiently dry they are piled in out-houses or stacked in the open air. The operation of peat-cutting is al-

ways performed in spring or summer. Where peat for fuel cannot be obtained in the way just described, the black mud of a semi-fluid bog is sometimes worked by the feet of men, women, and children until it acquires such a consistency that it can be molded by the hand. The process is laborious, but the fuel obtained is good.

Peat is a light and bulky kind of fuel, and cannot be conveyed to considerable distances without too great expense. Efforts have, however, been made, both in Scotland and Ireland, to render it more generally useful, and so to promote the reclaiming of bogs by compressing it until its specific gravity is nearly equal to that of coal. For this purpose it is first reduced to a pulp. The compressing of peat has not been advantageously prosecuted on an extensive scale.

Peat-charcoal, made from uncompressed peat, is very light and inflammable, and therefore unsuitable for many purposes, but is well adapted for others, particularly for use as an antiseptic and deodorizer. Peat-charcoal is highly esteemed for the smelting of iron, and for working and tempering the finer kinds of cutlery. Charcoal made from compressed peat is in density superior to wood-charcoal, and is capable of being used as coke. Various attempts have been made to obtain valuable products from the destructive distillation of peat, but without profitable results. Kane states that 1000 parts of peat yield about 11 of sulphate of ammonia. For further information, consult: Storer, *Agriculture* (New York, 1897); Koller, *Die Torf Industrie* (Leipzig, 1898); Bach, "Peat," *The Mineral Industry*, vol. vii. (New York, 1899); Ries, "Peat," *Mineral Resources, in United States Geological Survey Reports for 1901* (Washington, 1902); Page, "Making Coal of Bog Peat," in *Iron Age*, vol. lxii. (New York, 1898); Johnson, *Peat and Muck* (Hartford, 1859). See COAL. See Plate of MOSSES AND LICHENS, with the article MUSCI, for illustration of peat moss.

PEAT BOG. See SWAMP.

PEA TREE. See PEPPER TREE.

PEAUCELLIER'S CELL. See LINKAGES.

PEAU DE CHAGRIN, pō dē shā'grăn' (Fr., Asses' Skin). A tale by Balzac (1831), in which the author incorporates portions of his own experiences and philosophy. The central idea is the conflict between the ideal and the material. The hero, Raphaël, is the possessor of a piece of ass's skin having the magic power of fulfilling material wishes, but diminishing in size each time the power is exercised, and associated with a corresponding shortening of the possessor's life. After a reckless use of its properties, Raphaël tries to refrain from wishing, but is overcome by the material side of his nature and perishes. The work exhibits Balzac's power of giving reality to the fantastic and unnatural.

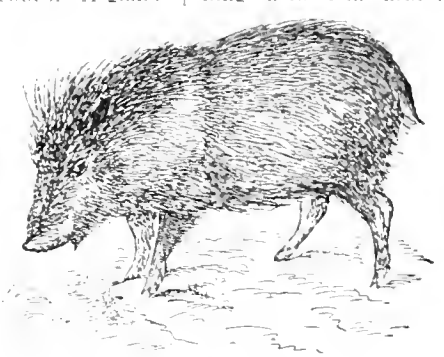
PE'BA (South American Indian name). A small armadillo (q.v.). In Texas and Mexico the name is given to the nine-banded armadillo (*Tatusia novemcincta*), which is about 30 inches long, and is notable as the only edentate that occurs in the United States. In South America the name is sometimes given to armadillos of the genus of Dasypus.

PEBRINE. A disease of silkworms. See SILKWORM.

PECAN (probably from the North American Indian name), *Hicoria pecan*. The common name of an American forest tree 75 to 170 feet high, and its fruit—a nut. (For the botany of the pecan and its forestry value, see HICKORY.) The tree is native to river bottoms from Iowa and Kentucky southwest into Texas and Mexico, but is now grown commercially in a number of other Southern States and in California. It has not proved commercially successful north of parallel 40°.

The trees grow on nearly all soils, but for nut production a sandy loam soil with a clay subsoil has proved most satisfactory in the Southern States. The trees should be set about 40 feet apart. Clean orchard cultivation should be practiced. Through cultivation and selection a number of varieties have been originated, which, since they do not come true to seed, are budded or grafted upon seedling stocks. Little pruning, except the removal of dead limbs, is required after the head has been formed. The trees come into bearing in five or six years, but paying crops cannot be expected under ten years, and full crops not under twenty. Mature trees sometimes yield as high as twenty bushels of nuts each, but two to three bushels per tree is probably a good average. The nuts have a rounded oblong shape and vary in weight from 25 to 100 to the pound. The varieties called paper shells are considered most desirable, because their shells are very thin and are easily cracked between the fingers. The meats are large and separate easily from the shell. At the present time Texas and Louisiana furnish the bulk of the commercial nuts, mostly from native trees.

PECCARY (probably from the South American Indian name). A small wild hog of the warmer parts of America, two species of which, of the genus Dicotyles, represent the swine (Suidæ) in the New World, or, in the view of some, constitute a separate family Dicotylidæ. They differ from typical swine in having a mere tubercle instead of a tail; no external toe on the hind feet; and the tusks short and not curved outward. A gland opening on the loins near the



THE COLLARED PECCARY.

tail secretes a fetid humor, and must be cut out at once after killing a peccary, or the flesh will be tainted. The common collared peccary or tajaeu (*Dicotyles torquatus*) is found in almost all parts of South America and north through Mexico to Texas and Arkansas; the white-lipped peccary (*Dicotyles labiatus*) lives in Guiana, Brazil, Paraguay, and Peru. Both species are gregarious, the white-lipped often assembling in very large herds, and sometimes doing great mischief to maize and other crops,

... attacked at night, when the animals do ... feeding. The common peccary chiefly ... forests, and small companies sometimes take up their abode in the hollow of a great tree. It is about the size of a small hog, grayish, bristly, and maned. A narrow white collar encircles the neck. The white-lipped peccary is considerably larger, of a darker color, with conspicuously white lips. Both species are capable of being tamed, but are of irritable and uncertain temper. In a wild state they defend themselves vigorously against assailants, making good use of their sharp tusks, a whole herd combining for defense. Their most dreaded enemy is the jaguar, or in the north the puma, which seizes one when it can be caught alone, but hurries into a tree to escape the onslaught of a herd. Human hunters have less to fear from them, judging by the Texas examples, than old stories would indicate. They are omnivorous, and, if hurtful to crops, render service by destroying reptiles. Their voice is somewhat like that of the hog, but more sharp. Their flesh is inferior to domestic pork. Consult: Alston, *Biologia Americana Centrali: Mammals* (London, 1879); Audubon and Bachman, *Quadrupeds of North America* (New York, 1841).

PE-CHI-LI, or **PE-CHIH-LI**, pā'chē'lē'. An old name for the province of China which is now known as Chi-li, which means 'Direct Rule,' and is so called because it is the one in which is situated the Imperial capital (Map: China, E 3). The name Pe-chi-li is in frequent use by foreigners outside of China and on maps, but is not used by the Chinese themselves.

Chi-li is the most northerly of the six maritime provinces of China proper. It is bounded on the north by inner Mongolia, on the west by Shan-si, on the south by Ho-nan and Shan-tung, on the northeast by a small portion of Liao-tung, and on the east by the Gulf of Pe-chi-li. It now includes within its jurisdiction a portion of inner Mongolia lying north of the Great Wall, where many Chinese have settled. Area, 59,949 square miles, nearly half of which lies beyond the wall.

With the exception of a number of scattered ridges of moderate height in its western and northern parts, the entire province is a plain formed by delta deposits. It is well watered by the Pei-ho (q.v.) with its numerous tributaries and their many feeders, and by the Lan-ho, which rises in Mongolia, and, like the Pei-ho, flows into the Gulf of Pe-chi-li. It is also traversed from southwest to northeast by the Yun-liang-ho or Grand Canal, which terminates at Tien-tsin. There are three lakes in the centre of the province, and several lagoons elsewhere. The province is rich in minerals, especially in coal, which has long been worked by the natives, and is now mined by modern methods at Kai-ping (q.v.). Iron is also plentiful, and silver has been found in several places. In the hills are great quarries of granite, marble, white saccharoid, and blue limestone. Except along the shores, where there are alkaline exudations, the soil is fertile and produces good crops of wheat, barley, millet, maize, cotton, tobacco, indigo, etc. The production of rice is not great; it is grown chiefly in the vicinity of the lakes. The climate is extreme, the temperature ranging from 8° F. below zero in winter to 95°, 100°, and at times 108° F. in summer. The rivers are frozen over from the middle of November to about the end of March. The shores are very low and the coast waters shallow. The chief outlet for commerce is the Pei-ho, and Tien-tsin was the only treaty port until December 15, 1901, when the port of Chin-wang-tao, near the end of the Great Wall (which had been seized by the foreign admirals operating against the Boxers in 1900, and improved by them), was thrown open to foreign trade. This has a wooden pier 2000 feet long, at which vessels drawing 16 feet can unload. The roads are very poor, but railways have been introduced and under foreign competition are extending rapidly.

For administrative purposes Chi-li is divided into 11 fu or departments, 6 chi-li-chow or subdepartments, each subdivided into a certain number of prefectures, with the rank of *ting*, *chow*, or *hien* (or *hsien*). At the head of the Government is a Governor-General, a Governor, and the usual corps of provincial officials, all of whom reside at the capital, Pao-ting-fu (q.v.). Since the opening of Tien-tsin to foreigners, however, the Governor-General finds it convenient to spend most of his time there. Of the 11 fu, one called Shun-t'ien-fu is detached from the jurisdiction of the provincial Government. Its chief city, Shun-t'ien-fu, is the seat of the National or Imperial capital, and is best known as Peking. The officer who rules the department of Shun-t'ien-fu resides here. The population of the province is estimated at 18,000,000 to 20,000,000.

PECHT, pĕkt, Friedrich (1814—). A German painter, illustrator, and art-critic, born at Constance. He was at first occupied for some years as a lithographer in Munich, then went to Paris in 1839 to study painting under Delaroche, and subsequently worked in Munich, Dresden, Leipzig, Frankfort, and London on portrait and genre pictures. A sojourn in Italy (1851-54) was devoted chiefly to art-historical studies, the results of which he embodied in *Südfrüchte. Skizzenbuch eines Malers* (1854). Settled in Munich, he became favorably known through a series of scenes from the lives of Goethe and Schiller, but more especially through his illustrations for the *Schiller-Galerie* (1855-59), *Goethe-Galerie* (1861-62), *Lessing-Galerie* (1866-68), and *Shakespeare-Galerie* (1870-76). For these publications he also supplied the text. In fresco he executed in a hall of the Maximilianeum at Munich twelve portraits of generals and statesmen (1868-71), and in the council chamber at Constance "Episodes from the History of the City" (1869-77, in collaboration with Fr. Schwörer). His publications include: *Deutsche Künstler des neunzehnten Jahrhunderts* (1877-85); *Geschichte der Münchener Kunst im neunzehnten Jahrhundert* (1886-87); and *Aus meiner Zeit, Lebenserinnerungen* (1894); and he edited *Die Kunst für Alle* (Munich, 1885 et seq.).

PECK (perhaps from *peck*, *pick*, AS. *pycan*, Icel. *pikka*, to pick, prick). A measure of capacity for dry goods, such as grain, fruit, etc., used in America, and equivalent to two imperial gallons, or 554.54 + cubic inches. It is thus the fourth part of a bushel (q.v.). See Weights and Measures.

PECK, George (1797-1876). A Methodist minister. He was born at Middlefield, N. Y.; joined the Genesee Conference of the Methodist Episcopal Church in 1816; was appointed presiding elder of the Susquehanna District in 1824; was principal of Cazenovia Seminary 1835-40, and in the last year was elected editor of the

Methodist Quarterly Review, which position he filled for eight years. In 1848 he was elected chief editor of the *Christian Advocate and Journal*, in New York, retaining the position for four years. He was pastor at Wilkesbarre, Scranton, Providence, and Dunmore; and his public labors included a period of sixty years. His published works are: *Universalism Examined* (1826); *Scripture Doctrine of Christian Perfection* (1841); *Rule of Faith* (1844); *Reply to Bascom on Slavery* (1845); *Christian Exertion* (1845); *Manly Character* (1852); *History of Wyoming* (1858); *Early Methodism Within the Bounds of the Old Genesee Conference* (1860); and *Our Country* (1865). Consult his autobiography (New York, 1874).

PECK, Harry Thurston (1856—). An American classical scholar, editor, and critic, born in Stamford, Conn. In 1881 he graduated at Columbia University, in which institution he was made successively instructor in Latin, and for a while in the Semitic languages, and in 1888 professor of Latin language and literature, after having spent some time in advanced study in Paris, Berlin, and Rome. In the line of his own researches, his publications include *The Semitic Theory of Creation* (1885); *Suetonius* (1889); *Latin Pronunciation* (1890); and he also edited *University Bulletin; A Dictionary of Classical Literature and Antiquities* (1895); *Classical Studies* (1895); *Roman Life in Latin Prose and Verse* (1895); *Trimalchio's Dinner* (1899); and a series of Latin classics for college use. In 1890 he became editor-in-chief of *The International Encyclopædia*, continuing as such until 1901, when, with President Gilman and Professor F. M. Colby, he edited *The New International Encyclopædia*. He was also the editor-in-chief of Appleton's *Atlas of Modern Geography* (1892) and of *Masterpieces of Literature* (1899). In 1895 he assumed the editorship of *The Bookman* when that magazine was established, and thereafter published the following works in general literature, besides a large number of special papers, monographs, and reviews: *The Personal Equation* (1897); *The Adventures of Mabel* (1897); *What is Good English?* (1899); and a volume of verse, *Graystone and Porphyry* (1900).

PECK, Jesse Truesdell (1811-83). A Methodist Episcopal bishop. He was born at Middlefield, Otsego County, N. Y.; studied at Cazenovia Seminary; joined the Oneida Conference in 1832; was principal of Gouverneur Wesleyan Seminary in 1837-41, and of the Troy Conference Academy at West Poultney, Vt., in 1841-48; president of Dickinson College in 1848-52; pastor of the Foundry Church in Washington, D. C., two years. In 1854 he was appointed secretary and editor of the Methodist Tract Society; he labored eight years in California as pastor and presiding elder. Returning to the East, he was pastor in Peekskill, Albany, and Syracuse, and in 1872 was elected bishop. He was one of the founders of Syracuse University. He published: *The Central Idea of Christianity* (1855); *The True Woman* (1857); *The History of the Great Republic Considered from a Christian Standpoint* (1868).

PECK, John James (1821-78). An American soldier, born at Manlius, N. Y. He graduated at West Point in 1843, and was assigned to the Second Artillery, with which he served both in the Southern and the Northern campaigns during the war with Mexico, winning by his gallantry the brevets of captain and major. In 1853 he resigned from the service and became treasurer of a projected railroad from New York to Syracuse and cashier of the Burnet Bank in Syracuse. He was a delegate to the Democratic national convention at Charleston in 1860. At the outbreak of the Civil War he accepted a commission as brigadier-general of volunteers in the Federal service. In 1862 he took part in the Peninsular campaign, and after the battle of Malvern Hill (July 1, 1862) commanded the infantry of the rear guard. On July 4th he was promoted to be major-general, and after the withdrawal of the main army from the Peninsula commanded the troops left to hold the strategic position at Suffolk (September, 1862-May, 1863). There he was attacked by Generals Longstreet and D. H. Hill with a superior force, but managed to hold his own until General Hooker's movements before Fredericksburg caused the Confederate Government to send its forces north. He was mustered out of the service on August 24, 1865, and in 1867 he organized the New York Life Insurance Company at Syracuse, of which he was president until his death.

PECK, Samuel Minturn (1854—). An American poet, born in Tuscaloosa, Ala. He was educated at the University of Alabama and in New York. His poems are collected under the titles: *Cap and Bells* (1886); *Rings and Love-Knots* (1893); *Rhymes and Roses* (1895); and *Fair Women of To-day* (1895). His best known song is "The Grapevine Swing."

PECK, Tracy (1838—). An American Latinist, born at Bristol, Conn. He graduated from Yale in 1861 and continued his studies at the universities of Berlin and Bonn, Germany. From 1871 to 1880 he was professor of Latin at Cornell University. Since the latter date he has held a similar position in Yale College. In 1898-99 he was director of the American School of Classical Studies at Rome. His publications include papers read before the American Philological Association, and an edition with Professor Greenough of *Livy*, books xxi. and xxii. (Boston, 1893). With Prof. C. L. Smith he is editor-in-chief of the *College Series of Latin Authors*.

PECK, William Guy (1820-92). An American soldier and mathematician, born at Litchfield, Conn. He graduated at West Point in 1844, and was assigned to the corps of topographical engineers. In 1845 he accompanied Frémont's third exploring expedition through the Rocky Mountains, and during the war with Mexico served under General Kearny in the Army of the West. In 1847 he was appointed assistant professor of mathematics at the Military Academy, but in 1855 he resigned from the army and became professor of physics and engineering at the University of Michigan. In 1857 he accepted the position of adjunct professor of mathematics and astronomy at Columbia, and in 1861 he was promoted to the chair of mathematics, mechanics, and astronomy. He published a number of excellent elementary text-books on mathematics, and was joint editor with Prof. Charles Davies of the *Mathematical Dictionary and Cyclopædia of Mathematical Science* (1855).

PECKHAM, pĕk'ăm, Rufus William (1838—). An American jurist, born in Albany, N. Y.

He was educated at the Albany Academy and in Philadelphia. He was admitted to the bar in 1859, and in the following year succeeded his father, Rufus Wheeler, as law partner to Lyman Tremain. As district attorney of Albany County, Peckham served for three years. He was counsel to the Albany and Susquehanna Railroad in its famous suit against the Erie Railroad; and in 1881 was successful in the national bank tax cases before the Supreme Court. At the same time he had entered politics and was a representative to the Democratic national conventions of 1876 and 1880. He became corporation counsel of the city of Albany in 1881; was justice of the New York State Supreme Court (1883-86); and, during his term as justice of the State Court of Appeals in 1895, was appointed associate justice of the United States Supreme Court.

PECKHAM, Wheeler Hazard (1833—). An American lawyer, son of Rufus Wheeler Peckham, born in Albany and educated at Union College. He studied law in the office of Peckham and Tremain, practiced in New York City with his father, then in Saint Paul until 1862, and in 1864 again in New York. His growing fame as a constitutional lawyer and his argument on the constitutionality of taxing greenbacks won him the friendship of his opponent in this case, Charles O'Conor, who as Deputy-Attorney-General during the exposure of the Tweed ring made Peckham his assistant. In 1884 he was appointed district attorney of New York City, but soon returned to law practice in the firm of Miller, Peckham & Dixon. In January, 1894, President Cleveland nominated him for the Supreme Court, at a time when he was president of the State Bar Association. But the nomination was not confirmed by the Senate, because of the opposition of the New York Senators to Mr. Peckham's anti-machine Democracy. In 1896 he took a firm stand in favor of sound money.

PECKSNIFF. A character in Dickens's *Martin Chuzzlewit*, a pompous hypocrite and fraud, who pretended to carry on a school for architects, but really plundered and abused his pupils. His daughters were Merry and Cherry, one of whom married Jonas Chuzzlewit, while the other was the victim of unrequited love.

PE'COCK, Reginald (c.1395-c.1460). A British Bishop of the Roman Catholic Church, born in Wales. He was educated at Oxford, and was ordained a priest in 1421. Ten years afterwards he was master of Whittington College, London, and he was appointed rector of Saint Michael's, in Riola, Bishop of Saint Asaph's (1444), and of Chichester in 1450. He took an aggressive part in the controversy with the Lollards, who were striving to abolish certain rites of the Church of which he approved, and published an introduction to the Christian faith in dialogue form, entitled *Donet* (c.1440), and *Repressor of Over Much Blaming of the Clergy* (c.1455). In his *Book of Faith* (c.1456, partially printed in 1688), he argued against the infallibility of the Church, and in later works went so far as to deny the authenticity of the Apostles' Creed and to place reason above authority. For these and other heresies, forerunners of modern toleration, he was called to account before Henry VI. and his lords at Westminster (1457) and was given the choice between the stake and recantation. He chose the latter, his fourteen books were burned, and he ended his days in a cell of Thorney Abbey, Cambridgeshire.

PECOS, pā'kŏs. The principal tributary of the Rio Grande. It rises at the foot of Baldy Peak, near Santa Fé, in north-central New Mexico, and flows first southeast, then southward along the western escarpment of the Llano Estacado, turning again southeast in Texas, and emptying into the Rio Grande 36 miles northwest of Del Rio, Texas, after a course of 800 miles (Map: Texas, C 4). In its upper course it flows through a cañon-like valley, and it receives nearly all its tributaries from the west. Near Carlsbad, N. M., storage reservoirs have been constructed for irrigation purposes.

PECQUET, pe'kâ'. Jean (1627-74). A French anatomist, born at Dieppe. He studied medicine at Montpellier, where he soon made the important discovery of the course of the lacteal vessels, including the *receptaculum chyli*, or reservoir of Pecquet, as it is sometimes called, and the termination of the principal lacteal vessel, the thoracic duct, into the left subclavian vein. His principal works are: *Experimenta Nova Anatomica* (Paris, 1651; Amsterdam, 1661; trans. into Eng., London, 1653); *De Circulatione Sanguinis et Chyli Motu*, and *De Thoracicis Lactcis* (1654).

PÉCS, pāch. The native name of a royal free town of Hungary. See Fünfkirchen.

PECTASE (from Gk. *πηκτικός, pēktikos*, congealing, from *πηγνύναι, pēgnynai*, to solidify). An enzyme (q.v.), widely distributed in plants, attacking certain of the constituents of the cell wall. The formation of vegetable jellies from ripe fruits is mainly dependent upon the action of this enzyme. The substances it decomposes may be termed in general pectins. Their composition and relationships are not thoroughly understood, though they are undoubtedly allied to the carbohydrates, especially to cellulose. In the presence of minute quantities of pectase and of a calcium salt in solution, the pectins are decomposed and form pectose and calcium pectate, which gelatinize promptly. Pectase, therefore, is to be reckoned as one of the clotting enzymes. When fruits are boiled and the juice is expressed and allowed to cool it sets into a jelly; because the pectase and pectins extracted therefrom react, and in the presence of the calcium salts, always found normally in plants, set into a jelly, entangling the other dissolved and suspended materials present.

PECTEN. See Scallop.

PECTORAL SANDPIPER (Lat. *pectoralis*, relating to the breast, from *pectus*, breast). A well-known migratory sandpiper (*Tringa maculata*) of North America, called 'grass-snipe,' 'jack-snipe,' and 'meadow-snipe' by gunners. It owes its booknamc to an extraordinary ability on the part of the male to puff out its throat (œsophagus) after the manner of a pouter pigeon. (The act is depicted on the Colored Plate of Shore Birds.) It was first noticed by Edward Adams (*Proceedings Zoölogical Society of London*, 1859), and afterwards confirmed, described, and figured by Nelson, Murdoch, and others in their works on the natural history of Alaska (cited under Alaska), where it has its summer home. This performance is a part of its courtship, not only as an attention to the female, but

as a menace to rivals. (Compare RUFF.) During its migratory visits to the United States it is a favorite with sportsmen, because of its game-like manner of lying well in the grass before a dog, and its crooked, snipe-like flight. Moreover, its flesh is exceedingly palatable.

PECTORILOQUY (from Lat. *pectus*, breast + *loqui*, to speak). The term applied to a distinct transmission of articulate voice-sounds when the ear or stethoscope of the listener is placed upon the chest wall. This phenomenon was discovered and named by Laennec (q.v.). In the normal chest the voice sound is transmitted through the lung substance of the patient to the ear of the listener only as a distant, muffled sound, known as *vocal resonance*. Over the bronchi this vocal resonance is increased, the voice sounds become nearer and louder. When there is an approach to articulate speech, this is called *bronchophony*, and occurs also over portions of lung tissue which have become solidified by disease. In pectoriloquy, however, the voice is not only louder and plainer, but words and even syllables are perceived with startling distinctness. The pathological conditions under which this occurs are either a consolidation of the lung substance connecting a large bronchus with the chest wall, which consolidation acts as an unusually perfect conductor of the vocal vibrations; the presence of a cavity in the lung having free communication with a bronchus, in which case the sound is conveyed by air; a pneumothorax having open connection with a bronchus; or, more rarely, compression of the lung by an extensive pleuritic effusion. (See PLEURISY.) As a rule pectoriloquy is interpreted to mean the existence of a cavity in the lung with a thin layer of solidified tissue between it and the chest wall.

Whispering pectoriloquy is produced, under the same conditions mentioned above, when the patient whispers instead of talking. It is a curiously distinct reproduction of the whispered words, and is a test of much delicacy and exactness.

PEDAGOGY, pĕd'ă-gō'jĭ, or **PEDAGOGICS** (from Gk. *παιδαγωγία*, *paidagōgia*, training of children, from *παιδαγωγός*, *paidagōgos*, trainer of children, from *παῖς*, *pais*, child + *ἀγωγός*, *agōgos*, leader, from *ἄγειν*, *agein*, to lead). The science of education; a body of facts and principles bearing on the aims and methods of effectively equipping the young for life—aiding them in attaining their spiritual majority, and fitting them for their vocation. It is still in its infancy; comparatively few of the problems pertaining to education either in the home or at school are as yet solved by applying established principles in a scientific manner. Numerous and complex, these problems can be worked out only by the help of the sciences of psychology, physiology, ethics, sociology, and anthropology, and in the light of the spirit of the time, the ideals of the nation, and existing local conditions. Any solution of them, indeed, is impossible, except through the coöperation of the various institutions that make up society: the home, the school, the Church, the diverse vocations, and the State in its several functions. That the present time is marked by progress toward more efficient coöperation between these factors is gratifying.

While there are certain fixed factors in education, and certain principles of universal application, the greater part of the educational field is characterized by adjustment and change. With the growth of cities, home life is revolutionized; inventions and discoveries make possible and necessary the introduction of new subjects, and the changing of old ones; foreign-born children require a somewhat different curriculum from that of native-born children, city children from country children; in a commercial centre, a high school of commerce is a necessity; an industrial community calls for industrial schools; the children of a farming district should have opportunity to study the elements of agriculture; schools of forestry are the natural preventive of the denudation of forest lands; in an age of pressing economic problems, it is an anomalous condition that the study of economics should be postponed till the college course. The study of Latin clearly cannot hold the same place in the twentieth century that it held in the sixteenth or even the nineteenth.

The expansion of modern knowledge and the complexity of modern life are reflected in the modern crowded curriculum, and in the problems to which it gives rise. In a 'three-R' elementary curriculum, or in a college course consisting largely of Greek, Latin, and mathematics, the choice of studies was only an academic question; with a multitude of subjects to choose from, the question of educational values becomes vital. This question has been asked and answered in various ways. With Herbert Spencer it took the form: What knowledge is of most worth? Spencer's answer was, Science, by which he meant the scientific habit of mind in mastering those subjects which bear on man's efficiency in society, including, primarily, the natural sciences and history, with literature and art subsidiary to these. Nicholas Murray Butler, in an essay bearing the same title, assigns the highest place to those subjects that afford in the highest degree nurture and exercise to man's spiritual nature, and in this judgment modern educators generally agree with him. Attacking this same problem at closer quarters, Commissioner William T. Harris asks the question, What groups of subjects are essential to a complete education? and gives this answer: There are six coördinate groups of studies: (1) Mathematics and physics, which give us the command of nature quantitatively; (2) biological science, which gives us the key to the organic phase of nature; (3) literature and art, which reveal human nature in its intrinsic form, and show man in his relation to social institutions; (4) grammar and language, and studies allied with them, such as logic and psychology, which enable the mind to know itself analytically; (5) history, or the study of the development of the State and its relations to the individual; (6) religion, which looks at human experience and knowledge in their relation to God. An education which should not provide at least the elements of each group would be incomplete.

The question still remains, Upon what principles shall studies be chosen within these groups? A favorite way of approaching this question has been to classify all subjects (1) as giving discipline to the faculties of the mind; (2) as giving practical training for life; (3) as giving culture. Thus, bookkeeping and spelling are valued chiefly for their practical value; algebra

and grammar for their disciplinary value; literature and art for their power to give that sympathy, appreciation, and insight into the meaning of life which we call culture. But it is clear that no subject is without some value in each of these departments. And, further, it appears that much depends on the method of teaching, the purpose in view, and individual attributes; the same study may serve now as a bread-and-butter subject, now as a culture subject, according to circumstances. The same study may train memory or reason, according to the method employed; or the same study may be good for one pupil, and not so good for another. Moreover, with the fall of the faculty theory in psychology, the dogma of formal discipline has been discredited. It is held that there is no such thing as training 'the memory,' and that to transfer skill acquired in one department to another department is not in any strict sense possible. It follows that, in any given case, considerations of environment, aptitude, aim in life, and method must have greater weight in determining the choice of studies than values assigned to studies in the abstract. These considerations furnish justification from one point of view for the expansion of the modern curriculum and the concomitant development of the elective system.

At what point shall studies be introduced? This question is to be answered partly in the light of the capacity of the child, and partly in the light of the culture-epoch theory, which assumes that the child in his development passes through a series of stages corresponding closely to the epochs through which the race has passed in its progress from primitive to modern culture. Gen. Francis A. Walker, after investigating the study of arithmetic in the elementary school, protested against 'prying up' the powers of the child by giving him tasks for which he was not yet ready, and which he could in due time perform naturally and easily. On similar grounds, it has been proposed to decrease the amount of reading and writing called for in the first three years of school; but advocates of this plan seem not to give sufficient weight to the fact that children in these very years show a decided tendency to perform these activities, and a marked ability to master them. It is clear that to postpone the study of mythology and of mediæval history until the child has passed the culture epoch to which they appeal involves waste. The application of this latter principle, however, is made difficult by the fact that the youngest child is a member of the modern world as well as of the primitive world—that he can and must learn about the arrangements for heating and lighting his own house as well as about back-logs and tallow candles.

Children in the elementary school sometimes carry as many as fifteen so-called 'subjects' at one time: how shall they be kept from being overwhelmed by the multiplicity of subjects and interests? Certain well-established principles throw light on the solution of this problem. First, the doctrine of apperception, which asserts that the mind acquires knowledge by means of knowledge already possessed—that what we can learn is conditioned absolutely by what we have to learn with. Secondly, the principle of self-activity, which affirms that the child is not primarily a knowing being, but an active being, whose instincts and impulses start him on the way to knowledge, and whose practical needs teach him to think. Empirical observation attests the truth of these principles; it has been conclusively shown, for example, that under the old régime children learned the little they had to learn with greater difficulty and strain than they accomplish their greatly increased tasks, if only the work be properly organized and conducted.

In order to understand the various attempts at *correlation*, it is necessary to consider the evolution of the idea. The revolt against the isolation of studies was the outgrowth of Herbartian doctrines. According to Herbart, 'erziehender Unterricht'—instruction that educates, or education through instruction—expresses the aim and the chief means of formal school work. Now, education means moral character-building, and character is produced by the training and culture of volition—the will being reached only through the emotions, these in turn depending on ideas. But not from ideas in any form and relation do emotional warmth ('interest') and volitional energy spring, but only from those ideas that are knit into a living whole. Hence the fundamental significance in the Herbartian pedagogy of the phrase *'circle of thought,'* by which it is meant that instruction should be both many-sided and closely connected; and hence the capital rôle played in the same system by *interest*—interest being that condition of mind of which the cause is knowledge made real and vital through being related, and of which the effect is volition. The early schemes of correlation were produced in Germany and were characteristically formal, treating correlation as chiefly a question of curriculum, and so perhaps better described as schemes for the *coördination* of studies. Usually, however, German plans of coördination took the form of *concentration*, whereby certain studies were made dominant and others were treated as subsidiary to them. There was no agreement as to what studies should be the core, some choosing literature and history, others natural sciences. In America, under the impulse of Herbartian ideas, much fruitful experimenting has been done, at first after the German manner (taking *Robinson Crusoe*, for example, as the central subject of a year's work and 'relating' arithmetic, geography, reading, drawing, manual training, and other studies to this core), and later in ways independently American. For the most part, this latter work may be described as *informal correlation*. For example, a part of the work of a year or a part of the year in a certain grade may cluster around the reading of *Hiawatha* and the making and decorating of various objects illustrative of the story, no attempt, however, being made to confine the work in arithmetic, geography, and nature-study within the limits of Hiawatha's life. Even where correlation is not recognized in the curriculum there is an increased tendency to recognize the manifold inter-relations which exist between all subjects and parts of subjects. In support of such partial schemes it is claimed (1) that variety and difference are as essential to wholesale mental development as are identity and relatedness; (2) that the child studies with intense interest and with assimilation so apparently isolated a study as arithmetic; (3) that a correlating teacher can make an apperceptive child even without a correlated curriculum. But there can be no doubt that waste is

often avoided by studying at the same time subjects related both to each other and to the theoretical and practical interests of the child.

The most important single contribution to this subject made by American educators is the monograph *Interest as Related to Will*, by Prof. John Dewey, in which interest is represented as arising when the child does that which makes for self-expression (self-realization). This view not only places interest in its proper subordinate place, but also makes it clear that a curriculum is not to be worked out in the closet, and that character-building does not necessarily result when the child is occupied with apparently interrelated studies. In the practical working out of this principle, the child, with his manifold impulses to act, his interests, his social relationships, his spiritual environment and heritage, becomes the core of correlation, and those creative social activities that have to do with providing food, clothing, shelter, and æsthetic expression become the gateway both to knowledge and to character. The influence of this insight into the dynamic nature of education (whereby 'educative activity' is substituted for 'educative instruction') has been and is destined to be profound and far-reaching.

In an ideal system of education, the pupil would pass without loss of time or energy from the kindergarten into the elementary school, thence into the high school, college, and professional school. Between the kindergarten and the elementary school, on the one hand, and the college and the professional school on the other, the transition is now, indeed, measurably natural and easy. But the transition from elementary school to high school and from high school to college involves considerable waste, which it is being attempted to obviate through conference, discussion, and experiment.

The foundation principles of education may for the present purpose be summarized in the form of an answer to the question, Wherein does the so-called 'new education' differ from that system which it has replaced or is replacing? Ever since the rise of democratic institutions, there has been developing a new conception of the worth of the individual; and during the past fifty years this conception of the individual has been modified and reinforced by a new conception of society. It is now coming to be vividly realized that the ideal of individual development is realized in the highest social efficiency, and that the ideal social or institutional development demands individuals that have attained perfect self-realization. This insight has been reflected in educational aims and methods. In the old education, based on a certain lack of faith in the individual and on contempt for the body and this present world, the characteristic notes were authority, intolerance, and disregard of hygienic laws; the mainstay in teaching was naturally memorizing. The new education is based on respect and even reverence for humanity —on belief in the worth of the present moment, and on the doctrine of evolution. Its dominant features are, therefore, appeal to individual observation, experience, judgment, reason—enrichment of school programmes; and enlightened consciousness of the differences in individuals, and a consequent tolerance and adaptation. Under the impulse of these conceptions school hygiene is recognized as an important adjunct to pedagogics; psychology, instead of dealing only with traits supposed to be common to all, is investigating those peculiar to types and even to individuals; child study makes careful studies of actual children at various stages of development in order to determine effective ways of dealing with each type at each stage. As for educating the child to be a social being, the new education proceeds by regarding and treating him as a social being from the start. The most advanced schools of all grades are those which recognize most fully the possibilities of social training latent in the class, the school, the playground. Constructive work, especially the form known as group work (where all the members of the class are engaged on a common project, each contributing his share) is a fine illustration of how a subject can contribute to both individual and social development. Mention has already been made of the recognition of the need of adjusting the child to his social environment through the curriculum. The bearing of these ideas on *moral education* is obvious. Morality is to be attained in the individual as such only through his own free and responsible choosing to obey law; it is best to be attained in the individual considered as a social unit by living morally in the society of which he is a member—the family, the school, the neighborhood.

The main objection urged against the new education is that it fails to provide for training that power to "endure hardness as a good soldier" which is the bone and sinew of character; that in suiting school work to the grain of a child's disposition it fails to prepare for those demands of life which go against the grain. It is a sufficient answer to this objection to say: (1) that bone and sinew are none the less firm, and they are the more useful, when developed by growth rather than inserted ready-made; and (2) there is no virtue or strength either in school or in life to be gained by overcoming difficulties merely by a dead pull; the secret of power in performing difficult tasks is the ability to raise any task above the level of drudgery into relation with life as a whole. By giving this power, the new education greatly multiplies the ability to overcome obstacles.

Educational Methods. The word 'method' is used in two senses: (1) to designate those special rules which are applicable to the teaching of a particular subject; and (2) to designate general modes of procedure applicable to all subjects. Examples of the first are the various methods of teaching reading, as the phonetic method, the sentence method, the word method, etc. Each of these methods can be defended on psychological grounds, yet each is incomplete. The most effective method is that which combines the good points of all methods into one. The final test of a method is not, "Can arguments be made in its favor?" but "Will it work?"

Under the head of 'general method' belongs the doctrine of the *formal steps of instruction*. This doctrine is based on the assumption that the mind must follow a certain order of processes in grasping any subject presented to it: there must be *preparation* of the ideas already in the mind, *presentation* of the new facts, *comparison*, *abstraction*, *generalization*, whereby the meaning of the facts is arrived at and stated in terms; and, finally, *application*, whereby the knowledge thus gained is translated into life. The essential value

of this doctrine lies not so much in its assumption of an unchanging time order of processes, as in its emphasis of the fact that there are certain processes which are essential to a complete act of instruction.

Using 'general method' in the sense of a law of teaching applicable to any subject, the following maxims may serve as examples: (1) In all teaching, whether in instruction or in training, let spirit be uppermost, and mechanism subordinate to it. This is the first and great commandment; upon it are based a multitude of specific directions: such as, thought first, form second; interest first, then criticism; praise first, if possible, and let blame be simply the subtracting from a fund of praise; let the teacher's first aim be to lead the pupil to love a subject, and afterwards he may do what he will; seize the moment of excited curiosity that it may not run to waste—an impulse of the human spirit is a power which the teacher cannot produce at will, but which, unfortunately, he can cramp and suppress; on the other hand, the teacher should make mechanism his ally, not his enemy. 'Drive thy habits, let them not drive thee.' (2) A second general principle may be stated thus: We learn most effectively by our own activity under the spur of a practical interest. We learn least effectively when we are least active and least interested. A teacher who applies this principle will multiply opportunities whereby his pupils may learn by experience, by discovery, by executing; by object lessons, laboratory and shop work and the relations of school life; whereby they may apply what they have heard or read or gained in any second-hand way, thus supplying, though in the reverse order, the element reality. (3) A third general principle of teaching may be described as learning by thinking. The teacher who follows this leads his pupils to avoid being swamped by details, because, grasping together many particulars into a convenient bundle duly tagged, he will form in them the habit of foresight and forethought, and he will develop in them the power to search out meanings and to find the essential point of a problem, a situation, or an argument.

In deciding the order to be followed in teaching the topics in a subject, two conflicting systems have held sway. The first arranges the topics of the subjects in logical order, ignoring the fact that what is first in experience is last in thought, that the psychological order is usually the reverse of logical order. The second arranges the topics with reference to the child's supposed needs; either (1) teaching related processes concurrently (as in the Grube method in arithmetic) and carrying a number of topics abreast, returning to each at more or less regular intervals with increased power, as in the *spiral method*, or (2) determining the order of topics rather by the need of the child than by the strict development of the subject; for example, introducing the subject of osmosis at the point when the children are eager to understand how the root of a plant receives nourishment from the earth.

By the *inductive method* of teaching, a pupil is led from facts to generalizations; for example, in natural science where individual forms are first observed, then classified according to essential characteristics; and in the study of syntax, where the rule is formulated after several cases of the construction are observed and compared.

By the *deductive method*, the teacher or the author first states a principle and then proceeds to elucidate and exemplify it, as when in grammar the definition of noun is given and then examples of nouns. Each of these methods has its own field, every subject having its deductive and its inductive stage, and every study of any subject being partly deductive and partly inductive. In the *Socratic method*, the teacher asks questions designed to lead the pupil to think about what he already knows, to see his mistakes, revise his judgments, and discover the truth. This method is especially applicable in subjects involving moral or æsthetic judgments, where the pupil has experiences and knowledge more or less unorganized. Akin to this is the *method of discovery*, which leads the pupil to experiment, observe, infer, and formulate conclusions. In all the above methods the principle of self-activity and participation is called in. Often combined with these is the *method of discussion*, in which the teacher proposes, or has members of the class propose, theses to be defended. The advantages and dangers of this method are extreme. Great skill and address, together with the power of summarizing the discussion, are required in the leader. All these methods aim to make the pupils ready, resourceful, self-reliant. They need to be supplemented by some form of the *lecture method* or by the *text-book method*, which are strong on the side of exactness and breadth. The *recitation* (which is the name applied in the United States to class exercises in general) varies in efficiency according to the method pursued. The minimum of advantage results if the time be spent in saying lessons learned memoriter from a book, or in reciting facts more or less known to all the class. A class exercise is at its best when the class is engaged upon some problem toward the solution of which each one, including the teacher, from his peculiar point of view, contributes his proper share. It has been proposed that instead of recitations in which the quick and the slow proceed at the same rate, each pupil should be allowed to go at his own pace under the guidance of the teacher. This plan (known as the *Pueblo plan*), though it contains an element of wisdom, is of only limited application. Its vital defect lies in its failure to recognize sufficiently the social value of the recitation.

PEDAL (Lat. *pedalis*, relating to the foot, from *pes*, foot). Any part of a musical instrument acted on by the feet. The pianoforte, the harp, and the organ are furnished with pedals, which, however, serve an entirely different purpose in each instrument. In the pianoforte their object is to effect a change in the quality or in-

tensity of the sound: the damper pedal prolongs the sound after the finger is lifted from the key, and the shifting or *una corda* pedal softens the tone. The pedals of the harp are the means by which the chromatic changes of intonation are effected. In the organ the pedals are keys put in action by the feet. The division of the organ which is connected with the foot-keys is called the pedal organ, and contains the largest pipes. The introduction of pedals in the organ has been attributed to various men, among them a German of the name of Bernhard, who lived in the fifteenth century. Pedals known as *combination pedals* are also used in the organ by which certain fixed combinations of stops may be utilized. Recent improvements in organ-building have made possible the choice of such combinations by the performer, who before commencing to play arranges the combinations he wishes to use, to act on the swell and on the stops. See ORGAN.

PEDAL-POINT. See ORGAN-POINT.

PEDDLER. A person who travels from place to place selling at retail goods, wares, and merchandise, which he carries about with him. Peddlers are to be distinguished from ordinary traveling salesmen, who sell goods by sample and have a recognized headquarters from which the goods are shipped. Because of the irresponsible character of most peddlers and the difficulty of tracing fraud or other crime to them, statutes have been enacted in almost all of the United States requiring them to take out licenses and to conform to certain other regulations, such as wearing a badge or shield, bearing their license number, where it can be easily seen. See LICENSE.

PEDEE', GREAT. A river in South Carolina. See GREAT PEDEE RIVER.

PEDESTAL (It. *piedestallo*, base of a pillar, from *piede*, from Lat. *pes*, foot + *stallo*, from OHG. *stal*, Ger. *Stall*, stall). A base for columns, statues, vases, etc. The pedestal is much used in classic (especially Roman) architecture. Like the column, it has a base, a body or central block, and a capital or cornice, usually called the surbase. The shaft or plain block is called the dado or die.

PEDIC'ULA'RIS (Lat., lousy). A genus of more than 100 herbs of the natural order Scrophulariaceæ, some of which have rather large and finely colored flowers. Several species have been called lousewort, the English equivalent of Pedicularis, from their supposed influence in producing the louse disease in sheep. Their acridity seems to make them injurious as sheep food. Many species are found in Continental Europe and Northern Asia, and some in North America. A few species are cultivated chiefly for their finely cut beautiful foliage. *Pedicularis Canadensis*, wood betony, is the most common species in the United States.

PEDIC'ULA'TI (Neo-Lat. nom. pl., from Lat. *pediculus*, little foot, diminutive of *pes*, foot). An order of marine fishes having the carpal bones elongated into a kind of arm which supports the broad pectoral fin, and the anterior dorsal fin reduced to a few tentacle-like, mostly isolated, spines; the anglers (q.v.), frog-fishes, etc. See Plate of ANGLERS AND BATFISH.

PEDIGREE (of uncertain etymology; perhaps from OF. *pied de grue*, crane's foot, in allusion to the resemblance of the lines of a pedigree to a bird's foot). Family relationship traced back through a number of degrees or generations, sometimes including the record of births, marriages, and deaths. The term is most frequently employed in the law in connection with a rule of evidence which forms one of the exceptions to the so-called 'hearsay rule' of evidence, and may be generally stated to be, that statements as to the pedigree of the party in question made by a blood relative of that party, as a brother, since deceased, may be repeated by a witness who heard them made. See AFFINITY; CONSANGUINITY; EVIDENCE; KIN, NEXT OF.

PEDIMENT (Lat. *pedamentum*, prop for a vine, from *pedare*, to furnish with feet, from *pes*, foot). The triangular space over the colonnade at the ends of the roof of classic buildings. It is inclosed by the horizontal and the raking cornices, the latter following the slopes of the roof and corresponding to the cornice of the entablature. The pediment may be called the gable of classic buildings. In Greek temples the pediment was frequently enriched with sculpture, for which it forms a fine setting. The finest examples are the pedimental sculptures of the temples of Ægina, Olympia, and the Parthenon at Athens. The doors and windows of buildings of the Renaissance are often surmounted by pediments, either straight-sided or curved, and the form was also used in mediæval structures for façades and minor architectural parts. In such cases the terms to use are more properly gable (q.v.) and fronton.

PEDOMETER (from Lat. *pes*, foot + Gk. *μέτρον metron*, measure). An instrument resembling a watch and used for measuring distances traveled by walking. Such an instrument usually records on a dial plate the number of steps taken by the person carrying it.

PEDRARIAS DÁVILA, pā'drā-rē'ās dā'vē-lā (*c.*1440–1530). A Spanish administrator in America, born in Segovia, Spain. Pedro Arias de Avila was his proper name, but historians have contracted it. He distinguished himself in the conquest of Granada, and he served in the New World as governor of the Spanish colonies on the Isthmus of Panama in 1514. He found a rival there in Balboa, whom he finally executed (1517). This deed put Pedrarias out of favor with the Spanish Court, but the emissaries sent to dislodge him failed in their mission, and he continued governor, founded Panama (1519), and extended his sovereignty by settling colonies to the north and south. But he was jealous of any one else attempting the same, hindered Pizarro as much as he could, and had Córdoba beheaded for trying to league himself with Hernando Cortés at Honduras. For these and other tyrannical acts Pedrarias was called upon to exchange the governorship of Panama for that of Nicaragua, where he died.

PEDREGAL Y CANEDO, pā'drā-gäl' ē kā-nā'thō, MANUEL (1832–96). A Spanish politician and author, born at Grado. He studied law, and took a prominent part in politics as an ardent Republican. After the abdication of Amadeus, in 1873, and during the period of the Republic, Pedregal was twice Minister of Justice, and once Minister of Finance. The following year he

reformed to private life and devoted himself to study, and to the foundation of the Institución Libre de Enseñaza, of which he was made rector in 1883. He reëntered politics in 1882 as Deputy from Oviedo, and with Azcárate, Salmeron, Labra, and others, organized the Republican party called 'centralista,' which has stood for the best element in radical politics. His works include *El poder y la libertad en el mundo antiguo* (1878); *Estudios sobre el engrandecimiento y la decadencia de España* (1878); *Elección presidencial de los Estados-Unidos* (1892); *Nociones de hacienda pública* (1881); and *Sociedades cooperativas* (1888).

PEDRELL, pā-drĕl'y', Felipe (1841—). A Spanish writer on music. He was born at Tortosa, studied music, and in his earlier period composed considerably. His works include the operas *El último Abencerraje* (1874), for which he wrote music and book, *Quasimodo* (1875), and *El Tasso en Ferrara* (1881), and the lyric dramas *Cleopatra*, *Mazeppa*, and (1894) *Los Pirineos*, as well as songs and masses. In all these works there is originality and an evident effort to build up a national musical style. Of even more importance is Pedrell's works as a critic and historian of music. The two great works, *Hispaniæ Schola Musica Sacra* (1894 sqq.) and *Teatro lírico español anterior al siglo XIX* (1897 sqq.), are original and able. His lexicographical labors include *Diccionario técnico de la música* (1894) and a biographical dictionary of Spanish and Portuguese musicians (1897 sqq.).

PEDRO I., *Port. pron.* pā'drô (Dom Antonio Pedro de Alcantara Bourbon) (1798-1834). Emperor of Brazil. He was the second son of John VI., King of Portugal from 1816, and was born at Lisbon, October 12, 1798. In 1807 the royal family fled to Brazil before the invading armies of France. There John VI., on the death of his mother, Maria I., was crowned King of Portugal, and Dom Pedro, heir apparent since the death of his elder brother (1801), attained much influence in politics in spite of his youth and his rather irregular education. In 1821 King John returned to Portugal and Dom Pedro was made Regent of Brazil. He soon threw in his lot with the Brazilian national party, who were disgusted by the systematic preference shown to the Portuguese in the appointment to high offices in Church and State. The separatist movement attained formidable proportions, and on October 12, 1822, Dom Pedro was proclaimed Emperor of Brazil. The slight resistance made by Portugal was easily overcome, and in 1825 the mother country acknowledged the independence of Brazil. The popularity of the Emperor, which was at first very great, was gradually weakened by the arbitrary measures taken against the Republican faction, and his acceptance of a new constitution in 1824 did not materially mend matters. In 1828 the Province of Uruguay succeeded in establishing its independence of Brazil. Opposition to the Government increased, and Pedro at length, April 7, 1831, abdicated in favor of his son, Pedro II., and went to Europe. He had been proclaimed King of Portugal upon the death of his father, in 1826, but had resigned the throne in favor of his daughter, Donna Maria da Gloria, who had been set aside by her uncle, Dom Pedro's younger brother, Miguel (q.v.). The ex-Emperor invaded Portugal in the early part of 1832 with an army largely made up of English and French volunteers, to make good his daughter's title to the throne. He occupied Oporto in July, and a year later made his entry into Lisbon after his admiral, Sir Charles Napier had vanquished the fleet of Dom Miguel off Cape Saint Vincent. The usurper was forced to abandon all claims to the throne in 1834. In August, 1834, Dom Pedro was chosen Regent of the Kingdom, but he died on September 24th of the same year, two days after the coronation of the young Queen, Donna Maria.

Armitage, *History of Brazil* (London, 1836), gives an excellent account of events during the residence of the Braganza family in Brazil.

PEDRO II. (?-1213). King of Aragon. A brave soldier and a gifted troubador. He succeeded his father, Alfonso II., in Aragon and Catalonia in 1196, and in France he secured the lordship of Montpellier. He was crowned at Rome in 1204, and promised to send a yearly tribute to the Papal chair. His efforts to impose a new tax on his people aroused opposition on the part of the nobility and the towns, and these formed a league against him. In 1212 he entered into an alliance with the kings of Castile and Navarre against the Almohades (q.v.), which resulted in the great victory of Las Navas de Tolosa on July 16. The next year he crossed into France to aid the Albigenses against Simon de Montfort (q.v.), and was killed at the battle of Muret, September 2, 1213.

PEDRO II. (Dom Pedro de Alcantara) (1825-91). Emperor of Brazil. He was the son of Emperor Pedro I. and was born at Rio de Janeiro, December 2, 1825. He was but five years old when his father abdicated in his favor, April 7, 1831. During his minority the country was governed by a regency. He was declared of age in 1840, was crowned in 1841, and married in 1843 Theresa Christina, sister of Ferdinand II. of the Two Sicilies. His sons died in childhood, and his daughter Isabella became heiress to the crown. The early years of the reign of Pedro II. were marked by revolutionary disturbances within the country and complications with the neighboring South American States. Revolts in the provinces of Sao Paulo and Minas Geraes were suppressed in 1842, as were similar insurrections in Rio Grande do Sul in 1845, and Pernambuco in 1849. In 1851 Brazil assisted General José de Urquiza, Governor of Entre-Rios, in his struggle against Rosas, the dictator of Buenos Ayres, and was instrumental in bringing about the fall of the dictator. A five years' struggle in conjunction with Uruguay and the Argentine Republic against Lopez, the dictator of Paraguay (1865-70), ended in the triumph of the allies. In 1867 Dom Pedro opened the Amazon to the commerce of all nations. In 1871 a law was passed for the gradual abolition of slavery, which was hurried to its completion by popular demonstrations in 1888. Dom Pedro's administration was conducted with tact and good judgment. On November 15, 1889, however, as a result of a revolution instigated by the officers of the Brazilian army, Dom Pedro was forced to abdicate and a republic was proclaimed. A pension was conferred on the ex-Emperor and he was sent to Europe on a Government vessel. Dom Pedro spent the remaining years of his life in France, and died in Paris, December 5, 1891. He was a man of wide culture, and Brazil made

great progress under his guidance. He traveled extensively, both in America and in Europe, and devoted much time to studying systems of government and education.

PEDRO THE CRUEL (1334-69). King of Castile and Leon from 1350 to 1369. He was the son of Alfonso XI. and Maria of Portugal, and was born at Burgos, August 30, 1334. On his father's death Pedro succeeded to the throne without opposition. He was greatly influenced by his mother, and Albuquerque, his favorite. His bastard brother, Henry of Trastamare (q.v.), plotted against him constantly. But the great opposition which he encountered was due to his marriage, in 1353, to Blanche of Bourbon, whom he abandoned after three days, and a second marriage in 1354 to Juana de Castro, whom he abandoned after two days. The friends of both joined his brothers. He was taken prisoner in 1354, but soon escaped and took cruel revenge. From 1357 to 1361 he was engaged in a war with Pedro IV. of Aragon. Henry of Trastamare, who had fled to France, returned (1366) at the head of a body of exiles, reinforced by Bertrand du Guesclin (q.v.) with an army of mercenaries, and aided by Aragon, France, and the Pope. Pedro prevailed upon Edward, the Black Prince, to espouse his cause. Edward invaded Castile in the spring of 1367, defeated Henry and Du Guesclin at Najera, and restored Pedro to the throne. But the King disgusted his chivalrous ally by his cruelty to the vanquished, and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees, and left the treacherous monarch to his fate. The whole kingdom groaned under his cruelties; rebellions broke out everywhere; and in August, 1369, Henry returned. Pedro's forces were routed at Montiel, and he himself was compelled to retire for safety within the town, whence he was treacherously decoyed and captured by Du Guesclin. He was carried to a tent, where a quarrel took place between him and Henry, in which the latter killed Pedro. Consult: Garcia, *Castilla y Leon durante los reinados de Pedro I., Enrique II., Juan II., Enrique III.*, vol. i. (Madrid, 1891); Burke, *A History of Spain*, vol. i. (London, 1895).

PEEBLESSHIRE, pē'b'l-shēr, or TWEEDDALE. A southeastern county of Scotland, bounded by Edinburgh on the north, Selkirk on the east, Dumfries and Selkirk on the south, and Lanarkshire on the west (Map: Scotland, E 4). Area, 355 square miles. The surface generally is mountainous, 450 feet above the level of the sea at the lowest point and attaining a maximum altitude of 2754 feet in Broadlaw. The principal river is the Tweed (whence Tweeddale) and its affluents. The arable lands are in the valleys, the highlands being chiefly pastoral. Cereals are largely grown and green crops. Coal is mined and there are deposits of ironstone and limestone. Woolens are manufactured. Capital, Peebles. Population of county, in 1891, 14,750; in 1901, 15,066. Consult Chambers, *A History of Peeblesshire* (Edinburgh, 1864).

PEEKSKILL. A village in Westchester County, N. Y., forty-one miles north of New York City; on the east bank of the Hudson River, just below the Highlands, and on the New York Central and Hudson River Railroad (Map: New York, G 4). It has several private secondary schools and the Field Library, with over 6800 volumes; Helping Hand Hospital, St. Joseph's Home, a House of the Good Shepherd, and the State Military Camp. There are extensive manufactures of stoves, fire brick, hats, underwear, foundry products, blank books, etc. The water works are owned and operated by the municipality. Peekskill was settled in 1764, and derives its name from Jans Peek, an early Dutch navigator. It was incorporated as a village in 1816 and was reincorporated in 1827. Near it is the famous Robinson House, the headquarters of Generals Putnam and Parsons in 1778-79, and of Arnold in the summer of 1780. It was here that Arnold first learned of the capture of André. Population, in 1890, 9676; in 1900, 10,358.

PEEL. A seaport town and a favorite watering resort on the west coast of the Isle of Man, England (Map: England, B 2). It was formerly called "Holm." Its fisheries are productive, and the building of vessels of small tonnage and the manufacture of nets are carried on extensively. At the northern extremity of the bay on which it stands are several grotesque and romantic caverns. The southern extremity is formed by Peel Island, which contains the grand old ruins of Peel Castle, described in Scott's *Peveril of the Peak*. The castle was formerly the frequent residence of the earls of Derby, then lords of the Isle of Man, and is expressly named in the original grant of Henry IV. to the Stanley family. It incloses a 'round tower' and the ruins of a cathedral, beneath which is a strong subterranean dungeon, where many notable persons were imprisoned. Population, 3600.

PEEL, PAUL (1860-92). A Canadian artist, born in London, Ontario. At the age of sixteen he went to the Pennsylvania Academy of Fine Arts in Philadelphia, and in 1880 to the Royal Academy, London, thence to Paris, where he studied with Gérôme, Boulange, and others. He was a pupil of Benjamin Constant for nearly five years and achieved great skill as a colorist, especially in flesh tints as shown in nude children. In 1889 he obtained an honorable mention at the Paris Salon for his painting "How Bitter Life Is," and the following year was awarded a gold medal for "After the Bath," which was acquired by the National Gallery at Budapest, Hungary. Queen Alexandra bought his "Two Friends" for Buckingham Palace, and "Fording the Stream" hangs in the City Hall, Toronto. His other pictures include "The Unwilling Model," "In Punishment," "The Unexpected Meeting," and "The Twins."

PEEL, Sir ROBERT (1788-1850). An eminent British statesman. He was born on February 5, 1788, the eldest son of Robert Peel (created a baronet in 1800), a wealthy cotton-spinner. Peel was educated at Harrow and Christ Church, Oxford, graduating from the latter in 1808. In 1809 he entered the House of Commons, where he began his career in supporting the Tory Ministry of the Duke of Portland. In 1810 he was appointed Under Secretary for War and the Colonies. In 1812, Lord Liverpool having meanwhile become Prime Minister, Peel became Chief Secretary for Ireland. In this capacity he had to consider three great questions: patronage, the preservation of order, and the maintenance of the Protestant ascendency. In order to carry out these affairs successfully, Peel ignored all personal ends, and appointed Catholics and Protestants alike,

thus strengthening his party. He created the Irish constabulary, dubbed 'Peelers,' and became involved in such a bitter contest with Daniel O'Connell (q.v.) that he was driven in 1815 to send the agitator a challenge. The police, however, prevented the duel from taking place. Peel remained Irish Secretary until 1818, when he resigned. He had been chosen in 1817 the representative of Oxford in Parliament, an unusual honor for so young a man. He also began about this time to acquire a reputation as a financier and economist; and in 1819 he was appointed chairman of a special committee to consider the state of the Bank of England. As a result the so-called 'Peel's Act' was adopted, according to which specie payments were resumed on May 1, 1823.

Peel had been a vigorous opponent of all acts intended to emancipate the Catholics, but about this time his views gradually began to change, though the process was so slow that after he had reëntered the Ministry in 1822 as Home Secretary he continued to oppose the measures of Canning, the most powerful advocate of the Catholics, and in 1827, after Canning had become Prime Minister, Peel resigned. In 1828 he again became Home Secretary in the Cabinet of the Duke of Wellington. By this time Peel decided to support Catholic emancipation, and on March 5, 1829, himself introduced a bill to effect this change, which soon became a law. As a result of this reversal of his views, Peel no longer remained the representative of Oxford. He also brought about at this time numerous reforms in the laws, and in 1829 established the London police force.

In November, 1830, the Cabinet was defeated, on the question of Parliamentary reform, and Peel for the first time belonged to the Opposition. He vigorously attacked the Reform Bills, and played an important part in the various dramatic episodes of that time. On December 9, 1834, he became Prime Minister, and tried to carry on the Government in the face of an overwhelming hostile majority, but on April 8, 1835, he was compelled to give up the contest. He began slowly, but surely, to build up the great Conservative Party, so called since 1831, and gathered together under his leadership young men like Disraeli and Gladstone. In 1839 the Conservative leader was summoned on one occasion to form a Cabinet, but Queen Victoria refused to submit to changes in the personnel of her household, and so the Whigs remained in power. They were, however, pressed on the one side by the new Radical Party and the Anti-Corn League, and on the other by O'Connell. They lost ground, and in 1841 were compelled to dissolve Parliament. The general election that ensued was virtually a contest between free trade and protection, and the latter won. When the new Parliament met, the Conservative Party, headed by Peel, came into office. The Whigs desired a fixed and moderate duty on foreign corn; the Anti-Corn League wished free corn; while Peel was in favor of a modification of the sliding scale of duty which had existed since 1828. He introduced and carried in 1842, in spite of strong opposition, a measure based upon this principle. The deficit in the revenue, which had become quite alarming under the Melbourne Administration, next engaged his attention, and led him to bring in a bill (1842) for the imposition of an 'income tax' of 7d. in the pound, to be levied for three years. To equalize still further the burdens of taxation, Peel commenced a revision of the general tariff, and either abolished or lowered the duties on several very important articles of commerce. The great Bank Charter Act of 1844 was the measure to which Peel himself felt most attached, and which he considered the most important and far-reaching of his Administration. He also showed himself resolute in the repression of the malcontents of Ireland. O'Connell (q.v.) was tried for conspiracy, and though the judgment against him was set aside on appeal to the House of Lords, the influence of the 'agitator' was broken. The first half of 1845 was marked by the increase of the allowance to Maynooth and its change into a permanent endowment instead of an annual grant, and by the foundation of the Irish nonsectarian colleges and other important measures. The potato-rot in Ireland during the autumn, followed by a frightful famine, rendered 'cheap corn' a necessity, if millions were not to starve. Cobden and the League redoubled their exertions. Lord John Russell announced the views of the Liberal Party on the crisis, and Peel finally yielded. He told his Ministerial colleagues that the corn-laws were doomed, and their repeal was inevitable. Some of them refusing to go along with him, he resigned; but after a few days he was recalled, and the repeal was carried. He was, however, immediately afterwards defeated on a protection of life bill for Ireland. Not so much upon this account, as because he felt that the course which he had pursued had produced a dissolution of the old ties of party, and that he could not expect for some time to find himself at the head of a strong Government, Peel retired from office in June, 1846, giving place to a Liberal Administration under Lord John Russell, to which he gave an independent but general support as the leader of a middle party rather than Liberal or Conservative. In the critical times of 1847-48 he was one of the most important props of the Government, whose free-trade principles he had now completely accepted. His ecclesiastical policy had also undergone a remarkable change, and he now frankly supported the Liberals in their efforts to carry an act for the repeal of the Jewish disabilities. On June 28, 1850, he spoke with great eloquence in the debate on Lord Palmerston's Greek policy. On the following day he was thrown from his horse in Hyde Park, and was so much injured that he died on the evening of July 2, 1850.

The best authorities for a study of Peel are: *Collection of Speeches Delivered in Parliament* (4 vols., London, 1853); Stanhope and Cardwell, *Memoirs by Peel* (ib., 1857); Hardinge and Peel, *Sir Robert Peel: His Life and His Private Correspondence* (ib., 1891). A great number of biographies of Peel exist. Among the best may be named: Taylor and Mackay, *Life and Times of Sir Robert Peel* (London, 1846-50); Doubleday, *The Political Life of Sir Robert Peel* (ib., 1856); Sir Lawrence Peel, *Life and Character of Sir Robert Peel* (ib., 1860); Guizot, *Sir Robert Peel: Etude d'histoire contemporaine* (ib., 1856). Consult also "Peel," in *Twelve English Statesmen Series*, in *Prime Ministers of Queen Victoria Series*, and in *Statesmen Series*.

PEELE, GEORGE (c.1558-c.1597). An English dramatist. He was educated at Christ's Hospital

School, where his father was a clerk, and at Christ Church, Oxford, graduating B.A. in 1577, and M.A. in 1579. On returning to London he was driven from the precincts of Christ's Hospital owing to his dissipated conduct. He seems to have been a skillful player as well as a playwright. His chief plays are the *Arraignment of Paris*, performed before the Queen probably in 1584; *Edward I.* (printed 1593), one of the earliest historical plays in English; *The Battle of Alcazar* (printed 1594); *The Old Wives' Tale* (printed 1595); and the richly Oriental *David and Bethsabe* (printed 1599). Though Peele's dramatic work has less importance than Greene's and Marlowe's, it yet helped prepare the way for Shakespeare. Peele wrote a couple of pageants, also, and among his miscellaneous writings are "An Eclogue Gratulatory," addressed to the "Renowned Shepherd of Albion's Arcadia, Robert, Earl of Essex," and "The Beginnings, Accidents, and End of the Fall of Troy," important because Shakespeare may have got from it the idea of treating fully the theme of Troilus and Cressida. Peele's style is often highly poetical. His verses are sweet, but his rhyme seems faulty. Many of the lyrics and pastorals scattered through his plays have great charm. Consult his *Works*, ed. by Bullen (London, 1888).

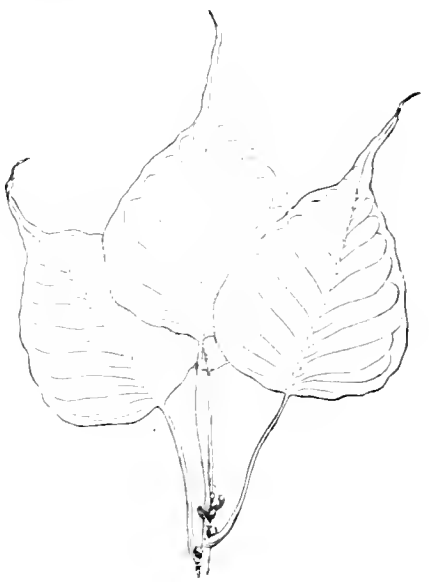
PEELE, John Thomas (1822—). An English-American genre painter, born in Peterborough, England. He came to the United States at an early age, and was self-taught. He began by painting portraits, but after 1846 took up genre painting, especially of juvenile subjects. He settled in England about 1851. His works include "The Children of Robert Thornton," and "Children of the Wood," bought by Prince Albert of England.

PEENE, pā'ne, Hippoliet Jan van (1811-64). A Flemish dramatist. He was born at Capryeke, in East Flanders, studied medicine at Louvain, and practiced in Ghent from 1837 to his death. Besides a popular song, *De Vlaamsche Leeuw*, for which the music was written by Karel Miry, Peene's work was for the stage. As early as 1835 he had written a French vaudeville, *La vieillesse de Stanislas*. His *Keizer Karel* (1847) is the first example in Flemish of the same genre. Of his later plays the more important are: *Brigitta* (1847), an opera; *Jan de Vierde* (1848), an historical drama; *Vader Cats* (1855); and *Jolleu en Mietje* (1858), as well as texts for French opera. His collected works in thirty-eight volumes appeared at Ghent (1880-82).

PEEPER. One of the small tree-frogs which in early spring are heard peeping all over the country as the sexes gather in the ponds and puddles for breeding purposes. The first voice heard in this chorus of early March in the Northern States is that of Pickering's or the little yellow tree-toad (*Hyla Pickeringii*). In the Southern States a small greenish peeper, very common, is *Hyla squirella*.

PEEPING TOM OF COVENTRY. The only person in Coventry who disobeyed the injunction not to look out on the street while Lady Godiva (q.v.) rode by. The name has become a conventional term for an inquisitive person.

PEEPUL, PIPUL, or PIPPUL (Hind. *pipal*, from Skt. *pippala*, long pepper, sacred fig tree). *Ficus religiosa*. A species of fig (q.v.) known in Ceylon as the bo tree. It somewhat resembles the banyan, but the branches do not root like those of that tree, and the leaves, rounded at the base, have long attenuated points which are considered special devices for carrying off the water from leaves, a necessary device in wet tropical



PEEPUL.

forests. The tree, which often attains a height of 100 feet or more, is held sacred by the Hindus, who maintain that Vishnu was born under it, hence its name 'sacred fig.' It is frequently planted near temples, and religious devotees spend their lives under its shade. The Buddhists also held it sacred. It is often planted for shade near houses, and by the side of walls. The juice contains caoutchouc, and is used by women as bandoline. Lac insects feed upon the tree, and much lac is obtained from it. The fruit is not much larger than a grape, and, although edible, is not valued.

PEER (OF. *per*, *peir*, Fr. *pair*, peer, equal, from Lat. *par*, equal). A general name applied to the various members of the titled nobility of England. The peerage comprises the ranks of duke, marquis, earl, viscount, and baron. The dignity of the peerage, still hereditary, was in early times also territorial. Life peerages seem to have been not unknown at one time in England; but in 1856, in the case of the law lord Baron Wensleydale, the House of Lords ruled that his creation 'for and during the term of his natural life' did not convey the privilege of a seat and a vote in their House. Women may be peeresses in their own right, either by creation or by inheritance. In France the great vassals of the Crown were very early known as peers, while the legal fiction of a semi-equality with the King was still maintained; the title occurs under Robert I. and Louis VII., though the earliest letters patent creating a peerage which are known are those issued by Philip IV. in favor of Robert II., Count

of Artois. Under Philip Augustus there were six lay peers and six ecclesiastical. When three of the lay peerages were extinguished by union with the Crown, the King created new ones, at first of the blood royal, to counterbalance the ecclesiastical peerages. The policy of Richelieu and Louis XIV. reduced the prerogatives of the peerage to a simple question of precedence, the debates over which occupy such a large part of Saint-Simon's memoirs. Their only privilege was that of sitting in the parliaments and being judged only by these high courts.' At the Revolution there were forty-nine peerages, including five princes of the blood, six spiritual peers (the same archbishops as in the Middle Ages), and thirty-eight lay peers, ranging in seniority from Uzès, 1572, to Aubigny, Choiseul, and Coigny, 1787. The peerage was then suppressed. From 1814 to 1848 a House of Peers was in existence, modeled on the English Upper House. Hereditary succession was abolished in 1830.

PEER GYNT, pār gynt. A dramatic poem by Henrik Ibsen (1867). It has been called the Scandinavian *Faust*, and is a satire on certain Norwegian traits exemplified in the hero. It has, however, a broader application as the story of a human soul. Peer Gynt, as the drama begins, is a peasant, dreamy, selfish, sordid, superstitious, and a liar, leading a life of smatterings. Later the scene changes to foreign lands where Gynt apparently has prospered, but his character remains unchanged. At last, in old age, he returns to his early home, and realizes the worthlessness of his miserable existence, but is saved from utter despair by the devotion of the woman who has loved him from his youth. In spite of its dismal theme, the poem is varied and witty, full of allusions to Northern folk-lore, the name and nature of Peer Gynt being taken from a folk-tale of that title. The composer Grieg has a suite named from the poem and suggested by its theme.

PEERLKAMP, pārl'kămp, Hofman Peter (1786-1865). A prominent Dutch Latinist and critic. He was born at Groningen, studied there and at Leyden, where, after teaching in Haarlem and Dockum, he became professor of classics and ancient history (1822). This chair he resigned in 1848 because of ill health. As a classical scholar, he had a remarkably brilliant style and a purely subjective standard of criticism which led him to judge as interpolations much of Latin poetry. Peerlkamp edited Horace's *Odes* (1834; 2d ed. 1862), his most famous work; Vergil's *Æneid* (1843); Horace's *Ars Poetica* (1845) and *Satires* (1863); as well as Tacitus's *Agricola* (1827; 2d ed. 1864) and the works of Xenophon of Ephesus (1818); and he wrote much on the history of Dutch literature and classical scholarship. He founded (1825) the *Bibliotheca Critica Nova*. Consult Leopold, *Studia Peerlkampiana* (Groningen, 1892).

PEERS, Richard (1645-90). An English author and translator. He was the son of a tanner and was born in Lisburn, in the County of Antrim, Ireland. Disliking his father's trade, to which he was apprenticed, he ran away to England, where he was sent to school by an uncle. He graduated B.A. from Christ Church, Oxford, in 1668, and M.A. in 1671. In recognition of his scholarship, he was elected esquire bedell in the faculty of arts (1675) and afterwards in the faculty of physic. Under the supervision of Dr. John Fell (q.v.), he translated into Latin Anthony à Wood's *History and Antiquities of Oxford* (1674); and unaided made the first catalogue of Oxford graduates under the title of *A Catalogue of Graduates in Divinity, Law, and Physic*, etc. (1689), and contributed to the famous *English Atlas* (vol. iv.) of Moses Pitt, *The Description of the Seventeen Provinces of the Low Countries or Netherlands* (1682). He also published *Verses on Sundry Occasions* (1667). His life was passed in and near Oxford.

PEERYBINGLE, Mrs. In Dickens's *Cricket on the Hearth*, the devoted and cheery little wife of the Carrier John Peerybingle. Her husband called her *Dot*, under which name Dion Boucicault's dramatization of the story was presented in 1862.

PEET, Harvey Prindle (1794-1873). An American educator, born at Bethlehem, Conn. He graduated at Yale in 1822, and two years later became superintendent of the American Asylum for the Education of the Deaf and Dumb, the first institution of the kind in this country. In 1831 he became president of the New York institute for the deaf and dumb. He was the author of *A Course of Instruction for the Deaf and Dumb* (1844-46), and of several other works on deafness and on insanity.

PEET, Stephen Denison (1830—). An American archæologist, born at Euclid, Ohio. He graduated at Beloit College in 1851, studied theology at Andover, Mass., and after 1854 was pastor of Congregational churches in Racine and Clinton, Wis., Ashtabula, Ohio, and Mendon, Ill. He became editor of the *American Antiquarian* and published *History of Early Missions in Wisconsin* (1886), *Religious Beliefs of the Aborigines of North America* (1886), *The Clan Centres and the Clan Habitat of the Effigy Builders* (1891), *The History of the Explorations in the Mississippi Valley* (1896), and *Prehistoric America* (3 vols., 1890-99).

PEF'FER, William Alfred (1851—). An American lawyer and legislator, born in Cumberland County, Pa. He was entirely self-educated. In 1853 he settled in Indiana, in 1859 in Missouri, and later in Illinois. He enlisted in the Eighty-third Illinois regiment in 1862, was mustered out as lieutenant in 1865, and, removing to Kansas, established the Fredonia *Journal* and the Coffeyville *Journal*. In 1874 he was elected to the State Senate, in 1880 was a Republican Presidential elector, and in 1881 assumed the editorship of the *Kansas Farmer*. From 1891 to 1897 he represented the People's Party in the United States Senate, and in 1898 was nominated by the Prohibitionists for Governor of Kansas. Among his publications are: *Peffer's Tariff Manual* (1888); *The Way Out* (1890); *The Farmer's Side* (1891); *Americanism in the Philippines* (1900); *Rise and Fall of Populism in the United States* (1900).

PEG'ASUS (Lat., from Gk. Πήγασος; connected with πηγός, *pēgos*, strong, πηγνύναι, *pēgnynai*, to fasten; popularly derived from πηγή, *pēgē*, spring). In Greek legend, a winged horse, begotten by Poseidon on the Gorgon Medusa, and with Chrysaor springing from her neck when she was beheaded by Perseus. Later by the aid of Athena he was caught at the spring Peirene in

Corinth by Bellerophon, who used him in his conflict with the Chimæra, and his later wars. Afterwards he was said to have flown to heaven, and later writers told how he had been placed among the stars. The Alexandrian poets seem to have been the first to attribute the spring Hippocrene on Mount Helicon to a blow of Pegasus's hoof, and the same story is found in connection with Aganippe and several other fountains in Greece. This story brought Pegasus into connection with the Muses of Mount Helicon, and as the spring-inspired poets we find them honoring Pegasus for his gift. As the poet's horse on which he is carried from the earth into the realms of poetic fancy, Pegasus is unknown to antiquity. That conception seems to appear first in Boiardo's *Orlando Innamorato*. Consult Hannig, *De Pegaso* (Breslau, 1901).

PEG'GOTTY. The name of a family in Dickens's *David Copperfield*, consisting of Clara Peggotty, David's devoted nurse, who married Barkis, the carrier, her brother Dan, and nephew Ham, Yarmouth boatmen, who live in a remodeled barge with Little Emily and Mrs. Gummidge.

PEGMATITE (from Gk. πῆγμα, *pēgma*, anything fastened together, from πήγνυναι, *pēgnynai*, to fasten). A coarse-grained rock of siliceous composition occurring in dikes or veins and generally in association with a parent mass of granite rock. Most pegmatites have the composition of a siliceous granite. They are made up chiefly of feldspar (orthoclase, microcline, plagioclase), quartz, and muscovite; but they are also the home of many of the minerals containing rarer chemical elements, such, for example, as boron, beryllium, uranium, cerium, etc. Pegmatites supply the feldspar for porcelain and the mica for isinglass. They are in part of igneous and in part of aqueous or aqueo-igneous origin.

PE'GRAM, John (1832-65). An American soldier, born at Petersburg, Va. He graduated at West Point in 1854, and was assigned to frontier duty with the First Dragoons. On February 28, 1857, he was appointed first lieutenant. He served as assistant instructor of cavalry, and took part in the Utah Expedition of 1857-58. From 1858 to 1860 he was on leave, traveling and studying in Europe, and on his return served against the Indians in New Mexico. He resigned on May 10, 1861, and became a captain of cavalry in the Confederate army. In June and July he was lieutenant-colonel in General Garnett's operations around Beverly in western Virginia, and was captured at Rich Mountain (July 11). When exchanged, he was sent in July, 1862, to General Bragg in Mississippi as chief of engineers, and afterwards was chief of staff for Gen. E. Kirby Smith in Tennessee. He was made brigadier-general of cavalry in November, 1862, was engaged at Murfreesboro, and commanded a division at Chickamauga. He was transferred to the Army of Northern Virginia, Early's division, Second Corps, and repulsed an attempt to turn the right Confederate flank at the Wilderness. He served in the campaign against Sheridan in the Shenandoah in the fall of 1864, and was promoted major-general. While on service around Richmond he was mortally wounded in the skirmish at Hatcher's Run in February, 1865.

PEGU, pē-gōō'. A division of Lower Burma (q.v.). British India (Map: Burma, C 3). Area, 13,106 square miles. Population, in 1891, 1,522,500; in 1901, 1,819,000. It comprises the districts of Pegu, Rangoon, Hanthawaddy, Tharrawaddy, and Prome. It is watered by the Irrawaddy, the Rangoon, the Pegu, and the Sittang. The surface is uneven, attaining in the Arracan Yoma Mountains, on the west boundary, a maximum altitude of about 6000 feet. The climate is warm and humid, but not unhealthful. The soil is fertile; the river valleys are well cultivated and highly productive; and there are extensive forests of valuable trees. Rice is the principal crop, and teak timber is largely exported. The Peguans belong by race to the Mons (q.v.), one of the great groups of primitive peoples of Indo-China. Pegu was an independent Talaing kingdom until 1752; its subsequent history is merged with that of Burma (q.v.). It became British in 1852.

PEGU. The capital of a division of Southern Burma, on the Pegu River, at its confluence with the Irrawaddy, 40 miles northeast of Rangoon (Map: Burma, C 3). Before its destruction by Alompsa in 1757 it was a large and fine city, said to have had over 100,000 inhabitants. Its population is now about 12,000. It contains a number of interesting pagodas, a colossal recumbent figure of Buddha, and many ancient relics.

PEHLEVI, pā'lā-vē, more correctly pāk'lā-vē. See Pahlavi Language and Literature.

PEI-HO, pā'hō' *or* pī'hō' (Chin., white river). The most important river of North China (Map: China, E 4). It rises near the Great Wall north of Peking, flows southward, receiving several tributaries, past T'ung-chow fu, 12 miles east of Peking, to Tien-tsin, where it takes a southeastern course and falls into the Gulf of Pe-chi-li at Taku (q.v.), its course being wholly within the Province of Chi-li. At Tien-tsin it receives from the northwest the Hun-ho, swollen by the accession near its confluence with the Pei-ho of the waters of many rivers, with numerous feeders, from the west and southwest. Here, also, it connects with the Grand Canal. Its course is very tortuous, especially below Tien-tsin, the distance from that point to Taku by water being 80 miles, but only 35 by land. Its waters are thick with silt, but are navigable by coast and river steamers as far as Tien-tsin and by native vessels above that point to T'ung-chow. There is a bar of stiff clay at its mouth which greatly impairs its value as a waterway, and the water along the coast is so shallow that heavily laden vessels cannot approach nearer than eight miles. The total length of the river is estimated at 350 miles.

PEILE, pēl, John (1838—). An English philologist, born at Whitehaven, Cumberland. He studied at Christ's College, Cambridge, where he was fellow and lecturer in 1860, and in 1887 master. Peile took much interest in university extension. He published: *Introduction to Greek and Latin Etymology* (1869) and *Primer of Philology* (1877), both popular works; *Notes to the Tale of Nala* (1881); and a *History of Christ's College* (1900).

PEINE, pī'ne. A town in the Province of Hanover, Prussia, on the Fuse, 20 miles southeast of Hanover (Map: Prussia, D 2). It has cattle markets, breweries, and manufactures of iron, sugar, furniture, jute goods, malt, artificial

guano, etc. Population, in 1890, 10,100; in 1900, 15,400. Peine was founded in the ninth century.

PEINE FORTE ET DURE, pān fôrt ā dur (OF., strong and hard punishment). A punishment formerly imposed by the laws of England upon persons who, on being arraigned for felony (q.v.), refused to plead, stood mute or peremptorily challenged more than twenty jurors, which was considered a contumacy equivalent to standing mute. By the early English law, an accused person must plead 'guilty' or 'not guilty' before he could be tried, and the form of coercion hereinafter described was devised to force an accused person to plead in case of his obstinate refusal.

In the beginning of the thirteenth century the penalty consisted merely of a long imprisonment and a low diet, persisted in until the prisoner submitted. However, by the reign of Henry IV. it had become the practice to lay the accused on his back on a bare floor, place on his body as great a weight of iron "as he could bear, and more," and give him only the 'worst' bread and water from the nearest stagnant pool until he consented to plead or died. During the fifteenth, sixteenth, seventeenth, and even the eighteenth centuries, a number of cases are recorded of the infliction of the above punishment for 'standing mute' on an arraignment for felony.

This form of coercion of a plea was finally abolished in 1772, by the statute of 12 Geo. III., chap. 20, which provided that 'standing mute' on an arraignment for felony should be considered as equivalent to conviction. This harsh rule was altered by the statute of 7\&8 Geo. IV., chap. 28, by the humane provision that a plea of 'not guilty' should be entered in case of the refusal of a prisoner to plead, and this rule prevails everywhere to-day.

American records are stained by only one well-authenticated instance of the infliction of this torture. One Giles Cory, accused of being a witch, refused to plead on his arraignment, and was pressed to death at Salem, Mass., in 1692. Consult Stephens, *History of the Criminal Law of England* (London, 1883).

PEIPUS, pī'pŭs (Russ. *Tchudskoye Ozero*). A large lake in the Baltic Provinces of Northwestern Russia. It lies 30 miles south of the Gulf of Finland, into which it is drained through the Narova River (Map: Russia, C 3). It is 45 miles long and 20 miles broad, and connects southward through a narrow channel with Lake Pskov. Its banks are low and sandy, and for the greater part wooded, and it is rich in fish, which supply the markets of Saint Petersburg. The lake is deep enough for large vessels, and is navigated by steamers. It was formerly the chief waterway between the Hanse towns of the Baltic and the interior of Russia.

PEIRCE, pērs *or* pĕrs, Benjamin (1809-80). An American mathematician and astronomer, born at Salem, Mass. He graduated at Harvard College in 1829. He became tutor there in 1831; professor of mathematics and physics in 1833, and Perkins professor of mathematics and astronomy in 1842, which position he held till his death. In 1849 he became consulting astronomer to the *American Ephemeris and Nautical Almanac*, and in 1855 one of the council to organize the Dudley Observatory, Albany. In 1867 he succeeded Professor A. D. Bache as superintendent of the Coast Survey, in which service he continued till 1874. In his early life he was a contributor to the *Mathematical Miscellany*, and also published the *Cambridge Miscellany of Mathematics, Physics, and Astronomy*, in which appeared his celebrated investigation of the motion of a top spinning on a plane surface. He also prepared a series of mathematical text books for the use of the university, and it was chiefly by his exertions that the Harvard Observatory was established and perfected. In 1851 he published in the *Astronomical Journal* remarkable papers on the constitution of Saturn's rings, in which he considered the conditions of statical equilibrium of a transverse section of the ring, and came to the conclusion that if there are separate rings, they must be more numerous than Laplace had even supposed. (See Saturn.) In 1857 he published the *System of Analytical Mechanics*. Among his important contributions to mechanics may be mentioned his investigation of the forms of an elastic sac containing a fluid, a subject which led to the theory of analytic morphology. His contributions to mathematics are of the broadest and profoundest character. They are principally embraced in certain communications on *Linear Associative Algebra*, to the National Academy of Sciences, which had been suggested by the publication by Hamilton in 1852 of his quaternions. These communications were collected in 1870, and 100 lithograph copies were published. It was reprinted in the *American Journal of Mathematics* (1882). Peirce was a member of various learned societies in Europe and America.

PEIRCE, Benjamin Osgood (1854—). An American mathematician and physicist, born in Beverly, Mass. He graduated at Harvard in 1876; studied in Leipzig and Berlin after acting as assistant in physics at Harvard for a year; taught in the Boston Latin School; was instructor in mathematics at Harvard from 1881 to 1884, and was promoted from an assistant professorship to the Hollis chair of mathematics and natural philosophy. He contributed to the *Proceedings* of the American Academy of Sciences many papers on magnetism, electricity, and heat, and published a *Table of Integrals* (1899).

PEIRCE, Bradford Kinney (1819-89). A minister of the Methodist Episcopal Church. He was born at Royalton, Vt., graduated at Wesleyan University, Middletown, Conn., 1841, and joined the New England Conference 1846. He was editor of the *Sunday-school Messenger* and *Sunday-school Teacher*, 1844-45; agent of the American Sunday School Union 1854-56; State Senator 1855-56; superintendent and chaplain of the State Industrial School, Lancaster, Mass., 1856-62; chaplain of the house of refuge on Randall's Island, New York, 1862-72; editor of *Zion's Herald*, 1872-1888; financial agent for Boston University, 1889. He wrote *The Bible Scholar's Manual* (1847); *Notes on the Acts* (1848); *The Eminent Dead* (1851); a series of question books for Sunday-school scholars (1849-52); *Trials of an Inventor* (1866); *The Word of God Opened* (1868); *A Half Century With Juvenile Delinquents* (1869).

PEIRCE, Charles Sanders (1839—). An American physicist, born in Cambridge, Mass. He graduated at Harvard in 1859, and at the

Lawrence Scientific School in 1863. Entering the United States Coast Survey, in 1872 he conducted a valuable series of pendulum experiments to determine the density and shape of the earth. He was a lecturer on logic at the Johns Hopkins and Harvard Universities, and in 1869 lectured on philosophy before the Lowell Institute of Boston. In 1876 he was elected a member of the National Academy of Science. He was a member of the staff of the *Century Dictionary*.

PEIRCE, JAMES MILLS (1834—). An American mathematician, born at Cambridge, Mass. He graduated at Harvard in 1853, and after several years of tutoring became an assistant professor of mathematics there in 1861. In 1869 he was raised to the rank of professor and in 1885 was appointed Perkins professor. Among his publications are *A Text-book of Analytic Geometry* (1857); *Three and Four Place Tables of Logarithmic and Trigonometric Functions* (1871); and *The Elements of Logarithms* (1874).

PEIROL, på'rôl' (?-c.1225). A French troubadour, so called from his birthplace, Peirol in Auvergne. The Dauphin, Robert of Auvergne, received him at his Court. But there Peirol met and loved Robert's sister, Assalide, or Sail de Claustra as he calls her in his verse, and according to the Provençal *Life* of the poet for a time lived at Court as her favorite with Robert's knowledge, but was finally exiled by the jealous Dauphin. In the Crusade of 1189 he seems to have taken an active part. On his return, he lived at Montferrat, whence in all probability he made a pilgrimage to the East. If we are to believe the manuscript *Life*, he settled at Montpellier and there married and died. His poems, thirty canzones and his part of a few tenzons, are especially valuable as contributions to the history of the spirit of the Crusades.

PEISHEVA. See PESHWA.

PEISIS'TRATUS. See PISISTRATUS.

PEIXOTO, på-shō'tô, FLORIANO (1842-95). A Brazilian soldier and politician, born at Pico, in the Province of Alagoas. He entered the army as a private, rose rapidly, and distinguished himself in the war with Paraguay. In 1889 he assisted Fonseca in establishing the Republic, and after serving as Minister of Finance was elected Vice-President in 1891. Fonseca resigned from the Presidency in the same year, and Peixoto took his place. As leader of the military party he was somewhat unpopular, and had to cope with a great revolt headed by Mello and Da Gama, and with insurrections in various parts of the Republic. He was unsuccessful in his candidacy for reëlection, and was succeeded in 1894 by Moraes. Consult: Luiz José Pereira da Silva, *Floriano Peixoto* (Rio de Janeiro, 1894). See BRAZIL.

PEIXOTO, IGNACIO JOSÉ DE ALVARENGA (1748-93). A Brazilian poet, born in Rio de Janeiro. He was educated in Portugal at the University of Coimbra and studied law at Cintra. He returned to Brazil in 1776 and was made a judge in São-João-d'El-Rei, in the interior Province of Minas Geraes. He was one of the twelve arrested for implication in the republican plots, and was kept for two years in a dungeon without trial; but his death sentence was commuted to deportation to Angola, in Portuguese Africa. Some of his poems, which rank among the best in the Portuguese tongue, were published in Paris in 1866, under the title *Obras poeticas, colligidas annotadas, precedidas de juizos criticos*.

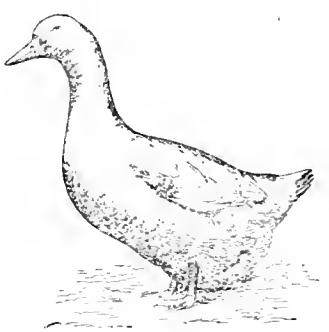
PEK'AN, or PENNANT'S MARTEN. See FISHER.

PEKEA TREE. A tropical American tree. See CARYOCAR.

PEKIN. The capital of China. See PEKING.

PE'KIN. A city and the county-seat of Tazewell County, Ill., ten miles south of Peoria; on the Illinois River, and on the Cleveland, Cincinnati, Chicago and St. Louis, the Chicago and Alton, the Illinois Central, the Atchison, Topeka and Santa Fe, the Chicago, Peoria and Saint Louis, and other railroads (Map: Illinois, C 3). It has a public library and fine public school buildings. In the vicinity are productive veins of coal and fertile agricultural lands. The city is a noted grain market and controls an important shipping trade by rail and water. Its manufactures also are extensive, and include agricultural implements, plows, wagons, carriages, beet sugar, glucose, spirits, alcohol, ammonia salts, fertilizer, brick and tile, organs, foundry products, planing mill products, etc. Settled in 1829, Pekin was incorporated first in 1850. The government is administered under a revised charter of 1875 which provides for a mayor, elected every two years, and a council. Population, in 1890, 6347; in 1900, 8420.

PEKIN DUCK. A domestic duck introduced from China about 1870, which has become widely extended and popular, both for the table and as a producer of excellent eggs. In color it is white or cream-white, with deep yellow bill, lead-blue



WHITE PEKIN DUCK.

eyes, and orange feet. The body is long and deep, the size large, some birds weighing as much as twenty pounds to the pair, and the breed is hardy, easily raised, and profitable.

PEKING, pē'king' *or* pā'king' (Chin., Northern Capital); or, in the Court dialect, **PEI-CHING,** pā'ching'. The capital of the Empire of China, coincident in position and area with the chief city of the Department of Shun-t'ien-fu, in the Province of Chih-li (see PE-CHI-LI), but not within the jurisdiction of the Governor-General or so-called 'Viceroy' of Chih-li (Map: China, E 4). It has been the seat of the Imperial government since 1409, and is called Peking, or "northern capital," to distinguish it from Kiang-ning-fu, south of the Yang-tse, which had been the seat of the capital from 1368 to that date, and is now known as Nanking (q.v.).

Peking is a walled and moated city, with an area of about twenty-five square miles, and is

situated in a sloping sandy plain about twelve miles west of the Pei-ho (q.v.), 70 miles southeast of the Great Wall, and 100 miles from the Taku Forts, where the Pei-ho enters the Gulf of Pe-chi-li. The Imperial Observatory stands in lat. 39° 54′ 31″ N., and in long. 116° 28′ 24″ east of Greenwich. The elevation above the sea is about 120 feet. The city is surrounded on three sides by mountains distant from 10 to 30 miles, the mountains in the west providing cool breathing spots for the foreign residents in summer, as well as an abundant supply of coal for all seasons. Peking is in the main healthful. The climate is that of North China generally, intensely cold in winter (zero and below), the city, however, being sheltered somewhat by the high walls, while the heat in summer is great, cooling winds being barred out by the height of the walls.

General Description. Peking consists of two parts of different shapes, sizes, and dates: The Tatar or 'Inner' city, which lies to the north, and the Chinese or 'Outer' city, which adjoins the other on the south, the south wall of the Tatar city forming the main part of the north wall of the Chinese city. The former, which is nearly square, has a circuit of about 12.3 English miles, and the latter, which has its greatest extension from west to east, is an imperfect parallelogram measuring five miles by two. The walls of both cities are of earth and concrete, faced within and without with brick. Those of the Tatar city are 40 feet high, 62 feet thick at the base, and 34 at the top, access from within to the top being by stone-paved ramparts. The walls are strengthened at intervals of 60 yards by huge buttresses which project outward 50 feet, and the parapets of both walls and buttresses are loopholed and crenelated. The Chinese city walls are only 30 feet high, and 25 feet thick at the base. These walls are pierced by 16 gates, 9 of which are in the Tatar city (3 in the south wall, communicating with the Chinese city, and 2 in each of the other three sides). Of the 7 gates in the Chinese city, 3 are in the south wall, one in the east wall, one in the west, and 2 in those portions of the north wall which project east and west for a quarter of a mile beyond the common wall of the Tatar and Chinese cities, and open toward the north. Each gate is protected by a demi-lune or enceinte, and is surmounted by a lofty three-storied tower 99 Chinese feet (about 119 English feet) in height, and covered with green glazed tiles. The Ch'ien mên, or 'Front Gate' in the centre of the south wall of the Tatar city, like the Yung-ting gate of the south wall of the Chinese city, has 3 entrances, the one in the centre being reserved for the Emperor. All gates are closed at sunset.

The Chinese city, built in 1543, is newer than the Tatar city, which was built by Kublai Khan in 1267-71. It contains many vacant spaces, but the bulk of the population is here. Entering by the Yung-ting gate in the south wall, a roadway 2 miles in length leads due north to the Ch'ien-mên or 'Front Gate,' the main entrance to the Tatar city. On the right or east side of this roadway stands the inclosure (one square mile in extent) containing the Altar of Heaven, surrounded with temples and shrines, including the circular triple-roofed Temple of Heaven, about 119 English feet high. It was burned down in 1889, but has been rebuilt, Oregon pine being used for the pillars. It is roofed with blue porcelain tiles. Here at midnight of the winter solstice, the Emperor, after due fasting and prayer, worships Shang-ti, the 'Supreme Ruler,' with prayer, hymns, prostrations, and burnt-offerings of oxen, sheep, hares, etc., and of silk, jade, and other precious things. On the west side of the roadway stands the Temple of Agriculture, dedicated to Shin-nung (q.v.), the 'Divine Husbandman.' In this spot every year at the 'opening of spring' the Emperor plows a furrow or two and thus inaugurates for the year the principal industry of his people. In the Chinese city most of the mercantile business of the city is carried on. It also has a powder factory, an Imperial pottery, a mosque, and many theatres. Here also is the fashionable promenade known as Booksellers Street, where curios of all sorts, precious stones, etc., can be bought. Proceeding northward about half way to the entrance to the Tatar city is a magnificent marble bridge, an essential, according to the requirements of Fŭng-shui. Within the Tatar city the first important cross street to the right is 'Legation Street,' a macadamized thoroughfare, extending southeastwardly. Here are the foreign legations, the headquarters of the Imperial maritime customs, the hotel, the two foreign banks, etc.; and here the fury of the bloody Boxer outbreak concentrated as far as the city of Peking was concerned.

Immediately north of the Great Gate is a paved square bordered by a stone palisade. The Mongol market is found here. North of this square is the outer gate leading to the Hwang-ch'ing or 'Imperial City,' walled and towered like the Tatar city itself. From this a wide avenue leads for a quarter of a mile to the inner gate, within which right and left are seen the temples of ancestors and of grain. A mile and a half farther brings us to the entrance of the Tsze-kin-ch'ing or 'Purple Forbidden City,' a great walled inclosure with towers on the corners and over the gates, one square mile in extent, containing the Imperial Palace and its pleasure grounds and gardens, as well as the numerous reception halls, pavilions, and offices required by the Emperor and his high officers of State in conducting the affairs of his great Empire, all roofed with yellow porcelain tiles. North of all this is the beautiful finely wooded artificial hill called King-shan, or 'Prospect Hill,' 170 feet high, with five peaks, each having a Buddhist temple on top, the whole surrounded with a park a mile in circuit. Continuing northward, the traveler passes through the 'back gate' into the Imperial City, where is the palace of the Ti-tu, or General, who is responsible for the peace of the city. Northward still is the gate leading from the Imperial into the Tatar city.

It is seen that the Tatar city is really a nest of cities, with the Forbidden City in the centre, the Forbidden City being surrounded by the Hwang or Imperial City (six miles in circuit), containing Government offices, temples, pleasure-grounds, a beautiful artificial lake on the west side, the White Ming pagoda built on the spot where the last Emperor of the Ming dynasty hanged himself (1643), the Pei-t'ang, or Roman Catholic cathedral, and many elegant residences of princes, and of officers of the Government. The Tatar city thus surrounds both the Forbidden and the Imperial cities. Originally intended for Manchus alone, it is now largely occupied by Chinese. It contains the public offi-

ces of the Eight Boards or Government departments, including the Wai Wu Pu, or Foreign Office, which recently superseded the Tsung-li Yamên; the Imperial Censorate, the site of the Han-lin (q.v.), adjoining the British Legation on the north and burned down with its unreplaceable libraries, during the Boxer disturbances; the Imperial University; the Examination Hall, with its 10,000 cells for the triennial competitive literary examinations; the Imperial Observatory; the Christian mission houses, churches, and schools in different parts of the city (mostly burned down by the Boxers); Confucian, Buddhist, Taoist, and Lamaistic temples; a great drum-tower, etc. There is in addition the temple erected in 1578 to house the great bronze bell, 17 feet high, 12 feet 8 inches in diameter, weighing 87,000 pounds, cast in the early years of the fifteenth century, and covered within and without with quotations from the Buddhist scriptures. There is also another Roman Catholic cathedral. It is situated in the southwest part of the city.

The principal streets of Peking are lined with shops, gorgeously painted, and decorated with great pendent signs with gilt characters. At times the streets are very noisy and full of activity. Besides the hurrying to and fro of mandarins and their followers, Government messengers, envoys from vassal States and provinces, Mongols with their big Bactrian camels, yellow-robed Tibetan and Mongol lamas, itinerant vendors of amusement, or of infallible medicines, or of things to eat or wear, make up a scene of great interest. The principal conveyances are the sedan chair and the springless covered carts, politely called 'carriages.' The smaller streets are filthy and vile-smelling, but since the post-Boxer military occupation many improvements have been inaugurated by the reforming and progressive prince in whose charge the streets have been placed. The sewers have been thoroughly cleaned out, and the practice of sprinkling the dusty roads with the foul liquid from the gutters has been suppressed. Macadamizing is everywhere in progress.

GOVERNMENT. The peace of the city is in charge of a board, consisting of the Chih-fu (head of the Department of Shun-t'ien), the two Chih-hien (heads of the two prefectures included within the city), five members of the Board of Censors, and the Ti-tu, or general. Besides the military, 12,000 police are subject to this board, 10 being stationed at each barrier. Each of these has 150 runners under him. The Tatar garrison is divided into 8 banners, each in three divisions (Mongol, Manchu, and Chinese).

The population of Peking is estimated at 1,300,000.

ENVIRONS. Without the city are many points of great interest. On the east side is the Temple of the Sun, and on the west the Temple of the Moon, where the Emperor worships at the summer solstice. On the north, outside the An-ting Gate, is the Altar of Earth, where the Emperor worships at the vernal equinox. To the northwest are the tombs of the Ming emperors (except two, who were buried at Nanking), approached through a long avenue of colossal lions, unicorns, camels, elephants, and horses, in marble, two pairs of each. Nine miles northwest is the celebrated Yuen-Ming Yuen, or 'Summer Palace.'

HISTORY. From the earliest times there has been a city on or near this spot. In 937 the Khitan Tatars, who had conquered North China, made it one of their capitals and called it Nan-king, or 'Southern Capital,' the northern being in Tatary. In 1151 the Kin Tatars called it Chung-tu, or 'Middle Capital.' In 1215 the city was captured by Genghiz Khan, and in 1264 Kublai Khan made his capital here and built the present Tatar city, called Ta-tu, or 'Great Capital,' in Chinese, and called Khan-baligh, or 'City of the Khan,' in Mongol, the Kambálu of Marco Polo. The third Emperor of the Ming dynasty settled here in 1409, caused 12½ miles of its length to be cut off, and built the present north wall. The ruins of this discarded section can still be traced. The Manchus in 1643 accepted the city as they found it, but have improved it much. In 1860 it was spared by the Anglo-French expedition, who had no quarrel with the people. By agreement, however, they held the An-ting gate during the negotiations. On August 14, 1900, its walls were breached and entered by the allied forces sent to relieve the foreigners besieged in the British legation, and the city was held by the troops until September, 1901. In 1884 Peking was brought into telegraphic communication with the rest of the world. In 1897 it was connected by rail with Tien-tsin, the terminus remaining outside the south gate until the military occupation made it necessary to carry it into the city. The station is now opposite the Altar of Heaven. Peking is now also in railway connection with Shan-hai-kwan and Manchuria and through the Russian lines with Europe.

PELADAN, pā'lā'dăN', JOSÉPHIN, called 'Le Sar' (1859—). A French mystic, novelist and art-critic, born in Lyons. He became known as a disciple of Barbey d'Aurevilly, posed as a descendant of the last kings of Babylonia, assuming the title 'Sar' (chief) and a theatrical costume, and attracted increasing attention by a series of novels under the general title of *La décadence latine*, which include *Le vice suprême* (1886), *Curieuse* (1886), *L'initiation sentimentale* (1887); *Le cœur perdu* (1888), *Istar* (1888), *La victoire du mari* (1889), *Cœur en peine* (1890), *L'androgyne* (1890), and *Le gynandre* (1891). These works are an extraordinary mixture of originality and merely riotous imagination, in which human passions, astrological dreams, esoteric doctrines, and astral adventures vie with one another for precedence, and the subtlest sensuality does not come off a loser. Entirely distinct from this cycle is the novel *Femmes honnêtes* (1885). As art critic he published *Rembrandt* (1881), *Une introduction à l'histoire des peintres de toutes les écoles* (1884), and *La décadence esthétique* (1888). He founded the order of "La Rose Croix. Croix du

Temple" in 1892, and the cult spread prodigiously for a few years. In spite of many absurdities, it seems really to have been a reaction against much that was purely material in French art, a reaction that had its equivalent in the Pre-Raphaelite movement in England several years earlier. The Rosicrucians held Salons, called the 'Esthetic Geste,' and gave concerts, lectures, and plays written by the Sar Peladan.

PELA'GIANISM. A fifth-century Western heresy, which originated with the monk Pelagius (q.v.), who denied the dependence of the human will upon grace, in opposition to Augustine's doctrine of the necessity of divine assistance, and minimized the consequences of Adam's fall, thus denying the doctrine of original sin. The views commonly called Pelagian are not foreign to Greek Christianity. The later Origenists, who are generally thought of only as interested in the Christological discussions, had much sympathy with the teaching of Pelagius. So, for instance, Theodore of Mopsuestia, to whom Nestorianism was largely indebted, held that Adam's transgression wrought no special injury to his descendants. It has been suggested that 'the Nestorian Christ' would be the 'fitting Saviour for the Pelagian man.' (See NESTORIUS.) On the other hand, it has often been charged by the Pelagians and their apologists that their opponents held the Manichæan view of the matter, and that it influenced their conception of original sin, as if the physical body were itself essentially evil. See MANICHEISM.

Pelagius spent some time in Rome, in high repute, before raising the issue which was so deeply to agitate the Western Church. About the year 405 he openly objected to a prayer contained in Augustine's *Confessions*, "Give what thou commandest, and command what thou wilt," on the ground that it tended to destroy all sense of responsibility. He was soon joined by an able ally, Cœlestius, who had been trained as an advocate, and whose subsequent history is bound up with the Pelagian cause. Fleeing before the Gothic invasion (410), the two friends made their way to Africa, where Augustine was then engaged in his controversy with the Donatists (q.v.). Here Pelagius taught that infant baptism was administered not to remove the stain of sin, because infants had none, but rather to sanctify and admit them to the kingdom of heaven. This was not Augustine's view at all, and as soon as the Donatist dispute permitted he turned to deal with the new foe. By that time, however, Pelagius had left Africa for Palestine, but Cœlestius remained and was seeking ordination as a presbyter. Objection was raised by one Paulinus, a deacon from Milan, who charged Cœlestius with error. He was examined before a synod (412) and condemned for teaching that Adam would have died even if he had not sinned; that Adam's transgression injured only himself; that infants are born into the state in which Adam was before the fall; that unbaptized infants, dying in infancy, have eternal life; that men may attain heaven through a righteous life (keeping the law), as well as through the Gospel; that some men have lived without sin, and others may; and that men can easily live without sin, if they will. In opposition to these views Augustine maintained that Adam's sin affected the race, involving all mankind in guilt; that physical death is the penalty of sin; that infants are baptized for the remission of original (inherited) sin; and that the only sinless man in the world was Jesus Christ. Most of these ideas are found in his earliest anti-Pelagian work, *The Deserts of Sins and Their Remission* (written in 412).

The arrival of Pelagius in Palestine opened the first chapter in the Eastern history of the controversy. Not a few Origenists sympathized with his views, and none of them openly opposed him. But Jerome (q.v.), and a little later the Spanish presbyter Orosius, promptly opened the attack. A synod was summoned by John, Bishop of Jerusalem, to consider the question (415), and to it Orosius reported the action of the African clergy in the case of Cœlestius. During the examination of Pelagius his Latin and the synod's Greek seem to have occasioned some misunderstanding, but he finally consented to anathematize any one who taught "that man can ever become perfect without God's aid," and this so far satisfied the synod that it dissolved without condemning him. Orosius, however, and some others, felt that the Bishop had not been impartial in his conduct of the inquiry. At the more important synod of Diospolis, presided over by Eulogius, of Cæsarea (415), Pelagius either disavowed or explained away the heretical opinions with which he was charged, and was thereupon pronounced orthodox —a result which angered Jerome, and caused Augustine afterwards to declare that Pelagius had deceived his judges. Pelagius now proceeded to issue his treatise *On Free Will*, which was presently supported by Theodore of Mopsuestia, who attacked Jerome's idea that "men sin by nature, not by will."

Upon Orosius's return to Carthage, a synod was held (416), reaffirming the adverse judgment of the African Church and appealing to Innocent, Bishop of Rome, to aid in opposing Pelagianism with "the authority of the Apostolic See." A similar appeal was made by the Synod of Mileve, in Numidia. Innocent replied as they had hoped he would, saying that Pelagians must be excluded from the Church. Two months later he was succeeded by Zosimus, a Greek, who proved more friendly to the Pelagians than his predecessor. To him Cœlestius appealed in person, and after examination, in which he denied the heretical opinions charged against him and made a formal profession of faith, the Pope refused to condemn him, although he cautioned him to abstain from pursuing further his unprofitable speculations. Soon after this Zosimus received from Pelagius a written statement of belief, similar to that of Cœlestius, on the strength of which he too escaped condemnation. The African clergy were greatly disturbed at the Pope's action, reversing as it did the policy of Innocent, but they were not to be turned from their position. Another large synod reaffirmed once more the condemnation of Pelagianism, and urged upon Zosimus a reconsideration of the whole case. Their action, coupled with the fact that at this juncture the Emperor Honorius issued a strong anti-Pelagian decree, aroused the Pope to action. He reversed his judgment, and now wrote a circular letter to the bishops, calling upon them to assent to the condemnation of Pelagius and Cœlestius, and setting forth in Augustinian terms the true doctrine of sin and

grace. This document is known as the *Epistola Tractoria*, and its date is 418. What may be regarded as the final collective action in the West was taken by a great national synod, held the same year in Carthage, whose decrees anathematize Pelagianism in clear and unmistakable terms. Soon afterwards Augustine wrote his two works, *On the Grace of Christ* and *On Original Sin*, in which he argues that all man's righteousness comes from God, who is the ultimate principle of goodness, back of every impulse of the human heart. Here one may find the uncompromising doctrine of the necessity of divine grace which is characteristic of Augustinianism. And here, too, is that last resort to which Augustine more than once was driven by the logic of his opponents, the inscrutability of God's dealings with His creatures, expressed in the words of Saint Paul, "O the depth of the riches, both of the wisdom and the knowledge of God!" (Rom. xi. 33). Augustine had indeed reached the boundaries of knowledge.

But Augustinianism was not yet victorious. Eighteen Italian bishops refused their assent to the *Tractoria* of Zosimus, among them Julian of Eclanum, one of the best debaters on the Pelagian side. These bishops were promptly excommunicated, but Julian headed a schism which lasted for several years and gave the Church no little trouble. The Pelagians took refuge in the East, where, among others, the patriarch Nestorius showed them favor. But their partial alliance with him proved disastrous in the end, for at the Third Ecumenical Council (Ephesus, 431) both Nestorius and Pelagius were condemned. This result was largely due to the untiring efforts of Marius Mercator, a layman from the West, to whom we owe much of our information on the subject. Pelagian views did not at once disappear, either in the East or in the West; for their subsequent history, see SEMI-PELAGIANISM. Besides the works referred to under PELAGIUS, consult: Hefele, *History of the Councils*, vol. ii. (Eng. trans., Edinburgh, 1876); Harnack, *History of Dogma*, vol. v. (Eng. trans., London, 1898); Rainy, *The Ancient Catholic Church* (New York, 1902).

PELAGIC ANIMALS (from Gk. πελαγικός, *pelagikos*, relating to the open sea, from πέλαγος, *pelagos*, open sea). The pelagic or surface fauna of the ocean comprises an assemblage of animals which live on the high seas, far from land. They live permanently at or near the surface of the ocean, in the warmer parts of the earth. Among them are many Foraminifera, of which Globigerina is the most abundant, also the Radiolaria (q.v.), Siphonophora (q.v.), many Medusæ (q.v.), all the Ctenophora, many entomostracous Crustacea, certain schizopod Crustacea, as Mysis, pteropod and heteropod mollusks, the nudibranch Glaucus, the Salpæ (q.v.), and most cephalopods, as the squid and calamary; while the flying-fish, certain little fishes (Antennariidæ) nesting in gulf-weed, many sharks, and the whales and porpoises make up the assemblage.

The pelagic invertebrate animals, such as the Medusæ, Salpæ, etc., are very transparent, either colorless or with blue or violet tints. The pelagic fishes are usually gray or steel-blue above, white beneath, not being so strikingly marked as those frequenting the shore or coral reefs. See OOZE; PLANKTON; LANTERN-FISH.

PELAGIUS, pē-lā'jĭ-ŭs. A British monk, author of the Pelagian heresy, who flourished during the first quarter of the fifth century. The dates of his birth and death are unknown. A late and uncertain tradition says that his name was Morgan (*Morigena*, sea-born), of which Pelagius (Πέλαγιος) would be the Greek translation. Some of his theological opponents describe him as immoral, but Augustine calls him a "holy man, who has made no small progress in the Christian life." The history of his life begins with his visit to Rome, whither he went probably in the year 401; thenceforth it is that of the Pelagian controversy, for which see PELAGIANISM. Nothing is known with certainty of the close of Pelagius's life, but one tradition says that he died in Palestine at the age of about seventy years. Among his writings we have the creed which he submitted to Bishop Zosimus, a letter to Demetrius about the ascetic life, and some fragments. He wrote a work *On the Trinity*, another *On Free Will*, a *Commentary on Paul's Epistles*, probably extant in a revised form among the works of Jerome, and the *Eulogia*, a collection of extracts from the Scriptures, for use as an aid to Christian living. Consult: Augustine, *Anti-Pelagian Works*, Eng. trans. in *The Nicene Fathers, First Series*, vol. v., ed. by Schaff (New York, 1887); Fisher, *History of Christian Doctrine* (ib., 1896); Bright, *The Age of the Fathers*, vol. ii. (London, 1903); Smith and Wace, *Dictionary of Christian Biography*, article "Pelagius" (ib., 1887).

PELAGIUS. The name of two popes. PELAGIUS I., Pope 555-60. He came of a noble Roman family, and as a deacon accompanied Pope Agapetus I. to Constantinople (536). Pope Vigilius appointed him his representative at the Imperial Court there in 540, and he won great influence over the Emperor Justinian. He took a vigorous part in the controversy over the Three Chapters of Justinian (see CHAPTERS, THE THREE), in which the decree of the Council of Chalcedon on the Person of Christ was constructively condemned. Despite his opposition to the Emperor's views, the latter, on the death of Vigilius, put him forward as his candidate for the vacant see. He was ill received on his return to Italy as the Imperial nominee, and only two bishops came to assist in his consecration. He endeavored to clear himself from the charge of complicity in heresy by a solemn protestation of allegiance to the teaching of the four general councils, and especially that of Chalcedon; but he could not prevent a schism in Northern Italy. He died in Rome, March 3, 560, or, according to Duchesne, March 4, 561. His letters are in Migne, *Patrologia Latina*, lxix; some additional ones in Löwenfeld, *Epistolæ Pontificum Romanorum Inedita* (Leipzig, 1885).—PELAGIUS II., Pope 578-90, born in Rome of a Catholic family. He was elected Pope when Rome was besieged by the Lombards, and appealed to the Greek Emperor Tiberius II. for assistance; but that monarch was too much occupied with a war in Persia. He then turned to the Franks, with whom Maurice, the successor of Tiberius, concluded a treaty. The Franks, however, proved untrustworthy allies, and the troubles of Italy continued. He took great offense at the toleration of the title 'universal bishop' by John the Faster, Patriarch of Constantinople, and forbade his representative there to attend any service celebrated by John.

But his heart was gladdened at the end of his pontificate by the news that the West-Goths in Spain had returned from Arianism to the orthodox faith (589). He died of the plague in Rome, February 7, 590. His letters are in Migne, *Patrologia Latina*, lxxii. He was succeeded by Gregory the Great, who had long been his trusted counselor, and in whose biographies many of the events of his pontificate will be found; consult also Weise, *Italien und die Langobardenherrscher* (Halle, 1887).

PEL'AGOSAU'RUS (Neo-Lat., from Gk. *πέλαγος*, *pelagos*, open sea + *σαῦρος*, *sauros*, lizard). An extinct Liassic crocodile, found fossil in Southern Germany, in France, and in England, having a peculiarly elongated narrow skull and jaws furnished with many sharp, slender teeth. See CROCODILE.

PELARGONIC ACID, $C_9H_{18}O_2$. One of the so-called *fatty* acids. It is an oily liquid, nearly insoluble in water, but soluble in alcohol and ether. It derives its name from its having been originally obtained from the leaves of *Pelargonium roseum* by distilling them with water. It may also be obtained by the oxidation of oil of rue with nitric acid. It is supposed to exist in a combined form in old whisky.

PELARGONIUM (Neo-Lat., from Gk. *πέλαργος*, *pelargos*, stork; so called from the resemblance of the capsules to a stork's bill). A genus of plants of the natural order Geraniaceæ, including many favorite greenhouse and house plants, to some of which the old generic name Geranium (q.v.) is popularly given. The genus contains about 170 species, smooth or downy perennial herbs or undershrubs, native chiefly of South Africa, a few species being found in Australia. The species in cultivation have become so modified that it is often difficult to determine their origin. The leaves exhibit great variety in form,

A CULTIVATED VARIETY OF PELARGONIUM.

texture, fragrance, and color. The flowers always adhere to a certain type in form, but vary greatly in color and size; they are always in stalked umbels, arising from the axils of the leaves, or in the stemless kinds from the midst of the leaves. In no genus has the art of the gardener produced more striking results than in this; and the number of beautiful hybrids and varieties is very great, some of them excelling in beauty any of the original species. Some species, not possessing much beauty of flower, are cultivated for the grateful odor of their leaves. The cultivated species are divided into four groups, namely, ivy geraniums, derived from *Pelargonium peltatum*; scarlet, horseshoe, or zonal geraniums, from *Pelargonium zonale* and *P. inquinans*; Lady Washington geraniums; and rose geraniums. The horseshoe geraniums often have a horseshoe-shaped dark zone on the leaf. The flowers of the Lady Washington varieties are very large and irregular, while the rose-colored or purple flowers of the rose geraniums are rather small. These last two groups each include a number of different species. Most of the common varieties are largely grown as bed and border plants, their outdoor culture being quite simple. For this purpose the plants are taken from the greenhouse after danger of frost has passed and set out in a well-worked, rich, sandy loam. Water must be liberally supplied during the time of flowering; but for no plants is a period of rest more necessary, and water must then be very sparingly given. Many of the shrubby kinds may be trimmed of leaves and watery shoots, hung up by the roots in a dry cellar, or covered with hay in a box, in a cool but frost-proof dry loft or garret. Another method is to cut off every leaf before frost comes, and to keep the plants all winter in their pots in a dry, cool room, without watering them. By such means many varieties are successfully cultivated by persons who have no greenhouse. Pelargoniums are commonly propagated by cuttings from the firm shoots, which root readily.

PELASGIAN ARCHITECTURE. See CYCLOPEAN ARCHITECTURE.

PELAS'GIANS (Lat. *Pelasgi*, from Gk. *Πελασγοί*, *Pelasgoi*, of uncertain etymology). The name of a people dwelling in Greece in early times, used with very different meanings at different times. In the earliest Greek writings, the Homeric poems, the Pelasgians seem to be the inhabitants of Pelasgian Argos and the fertile valley of the Peneus around Larissa in Thessaly, and the Zeus of Dodona is also called Pelasgian. In a somewhat late part of the *Iliad* they appear among the allies of the Trojans, thereby causing much trouble to ancient and modern commentators. As there is no other trace of their existence in Asia Minor, very possibly the poet, knowing of enmity between the Achæans of Phthiotis and their northern neighbors, thought of the latter as coming from Thessaly to Troy. In the *Odyssey* they are once mentioned as one of the tribes in Crete. Nothing in the epic indicates that they are of other race than the Greeks. Like the other tribes of Thessaly, they seem to have been conquered by the Thessalians, and probably largely reduced to Penestæ, though their old territory was known in historical times as Pelasgiotis. Tradition, however, told of the former state of their King, Pelasgus, son of the earth. This seems the slender basis on which the extensive and contradictory legend of the Pelasgians grew up. In Hesiod we find Pelasgus transferred to Arcadia, whose people also claimed to be autochthones, though it must be said that Pelasgians do not appear as a race in any early Arcadian legend. The epithet Pelasgian was transferred to Argos in Peloponnesus, and now we find there also a King Pelasgus prepared to receive Danaus and his daughters. Herodotus has decided that the old name of Greece was Pelasgia, and that the Pelasgians preceded the Hellenes; naturally, since Hellenes could not well exist before Hellen and his three sons, while many Greek genealogies traced descent from different sources. Further confu-

sion was invited by the transformation of the Athenian name for the old fortification of the Acropolis, *Pelargicon*, into Pelasgicon; whence it followed that Pelasgians had lived in Attica. Moreover, Hecataeus, who seems to have made this transformation, also identified the Tyrrhenians of Lemnos with Pelasgians, and brought them from Attica to the island. As the Etruscans were also Tyrrhenians, it followed that they were Pelasgians, and so the race appeared in Italy. This identification also converted Pelasgians into barbarians, for every one knew that the Tyrrhenians were not Greek. Thus toward the end of the fifth century B.C., apparently by Hellanicus, the legend was fully developed that they were the original inhabitants of Greece, driven from Peloponnesus to Thessaly by the Danaans, and scattered to the four winds by the Hellenes. It has been well said that in general the Pelasgians only appear in a land in order to be driven out. From this conception of the Pelasgians naturally arose the theory that to them were due the great works of the early days, and the mighty walls that some called Cyclopean were by others termed Pelasgian. In recent years it has become very common to employ the term Pelasgian to designate the pre-Aryan population of Greece and Italy, to whom is attributed the pre-Mycenæan civilization; not, of course, with the implication that this population formed one great people, but rather as a convenient collective name for more or less closely related tribes. This use may be criticised as easily leading to the belief that it rests on ancient authority, and not on modern speculation. Of late they have been brought into special prominence by the theory that to them is due the entire Mycenæan civilization; that they were invaded and conquered by the Achæans, a fair-haired tribe akin to the Celts, who became a ruling class, and to whom is due the Homeric civilization. The dark-haired Pelasgians gradually absorbed their conquerors, as has been the case in other invasions of these lands by blond northern races. The theory uses largely, if uncritically, the ancient authorities, but has not won general acceptance.

The literature on this question is very voluminous. The more important discussions, to 1889, are collected in Hermann's *Lehrbuch der griechischen Antiquitäten*, 6th ed. by Thumser (Freiburg, 1889). Consult also Busolt, *Griechische Geschichte*, i. (2d ed., Gotha, 1893). For the ancient statements, consult S. Bruck, *Quæ Veterum de Pelasgis Tradiderint* (Breslau, 1884), and especially the thorough examination by E. Meyer in his *Forschungen zur alten Geschichte*, i. (Halle, 1892), who has shown how largely they consist of guesses. The new theory is presented in Ridgeway's *Early Age of Greece* (Cambridge, 1901 et seq.). It is discussed in Hall's *Oldest Civilization of Greece* (London and Philadelphia, 1901), and by J. C. Myres, in *Classical Review*, vol. xvi. (London, 1902).

PELAYO, pā-lī'yō (died 737). The first Christian King in Asturias, after the conquest of Spain by the Arabs. Practically nothing is known about his life. He was, strictly speaking, nothing but a robber chieftain; still by his defense of Covadonga, a mountain fastness, in 718 against the Moslems, he kindled the national spirit and became the founder of the Spanish monarchy. The legend states that at Covadonga he and thirty followers destroyed an Arab army four hundred thousand strong. Consult Burke, *A History of Spain*, vol. i. (London, 1895).

PELECYP'ODA (Neo-Lat. nom. pl., from πέλεκυς, *pelekys*, axe + πούς, *pous*, foot), or LAMELLIBRANCHIATA, or BIVALVES. A class of bilaterally symmetrical acephalous mollusks, all of which have bivalve shells, and gills in the form of vascular plates of membrane attached to the inner surface of the mantle. The body is very strongly compressed, the dorso-ventral diameter being much greater than the lateral. The *adductor* muscle, which closes the shell, is single in some, double in the greater number. The shell is naturally more or less open, owing to the peculiar elastic hinge which tends to keep it open. But the adductor muscles continually tend to close it. Consequently when a live mollusk is irritated the shell closes tight, but when the animal is dead the muscles relax and the shell gapes open. Important differences exist in the powers of locomotion. Oysters are fixed to one spot by one of the valves of the shell; but most of the pelecypods have the power of moving by swimming, leaping, or burrowing in sand, sometimes in more than one of these ways, being provided for this purpose with a fleshy muscular organ called the *foot*. Some, as mussels, fix themselves when young by a cable of chitinous threads, the *byssus*. The mouth is jawless and toothless, but on each side are two flaps, the labial palpi. All seem to depend for their food on the currents of water continually brought by ciliary action into the mouth. The edges of the mantles are sometimes entirely separate from each other, but are often more or less fused. In the latter case two openings are left in the posterior edge, through the lower of which water is brought into the mantle cavity, where, having been deprived of its oxygen by flowing over the gills, and of its nutritive material in the stomach, it passes out through the upper opening, carrying away the waste, and, at the proper season, the reproductive elements. Various modifications of this inhalent and exhalent apparatus exist; and in many forms the orifices become elongated into two tubes called 'siphons,' which, as in the clam, may often be extended several inches beyond the shell. Bivalves, with such siphons, live buried in mud or sand with only their siphons reaching the surface. The edges of the mantle often bear tentacles, papillæ, glands, and more or less complicated eyes. The two halves of the shell are usually of about the same size, but in some forms one valve is very much larger than the other. Generally the shell covers the whole animal, and when the shell is closed the animal is completely shut in, but in the shipworm (q.v.) the two halves of the shell are very small, and inclose only an insignificant part of the greatly elongated body.

The ear or otocyst is situated in the 'foot.' The heart is three-chambered, there being two auricles and one ventricle. The sexes exist in different individuals. The number of eggs is usually enormous, the oyster producing about two millions each season. The young pelecypod passes through a free-swimming veliger stage, and some bivalves get their growth in a single year. The fresh-water mussels live from ten to twelve years, while the giant clam (Tridacna) is supposed to attain an age of from sixty to one hundred years. Many bivalves are of great use to man as food, notably oysters, clams, and scallops. Others, as

the ship-worm (q.v.), are injurious. The mollusks of this class vary in size from a small fraction of an inch up to the giant clam (q.v.) of the East Indies, which reaches three feet in length. In many species the shells are very beautiful, the interior being lined with nacre, or mother of pearl. Pearls (q.v.) are formed in many, especially in the pearl oyster and fresh-water mussels. Bivalves inhabit all parts of the world in both salt and fresh water, and form a highly important part of the food of many valuable fishes, especially those of the cod family, as well as of other marine animals. About 14,000 species are known, 8000 or 9000 of which are fossils; and they are generally grouped in five orders, distinguished by the character of the gills.

See MOLLUSCA; MOLLUSK and authorities cited thereunder; Colored Plate of CLAMS AND EDIBLE MUSSELS and Plate of ABALONE, ETC.

PELÉE, pā-lā', MONT (or more properly, MONTAGNE PELÉE). An active volcano of the island of Martinique, situated in its northwestern part, in about latitude 14° 48′ N. The elevation of the Morne de La Croix (the culminating point at the time) previous to May, 1902, was about 4300 feet; of the newly formed cone, with its extended 'plug' or obelisk, in May, 1903, 5200 feet. The mountain has exceedingly gradual slopes, which rise with gradients of from five to twenty-five degrees, and is constructed of alternating lava-masses (andesite) and fragmental agglomerates. Its surface is scarred by deep ravines and waterways, the latter numbering about twenty-five, the majority of the streams taking individual courses to the sea. Among the most noted of these are the Rivière Blanche (lying in the course of the devastated region), the Rivières Prêcheur, Grande, Basse-Pointe, Falaise, and Roxelane, the last-named flowing through the town of Saint Pierre. Prior to the eruption of May 8, 1902, a small tarn, the Lac des Palmistes—often, but probably erroneously, referred to as a crater-lake—occupied the flattened summit of the volcano, and was surrounded by beautiful and rank vegetation. The only historically recorded eruptions of Mont Pelée are those of 1762, August, 1851, and 1902-03 (those of May 8, 20, 26, June 6, July 9, and August 30, 1902, being especially accentuated), all having taken place from craterlets or soufrières located on the western and southwestern slopes of the mountain, and at elevations of from 2400 to 3000 feet. The great eruptions of 1902 were from the basin of the Etang Sec, or 'Dry Lake,' near the head of the Rivière Blanche, this being the true crater, a wild basin, about a half mile in greatest diameter, surrounded in greater part by rugged walls of rock 1600 feet or more in height. The seaward face of the Morne de La Croix plunged at an angle of 75° into this crater-basin. The active opening of this crater, the general character of which had been recognized fifty years before, was on April 25, 1902; from it, on May 5th, descended the 'avalanche' of boiling black mud that destroyed the sugar estate (*usine*) of Guérin, and buried beneath its mass thirty or more of the workmen (and proprietors), and on May 8th the black cloud of explosive and exploded superheated steam, charged with glowing incandescent particles, which (at 8.2 A.M.) destroyed Saint Pierre, and with it hardly less than 30,000 people. The phenomena of this remarkable eruption are not yet known in their full detail, but they are among the most extraordinary recorded in the intensity of the associated electric manifestations, the vast disturbance in the magnetic field, and the violence of the destroying blow. The magnetic disturbance was transmitted to the antipodal region of the earth in about two minutes' time, while the noise of the eruption manifested itself forcibly at Maracaibo, Venezuela, and beyond, at a direct distance of 850 miles, or considerably more.

The second death-dealing eruption of Mont Pelée took place on August 30th at about 9 P.M., and destroyed in less or greater part Morne Rouge and Ajoupa-Bouillon, besides inflicting considerable damage, with loss of life, upon Morne Balai, Morne Capot, and Bourdon (Basse-Pointe). The loss of life in this later explosion, whose characteristics appear to have been almost exactly those of the May cataclysm, has been estimated at from 2000 to 2500. Since that date, as well as in the period preceding the early days of May, the volcano has been continuously active, discharging vast quantities of lapilli and ashes. There has been at no time during the recent period of activity any lava flow, although the large ejected blocks or bombs, together with the massive extended obelisk, clearly show the presence of a molten magma within the throat or neck of the volcano. The column of ejected steam, laden with dust and lava bombs, shot forth from the crater on August 30th, just before the second great eruption, was estimated to have a diameter of 1500 feet as it rose over the crest of the crater, and its initial velocity was roughly computed to be in the neighborhood of 100 miles an hour. The steam ascended miles into the air, spreading out into a broad, mushroom-like canopy. The most extraordinary feature that is associated with the activity of Pelée is the giant mass of rock, a veritable obelisk, which has been slowly pushed out through the summit opening of the new cone, and rises (June, 1903) to upward of 800 feet, with a basal thickness of 300-350 feet. The molten lava rises into some portions of this, and may be followed at night-time along the passages, which are made brilliantly red.

It is a remarkable circumstance that, despite the accentuated warnings which for a period of two weeks and more Mont Pelée threw out presaging disaster, only a few hundred of the inhabitants of Saint Pierre took the precaution to leave the city; and this loss to the population was counterbalanced by numbers of refugees who from minor villages and hamlets had flocked to the larger city for protection. The annihilating blow came with appalling swiftness, and there is reason to believe that for the greater part of the 30,000 victims death was well-nigh instantaneous, or, at least, brought about in two to three minutes. Only two of the inhabitants from the city proper appear to have survived their wounds, although a dozen or more lingered on in the hospital of Fort-de-France and elsewhere for a few days. The attitudes and conditions of many of the corpses found among the ruins were largely suggestive of the remains (casts) recovered from Pompeii, and there is reason to believe that the destruction of the two cities may have been brought about in very nearly the same way. In both places many of the bodies were found wholly destitute of clothing or giving indication of having had the clothing swept from the body

by a tornadic blast. For several days preceding the cataclysm Saint Pierre was well covered with ash, and the local journals called attention to the wintry aspect of the city. See MARTINIQUE.

PÉLÉE ISLAND. An island of Lake Erie, belonging to Essex County, Ontario, Canada, about 6 miles northward of the Put-in-Bay group, and 10 miles southwest of Point Pelée on the north shore mainland. It is 9 miles long from north to south, and 4 miles wide at its widest part. More than half the surface is marsh; the remainder is sparsely timbered, and of late years has been considerably occupied with vineyards. Its beaches furnish sand for building purposes.

PE'LEUS (Lat., from Gk. Πηλεύς). In Greek legend, a son of Æacus, King of Ægina, and the nymph Endeïs, and a brother of Telamon. In jealousy he and Telamon brought about the death of their half-brother Phocus, and were banished. He withdrew to Phthia in Southern Thessaly, where Eurytus purified him from blood-guiltiness and gave him his daughter Antigone to wife. While participating in the Calydonian Hunt he had the misfortune to kill his father-in-law accidentally. Once more an exile, he withdrew to Iolcos, where Acastus, son of Pelias, was celebrating magnificent funeral games for his father. In these Peleus took part, but was defeated by Atalanta in wrestling. Here he attracted the notice of Astydameia, wife of Acastus (or, in another version, Hippolyte, daughter of Cretheus), who offered him her love. On his refusal she slandered him to his wife and Acastus. Antigone hanged herself, while Acastus planned the death of Peleus. Rescued by Chiron, the good Centaur, Peleus later returned with Jason and the Dioscuri, destroyed the city, and killed Acastus and his wife. Celebrated in legend was his marriage to the Nereid Thetis, who had been sought by Zeus and Poseidon, but was given to a mortal because of the prophecy that her son would be mightier than his father. Peleus, helped by the gods, lay in wait for her by the shore, and in spite of her transformations into fire, water, and wild beasts, held her fast until she returned to her original form. The marriage was attended by all the gods, who bestowed valuable gifts. Poseidon gave him two immortal horses, and Chiron the ashen spear which Achilles wielded at Troy. Into this gathering Ate threw the golden apple inscribed "For the Fairest," which led to the "Judgment of Paris," and the Trojan War. By Thetis Peleus became the father of Achilles, and in later writers she is said to have returned shortly to her life as a Nereid, while the boy was brought up by Chiron; but this seems unknown to the Homeric poems, though even in the *Iliad* Thetis is represented as dwelling in the sea. Peleus is also said to have been one of the Argonauts and to have accompanied Hercules and Telamon to Troy. The marriage of Peleus and Thetis was described by later poets, and represented on works of art, of which the best known is the celebrated François vase in Florence, made by the Athenians Clitias and Ergotimos, in the sixth century B.C.

PELEW, pē-lōō', or **PALAU,** pä-lou', **ISLANDS.** A group of 26 small islands in the Pacific Ocean lying to the east of the Philippine and to the west of the Caroline islands, between the parallels of 7° and 8° N., and the meridians of 134° and 134° 45' E. (Map: East Indies, H 3). They were discovered by the Spaniards in 1545 and remained in their possession until 1899, when they were purchased by Germany along with the rest of the 680 islands of Micronesia (except Guam), and now form part of the German "New Guinea Protectorate." Area, 170 square miles. The largest and most populous member of the group is Babelthuat; the most important politically is Korror, where the King resides. The southern islands are coral in origin, the northern volcanic. The surface is rugged and hilly and covered with forests. The soil is fertile and the vegetation tropical. The climate is equable and salubrious, the temperature ranging from 77° to 91° F. Rice is the principal food of the people; sugar-cane, tobacco, breadfruit, cocoanuts, bananas, lemons, oranges, and other tropical fruits are grown. Only six of the islands are inhabited. Pililu, one of the southern islands, probably gives name to the group. The natives of the Pelew Islands are of Malayo-Polynesian race, with, according to some authorities, a trace of Papuan blood. They are still among the most primitive and good-natured of the peoples of the Pacific, and are of considerable interest to ethnologists by reason of their marriage customs and other social institutions. These have been studied by Kubary in *Die sozialen Einrichtungen der Palauer* (Berlin, 1885).

PELHAM, pē'ăm, PETER (1684 or 1694-1751). An English mezzotint engraver, born probably at Chichester. His earliest plate is dated 1720. His subjects include: George I., George II., and Queen Anne, after Kneller; Peter Paul Reubens, after Reubens; Oliver Cromwell, after Walker. In 1726 he went to America and settled in Boston, where he opened a school in which he taught painting, reading, writing, dancing, and needlework, meanwhile keeping up his engraving. His portrait of Cotton Mather (1727) was the first of its kind ever produced in America. Other subjects treated by him include: Rev. John Moorhead (1731), Rev. Mather Byles, his own originals; Benjamin Coleman (1734), Rev. William Cooper (1743), Rev. Joseph Sewall, and Governor Shirley (1747), all after Smibert; plan of the city and fortress of Louisburg, after Richard Gridley (1746); Rev. Charles Brockwell, Rev. Thomas Prince (1750), Thomas Hollis (1751), and Rev. Edward Holyoke (1749), after Highmore. Pelham was the first master of John Singleton Copley, the painter.

PELHAM-HOLLES, hŏlz, Thomas, First Duke of Newcastle. See Newcastle, Thomas Pelham-Holles, First Duke of.

PELHAM, OR THE ADVENTURES OF A GENTLEMAN. A novel by Bulwer-Lytton (1828). The hero, though a dandy, is a young man of serious ambition, who devotes himself to politics. His love for Ellen Glanville induces him to take steps to prove the innocence of her brother, who was accused of murder, though at first convinced of his guilt.

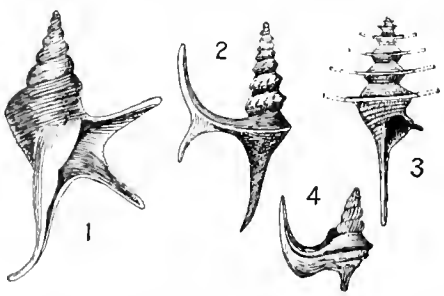
PE'LIAS (Lat., from Gk. Πελίας). In Greek legend, a son of Poseidon and of Tyro, daughter of Salmoneus, and twin brother of Nelens, father of Nestor. With his brother he was exposed by Tyro, but the children were found and reared by a herdsman, who named him Pelias (compare πελός, *pelos*, dark-colored) because his face was livid from a kick by a mare. In the meantime Tyro had become the wife of Cretheus, King of Iolcos in Thessaly, and mother of Æson, Pheres, and Amythaon. The twins later found their mother, and after Cretheus's death Pelias succeeded in seizing the throne from Æson, who fled into exile. By his wife, Anaxibia, daughter of Bias, he became father of Acastus and four daughters. One of these was Alcestis, who was won by Admetus, who met the test imposed by her father, by harnessing a lion and a boar to a chariot. Jealous of Jason, his nephew, Pelias dispatched him to secure the Golden Fleece at Colchis. On the return of the *Argo*, Medea persuaded the daughters of Pelias that she could rejuvenate their father, by boiling his flesh with magic herbs. They accordingly killed and cut up the old man, but were then mocked by Medea, who thus revenged the wrongs of her husband, Jason. His funeral was celebrated with great splendor by Acastus, and the games were a favorite theme with ancient poets. See Argonauts; Medea.

PELICAN (AS. *pellican*, from Lat. *pelicanus*, *pelecanus*, from Gk. πελεκάν, *pelekan*, pelican, connected with πελεκᾶς, *pelekas*, woodpecker, from *pelekan*, to hew with an axe, from πέλεκυς, *pelekys*, Skt. *parasu*, axe). A large web-footed, fish-eating water-bird of the family Pelecanidæ, having a very large, long, flattened bill. The upper mandible, which is terminated by a strong hook, curves over the tip of the lower one; and beneath the lower mandible, which is composed of two flexible bony branches meeting at the tip, a large distensible pouch of naked skin is appended. The tongue is very short and almost rudimentary; the face and throat generally are naked; the wings of moderate length, the tail rounded. About 12 species are known, widely distributed in warm regions, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. They take their prey by plunging upon it into the water, and store it in their pouch, for their own eating at leisure or to feed their young. Three species of pelican occur in the United States. The white pelican (*Pelecanus erythrorhynchus*) was formerly found throughout North America, but is now rare east of the Mississippi, except along the Gulf coast, where it winters. It resembles the common pelican of the Old World, but differs in having a curious horny prominence on the bill during the breeding season. The plumage is pure white, excepting the primaries. It is the largest American species, being five feet long and eight or nine feet across the wings. It breeds in colonies generally; the eggs, from one to four in number, are creamy or bluish white, 3½ inches long by 2¼ broad. The brown pelican (*Pelecanus fuscus*) is somewhat smaller than the white pelican, and gray and brown. It is found throughout the West Indies, occurs as far north as South Carolina, and breeds throughout its range. The brown pelican of the California coast (*Pelecanus Californicus*) is a trifle larger and shows more difference in color.

The common pelican of the Old World (*Pelecanus onocrotalus*) is as large as a swan. Its plumage is white, tinged with flesh color. It is a native of Eastern Europe, and of many parts of Asia and Africa, and frequents both the seacoast and rivers and lakes. It makes a nest of grass on the ground near the water, and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouches. The nail or hook which terminates the bill is red, and it has been suggested that the ancient fable of the pelican feeding its young with blood from its own breast originated from its habit of pressing the bill upon the breast, when the red tip might be mistaken for blood.

In heraldry, the pelican is drawn with her wings indorsed, and wounding her breast with her beak. When represented in her nest feeding her young with her blood, she is called 'a pelican in her piety.' This is connected with the fable above mentioned, and with the symbolism of the pelican in mediæval religious art as significant of self-sacrifice. Consult Twining, *Symbols and Emblems of Christian Art* (London, 1886). See Plate of Fishing Birds.

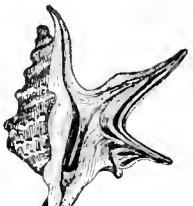
PELICAN'S-FOOT, or Spout-Shell. A shell of a gastropod of the family Aporrhaidæ, of which



FOSSIL APORRHAIDÆ.

1, *Alaria myurus* (lower Oolite); 2, *Anchura carinata*; 3, *Spanigera semicarinata* (Jurassic); 4, *Aporrhais calcarata* (upper Greensand).

but four living species remain, but a great number of quaintly shaped fossil species are known from the Jura onward. The most common specimens are of *Aporrhais pes-pelicani*, numerous on the Western European coast. Its widely distended and prolonged outer lips account for its popular name. A heavier, less forked species (*Aporrhais occidentalis*) is occasionally seen off New England. These mollusks inhabit rather deep water, and their habits are little known.



PELICAN'S-FOOT SHELL.

PELICAN STATE. Louisiana. See STATES, POPULAR NAMES OF.

PE'LION (Lat., from Gk. Πήλιον). A wooded mountain range on the coast of Thessaly, southeast of Ossa. The chief summit, now called Plessidi, is 5308 feet high, and in ancient times was a seat of the worship of Zeus Aeræus. The mountain is still thickly wooded with oak, chestnut, and beech. In ancient legend it played an important part as the home of the Centaurs, and especially of the good Chiron, whose cave was shown in later times. Otus and Ephialtes in their attempt to scale heaven were said to have piled Ossa on Olympus and Pelion upon Ossa, or, according to Vergil, Ossa on Pelion, and Olympus upon Ossa.

PÉLISSIER, pā'lē'syā', AIMABLE JEAN JACQUES, Duke of Malakoff (1794-1864). A marshal of France, born at Maromme, near Rouen. He studied at the artillery school of La Flèche and at Saint-Cyr, from which he entered the artillery of the Royal Guard in 1815. He served in Spain in 1823, made the campaign of the Morea in 1828, joined the first expedition to Algiers in 1830, and in 1839 returned to Algeria with the rank of lieutenant-colonel. He commanded the left wing of the French army at the battle of Isly (1844). In 1845 he acquired an unenviable notoriety by putting to death by suffocation some six hundred Arabs who took refuge in the caves of the Dahra and refused to surrender. Marshal Soult, then Minister of War, did not venture to approve this atrocity, but Marshal Bugeaud, commander-in-chief in Algeria, declared that Pélissier only carried out his positive orders, and so saved his subordinate from disgrace. By 1850 Pélissier had attained the rank of general of division. When the news of the coup d'état of December 2, 1851, reached Algeria, he espoused the cause of the Emperor, and placed the province under martial law until order was restored. In the Crimean War he was given command of the First Army Corps, and early in 1855 he succeeded Marshal Canrobert in the chief command. After the fall of Sebastopol Pélissier received a marshal's baton, and on his return to France was created Duke of Malakoff and a Senator. He was also made a member of the Order of the Bath by Queen Victoria. In 1858 he went to London as French Ambassador, but resigned in the following year a post for which he had little relish. He was then named Governor-General of Algeria, and died at Algiers May 22, 1864.

PELL, JOHN (1611-85). An English mathematician, born at Southwick, in Sussex. He was educated at Steyning and at Trinity College, Cambridge. He was a remarkable student, having at the age of twenty mastered Hebrew, Greek, Latin, Arabic, Italian, French, Spanish, and Dutch, and having shown much proficiency in mathematics. He was elected to the chair of mathematics at Amsterdam in 1643. By the invitation of the Prince of Orange (1646), he accepted the professorship of mathematics at Breda. He returned to England a few years later (1652), and was made political agent to the Protestant cantons in Switzerland by Cromwell in 1654. Returning again to England in 1658, he entered the ministry (1661), and became rector of Fobbing and vicar of Laindon, both in Sussex County, which offices he retained till his death. He was chosen Fellow of the Royal Society in 1663, and in the same year became domestic chaplain to Dr. Sheldon, Bishop of Canterbury, and took the degree of doctor of divinity. But his interest in philosophy and mathematics unfitted him for the ministry, leading him to neglect his clerical duties in pursuit of more congenial studies. Pell was influential in the matter of fixing the symbolism of algebra. The division symbol ÷ is commonly attributed to him, although it was due to Rahn, whose work, translated by Brancker, he edited (1688). His most important mathematical works are: *A Refutation of Longomontanus's Pretended Quadrature of the Circle* (1646, in Latin 1647); *A Table of 10,000 Square Numbers* (1672); *An Antilogarithmic Table*, computed with the aid of Walter Warner (c.1630-40), now lost; and a collection of some 40 folio volumes of letters and papers preserved in the British Museum.

PEL'LA (Lat., from Gk. Πέλλα). An ancient city, situated in the southeastern part of Macedonia, on the river Ludias, which formed around it impassable marshes, the present Lake of Janitza. It is mentioned in Herodotus, and at the end of the fifth century B.C. was the capital of King Archelaus. It first grew to a town of importance under Philip II., and became celebrated as the birthplace of Alexander the Great. It was the capital of the Macedonian kings from Antigonus Gonatas to Perseus, and in its acropolis they kept their treasure. By the Romans it was made a colony and seems to have enjoyed some prosperity, but under the later Empire gradually declined. The name seems to have clung to a spring not far from Janitza, and the ruins of the town are to be found at the neighboring Palatitza, where parts of a large palace have been excavated. Consult Heuzey and Daumet, *Mission archéologique en Macédoine* (Paris, 1876).

PEL'LAGRA (Neo-Lat., from Lat. *pellis*, skin + Gk. ἄγρα, *agra*, a catching, chase). A severe and chronic disease due to eating altered maize. It occurs extensively in the northern parts of Italy (whence it has been called Alpine scurvy or Italian leprosy), Spain, the south of France, and other parts of Europe. It has never been observed in America. The disease is generally confined to the poorer classes, especially of the country districts, and is worse in times of famine, when diseased or fermented maize is the chief article of diet. The trouble begins with indefinite digestive disturbances, with insomnia, but as it progresses there occurs an eruption on the skin followed by suppuration and the formation of dark crusts; the digestive symptoms become worse, with salivation, dyspepsia, and diarrhœa. In the more severe forms of the affection there are pronounced nervous phenomena —headache, backache, spasms, and paralyses. The mental depression is profound—melancholia and suicidal mania being common. The extent of the ravages of this affection may be estimated from the fact that of 500 patients in the Milan lunatic asylum in 1827 one-third were afflicted with pellagra; that in 1784 one out of every twenty and in 1817 one out of every five or six of the population presented symptoms of the disease. Treatment resolves itself into a correction of diet and removal from the infected district. For an elaborate discussion of the subject, see Jules Arnould, in the *Dictionnaire Ency-*

clopédique des Sciences Médicales, vol. xxii. (Paris, 1886); also the official report, *La pellagra in Italia* (Rome, 1880).

PELLAT, pā'lâ', JOSEPH SOLANGE HENRI (1850—). A French physicist, born at Grenoble. He studied in Paris at the Ecole Normale Supérieure, was assistant in physics at the Paris Observatory (1874), and taught in various lycées until 1893, when he was named adjunct in the scientific faculty of the University of Paris. In 1899 he was promoted to a full professorship. Pellat's especial field of research is electricity. On thermodynamics also he wrote for the *Journal de Physique* and the *Comptes Rendus*. He invented an electrodynamometer balance, and other apparatus for the measure of specific inductivity; and wrote: *Cours de physique* (1883-86); *Electricité atmosphérique* (1890); and *Cours de physique générale* (1896-97).

PELLEGRINO, pēl'lâ-grē'nō, TIBALDI. See TIBALDI, PELLEGRINO.

PELLETAN, pēl'tăN', CHARLES CAMILLE (1846—). A French politician, son of the following. He was born in Paris, studied at the Ecole des Chartes, and entered the political press with boldly republican attacks on the Empire. He became editor-in-chief of *La Justice* in 1880 and in the following year was elected to the Chamber of Deputies, where he voted with the Radical Left. He was an active opponent of Boulanger. In 1902 he received in the Combes Cabinet the portfolio of the navy and came near causing international complications because of his ill-advised speeches in which he foreshadowed a great war of conquest for France. His publications include: *Le théâtre de Versailles* (1876), a collection of his reports on the meetings of the National Assembly; *Question d'histoire: Le comité central et la Commune* (1879); *Georges Clémenceau* (1883); *Les guerres de la Révolution* (new ed., 1891); and *De 1815 à nos jours* (1892).

PELLETAN, PIERRE CLÉMENT EUGÈNE (1813-84). A French politician and publicist, born at Royan. He was educated at Poitiers and Paris, was engaged in journalistic work in the latter city from 1837, and incurred the displeasure of the Government by the freedom with which he voiced his political convictions. In 1868 he became chief editor of the *Tribune*, of which he had been a founder, and in 1863 he was elected to the Chamber of Deputies, where he sided with the opposition. During the Franco-Prussian War he was a member of the Government for National Defense; in 1871 he was elected to the National Assembly and in 1876 to the Senate. Three years afterwards he became vice-president of the Senate. He was the author of *La lampe éteinte* (1840); *L'histoire du brahmanisme* (1846); *La loi de progrès* (1857); *Decadence de la monarchie française* (1860); *La nouvelle Babylone* (1863); *Elisée: voyage d'un homme à la recherche de lui-même* (1877); and *Dieu est-il mort?* (1883). The friendship between Lamartine and himself was dissolved by the publication of Pelletan's *Profession de foi du XIXme siècle* and *Lettres à un homme tombé* (1857).

PELLETIER, pēl-tyā'. Sir CHARLES ALPHONSE PANTALÉON (1837—). A Canadian statesman, born at Rivière Ouelle, Quebec Province. He was educated in the Sainte Anne de la Pocatière College and Laval University, called to the bar in 1860, and became Queen's Counsel in 1879. He commanded the Ninth Battalion of the Voltigeurs de Quebec in the Fenian Raid of 1866, represented Kamouraska in the Dominion Parliament in 1869-77, and Quebec East in the Provincial House in 1873-74. He was made a Senator in 1877, served as Minister of Agriculture in 1877-78, and president of the Canadian commission at the Paris Exposition in 1878. He was made Speaker of the Senate in 1896, and was knighted in 1898.

PELLEW, pēl'ōō, EDWARD. See EXMOUTH, VISCOUNT.

PEL'LICA'NUS (Neo-Lat., skinner, furrier, from Lat. *pellis*, skin: a translation of his German name, *Kürschner*), CONRAD (1478-1556). A Swiss linguist and reformer. He was born at Ruffach in Alsace, studied for a short time at Heidelberg, entered a Franciscan monastery in his native town, and was later transferred to Tübingen. Subsequently he became professor at Basel. He gradually shifted toward Protestantism, and in 1526 threw aside his cowl and in the following year became professor of Hebrew at Zurich. He published the first Hebrew grammar written in a European language (1504; reprinted in phototype, 1877); his other works are an autobiography (published in Latin at Basel, 1877, and in German, Strassburg, 1891); and a biblical commentary in seven volumes (1532-39). Consult Reuss, *Konrad Pellicanus* (Strassburg, 1893).

PELLICO, pēl'lē-kō, SILVIO (1788-1854). An Italian poet, celebrated for his long and cruel imprisonment by the Austrians. He was born June 24, 1788, at Saluzzo, in Piedmont. In his sixteenth year he went to Lyons, where he stayed, giving his time mostly to French literature, until Foscolo's *Carme de' sepolcri* awakened in him a strong patriotic feeling, and an irresistible longing to return to Italy. About 1810 he went with his family to Milan, where he was professor of French in the Collegio degli Orfani Militari, and he also served as tutor in the family of Count Porro, in whose house the most distinguished men in Milan were wont to meet. His tragedy *Francesca da Rimini* (1818) shows how a mediæval theme may be classically handled. This play is full of lyric passages and of declamation. Pellico took an active part in a liberal periodical called *Il Conciliatore*, which was suppressed. For belonging to the Carbonari (q.v.) Pellico was arrested in 1820, and sent to the Prison of Santa Margherita, at Milan, where his friend the poet Maroncelli was also confined. In the beginning of the following year he was taken to Venice, and in January, 1822, to the prison on the isle of San Michele, near Venice. Maroncelli and he were at last condemned to death; but the Emperor commuted the sentence to twenty years' imprisonment for Maroncelli, and fifteen years for Pellico. In March, 1822, they were both conveyed to the subterranean dungeons of the Spielberg, near Brünn, in Moravia. In August, 1830, however, they were set at liberty. Pellico published an account of his sufferings during his ten years' imprisonment, under the title *Le mie prigioni* (1832). Pellico's health, however, was permanently injured. The Marchioness of Barolo received him into her house at Turin as her secretary. He died at Turin, January 31, 1854. Pellico wrote some twelve tragedies, only

eight of which he published, and nearly all of which deal with mediæval subjects. *Francesca da Rimini* is the last of them and is still a popular play. The verse novels and lyrics (*Poesie inedite di Silvio Pellico*, Turin, 1837) and the *Poesie* (Florence, 1869) belong chiefly to the period between 1834 and 1837. Pellico is shallow and sentimental, but his piety is sincere. His correspondence (*Epistolario*, Florence, 1856, and later editions, 1858, 1861, 1874, 1877) reveals his tendency to mystical contemplation. His fame rests on his account of his imprisonment. *Le mie prigioni* has been translated into many languages. Consult: Bourbon, *Silvio Pellico, sa vie et sa mort* (Paris, 1879); Rinieri, *Della vita e delle opere di Silvio Pellico* (Turin, 1899-1901).

PELLISOV, pĕl'lĕ-zôf, EMIL. The pseudonym of the German physicist Karl Franz Emil Schafhäutl (q.v.).

PELMATAZOA. A class of echinoderms characterized by the fact that (with a few exceptions) they are fixed in their dwelling-place by stalks. It includes the crinoids, cystoids, and blastoids. (See CRINOIDEA; PENTREMITES.)

PELLITORY OF SPAIN, *Anacyclus Pyrethrum*. A plant of the natural order Compositæ. Its small spindle-shaped, fleshy, acrid root has been used medicinally in parts of Europe and still is in Northern Africa, where the plant is native.

PELOP'IDAS (Lat., from Gk. Πελοπίδας) (?-B.C. 364). A Theban general and patriot, the associate of Epaminondas. He belonged to a good family and was in affluent circumstances. In B.C. 382 he was driven from Thebes by the oligarchic party, supported by the Spartans, and took refuge at Athens, but returned with a few associates in B.C. 379, recovered possession of the Cadmeia, or citadel, slew the Spartan leader, Leontiades, with his own hand, and established a democratic form of government. From this time until his death he was actively engaged in fighting for his country's cause, and was successful in several conflicts with the Lacedæmonians. His Sacred Band of Theban youth largely contributed to the victory of Epaminondas at Leuctra (B.C. 371), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant Alexander of Pheræ (B.C. 368) he was, after several important successes, treacherously taken prisoner, when in the character of an ambassador, but was rescued by Epaminondas in the expedition of the following year. He was then sent to Susa as ambassador from Thebes, and successfully counteracted the Spartan and Athenian intrigues at the Court of Persia. In B.C. 364 he defeated Alexander of Pheræ at Cynoscephalæ, but was himself killed while rushing in pursuit of the enemy. Consult Plutarch's *Life of Pelopidas*, and the standard histories of Greece.

PELOPONNESIAN WAR. See GREECE.

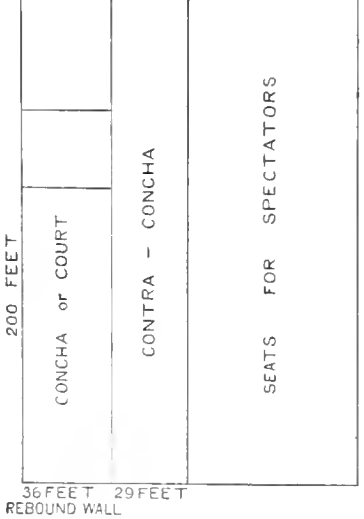
PEL'OPONNE'SUS (Lat., from Gk. Πελοπόννησος, island of Pelops, from Πέλοψ, *Pelops*, Pelops + νῆσος, *nēsos*, island). The ancient name of the peninsula forming the southern part of ancient Greece; now called the Morea (q.v.). It is separated from the mainland by the Corinthian and Saronic gulfs, and united with it only by the narrow Isthmus of Corinth. It was divided into six districts: Argolis, on the northeast; Laconia, on the southeast; Messenia, on the southwest; Elis, on the west; Achæa, on the north; and Arcadia, in the centre. The most famous cities were Mycenæ, Sicyon, Tiryns, Corinth, Argos, Trœzen, and Epidaurus in Argolis, Sparta in Laconia, Messene, Pylos, and Methone in Messenia, Elis in Elis, Patræ and Ægium in Achæa, and Tegea, Mantinea, and Megalopolis in Arcadia. After the conquest by the Dorians a long period of war resulted in the establishment of the supremacy of Sparta, which was maintained until the battle of Leuctra (B.C. 371), which was followed by the Theban invasion under Epaminondas, the restoration of the Messenians, and the founding of Megalopolis. From this time the Peloponnesus was the scene of internal strife until the Roman conquest (B.C. 146), when it became part of the Province of Achaia. Consult: Leake, *Travels in the Morea* (London, 1830); id., *Peloponnesiaca* (ib., 1846); Blouet, *Expédition scientifique de Morée* (and Atlas, Paris, 1831-38); Curtius, *Peloponnesos* (Gotha, 1851-52), still a standard work; Philippson, *Der Peloponnes* (Berlin, 1892), treats chiefly of the physical geography and geology. See GREECE, section on *History*; MOREA.

PE'LOPS (Lat., from Gk. Πέλοψ). In Greek legend, the son of Tantalus, King of Phrygia. His father was especially loved of the gods, but at a feast at which they were present he slew and served to them his son. The gods, recognizing the nature of the food, refused it, with the exception of Demeter, who, absorbed in grief at the loss of her daughter, devoured a shoulder. At the command of Zeus, Hermes threw the members into a caldron from which Clotho drew the boy restored to life, while Demeter replaced the lost shoulder by one of ivory. Later legend told of the love of Poseidon for the beautiful youth, and his gift of winged horses of matchless speed, by whose aid and the treachery of Myrtilus he was enabled to win the hand of Hippodamia, daughter of Œnomaus, King of Elis. Each suitor was required to take Hippodamia in his chariot and start from Olympia for Corinth, while Œnomaus offered a sacrifice to Zeus and then pursued. As his horses were a gift of the gods, he had hitherto overtaken and slain thirteen luckless lovers. Pelops bribed Myrtilus, Œnomaus's charioteer, to draw the lynch-pin, and thus secured the victory and the death of Œnomaus. He, however, refused to pay Myrtilus his reward, and even cast him into the sea, wherefore Myrtilus cursed the whole race of Pelops. It may be observed that the Homeric poems know nothing of this curse and the subsequent horrors, which furnished so much material to the Attic dramatists. While the ordinary versions localized this story at Olympia, and associated the Olympic games with Pelops, there are many indications that the race was in some versions considered as crossing the water to or from Lesbos. Of the later fortunes of Pelops many versions were current. He was the father by Hippodamia of Atreus, Thyestes, and other children, and by Axioche of Chrysippus, who was carried off by Laius of Thebes, or murdered by his jealous brothers and stepmother, thus beginning the woes of the family. At Olympia Pelops was especially honored in a sacred inclosure, the

Peloponnesus, where a black wether was yearly offered.

PELO'RIA (Neo-Lat., from Gk. Πέλωρ, *pelōr*, monster). A malformation occurring in flowers which are normally irregular, by which regularity is again attained. It was first described by Linnæus, who found the spurred flowers of the butter-and-eggs or toadflax (*Linaria vulgaris*) with five spurred petals instead of the normal one. The cause of such malformations has not been fully determined, though peloria has been produced by a change in the relation of the plant to light, one-sided illumination appearing favorable to its development.

PELOTA, pȧ-lō'tȧ, or **'JAI-ALAI'** (Sp., from *pilota, pelota*, little ball, from Lat. *pila*, ball). A Basque game introduced into the South American republics, and to Cuba, from the northern provinces of Spain, and imported thence to the United States. It can be played either in or out of doors. Its necessities are a *concha* or court, with level concrete floor 200 feet long and 65 feet wide, with a wall 36 feet square, called the *frontis* or front wall at one end, and at the opposite another similar wall, called *la pared de rebote*, or rebounding wall. On the front wall iron strips painted red mark the boundaries within which the ball must strike. On the floor of the court, occupying the whole space between the two ends, are also boundary lines within which



the ball must, on its rebound, strike, to be counted. A narrow strip 29 feet parallel with the *concha* is the *contra-concha*, within which the ball must remain to avoid being counted as a fault. The instrument with which the game is played is a light wickerwork basket arrangement fastened to the hand by means of a glove attachment. It is called a 'cesta.' The ball is about the size of a lawn-tennis ball. It has a core of india-rubber bound round with yarn, and is covered with sheepskin.

The game is played by four, six, or eight players, mostly by four, two on each side, one of whom on each team is the *delantaro*, or forward, and the other the *zaguero*, or back. Play is on when the forward of the side first entitled to do so runs to a certain mark on the court and throws the ball to the floor, catching it on the bound in the basket attached to his hand, and striking it against the front wall within the red-lined boundaries, whence it should rebound so as to touch the floor between the lines thereon defined. The forward of the opposing side must then strike it with his basketed hand either while it is in the air as it rebounds, or on its first bound from the floor, and throw it against the front wall again; and so on by each team in turn, until one side loses the point. If the ball falls or strikes outside the boundaries, it is a fault to the credit of the opponent. No player may hold the ball in his hand or in the basket; it must always be kept in motion. The first team to gain fifty points wins the game.

PELOTAS, pȧ-lō'tȧs. A town in the State of Rio Grande do Sul, Brazil, 26 miles northwest of the city of that name, on the São Gonçalo, and on the Rio Grande-Cacequy Railway (Map: Brazil (with ARGENTINA), G 10). It is a well-built, handsome city and the centre of an extensive interior and coastwise trade. The principal industry is the curing and preserving of meats, and in addition there are extensive exports of hides, horns, and tallow. The population, in 1894, was about 25,000.

PELOUBET, pĕl'o͞o-bĕt, FRANCIS NATHAN (1831—). An American biblical scholar, born in New York City. He graduated at Williams in 1853 and at Bangor Theological Seminary in 1857, and for twenty-five years held charges in Congregational churches in Massachusetts. In 1884 he revised Smith's *Bible Dictionary*. Peloubet's *Select Notes on the International Sunday-School Lessons* (1875 sqq.) and his *Sunday-School Quarterlies* (1880 sqq., in four grades) became widely known.

PELOUZE, pe-lo͞oz', THÉOPHILE JULES (1807-67). A French chemist. He was assistant to Gay-Lussac and later professor of chemistry at the Ecole Polytechnique and the Collège de France. In 1836 he was associated in research work with Liebig, and in 1837 became a member of the Institute. Pelouze carried out a number of important investigations in chemistry and published several works; jointly with Frémy he wrote a *Traité de chimie générale*, which passed through several editions.

PELS, pĕls, ANDRIES (?-1681). A Dutch poet and critic. He was born in Amsterdam, it seems, and probably studied law there. About 1670 he either founded or revived a literary circle called from its motto *Nil Volentibus Arduum*, with the purpose of purifying the Dutch language and creating poetic canons. This school was vigorously opposed by Joannes Antonides, but it exerted a great and baneful influence on Dutch literature. Pels wrote: *Didoos dood* (1668), a tragedy in the French classical manner; *Horatius Dichtkunst* (1677), a translation and adaptation in verse of the *Ars Poetica; Gebruiken Misgebruik des tooneels* (1681), also didactic; and a posthumous volume of poems, *Minneliedern en Mengelzangen* (1684).

PELTIER, pĕl'tyā'. JEAN CHARLES ATHANASE (1785-1845). A French physicist and me-

teorologist; born at Ham, in the Department of Somme. He was a watchmaker, but gave up his trade at the age of thirty, to apply himself to experimental science. He made several important discoveries in electricity and meteorology, known as the 'phenomena of Peltier,' and published a number of interesting memoirs, including *Sur la météorologie électrique* (1840). He also published an excellent work on water-spouts entitled *Observations sur les causes qui concourent à la formation des trombes* (1840). Consult Peltier, fils, *Notice sur la vie et les travaux de J. C. A. Peltier* (Paris, 1847).

PELU'SIO'TA. A name often applied to Saint Isidorus (q.v.).

PELU'SIUM (Lat., from Gk. Πηλούσιον, mud-city; Egypt. *Am*; probably, though not certainly, identical with the ancient *Avaris*, and the *Sin* of the Old Testament; also called, in Coptic and Arabic, *Pérémoun*, *El-Farmâ*, *Faramâ*). An ancient Egyptian city, situated a few miles from the Mediterranean, at the extreme northeast corner of the Delta, important as the key of Egypt on the Asiatic side. The eastern mouth of the Nile derived from it the name *Pelusiac*. Pelusium was the last stronghold of the Hyksos, and was finally taken by Amasis I. It was the scene of Sennacherib's defeat (II. Kings xviii., xix.). On this occasion, according to Herodotus, the camp of the Assyrians was invaded at night by a host of field-mice, who gnawed their bow-strings and shield-straps, so that in the morning, when the Egyptians fell upon them, they were defenseless. In B.C. 525 the Persians, under Cambyses, defeated the forces of Psammetichus III., near Pelusium, and overthrew the native Egyptian dynasty. The city was taken by Iphicrates and Pharnabazus in B.C. 374, and was besieged and conquered by the Persians in B.C. 369. In B.C. 170 it was the scene of the defeat of Ptolemy Philometor by Antiochus Epiphanes, and in B.C. 55 it was captured by Marcus Antonius. After the battle of Actium in B.C. 31, it fell into the hands of the Romans. It was, according to one account, the birthplace of Ptolemy the astronomer. At present the place is in ruins and nearly level with the surrounding country. Consult: Petrie, *Tanis* (London, 1885-88); Dümichen and Meyer, *Geschichte des alten Aegyptens*; Meyer, *Geschichte des Alterthums* (Stuttgart, 1884-93); E. Amélineau, *Géographie de l'Egypte à l'époque copte* (Paris, 1893).

PELVIC GIRDLE (from Lat. *pelvis*, basin; connected with Gk. πέλυξ, *pelyx*, πέλλις, *pellis*, πέλλα, *pella*, bowl). The pelvic girdle is that part of the vertebrate skeleton which serves for the connection of the hind limbs with the back. Among fishes there is no true girdle, although cartilaginous plates and rods lying in the muscular tissues of the ventral side, and often connected with the pelvic fins, are regarded as rudiments of such a structure. These are best developed in dipnoid fishes, but are quite distinct in the sharks and rays. In the Batrachia we find a well-formed pelvic girdle made up of three parts, a dorsal ilium, an anterior ventral pubis, and a posterior ischium. Each part is made up of a pair of bones, one on each side of the body, and the iliac bones are connected with the sacral vertebræ; the femur articulates with the pelvis at a point known as 'acetabulum,' where the iliac, pubic, and ischiac bones meet. In some salamanders an epipubis is present, consisting of a slender bifurcated rod of cartilage projecting forward from the anterior edge of the pubis. In frogs and toads the iliac bones are very long, while the ischium and pubis are completely fused with the posterior portion of the ilium into a single piece. Among reptiles the same essential elements are present in the pelvic girdle, and the pubic and ischiac bones are united ventrally, more or less perfectly. In crocodiles there is a prolongation of the iliac bone in front of the acetabulum. In birds this prolongation is very marked, but the relative proportion of anterior and posterior parts of the ilium differ greatly in different birds. The pubic bones of birds extend backward parallel with the ischiac, and in many birds fusing with them. All the parts of the pelvis of birds tend to become ankylosed, but a pubic symphysis is present only in the ostrich, and an ischiac symphysis occurs only in the rhea. Among mammals the pelvic girdle shows much variety. Both pubic and ischiac symphyses occur in monotremes, marsupials, many rodents, insectivores, ungulates, and carnivores. The pubic symphysis is wanting in bats and some insectivores, while the ischiac symphysis fails in many insectivores and carnivores and in the primates. In monotremes and marsupials there are present well-developed epipubic bones, known as 'marsupial' bones, though they are not concerned in any way with the marsupium; they are associated with the muscles governing the mammary glands. A fourth element, the 'pars acetabularis,' enters into the formation of the pelvis in the crocodile, birds, and many mammals, and it often shuts the pubis out from a part in forming the acetabulum; occasionally the ischiac bones are also excluded, as in the mole. The pelvic girdle has no fixed position throughout any class, but varies greatly according to the position and function of the hind legs. A pelvis is lacking in the apodous batrachians, in all snakes (with rare exceptions), in a few lizards, and in the Sirenia and Cetacea it is either wanting or reduced to a rudimentary ilium. Consult Wiedersheim's *Comparative Anatomy of Vertebrates* (New York, 1886).

PELVIS (Lat., basin). A bony ring interposed between the spinal column and the lower extremities, so as to transmit the weight of the former to the latter. Before considering the pelvis as a whole, it will be expedient to consider the individual bones of which it is composed. These, in the adult, are four in number, viz. the two ossa innominata which constitute its sides and front, and the sacrum and coccyx, which complete it behind. The *os innominatum* receives its name from its bearing no resemblance to any known body, and is a large irregular shaped bone. In the young subject it consists of three separate bones, which meet and form the deep cup-shaped cavity (the *acetabulum*), situated a little below the middle of the outside of the bone, and in which the head of the thigh-bone rests. Hence it is usual to describe this bone as consisting of the ilium, the ischium, and the pubes. The *ilium* is the superior, broad, and expanded portion which forms the prominence of the hip, and articulates with the sacrum. This bone may be described as divisible into an external and an internal surface, a crest, and an anterior and posterior border. The external surface (see Fig. 1) is convex in front and concave behind; it is bounded above by the crest, below by the upper border of the acetabu-

lum, and in front and behind by the anterior and posterior borders. It presents various curved lines and rough surfaces for the attachment of the *glutei* and other powerful muscles connecting the pelvis and the lower extremities. The internal surface, which is smooth and concave, has the same boundaries as the external, except inferiorly, where it terminates in a prominent line, termed the *linea ilio-pectinea*. The

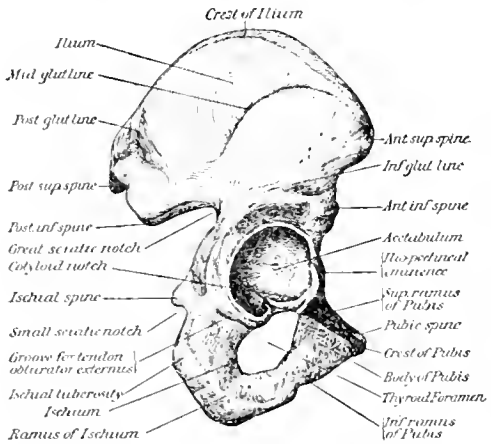


Fig. 1. OS INNOMINATUM OF THE RIGHT SIDE (outer surface).

surface of the crest is convex, roughened, and sufficiently broad to admit of the attachment of three planes of muscles. The borders will be sufficiently understood by a reference to Fig. 1. The *ischium* is the inferior and strongest portion of the bone. It consists of a thick and solid portion, the *body* (whose inferior border is termed the *tuberosity*), and a thin ascending portion, the *ramus*. In the ordinary sitting position the whole weight of the body rests on the ischium; and by sitting on the hands we can usually feel the part (the *tuberosity*, see Fig. 1) through which the weight is transmitted. The *pubis* is that portion which runs horizontally inward from the inner side of the acetabulum for about two inches, and then descends obliquely outward for about the same length, thus making an acute angle with its original direction. The former part is called the *body*, and the latter the *ramus*, of the pubes. The ramus is continuous with the ramus of the ischium. Between the ischium and the pubes is a large aperture, known as the *thyroid* or *obturator foramen*, which in the living body is closed by a membrane termed the *obturator membrane*. The object of this large foramen is probably to give lightness to the parts, without materially diminishing their strength.

The development of the os innominatum affords an excellent example of the general principles laid down in the article OSSIFICATION. There are no less than *eight* centres of ossification for this bone: three primary—one for the ilium, one for the ischium, and one for the pubes—and five secondary ones for various processes, etc. The first centre appears in the lower part of the ilium, at about the same period that the development of the vertebræ commences, viz. at about the close of the second month of fœtal life: the second in the body of the ischium, just below the acetabulum, at about the third month; and the third in the body of the pubes, near the acetabulum, during the fourth or fifth month. At birth the crest of the ilium, the bottom of the acetabulum, and the rami of the ischium and pubes are still cartilaginous. At about the sixth or seventh year these rami become completely ossified; next, the ilium is united to the ischium; and lastly, the pubes is joined to the other two in the acetabulum. The complete ossification of the bone, from the secondary centres in the crest of the ilium, the tuberosity of the ischium, etc., is not completed till about the twenty-fifth year.

Each os innominatum articulates with its fellow of the opposite side through the intervention of the *interosseous fibro-cartilage*, which unites the two surfaces of the pubic bones, with the sacrum, and with the femur (at the acetabulum). No less than thirty-five muscles are attached to this bone, some proceeding to the region of the back, others forming the walls of the abdomen, others forming the floor of the pelvis, others passing downward to the lower extremities, etc. As the other bones entering into the formation of the pelvis (the sacrum and the coccyx) belong essentially to the vertebral column, and will be described in the article on that subject, it is sufficient here to remark that, collectively, they form a triangular bony mass (with the base upward, and with a concave anterior surface), which constitutes the posterior part of the pelvic ring. See Fig. 2.

The pelvis, considered as a whole, is divisible into a false and true pelvis. The *false pelvis* is all that expanded portion which is bounded laterally by the iliac bones, and lies above the prominent line termed the *linea ilco-pectinea* (see Fig. 2); while the *true pelvis* is all that part of the general pelvic cavity which is situated below that line. The broad, shallow cavity of the false

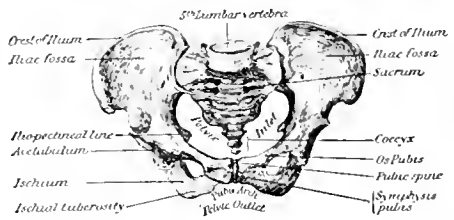

Fig. 2. PELVIS (FEMALE ADULT) SEEN FROM THE FRONT.

pelvis serves to support the weight of the intestines; while the rectum, bladder, and part of the generative organs lie in the cavity of the true pelvis. The upper aperture of the true pelvis is termed the *inlet*. It is somewhat heart-shaped in form, and has three principal diameters—an *antero-posterior* (or sacro-pubic), which extends from the angle formed by the sacrum with the last lumbar vertebra to the symphysis pubis, or point of union of the two pubic bones; the *transverse*, at right angles to the former, and extending across the greatest width of the pelvis; and the *oblique*, extending from the sacro-iliac symphysis (or union), on one side, to the margin of the brim corresponding with the acetabulum on the other. The diameters of the outlet are two—an *antero-posterior*, extending from the tip of the coccyx to the lower part of the symphysis pubis, and a *transverse*, from the posterior part of one ischiatic tuberosity to the same point on the opposite side. As the precise knowledge of the diameter and depth of the pelvis is of the greatest

importance in the practice of midwifery, we give the average numbers representing the dimensions of a well-formed adult female pelvis. *Diameters of inlet or brim*—antero-posterior, 4.4 inches; transverse, 5.4 inches; oblique, 4.8 inches. *Diameters of outlet*—antero-posterior, 5 inches; transverse, 4.3 inches. *Depth of the true pelvis*—posteriorly, 4.5 inches; in the middle, 3.5 inches; anteriorly, 1.5 inches.

The pelvis is placed obliquely with regard to the trunk of the body, the plane of the inlet to the true pelvis forming an angle of from 60° to 65° with the horizon. According to Gray, the extremity of the coccyx is in the female, when standing upright, about one-half inch higher than the lower edge of the symphysis pubis, the upper edge of the symphysis being at the same level as the lower edge of the second segment of the coccyx. By attention to these data, a detached pelvis may readily be placed at the angle at which it normally lies in the skeleton. The shape of the human pelvis is much affected by the curving forward of the lower part of the sacrum. This bend of the sacrum forward serves to support the viscera when the body is in an erect posture; but it is of much more importance in its relation to the act of parturition. If all the antero-posterior diameters of the true pelvis from the brim to the outlet were bisected, the points of bisection would form a curved line, similar to the curve of the sacrum, and termed the *axis* of the pelvis. As the head of the child has to follow this curve, the difficulties of parturition are much greater than if the axis of the pelvis had been straight, as in the other vertebrata. Without entering into unnecessary details, we may remark, generally, that the fœtal head is of oval shape, with its greatest diameter from before backward, and that in its passage through the pelvis it is so placed that its longest diameter at each stage of labor coincides with the longest diameter of the pelvis. The head enters the pelvis with the occiput (or back of the skull) being directed toward one ilium, and the face toward the other, while at its final emergence the face is turned toward the sacrum and coccyx. There can be no doubt that the screw-like or rotatory motion which is thus given to the fœtal head renders its passage through the pelvis more easy than it would otherwise have been.

There are well-marked differences, chiefly having reference to the act of parturition, between the male and female pelvis. In the female the bones are lighter and more delicate than in the male, and the muscular impressions and eminences are less distinctly marked. The iliac fossæ are large and expanded, and hence the great prominence of the hips. The several diameters (particularly the transverse diameter of the brim, which measures only 5.1 inches in the male) are somewhat greater; and the pubic arch is wider by about 10 degrees; the sacrum also is wider and less curved.

It is worthy of notice that the pelvis of the negro is smaller in all its dimensions than that of the European, and presents a partial approximation to that of the monkey, especially in the deficiency of its width. This difference is very much more obvious in the male than in the female negro; and parturition in the black races is facilitated both by the sacrum being less curved, and by the fœtal head being of smaller dimensions. In the apes and monkeys, which approach most nearly to man, the pelvis is longer and narrower, and much less curved than in the human subject. In other mammals the differences are for the most part the same in kind, but greater in degree. In many of the Cheiroptera (bats) and Insectivora (as the mole) the pubic bones are only loosely connected by a small ligament, or there is a complete opening between the bones (as occurs normally in birds), an arrangement by which the act of parturition in these animals is much facilitated. The pelvic bones are very simple in the Cetacea, in some cases being represented by two simple elongated bones lying near the anus, and converging from opposite sides (a transverse connecting piece being sometimes but not always present); in others, by a small V-shaped bone; while sometimes (as in Manatus) they seem to be entirely wanting. The additional pelvic bones in the non-placental mammals have been already noticed in the article on the MARSUPIALIA. In the echidna, which belongs to the Prototheria (*q.v.*), the acetabulum is perforated, as occurs normally in birds. In birds, in addition to the peculiarity just noticed, we find the pelvis open in front (or, more correctly, inferiorly), there being no union of the pubic bones in any bird except the ostrich. This normal incompleteness of the pelvic ring is obviously for the purpose of facilitating the passage of the eggs.

PEM'BA. An island on the east coast of Africa, 30 miles north of Zanzibar (Map: Africa, J 5). It is in the dominions of the Sultan, but under the protectorate of England. It is about 35 miles long, with an area of 380 square miles. It has a luxuriant vegetation, and produces rice, maize, and sugar cane; but since the abolition of slavery on the island agriculture has been neglected. There is some trade in timber and shipping supplies. The population is estimated at 50,000. The chief town is Chake, with a population of 5000.

PEM'BERTON. A town in Lancashire, England, two miles southwest of Wigan (Map: England, D 3). It has manufactures of cottons, chemicals, iron products, etc.; and there are neighboring coal mines and stone quarries. The municipality owns its electric lighting plant. Population, in 1891, 18,400; in 1901, 21,600.

PEMBERTON. JOHN CLIFFORD (1814–81). An American soldier, born in Philadelphia. He graduated at West Point in 1837, and was commissioned second lieutenant of the Fourth Artillery. During the Mexican War he was aide to General Worth, and was brevetted captain for gallantry at Monterey, and major after Molino del Rey. In 1848 he married Miss Martha Thompson, of Norfolk, Va. On the outbreak of the Civil War he refused to serve against the South. On June 15, 1861, he was commissioned major of artillery in the Confederate Army, and June 17th, brigadier general. He served north of the Nansemond River in Virginia until November, 1861, when he was transferred to the Eighth Military District of South Carolina. In January, 1862, he was promoted to be major-general and placed in charge of the Department of South Carolina, Georgia, and East Florida. He was promoted to be lieutenant-general October 13, 1862, and was placed in charge of Mississippi and east Louisiana, succeeding General Van Dorn. He disobeyed the orders of his superior, General

Johnston, to unite with him near Jackson, next to strike General Grant's rear at Clinton, and finally to evacuate Vicksburg. His correspondence with General Johnston was betrayed to General Grant, and he was sharply defeated at Baker's Creek or Champion's Hill, May 16, 1863, and at Big Black Bridge the next day. When he retired into Vicksburg he conducted the defense with skill until July 4th, when he surrendered 31,600 men and 172 cannon. His course met with so much criticism that he resigned his commission after his exchange, but in May, 1864, was placed in charge of the artillery defenses of Richmond, with the rank of lieutenant-colonel, and served here until the end of the war. He then engaged in farming in Virginia until 1876, in which year he removed to Pennsylvania. Consult for Vicksburg, Johnson and Buel (ed.), *Battles and Leaders of the Civil War* (New York, 1887).

PEMBERTON, Max (1863—). An English romancer, born in Birmingham, June 19, 1863. After graduating from Cains College, Cambridge, he joined the staff of *Vanity Fair* (1885). He also began writing stories and miscellaneous articles for several London periodicals, became the editor of *Chums* (1892-93), and in 1896 he became editor of *Cassell's Magazine*. Among his romances are: *The Iron Pirate* (1893); *The Sea Wolves* (1894); *The Impregnable City* (1895); *A Gentleman's Gentleman* (1896); *Queen of the Jesters* (1897); *The Garden of Swords* (1899); *Ffo* (1900); and *House Under the Sea* (1902).

PEMBROKE, pēm'brȳk. A seaport town and the capital of Pembrokeshire, Wales, 42 miles west of Swansea (Map: Wales, B 5). Pator, otherwise called Pembroke Dock, an important fortified Government dockyard, two miles from the town, embraces an area of 80 acres and provides the chief industry of the neighborhood. On the extremity of the ridge on which the town is built are the remains of its extensive castle, founded in 1094, and the birthplace of Henry VII. Beneath the ruins is a remarkable natural cavern, which had communications both with the castle and the harbor. In 1648 the castle was beleaguered by Cromwell and taken after a siege of six weeks. The town dates from the early years of British history. It owns its water supply, slaughter houses, and markets. Population, municipal borough, in 1891, 14,978; in 1901, 15,853.

PEMBROKE. A municipality of Leinster, Ireland, constituting a southeast suburb of Dublin. Population, in 1891, 23,992; in 1901, 25,799.

PEMBROKE, pēm'brōk. A town and the county-seat of Renfrew County, Ontario, Canada, on the Ottawa River, 86 miles from Ottawa (Map: Ontario, F 2). It has saw mills, factories, and a large business in lumber. Population, in 1891, 4401; in 1901, 5156.

PEMBROKE, pēm'brȳk, Earl of. A title of the British family of Herbert (q.v.).

PEMBROKE COLLEGE. A college at Cambridge, England. It was founded by Mary de Saint Paul, wife of Aymer de Valence, in 1347. It has always occupied an honorable place among Cambridge colleges, and has had among its members some of the most distinguished men in England. Of these, the greatest are Pitt, the poets Spenser and Gray, Archbishops Whitgift, Grindal, and Rotherham, the martyrs Ridley, Rogers, and Bradford. The college library, of some 20,000 volumes, is one of the most interesting and valuable college collections in Cambridge. There are thirteen fellowships and twenty-nine scholarships.

PEMBROKE COLLEGE. A college at Oxford, England. It was founded by James I., in 1624, and endowed by Thomas Tesdale, of Glympton, Oxfordshire, and Richard Wightwick, B.D., rector of Ilsey, Berks. It took its name from William, Earl of Pembroke, then chancellor of the university. Its buildings, though not large, and quite modern, are very attractive. The college has a master, ten fellowships, several honorary fellows and lecturers, and twenty-eight scholars, some seventy-five undergraduates in all. Never a large college, a number of distinguished men have been connected with it, especially in the seventeenth and eighteenth centuries. Among these may be mentioned Camden the antiquary, John Pym, Beaumont the dramatist, George Whitefield, Sir William Blackstone, Shenstone, Sir Thomas Browne, and Samuel Johnson.

PEMBROKESHIRE. The westernmost county of Wales, Great Britain, bounded north and west by Saint George's Channel, east by Cardigan and Carmarthen, south by the Bristol Channel (Map: Wales, B 5). Area, 628 square miles. The surface is undulating; the principal elevations are the Preceli Hills, which traverse the north of the county from east to west, and attain a maximum altitude of 1754 feet. The rivers are unimportant; the Eastern and Western Cleddau, which unite and form a navigable portion of Milford Haven, are the principal streams. The northern and western shores are indented with fine bays and dotted with islands; the estuary of Milford Haven forms one of the best harbors on the coast of Great Britain; the south shores are wild and rugged, fronted with precipitous cliffs. The climate is mild but damp. There are excellent and productive soils in the south, and along the northwest coast the barley districts are famous. Oats, barley, and potatoes are the principal crops. Coal, iron, and lead are mined, and slate is quarried. There are important fisheries. The chief towns are Pembroke (the capital), Saint Davids, Tenby, and Haverfordwest. Population, in 1891, 89,000; in 1901, 88,000.

PEMICAN (Cree Indian name). An Indian food preparation much used among all the tribes from about the Canada border to the Eskimo country, and consisting of lean dried meat of buffalo, deer, or, in modern days, beef, pounded to a powder, and liberally mixed with boiling fat, which is poured over it. It is then pressed into cakes and packed into parfleche cases until needed. Berries are frequently pounded up and mixed with the meat. Pemican contains a great amount of nutriment in compact form, and when thus prepared will continue sweet and good for an indefinite time so long as it is kept dry. It is extensively manufactured by the Cree and Red River half-breeds and is the staple commissary article of hunters, traders, and other travelers throughout the great Northwest.

PEMPHI'GUS (Neo-Lat., from Gk. πέμφιξ, *pemphix*, bubble), or PEMPHOLYX. A disease of the skin in which appear on its surface blebs or bullæ filled with serum, pus, or blood, with itching, fever, and great impairment of the general health. Similar blebs appear on the mucous membrane. The blebs burst after a time, leav-

ing a rough, reddened surface, and sealing occurs in the variety termed *pemphigus foliaceus*. This variety is always chronic, and an attack lasts from several months to several years, successive crops of bullæ appearing and rupturing. In *pemphigus vulgaris*, which may be acute or chronic, the vesicles contain clear serum at first. This variety may last but two or three weeks. In the treatment of this disease arsenic, strychnine, iron, and quinine are given internally, local applications of a sedative nature are made, and warm baths are given for months, the patients being suspended under water upon a hammock night and day.

PEN (OF., Fr. *penne*, from Lat. *penna*, pen, feather, OLat. *pesna*, feather; probably connected with Gk. *πτερον*, *pteron*, OHG. *fedara*, Ger. *Feder*, AS. *feþar*, Eng. *feather*, Skt. *patatra*, feather, from *pat*, to fly). An instrument for writing with a fluid ink. For many centuries the quill pen was the only kind used. Isidore of Seville, who died A.D. 636, mentions reeds and pens among the instruments employed in writing. A century and a half later Alcuin writes of the use of pens. Probably their general use began with the introduction of modern paper.

Steel Pens. Toward the close of the eighteenth century various experiments were being made in France, England, and America toward the manufacture of steel pens. At first they were barrel-shaped and were made as much like a quill pen as possible. They were made by bending a flat piece of steel into a tube and then filing it into shape, the joint of the two edges forming the slit. These pens were expensive and unsatisfactory, for they were hard and inflexible. In 1820 Joseph Gillott, of England, began the manufacture of steel pens and greatly improved their form. He also cheapened their price by introducing machinery for their manufacture. Presses were contrived for cutting, bending, and marking, and other machinery for cleaning and polishing. The manufacture of steel pens was not introduced into the United States until about 1860. By that time the art had been perfected and a knowledge of the varieties of steel best qualified for pens had been acquired. Most of the steel used in American factories is imported from Sweden. The steel, which is received by the manufacturer in sheets of varying thickness, is prepared for conversion into pens by a preliminary process of annealing, polishing, and rolling. The last named operation requires considerable care and skill, for the steel must be passed between successive rollers until reduced to a required thickness, which is usually 1-160th of an inch. The slightest variation in the thickness of the sheet affects the flexibility of the finished pen. The blanks are next stamped or pressed into the desired shape, and then the small hole which terminates the slit in the finished pen and prevents it from spreading is punched. After another annealing, the blanks are placed between a pair of dies which give them their curved form. Hardening by plunging into hot oil, cleaning in sand and sawdust, and tempering are the next processes. The polishing is performed by placing the pens in revolving barrels of sand or sawdust and then grinding against a revolving emery wheel. The tempering is done by placing the pens in an iron cylinder which is kept revolving over a charcoal fire until they are of the proper temper. This is a delicate process, regulated by the color shown by the pens, which indicates the temperature of the metal. The last and perhaps most important mechanical operation is slitting the pen point. This is done by a specially constructed pair of cutters of great delicacy of construction. The pens are now subjected to a final burnishing, and possibly lacquering to prevent rust, and are ready for the market.

Gold Pens. Though steel pens are used in greater quantities than any other kind, there is an increasing demand for gold pens on account of their greater flexibility and durability. Gold pens were first made in 1825 in England. In the United States their manufacture was first attempted by a watch-maker of Detroit in 1835. In 1840 the business was moved to New York, various improvements were introduced, and the manufacture grew in importance. At first the points of gold pens were protected by diamonds or rubies. The discovery that the native alloy of iridium and osmium could be used much more cheaply as well as satisfactorily was made by John Isaac Hawkins, an American, residing in England. The American right to this discovery was purchased by a New York establishment. About 1850 it was discovered that by imbedding the iridium points in the gold instead of soldering them on a stronger pen was produced. Gold pens are made in a manner similar to steel pens, by rolling the metal into thin sheets and stamping out the blanks and shaping them with dies. The under side of the point is notched with a circular saw to receive the iridium tip, which is secured by a flux of borax and a blowpipe. The slit is cut through the solid iridium by means of a thin copper wheel, after which it is extended up the pen itself, to the notch, with a saw. The pen is now finished by polishing it and by hammering till the desired degree of elasticity is secured.

Fountain Pens. A fountain pen is one having an ink barrel in the holder which supplies ink as required by means of an automatic feed. Fountain pens were manufactured in England as early as 1835, but they did not attain any great degree of success. In the Schaeffer pen the ink was admitted to the pen from a reservoir in the holder, by pressing a projecting button with the thumb. In the Parker pen the flow of ink was regulated by a piston controlled by a rotating nut. Other early attempts sought to control the flow from the barrel by means of tubes, springs, valves, or other mechanical contrivances. In all these early attempts the flow of ink was found to be irregular. All modern fountain pens are based on a different principle. The flow of ink is regulated by a feed, and air is admitted to the barrel to take the place of the ink as it is used. A typical fountain pen consists of four pieces of hard rubber and a gold pen. The handle containing the ink reservoir is in two pieces, connected with a screw joint, so that it may readily be taken apart for filling. The gold pen is held in the point section of the barrel by means of a third piece of rubber, the feed-bar, which also conveys the ink from the reservoir to the pen. Air is admitted to the barrel, to replace the ink as it is used, by means of a cavity in the feed connecting with the hole at the end of the slit in the back of the pen proper. During the act of writing the ink is drawn from the reservoir by capillary attraction, through the feed to the pen point, and the flow ceases with the writing. The fourth

piece of rubber is the cap, which covers the pen to protect it from injury and keep the ink from drying when not in use. A fountain pen usually holds ink enough for ten hours or more of continuous writing, or from 15,000 words up.

STYLOGRAPHIC PENS, like fountain pens, have a reservoir to hold the ink, but instead of an ordinary pen point it has a pencil-shaped point; the point is tubular and in it plays a needle which releases the ink when pressed on the paper.

STATISTICS. According to the Twelfth United States Census there were in the United States, in 1900, 48 establishments devoted to the manufacture of pens, of which 23 made fountain and stylographic pens, 22 made gold pens, and 3 made steel pens. The combined capital invested in these different establishments is given as $1,444,065, and the value of the annual product $1,855,658. In this amount 8028 gross of fountain pens, valued at $902,734, 1803 gross of stylographic pens, at $82,676, 6735 gross of gold pens, at $158,376, and 1,764,079 gross of steel pens, at $411,872, are included.

BIBLIOGRAPHY. Consult: *The Twelfth Census*, vol. x., part iv. (Washington, 1900), where is published an article entitled "Pens and Pencils;" also Depew, *One Hundred Years of American Commerce* (New York, 1895).

PENAL CODE. A collection or declaration of the laws of a State or country in relation to crimes and their punishment, in a single legislative act. By this means the various acts and omissions which constitute crimes, the degrees of crime, and the penalty imposed for each are all defined and clearly set forth in an orderly manner. Nearly all of the nations of Europe and several of the United States have thus embodied their criminal laws in the convenient and comparatively simple form of a penal code. Some States, including New York, have also adopted a code of criminal procedure which, as its name indicates, provides the mode of enforcing the law as set forth in the penal code. See CODE, and the authorities there referred to.

PENAL LAW. See LAW, CRIMINAL.

PENALTY (Fr. *pénalité*, from ML. *penalitas*, punishment, from Lat. *penalis*, relating to punishment, from *pœna*, punishment, from Gk. *ποινή*, *poinē*, fine, punishment; connected with *τίειν*, *tiein*, Skt. *ci*, to avenge). In the broadest sense, punishment of any kind for violations of law or legal duty, as the 'death penalty.' Usually, however, a 'penalty' is a sum of money the payment of which is required by law as a punishment for an offense, or omission to comply with some statutory provision. In this sense, a penalty is usually imposed for a violation of the law less serious in its nature than a crime, which is *malum in se* (q.v.). For example, a neglect to conform to sanitary regulations generally subjects the offender to payment of a sum of money imposed as a penalty, which is considered as commensurate with the gravity of the offense. Except in aggravated cases, imprisonment would be too severe for omissions of the above nature. A penalty differs but little from a fine in its nature and purposes. As penalties are commonly imposed for the least serious violations of the law, which are, for that reason, not so likely to come to the attention of the proper authorities, the statutes creating them often provide, as an inducement to persons to inform on offenders, that the whole or a part of the penalty shall go to the informer. In some jurisdictions the informer may recover the amount of the penalty by civil action, and in others payment to the public officials is enforced by the alternative of imprisonment, and the amount collected is then paid to the informer.

In the law of contracts the term penalty is applied to an arbitrary sum fixed by the parties to an agreement, to be paid by the one guilty of a breach thereof. This practice is no longer sanctioned, and a sum fixed as a penalty cannot be recovered. Where, however, a sum is based on a calculation as to the probable amount of damages in case of a breach, it will be considered as 'liquidated damages' (q.v.), and payment enforced.

PENANCE (OF. *penance*, *penaunce*, *pencance*, from Lat. *pœnitentia*, repentance, from *pœnitere*, to repent, frequentative of *pœnire*, *puire*, to punish, from *pœna*, punishment). The voluntary or accepted punishment by which a repentant sinner manifests his sorrow for sin, and seeks to atone for the sin, and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offense. Roman Catholics number penance among the seven sacraments (q.v.), and believe it to be of direct divine institution (Matt. xvi. 19; xviii. 18; John xx. 21). The *matter* of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin, as being an offense against God; confession, or detailed accusation of one's self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works, in atonement of the sin confessed; and the *form* of the sacrament is the sentence of absolution from sin pronounced by the priest who has received the confession, and has been satisfied of the penitential disposition of the self-accusing sinner. Even in the Apostolic times the practice prevailed of excluding persons of scandalous life from the spiritual fellowship of the Christian community (see EXCOMMUNICATION); and without attempting to fix the date, it may be stated as certain, from the authority of Tertullian and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offenses. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigor (see NOVATIAN) as, contrary to the clearly expressed sense of the Church, to carry it even beyond the grave. The penitent, in ordinary cases, could only be restored to communion by the bishop who had excluded him, and this only at the expiration of the appointed time, unless the bishop himself had shortened it; but in case of dangerous illness he might be restored, with the condition, however, that if he recovered from the illness the whole course of penance should be completed. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. This public discipline continued in force with greater or less

exactness in the fifth, sixth, and seventh centuries, gradually, however, being replaced by semi-public, and ultimately by private penance. In the eleventh and twelfth centuries the public penance had entirely disappeared. The nature and origin of private penance is a subject of controversy between Catholics and Protestants; the former contending that it had existed from the first, and that it held the same place even in the ages of public penance for secret sins which the public penance did for public offenses. At all events, from the date of the cessation of the public discipline it has existed universally in the Roman Catholic Church. The priest, in absolving the penitent, imposes upon him the obligation of reciting certain prayers, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance.

Outside of what is explained above as sacramental penance, devout Roman Catholics have always believed in the infliction of voluntary mortifications as being pleasing to God, since they are based on an intense detestation of sin and realization of its enormity; and many of the saints have gone to almost incredible lengths in seeking suffering as a means of purifying the soul and uniting it more closely with God.

Luther fought stoutly against the doctrine of penance current in his day as being contrary to some of what he considered the most essential principles of Scriptural Christianity, particularly to the doctrine of justification by faith in Jesus Christ alone, on the ground of His complete or 'finished' work; penance being founded on a doctrine of at least supplementary atonement by the works or sufferings of man—the sinner—himself. His teaching has been generally followed by Protestants. The outward expressions of humiliation, sorrow, and repentance common under the Jewish dispensation are regarded as very consistent with the character of that dispensation, in which so many symbols were employed. It is also held that the self-inflicted austerities, as fasting, sackcloth and ashes, etc., of Jewish and earliest Christian times, had for their sole purpose the *mortification* of unholy lusts and sinful passions in the people of God; or the expression of sorrow for sin, so that others beholding might be warned of its evil and restrained from it. Accordingly, in the discipline of the Protestant churches penance is now unknown. The nearest approach to the Roman Catholic polity on the subject was that in use among the English Puritans of the seventeenth century, and more particularly in the Church of Scotland during that and the succeeding century, when it was common "to make satisfaction publicly on the stool of repentance." See ABSOLUTION; CONFESSION; INDULGENCE.

PENANG' ('Betel-nut Island'). The most northerly of the British Straits Settlements (q.v.). It consists of the island of Penang, formerly officially called Prince of Wales Island, and the coast districts known as Province Wellesley and the Dindings. The island of Penang, with an area of 107 square miles, is situated off the west coast of the Malay Peninsula at the northern entrance to the Malacca Strait (Map: Burma, D 6). The island is still largely covered with jungle, and is of great commercial importance, Georgetown, the capital, situated at the northeastern extremity, being the chief port of the Straits Settlements next to Singapore. The town is defended by forts, and has a capacious harbor and a large shipping and commerce. In 1898 there entered and cleared at the port 5114 vessels, of 3,761,094 tons. In 1899 the imports amounted to $69,078,371, and the exports to $61,424,108. The principal exports are tin, spices, rice, and sugar, nearly all of which are produced on the mainland. The total population of the Settlement was, in 1891, 235,618, and in 1901, 248,207, mostly Malays and Chinese, there being only 1160 Europeans, most of whom were in the city of Georgetown. The population of Penang Island in 1901 was 128,830, and of Georgetown municipality 94,086. Penang Island was ceded to England in 1785 by the Rajah of Kedah, and organized in the following year under the East India Company, who later purchased Province Wellesley. In 1806 Penang was made a presidency of equal rank with Madras and Bombay, and it remained the chief seat of government of the Straits Settlements, including Malacca and Singapore, until 1832, when the latter city superseded it.

PENARTH'. A seaport of Glamorganshire, Wales, at the mouth of the Taff, opposite Cardiff (Map: Wales, C 5). It is a favorite seaside residence and bathing resort of the Cardiffians. It was an unimportant village until 1856, when its port was made a tidal harbor. It has extensive docks, and is an important shipping port for the minerals of South Wales, especially coal, iron, and alabaster. The docks have 6125 feet of quayage and the tidal harbor 15,000 feet. The town maintains public baths, parks, and pleasure grounds, and an isolation hospital. Population, in 1891, 12,400; in 1901, 14,200.

PENATES, pē-nā'tēz (Lat. nom. pl., gods of the store-room). The Roman gods of the storeroom, worshiped, with Vesta, at every hearth. The proper title is *di penates*, which indicates that a group of gods is here united under a comprehensive title, which is not really a proper name. It thus follows that the individual deities comprised in the title might vary in different families, and this seems proved by the variety of gods who appeared grouped with Lares and Genius as penates in the Pompeian paintings near the hearth. Vesta seems usually, if not always, included in these groups. Each family worshiped its own penates, though under the Empire the penates of the Imperial family were publicly honored. As the family had its private hearth, so the State had its temple of Vesta also, and with her were naturally worshiped the *public* penates, probably a collective title for the gods who cared for the prosperity of the State. Later (before B.C. 167, and probably by some considerable time) a little temple of the penates was built on the Velia, and now images after the type of the Greek Dioscuri were set up. Varro, it is true, denied that these were the true penates, whose sacred symbols were rather kept secretly in the *ædes Vestæ*, but other antiquaries did not follow him, and much ingenuity was displayed in attempted explanation of these mysterious gods. They were identified with the 'great gods' of Samothrace, and after the time of Augustus it was the orthodox belief that they had been brought from Troy to Italy by Æneas. See LARES; MANES.

PENCIL (OF. *pincel*, Fr. *pinceau*, from Lat. *penicillum*, *penicillus*, painter's brush, diminutive of *penis*, Gk. *πέος*, *peos*, tail, penis). An instrument for writing or drawing, employing some coloring material of which it is composed, as lead, graphite, or slate. Probably the pencil was the first instrument used by artists, and in its earliest form consisted simply of a lump of colored earth or chalk, cut into a form convenient to hold in the hand. With such pencils were executed the line-drawings of Aridices, the Corinthian, and Telephanes, the Sicyonian, and also the early one-colored pictures or *monochromata* of the Greeks and Egyptians. The use of metallic lead for marking is of very ancient origin. Pliny refers to the use of lead for making lines on papyrus, and Cortés in 1520 found the Aztecs using lead crayons. Black lead pencils are made of graphite or plumbago, which contains no lead whatever in its composition, but is in reality almost pure carbon. (See GRAPHITE.) The misnomer is probably owing to the fact that, previous to the employment of graphite for making pencils, common lead was used, a material which, indeed, continued to be employed until well into the nineteenth century. Consequently, as the plumbago with its black streak offered a contrast to the pale mark of the lead, it was called, in contradistinction, *black lead*.

DEVELOPMENT OF THE INDUSTRY. The manufacture of graphite pencils in England began in 1564, when a valuable graphite mine was discovered at Barrowdale, Cumberland. The mine was so highly prized that Parliament kept it guarded with an armed force, and, to keep up the value of the product, it was worked only six weeks in the year. The early graphite pencils were made by pulverizing the graphite and compressing it into solid blocks by means of a hydraulic press, and then cutting bars from the blocks. In 1850 the Barrowdale mine became exhausted. Graphite is now mined at Passau, Bavaria; Schwarzbach, Bohemia; in Norway, in New Zealand, in Mexico, and in various parts of the United States. The mine containing the purest graphite yet discovered is located at Ticonderoga, in New York State. It yields a product which is 99.9 per cent. pure carbon. The manufacture of lead pencils is extensively carried on in Germany, England, and America. In Nuremberg, Bavaria, are no less than 23 pencil factories, employing 10,000 workmen and turning out 4,400,000 pencils per week.

PENCIL MANUFACTURE IN THE UNITED STATES. The two raw materials essential for pencil manufacture—pure graphite and excellent cedar for the cases—exist in such generous quantities in the United States as to favor exceptionally the growth of this industry. The first manufacturer of black lead pencils in this country was William Monroe, of Concord, Mass., who in 1812 invented a process by which he pulverized and mixed the material and incased it in cedar holders. He was very successful in selling his product and continued the business for about eighteen months, when he was obliged to give it up on account of the difficulty of obtaining the raw materials. Later he resumed the manufacture of pencils and carried it on, on a small scale, for many years. Another pioneer in the industry was Joseph Dixon, and in 1860 the Fabers established a branch factory in the United States.

METHOD OF MANUFACTURE. The familiar lead pencil of every-day use consists of a round or polygonal stick of graphite mixed with clay, surrounded by a cedar case. The graphite is first reduced to an impalpable powder by grinding. Water is then added and the substance is run through mixers in a fluid state, the proper amount of finely powdered clay being put into the mixture and thoroughly blended with it. A little lampblack is sometimes added to the composition to increase the blackness. The more clay used, the harder will be the pencil. The mixing is performed by specially constructed machinery. After thorough mixing the mass is placed in filter presses to exclude the water and reduce the mixture to a doughy consistency. The material is next passed through dies, consisting of successive plates with holes of varying diameter. Great pressure is used, causing the mixture to ooze forth in doughy strings. This process is repeated several times. The final dies are of the same diameter as the finished lead. The graphite in this form is straightened, cut into three-foot lengths, and allowed to dry. It is next cut into pieces of the required length, usually about seven inches. These pieces are packed in crucibles and burned for several hours, to extract the moisture. The graphite is now ready to be inserted in its wooden case. Sometimes the plumbago is calcined before being mixed with clay. For some varieties of drawing pencils the leads are immersed for a minute in very hot melted wax or suet, before being mounted.

The leads are usually incased in the wood before it is shaped into a pencil. Little slabs of cedar, two, four, or six pencils wide, are passed through a machine which cuts out semicircular grooves, the diameter of the pencil. Into the grooves in one of these slabs the leads are laid and another grooved slab is glued to it, thus completely incasing the graphite. The slabs are now passed through machines which divide them into pencils, with their sides shaped in hexagonal or curved form. After the processes of polishing, varnishing, and stamping, all of which are performed by machinery, the pencils are ready for shipment.

COLORED PENCILS are made of chalk, clay, or wax, mixed with coloring pigments, the nature of which does not permit their being calcined like black pencils. They may be incased in wood like ordinary pencils, or simply wrapped in paper. Toward the close of the last century a process was invented by which both black and colored pencils were incased in paper instead of wood. A sheet of paper cut for a part of its width into strips about one-fourth of an inch wide is wrapped around the lead to form a case of the usual thickness. The surface is painted. When the pencil point wears down to the paper it is sharpened, that is more lead is exposed, by simply unwinding one of the narrow strips of paper.

SLATE PENCILS are sometimes inclosed in wood, but are more often little unprotected rods of slate. Partly from sanitary reasons, they are not nearly so much used as formerly, paper and lead pencil having taken the place of slate and pencil, for most purposes.

STATISTICS. According to the Twelfth Census of the United States, there were in 1900 seven pencil factories, having a total capital of $2,227,-

406, and producing an annual output of 1,385,822 gross of pencils, valued at $1,705,065. The number of factories reported has increased only one since the census of 1860, but the capital invested was then only $6,600, and the value of the product about $20,400. The value of the pencils imported into the United States for the closing decade of the nineteenth century is as follows: 1891, $116,687; 1892, $99,902; 1893, $105,720; 1894, $74,585; 1895, $142,817; 1896, $171,575; 1897, $182,687; 1898, $169,051; 1899, $197,406; 1900, $289,008.

BIBLIOGRAPHY. *The Twelfth United States Census*, vol. x., part iv., "Manufactures," contains historical, descriptive, and statistical matter regarding the pencil industry in this country. The Dixon Crucible Company, of Jersey City, N. J., and L. C. Hardtmuth Company, of New York, both publish pamphlets containing interesting descriptions of methods of pencil manufacture.

PENCIL (in mathematics). See PERSPECTIVE.

PENCK, pĕnk, ALBRECHT (1858—). A German geologist and physical geographer, born and educated at Leipzig. He made special studies of the mountains of Bavaria and Tyrol (1880), and traveled in Scotland and the Pyrenees. After serving as docent at Munich he was in 1885 appointed professor of physical geography at Vienna. He was editor of *Geographische Abhandlungen* (1886 et seq.) and has been one of the contributors to the *Geological Journal* of Chicago. In 1892 he was appointed president of the central commission for the study of the geography of Germany. He wrote: *Die Vergletscherung der deutschen Alpen* (1882); *Die Eiszeit in den Pyrenaen* (1885); *Niederlande und Belgien* (1889); *Donau* (1891); *Morphologie der Erdoberflache* (1894); and *Untersuchungen uber Verdunstung und Abfluss* (1896).

PENCZ, pĕnts, GEORG (*c.*1500-50). A German painter and engraver. He was born at Nuremberg and was probably a pupil of Dürer, or, at least, stood immediately under his influence. He was received into the Painters' Guild in 1523; but in the year following, together with Sebald and Barthel Beham, he was tried for infidelity and banished from the city. In 1525 he was allowed to settle in the neighborhood, and about 1532 he returned to Nuremberg, where he was frequently employed by the city council. In Rome, which he visited before 1530, and again in 1539, he diligently studied Raphael and other great masters, especially the Venetians, and perfected himself in the art of engraving under Marc Antonio. Of the few existing specimens of his historical, allegorical, and mythological paintings, his "Saint Jerome" (1544; in the Germanic Museum, Nuremberg) is the most remarkable. His fame as a painter rests chiefly on his masterly portraits, which for animated conception, excellent modeling, and warm, transparent coloring rank among the finest productions of the Nuremberg school. Especially characteristic are a "Young Man" (1534), "The Painter Erhard Schwetzer" (1544), and his "Wife" (1545), all in the Berlin Museum; a "Young Man" (1543), in the Vienna Museum; and "Fieldmarshal Sebaldus Schirmer" (1545), in the Germanic Museum, Nuremberg. All others in the various galleries of Europe are surpassed by the exquisite portrait of a "Scholar" in the Karlsruhe Gallery. Penez is most prominent as an engraver, ranking next to the Behams among the "Little Masters." In some of his plates he equals his master, Marc Antonio. Besides his largest plate "The Taking of Carthage" (1539, after Giulio Romano), may be mentioned the "Six Triumphs of Petrarch," "Life of Christ" (26 pieces), "Medea," "Paris," "Vergil and the Countess," and the portrait of John Frederick, Elector of Saxony. Consult: Scott, *The Little Masters* (London, 1880); and Kautzsch, *Der Maler Georg Pencz* (Leipzig, 1895).

PENDA. A king of the Anglo-Saxon Kingdom of Mercia (q.v.).

PENDANT (Lat. *pendens*, hanging, pres. part. of *pendere*, to hang). A hanging ornament, used in ceilings, vaults, staircases, timber roofs, as the end of keystones, posts, corbels, etc. It is sometimes a simple ball, and sometimes elaborately ornamented, and is chiefly used in the later Gothic and Renaissance styles.

PEND D'OREILLE, pän dŏrā'y'. See KALISPEL.

PENDEN'NIS, THE HISTORY OF. A novel by W. M. Thackeray (1850). Arthur Pendennis, the hero, a weak, commonplace, but thoroughly life-like young man, spoiled by an indulgent mother, and his own worst enemy, nearly wrecks himself in imprudent love affairs. From one such affair with an actress he is saved by his uncle, Major Pendennis, a shrewd man of the world. When he is jilted by Blanche Amory, he realizes the devotion of his cousin Laura and marries her. After a struggle, he becomes a successful writer in London, and as such tells the story of *The Newcomes*.

PENDENTIVE. A section of masonry forming the transition between a domical vault and the walls or piers supporting it. It occupies the angle where two walls meet and is usually roughly triangular in shape, with the apex below. The development of the pendentive by Byzantine architects of the sixth century made it possible to erect domes (q.v.) above rectangular or polygonal interiors, and this made it one of the greatest acquisitions in the history of architecture. Such pendentives are, strictly speaking, formed of a curved surface, but any device for passing from a vault to a wall of different plan may, by extension, be called a pendentive, as in the case of corner slabs or lintels, receding corbels, cones, and especially the Mohammedan stalactite pendentive.

PEN'DER, WILLIAM DORSEY (1834-63). An American soldier, born in Edgecombe County, N. C. He was graduated from West Point in 1854 and assigned to the artillery. He served against the Seminole Indians in New Mexico, and in the Apache campaign in 1856. He resigned in 1861 and was made captain of artillery in the Confederate Army, and May 16th was promoted to be colonel of the Third North Carolina Infantry. He was engaged at Bull Run, and at Seven Pines was made temporary brigadier-general. The appointment was made permanent after Gaines's Mill and Frazier's Farm. At the second battle of Bull Run he fought on foot, leading his men [illegible] again against the impregnable [illegible]. He was engaged at Winchester, [illegible] and Fredericksburg, winning the [illegible] 'Stonewall' Jackson. Pender [illegible]

general May 27, 1863, and took part in the invasion of Pennsylvania. On the first day at Gettysburg he attacked Seminary Ridge and was killed on the second day.

PENDLETON, pĕn'd'l-tŏn. A town of Lancashire, England, suburban to Manchester on the northwest (Map: England, D 3). Pendleton is part of the Parliamentary borough of Salford, and is incorporated with its municipality. The rapid increase of its population is due to the immense industries of the locality, which are identified with those of Salford and Manchester (q.v.). Population, in 1891, 57,000; in 1901, 75,000.

PENDLETON. A town and the county-seat of Umatilla County, Oregon, 47 miles southwest of Walla Walla, Wash.; on the Umatilla River, and on the line of the Oregon Railroad and Navigation Company and the Washington and Columbia River Railroad (Map: Oregon, G 4). It is the centre of a productive region interested largely in grain cultivation and in the raising of cattle, sheep, and horses; and has flouring mills, woolen and wool-scouring mills, machine shops, etc. Some of these establishments are operated by water power supplied by the river. The chief building is a fine court-house; and there are three bridges across the Umatilla here. The water-works are owned by the municipality. Population, in 1890, 2506; in 1900, 4406.

PENDLETON, Edmund (1721-1803). An American statesman of the Revolutionary period. He was born in Caroline County, Va., and was wholly self-educated. In 1744 he was admitted to the bar, and in 1752 was elected to the House of Burgesses, of which he was was a member for many years, serving several terms as Speaker. He was a member of the Committee of Correspondence in 1773; was a delegate to the First Continental Congress (1774); and was president of the Virginia conventions of 1775 and 1776. The resolution of May, 1776, instructing the State delegates to introduce a declaration of independence in Congress, was written by him. In 1776 he became president of the Committee of Safety, and, on the organization of the State Government, was elected Speaker of the House of Burgesses, and, somewhat later, president of the Court of Chancery. In 1777 he was crippled for life, but continued to serve as Speaker of the House, and in 1779 became president of the Court of Appeals, which position he held until his death. In 1788 he presided over the Virginia convention which ratified the Federal Constitution, he himself taking an active part in the debate and being largely responsible for the final decision.

PENDLETON, George Hunt (1825-89). An American lawyer, legislator, and civil-service reformer, born in Cincinnati, Ohio. He studied law, was admitted to the bar in Ohio, and became distinguished in his profession. He was a member of the State Senate in 1854-55; was elected to Congress in 1856; and served successively in the Thirty-fifth, Thirty-sixth, Thirty-seventh, and Thirty-eighth Congresses, being a member of the House Committee on Military Affairs during the first three terms, and a member of the Ways and Means Committee during the last term. He identified himself with the Anti-War Democrats, and attracted much public criticism on account of the boldness of his antagonism to the course of the Administration. In 1864 he was nominated for the Vice-Presidency of the United States on the ticket with General McClellan. Pendleton was one of the most prominent leaders of the Greenback Party, strongly opposing the payment of the Government bonds in gold, and the contraction of the currency. In 1879 he was elected to the United States Senate, where he won distinction as chairman of the Committee on Civil-Service Reform. Late in 1882 he introduced in the Senate the so-called Pendleton Bill for reforming the civil service. This bill passed the Senate on December 27th, and the House on January 5, 1883, and was approved by President Arthur on January 16th. It marks the first definite establishment of the merit system as opposed to the spoils system in the United States. (See Civil-Service Reform.) At the expiration of his term as United States Senator in 1885, he was appointed by President Cleveland Minister to Germany, which post he held until the time of his death, at Brussels, in 1889.

PENDLETON, William Nelson (1809-83). An American clergyman and Confederate soldier, born in Richmond, Va. He graduated at West Point in 1830; was assistant professor of mathematics there (1831-32); and resigned from the army in 1833. He taught in Bristol College, Pa., and Delaware College, and in 1839 became rector of the Episcopal Diocesan School at Alexandria, Va. At the outbreak of the Civil War he entered the Confederate service and became chief of artillery in the Army of Northern Virginia. In 1862 he was promoted to be brigadier-general, and in 1865 served as one of Lee's commissioners on surrender. At the close of the war Pendleton became rector of Grace Memorial Church, Lexington, Va. He wrote *Science a Witness for the Bible* (1860).

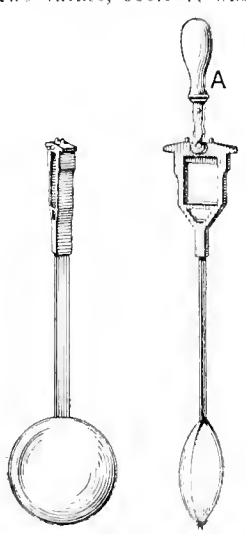
PENDULUM (Neo-Lat. neu. sg. of Lat. *pendulus*, hanging down, from *pendere*, to hang). A pendulum is any rigid body pointed about a horizontal axis so that it can swing to and fro, making vibrations under the influence of gravity. A 'simple' pendulum is the name given an imaginary pendulum consisting of a particle of matter suspended from a point by a cord supposed to be without mass. If the length of this cord is l and if g is the acceleration which the suspended particle would have if allowed to fall freely toward the earth, the period, or time taken for one complete vibration of the simple pendulum swinging in a vertical plane through very small arcs, is $2\pi\sqrt{\frac{l}{g}}$. The period of any actual or 'compound' pendulum is given by the formula $2\pi\sqrt{\frac{I}{mgl}}$, where I is the moment of inertia of the pendulum about its axis of suspension, m is its mass, l is the distance from the centre of gravity to the axis, and g has it usual value. It is seen that the period of vibration of a pendulum is constant, being independent of the extent of the amplitude of vibration, provided only that it be small compared with l. This fact was made use of by Galileo, who also recognized the connection between the period and the length of a pendulum.

The length of the pendulum, as will be seen from the formula, varies as the square of the

time of oscillation, and consequently a pendulum with a vibration period of one-half second has but one-quarter the length of a seconds pendulum. It is also apparent that pendulums of different kinds of matter—but in other respects identical—should have the same periods of vibration if g is the same for the different kinds of matter. This idea was tested by Newton and later by Bessel, who found that within experimental limits g is the same for all forms and kinds of matter. If g is different at different places on the earth, the fact will be shown by measuring the period of the same pendulum at these places. This was shown to be the case by Huygens.

The problem of deducting the length of a simple pendulum which should have the same period as a given compound pendulum was first solved by Huygens. See CENTRE OF OSCILLATION and MECHANICS.

If the same pendulum is swung at various positions on the earth's surface, its time of vibration will vary depending on the value of g. Accordingly one of the best methods of determining this quantity is to cause a pendulum to swing at different stations and carefully and exactly measure its time of oscillation. In the United States this work is done by the United States Coast and Geodetic Survey, and from their observations the value of the absolute force of gravity in the pendulum room of the Coast and Geodetic Survey at Washington has been found to be 980.165 on the C. G. S. system. The relative measure between Paris and Washington gave $g = 980.169$, and, accordingly, the mean of these two values, 980.167, was adopted.



HALF-SECOND PENDULUM.
Front and side views of United States Coast and Geodetic Survey standard form. A, handle for lifting pendulum from the knife edges on which it is suspended.

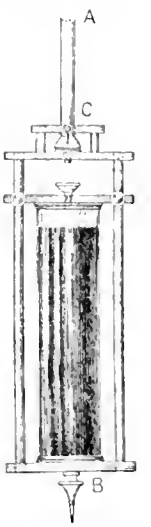
The pendulums used in the United States Coast and Geodetic Survey for gravity determinations swing with a period of one-half second in a case from which the air has been exhausted. The stem is flat and carries a lenticular bob, the pendulum being supported on agate bearings. A beam of light is thrown into the pendulum receiver every second, and when the pendulum is vertical it is reflected into a telescope through the coincidence of two slits. A carefully rated chronometer forms a part of the apparatus and enables the observer to determine with great accuracy the time of vibration of the pendulum. The instruments of the Survey are extremely portable, and the observers travel from station to station making observations.

This variation in time of oscillation is shown below in figures from three stations in North America, with considerable difference in their latitude. A pendulum whose period of vibration in Washington was .5008383 second had a period at Key West, Fla., of .5011320 second and at Umanak, Greenland, of .5002032 second.

Another application of the pendulum due to Foucault is to show the rotation of the earth. Using a long pendulum with a heavy weight, he found that the plane of oscillation would shift in the same direction as the motion of the sun, or opposite to the rotation of the earth. Were the pendulum to vibrate at the pole, it would continue in the same plane while the earth rotated, the path of the pendulum appearing to make one complete revolution in twenty four hours. At the equator, on the other hand, there would be no rotation of the plane of vibration.

In order to determine the length of a seconds pendulum at any particular place, the method devised by Captain Kater of using a reversible pendulum is employed. Here the centre of oscillation and the centre of suspension are interchangeable, and the apparatus will be equivalent to a simple pendulum, whose length is the distance between them. In practice these two points are formed by knife edges, which can be moved with respect to each other along a rod so that the vibrations of the pendulum will be synchronous irrespective of the knife edge by which it is supported.

COMPENSATION PENDULUM. As the length of a rod or bar of any material depends on its temperature (see HEAT), a clock with an ordinary pendulum goes faster in cold and slower in hot weather. In the method of correction usually employed, and called *compensation*, advantage is taken of the fact that different substances have different coefficients of linear expansion; so that if the bob of the pendulum is so suspended as to be raised by the expansion of one substance, and depressed by the expansion of another, the lengths of the effective portions of these substances may be so adjusted that the raising and depression, taking place simultaneously, may leave the position of the bob unaffected. There are two common methods of effecting this, differing a little in construction, but ultimately depending on the same principle. Of these, the *mercurial* pendulum is the more easily described. The rod AC and the framework CB are of steel. Inside the framework is placed a cylindrical glass jar, nearly full of mercury, which can be raised or depressed by turning a screw. With an increase of temperature, the steel portion AC is lengthened by an amount proportioned to its length, its coefficient of linear dilatation, and the change of temperature, conjointly and thus the jar of mercury is removed from the axis of suspension. But neglecting the expansion of the glass, which is very small, the mercury rises in the jar by an amount proportional to its bulk, its coefficient of cubical expansion, and the change of temperature conjointly. Now, by increasing or diminishing the



MERCURIAL COMPENSATING PENDULUM.

quantity of mercury, it is obvious that we may so adjust the instrument that the length of the equivalent simple pendulum shall be unaltered by the change of temperature, whatever be its amount, so long as it is not great enough to change sensibly the coefficients of dilatation of the two metals.

The construction of the *gridiron* pendulum will be easily understood from the cut. The shaded bars are steel; the second and fourth ones are zinc, or some substance whose coefficient of linear expansion is considerably greater than that of steel. It is obvious from the figure that the horizontal bars are merely connectors, and that their expansion has nothing to do with the vibration of the pendulum, so they may be made of any substance. It is easily seen that an increase of temperature lowers the bob by expanding the steel rods, whose effective length consists of the sum of the lengths of one of the outer rods and the steel bar to which the bob is attached; while it raises the bob by expanding the zinc bars, whose effective length is that of one of them only, the other, as well as one of the outside steel rods, being added to the instrument for the sake of symmetry, strength, and stiffness only. If the effective lengths of steel and brass be inversely as their respective expansion coefficients, the position of the bob is unaltered by temperature; and therefore the pendulum will always vibrate in the same period. This is on the supposition that the weight of the framework may be neglected in comparison with that of the bob; if this weight must be taken into account, the requisite adjustments, though possible, are greatly more complex, and can only be alluded to here. Practically, it is found that a strip of dry fir-wood, carefully varnished to prevent the absorption of moisture, and consequent hygrometric alterations of its length, is very little affected by change of temperature; and in many excellent clocks this is used as a very effective substitute for the more elaborate forms just described. In astronomical clocks, though they are kept at a temperature as nearly constant as possible, the compensation of the pendulum is a matter of delicacy.

GRIDIRON COMPENSATING PENDULUM.

PENEL'OPE (Lat., from Gk. Ηηνελόπη, *Pēnelopē* Ηηνελόπεια, *Pēnelopeia*). In Greek legend, a daughter of Icarios of Sparta and Peribœa, and wife of Odysseus. According to the Homeric story, Odysseus was soon called to the Trojan War, leaving his wife with their infant son Telemachus at Ithaca. When Troy had fallen and years passed without his return, numerous suitors gathered at his palace, whom the youthful Telemachus could not dispossess, though they devoured and wasted his father's goods, while importuning Penelope to choose a husband. For some time she put them off under the plea that she must first finish the shroud she was weaving for old Laertes, father of Odysseus. To protract the time, she unraveled at night what she wove by day. Betrayed by a maid, she was compelled to finish the work, and the suitors were preparing to force a decision, when Odysseus returned, and slew them. Later epics told how Odysseus was subsequently slain in ignorance by Telegonus, his son by Circe, and how after his death Telemachus, Telegonus, and Penelope journeyed to Circe's island, where Telemachus wedded Circe, and Telegonus Penelope. There is considerable evidence connecting both Odysseus and Penelope with Arcadia, as local divinities. At Mantinea the grave of Penelope was shown, and in Arcadian legends she is a nymph, who became by Hermes (or in another version by all the suitors) the mother of Pan. The later writers endeavored to account for her grave by saying that when Odysseus learned of her infidelity, he dismissed her, whereupon she wandered to Lacedæmon, and then to Mantinea, where she died.

PENEPLAIN. See PLAIN.

PENETRATION OF A PROJECTILE. See BALLISTICS.

PEN'FIELD, EDWARD (1866—). An American artist, born in New York City. He studied at the Art Students' League in New York City, and afterwards in Holland and England. He was associated with the Harpers Publishing Company from 1891 until 1901, and designed several posters, magazine covers, and calendars for them. He was one of the first in America to make poster designs in color, and showed himself to be an artist of originality and unusual force, especially in drawings of small size. His other works include decorations in Randolph Hall, Cambridge, Mass.

PENFIELD, SAMUEL LEWIS (1856—). An American mineralogist, born at Catskill, N. Y. He graduated in 1877 at the Sheffield Scientific School of Yale, and was appointed professor of mineralogy there. Penfield was elected to the National Academy of Sciences. His publications include: *Determinative Mineralogy and Blow-Pipe Analysis* (1898), and contributions to the *American Journal of Science and Art* on crystallography and mineralogy.

PENFIELD, SMITH NEWELL (1837—). An American organist and composer. He was born in Oberlin, Ohio, and graduated from Oberlin College. After teaching music for several years in Rochester, N. Y., he studied in Leipzig under Moscheles, Reinecke, and Plaidy, and on his return to America lived for some time in Savannah, Ga., then in Brooklyn, N. Y., where he was for two years organist of the Church of the Pilgrims, and in New York, where he held like positions in Saint George's, Saint Mark's, the Broadway Tabernacle, and the Scotch Presbyterian Church. In Savannah he founded the Mozart Club and a Conservatory of Music, and in Brooklyn the Arion Conservatory. Among Penfield's many compositions are services of the Episcopal canticles, a cantata entitled *The Eighteenth Psalm*, as well as marches, choruses, glees, and solos.

PENGE. A municipality of Surrey, England, and a residential suburb of London, seven miles southeast of Saint Paul's. Population, 1891, 20,400; 1901, 22,460.

PENGUIN (possibly from Welsh *pen gwen*, white head, applied to the auk and later transferred to the penguin, or perhaps from a native

South American name). One of the Antarctic seabirds of the family Spheniscidæ, representing the larger group Sphenisci. They have short wings, quite unfit for flight, but covered with short rigid scale-like feathers, and much like the flippers of turtles. The legs are very short, and are placed very far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and they thus maintain a perfectly erect posture. Their bones, unlike those of birds in general, are hard, compact, and heavy, and have no air-cavities; those of the extremities contain an oily marrow. The body is of an elliptical form; the neck of moderate length; the head small; the bill moderately long, straight, more or less compressed; the tail very short. They are among the most aquatic birds, and spend little more time on shore than is necessary for sleeping and reproduction. Their food consists of all the small life of the sea, which they catch by swimming and diving often to very great depths. The wings are modified internally as well as externally to make them effective aids in this work, and are used not together like oars, as other birds swim under water, but alternately and with a twisting motion, so that no part of the result of the effort is neutralized and continuous and very rapid progress is made without the aid of the feet, which merely serve as rudders. Underneath their skin is a layer of blubber-like fat, which assists them to withstand the icy air and water of their habitat. They go about in swimming 'schools,' and gather at their breeding grounds in enormous flocks.

About fifteen species are known, mainly in high southern latitudes, although some species straggle as far north as Peru and Brazil, New Zealand, and the Cape of Good Hope. It is upon the islands about Cape Horn and in the Antarctic Sea that they abound and breed in the greatest numbers. Some gather stones, bits of stick, grass, etc., into a sort of a nest; others make no nest whatever; while the king penguin, and perhaps some others, incubate the egg as do their Arctic analogues, the auks, by holding it between their thighs, resting upon the top of their feet, the male and female relieving each other at intervals. A single egg only is laid, but it is tended and guarded with great care; and the mother penguin is said to keep her young one with her for a twelvemonth.

The king penguins (Aptenodytes) are among the largest. They stand three feet high, and are grayish blue with black heads, white breasts, and orange or yellow throats. They exist in colonies of many thousands. The 'jackass-penguins' (Spheniscus) are medium-sized or small species with a stout bill. They receive their popular name from their cry. The rock-hoppers or macaronis (Eudyptes) are notable for being curiously crested with curly yellow plumes on each side of the head. The smallest known species of penguin is *Eudyptila minor* of Australia and New Zealand, which is only about a foot long. In the Eocene rocks of New Zealand fossil remains of a giant penguin (*Palæeudyptes antarcticus*) have been found, indicating a bird six or seven feet high.

(Boston, 1885); Buller, *Birds of New Zealand* (2d ed., London, 1888); Darwin, *A Naturalist's Voyage* (New York, 1899); Mosely, *The Naturalist in the Challenger* (London, 1879); and the writings of Antarctic navigators. See Plate of Auks, Albatross, etc.

PENHALLOW, pēn-hŏl'lō, Samuel (1665-1726). An American colonist and historian, born at Saint Mabon, Cornwall, England. He came to Massachusetts with the Rev. Charles Morton, his teacher, in 1686; lived for a time at Charlestown, Mass., and then removed to Portsmouth, N. H., where by marriage and business successes he acquired a considerable fortune, and was successively made a magistrate, a member of the council, recorder of deeds, and justice of the Supreme Court of Judicature (1714), of which court he was Chief Justice from 1717 until his death. He was also for several years treasurer of the colony. He is remembered as the author of a *History of the Wars of New England with the Eastern Indians, or a Narrative of Their Perfidy and Cruelty* (1726; reprinted in the *Collections* of the New Haven Historical Society in 1824, and separately at Cincinnati in 1859), which covers the period from 1703 to 1726, is the chief contemporary authority in English on Queen Anne's War, and the so-called Lovewell's War, and has been of great value to historians.

PENINSULAR CAMPAIGN. The name given to the campaign of General McClellan, at the head of the Federal Army of the Potomac, against Richmond, Va., in April-July, 1862, during the Civil War. The campaign was so named because of McClellan's attempt to reach the Confederate capital by way of the peninsula formed by the York and the James rivers. For details see McClellan, G. B.; Civil War in America; Yorktown; Williamsburg; Seven Pines; Gaines's Mill; Seven Days' Battles; Malvern Hill.

PENINSULAR STATE. Florida. See States, Popular Names of.

PENINSULAR WAR, The. The struggle carried on in the Iberian Peninsula from 1807 to 1814 between the Emperor Napoleon on the one side and the Spaniards, the Portuguese, and the English on the other. After the Treaty of Tilsit Napoleon resolved to seize Portugal in order more perfectly to enforce his Continental System (q.v.) against England. With the connivance of Spain, a French army under Junot invaded Portugal and occupied Lisbon on November 30, 1807. The flight of the royal family to Brazil left the Portuguese for the moment leaderless, but the English soon came to their assistance and, under the command of Sir Arthur Wellesley, afterwards Duke of Wellington, defeated Junot at Vimeiro on August 21, 1808, and by the Convention of Cintra, nine days later, forced him to evacuate Portugal. In the mean while the family affairs of Spanish royalty gave Napoleon a pretext for interfering in Spain. Armies under the direction of Murat occupied the country and on June 6, 1808, Joseph Bonaparte was proclaimed King of Spain. (See Charles IV.; Ferdinand VII.) One of the divisions of the French army of occupation was trapped by the Spaniards and forced to surrender at Bailen (q.v.) on July 20, 1808. This disaster so startled Napoleon that immediately after the Congress of Erfurt he in person undertook a campaign in Spain with three large armies and occupied Madrid on December 4, 1808. His army was lured away from Madrid by an English army under Sir John Moore, who

invaded Spain from Portugal and then conducted a skilful retreat to Coruña. During the pursuit Napoleon turned over the command to Soult and hurried away to prepare for the campaign against Austria. While Napoleon's marshals were busy completing the conquest of the Peninsula, an English army under Wellesley landed at Lisbon on April 22, 1809. Having taken Oporto from Soult, Wellesley invaded Spain and fought a drawn battle with King Joseph and Marshal Victor at Talavera de la Reina on July 27th-28th. This battle saved Portugal from further harrying by the French, who, however, won a series of successes in Spain, including the victories of Almonacid on August 11th and Ocana on November 18th. By the beginning of the summer of 1810, the French had subjugated practically the whole of Spain. The Province of Galicia and the fortified towns of Cadiz, Valencia, Badajoz, and Ciudad Rodrigo were the only important places still held by the Spaniards. During 1810 Napoleon hoped to take these places and to drive the English out of Portugal. With this purpose, a large army under Masséna laid siege to Ciudad Rodrigo, which was captured on July 19th. Invading Portugal, Masséna captured Almeida on August 26th, and after a repulse by Wellington at Busaco on September 27th, continued the pursuit of that general, who retired behind the well-fortified lines of Torres Vedras. The devastation of the country by the Portuguese, the incessant guerrilla warfare waged by the Spaniards, and the jealousies of the French marshals spoiled the plan of campaign. Soult captured Badajoz on March 11, 1811, but failed to coöperate with Masséna, who was forced to abandon the attempt to carry the lines of Torres Vedras in order to prevent the recapture of Almeida. Wellington defeated Masséna at Fuentes de Onoro on May 5th and the English reoccupied Almeida. During the year the French, under Soult, were defeated at Albuera on May 16th, and under Gérard at Arroyo Molinos on October 26th, and their only success was in Aragon and Valencia under Suchet, who captured the city of Valencia on January 10, 1812. In the same month Wellington took the offensive, captured Ciudad Rodrigo on January 19th, and Badajoz on April 6th, and defeated Marmont at Salamanca on July 22d, but failed to capture Burgos and retired into winter quarters in Portugal. Elsewhere in Spain the French held their own until the withdrawal of troops from the Peninsula for the campaign of 1813 in Germany. The resumption of hostilities by Wellington forced King Joseph to abandon his capital and retreat toward the northern mountains. Wellington pushed the campaign with vigor, defeating Joseph and Jourdan at Vitoria on June 21, 1813, capturing San Sebastián on August 31st, and invading France. Soult failed in successive attempts to check Wellington's victorious advance in Southern France in the battles on the Nivelle, on the Nive, at Orthez on February 27, 1814, and at Toulouse on April 10th. Suchet succeeded in withdrawing his army from Aragon without loss and was marching to the assistance of Soult when the news of Napoleon's abdication arrived. The termination of the war at this moment enabled the English to transport many of Wellington's veterans to America to take part in the campaign of 1814 against the United States. Politically the invasion of the Peninsula was the most costly error in Napoleon's career, for there he first aroused that spirit of nationality which was destined to bring disaster on him not only in Spain, but in Germany as well. From a military point of view the war in the Peninsula was a stupendous blunder for Napoleon, for it made a wanton increase in the number of his foes, it gave England her longed for opportunity of fighting him on land, while its campaigns and its guerrilla warfare cost Napoleon thousands of men and proved demoralizing to the efficiency of his army, so that in his final campaigns he found himself with a formidable foe at his rear and was therefore unable to put in the field against his great Continental enemies, Austria, Prussia, and Russia, the full military power of the French nation.

Bibliography. The best brief sketch is Shand, *The War in the Peninsula* (New York, 1898). The standard works are: Napier, *History of the War in the Peninsula* (London, 1828-40); and Foy, *Histoire de la guerre de la Péninsule sous Napoléon* (Paris, 1827). The best works of recent scholarship are Gomez de Arteche y Moro, *Guerra della independencia* (14 vols., Madrid, 1868-1903); Latino Coelho, *Historia politica e militar desde os fins do 18 seculo ate 1814* (Lisbon, 1886); and Oman, *History of the Peninsular War* (New York, 1902).

PENITENTIAL PSALMS. A name given to seven of the psalms, as being specially expressive of sorrow for sin, and accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are Psalms vi., xxxii., xxxviii., li., cii., cxxx., and cxliii., according to the Authorized Version, which correspond with vi., xxxi., xxxvii., l., ci., cxxix., and cxlii. of the Vulgate. These psalms were set apart at a very early period, and the collection is referred to by Origen. Pope Innocent III. ordered that they should be recited in Lent.

PENITENTIARY. A term commonly used as synonymous with prison (q.v.).

PENITENTIARY. In the history of the Roman Catholic Church, a priest attached to cathedral churches, whose special duty it is to deal with difficult cases of the judgment to be passed on grave sins and the penance to be prescribed for them. The custom of appointing such officials is at least as old as the outbreak of the Novatianist schism; but the fourth Lateran Council, of 1215, prescribed their appointment for all metropolitan and cathedral churches, to represent the bishop in such matters when he was absent or otherwise hindered from giving his personal attention to the matter. Since the Council of Trent the office has normally been held by a member of the cathedral chapter, sometimes combined with that of vicar-general. The cardinal penitentiary is an officer of the Roman curia who holds a corresponding position in regard to cases of absolution or dispensation such as are reserved to Papal decision. He must be a priest, and hold the degree of master in theology or doctor in canon law. He is assisted by an official theologian and canonist, and has a number of subordinates, who together make up the branch of the Roman administration called the *Penitenziaria*. A monthly session is held for the discussion of the more important cases, which are then, if necessary, referred directly to the Pope.

PENJAMO, pān'hä-mō. A town of Guanajuato, Mexico, 50 miles southwest of the city of

that name, on the Guadalajara branch of the Mexican Central Railroad (Map: Mexico, H 7). Its population, in 1895, was 7558. The patriot Hidalgo was born on the neighboring hacienda of Corralejo, and here, in 1817, the filibuster Mina was shot.

PENJDEH, pĕnj'dĕ. An oasis in the southern part of Russian Turkestan, 25 miles from the boundary of Afghanistan (Map: Asia, Central, H 3). It belonged to the latter country until 1885; in that year it was the scene of the defeat of a body of Afghan troops by the Russians, which brought about strained relations between England and Russia.

PENN, John (1729-95). A proprietary Lieutenant-Governor of Pennsylvania. He was born in London, and was a grandson of William Penn. After a course in the University of Geneva, he went to Pennsylvania, where, in 1753, he became a member of the council. He was a member of the Albany Congress of 1754, and in 1763 became Lieutenant-Governor of Pennsylvania, which office he held until 1771, and then, after a visit to England, from 1773 to 1775. When the Revolutionary War broke out, although he attempted to maintain a neutral attitude, his authority was soon superseded by that of a revolutionary government, and in 1777 he was imprisoned, but after a few months was released. He received one-fourth of the £130,000 voted by the Legislature in compensation for the confiscated proprietary rights, and the same share of a £4000 annuity later granted the proprietors by the English Government. Consult: the *Pennsylvania Archives;* and Sheperd, *Proprietary Government in Pennsylvania*, vol. vi. of the "Columbia University Studies in History, Economics, and Public Law."

PENN, John (1741-88). An American patriot, one of the signers of the Declaration of Independence, born in Caroline County, Va. He was admitted to the bar in 1762, and soon acquired a reputation as an eloquent and successful pleader. In 1774 he removed to Granville County, N. C., and almost immediately became prominent there. Having espoused the Patriot cause, he was, in September, 1775, chosen a delegate to the Continental Congress, and next year signed the Declaration of Independence. He was rechosen delegate in 1777, and once again in 1779. In 1780, after the disastrous defeat of Camden, he was given almost dictatorial power in North Carolina, and did much to assist General Greene in his campaign against the invaders under Cornwallis. In 1784 he was appointed receiver of taxes for North Carolina by Robert Morris, but found his duties so disagreeable that he soon resigned.

PENN, Richard (c.1735-1811). A British colonial Governor in America, born in England. He was a grandson of William Penn, and was educated at Saint John's College, Cambridge. He began the study of law, but went to Pennsylvania in 1763, became a member of the Council in 1764, and remained, probably, until 1769. When his brother John, who was Lieutenant-Governor, returned to England in 1771, Richard was sent out in his stead, and served until August, 1773. He was very popular with both colonists and Indians. With Arthur Lee he carried the petition of the Congress to England. When examined before the House of Lords as to the ability and disposition of the colonists to resist the acts of Parliament, he was sharply reproved by the Ministers for his obvious sympathy with resistance. From 1784 until 1809, he represented various boroughs in Parliament.

PENN, Thomas (1702-75). A British colonial proprietor, son of William Penn, the founder of Pennsylvania. He was born in Kensington, and in 1718 succeeded to one-fourth of the proprietorship of Pennsylvania. In 1732 he went to Philadelphia. He held a power of attorney for his two brothers and assumed direction of the colony until the arrival of his elder brother, John, in 1734. He remained in the colony after his brother's return to England, presided at many of the council meetings up to 1739, and held a great conference with the Indians in 1740. In 1747, upon the death of his elder brother, he inherited the latter's half-interest, and went to England to take charge. During the French and Indian War he sent £5000 for the relief of the colony, having previously given money and land for the establishment of a public library in Philadelphia. When the dispute over taxation of the proprietary estates arose, he received Franklin, the agent of the colony, who brought the 'Heads of Complaint,' in 1757, and he vigorously opposed the petition of the colony, in 1764, that the Crown should assume charge. His interest was finally purchased by the State.

PENN, Sir William (1621-70). A British sailor, probably born in Bristol, England. He was brought up to the sea, and under the Commonwealth held many important naval commands. In 1649 he was appointed vice-admiral of the Irish fleet, and in 1650-51 cruised along the coast of Southern Europe and in the Mediterranean, seeking Prince Rupert. In 1652 he was appointed vice-admiral of the fleet under Gen. Robert Blake (q.v.), and participated in the victory off Portland (February 18, 1653), and those of June 3d and July 31st. After the conclusion of the Dutch War Penn entered into negotiations with the Stuarts, but these proving fruitless, he accepted the command of a fleet sent against the Spanish possessions in America, and on May 17, 1655, captured the island of Jamaica. In 1660 he was knighted by the King and appointed a commissioner of the navy. Five years later he won, though nominally under the command of the Duke of York, a victory over the Dutch near Lowestoft (June 3, 1665). Consult: Granville Penn, *Memorials of the Professional Life and Times of Sir William Penn*, and Dixon, *Life of William Penn*.

PENN, William (1644-1718). A celebrated English Quaker and the founder of Pennsylvania. He was the son of Sir William Penn, was born in London, and was educated chiefly at Christ's Church, Oxford, where he became a Quaker. His enthusiasm for his new faith assumed a pugnacious form. Not only did he object to attending the services of the Church of England and to wearing the surplice of a student—both of which he considered papistical—but, along with some companions, who had also become Quakers, he attacked several of his fellow-students, and tore the obnoxious robes from their backs. For this conduct Penn was expelled from the university. His father, although excessively annoyed at his conduct, sent him to travel on the Continent, where he became a frequent guest at the Court

of Louis XIV. After studying law a short time at Lincoln's Inn, he was sent by his father to Ireland to look after his estates in the County of Cork. In the city of Cork, however, he fell in with Thomas Lee, and for attending a Quaker meeting was, along with some others, imprisoned by the Mayor, though he was promptly released. He now became a minister, and on his return to England he and his father again quarreled, because his 'conscience' would not allow him to take off his hat to anybody—not even to the King, the Duke of York, or the Admiral himself. Penn was for a second time turned out of doors by his father, but his mother smoothed matters so far that he was allowed to return home, and the Admiral even exerted his influence with the Government to wink at his son's attendance at the illegal conventicles of the Quakers, which nothing could induce him to give up. Meantime he was engaged in preaching and writing tracts on various religious subjects. In 1668, however, he was thrown into the Tower, where he was confined for eight months on account of a publication entitled *The Sandy Foundation Shaken*, in which he attacked the ordinary doctrines of the Trinity. While in prison he wrote the most famous and most popular of his books, *No Cross, No Crown*, and *Innocency with Her Open Face*, a vindication of himself which contributed to his liberation through the interference of the Duke of York. In September, 1670, Admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon the Government for £16,000. In 1671 he was again committed to the Tower for preaching in violation of the Conventicle Act, and, as he would take no oath at his trial, he was sent to Newgate for six months. Here he wrote four treatises, one of which, entitled *The Great Cause of the Liberty of Conscience*, is an admirable defense of the doctrine of toleration. After regaining his liberty he, together with Fox and Barclay, visited Holland and Germany for the advancement of Quaker interests. The Countess Palatine Elizabeth, the granddaughter of James I., showed him particular favor. On his return he again engaged in preaching and writing on religious topics, but circumstances soon turned his attention to the New World. In 1676 Penn and several associates founded a Quaker colony in West Jersey, which had come into their possession by purchase. In 1681 Penn obtained from the Crown, in lieu of a debt of £16,000 due from the King to his father, a grant of the territory now forming the State of Pennsylvania. By a royal charter he was made full proprietor of the territory of Pennsylvania. His great desire was to establish a home for his co-religionists in America, where they might preach and practice their convictions in unmolested peace. In the same year he sent out a governor to take possession of the province, and in the following year, 1682, with several friends, sailed for the Delaware, arriving in October. After taking formal possession he laid out a site for his new capital, which he named Philadelphia. Some time during the following year he had his famous interview with the Indians under the great Elm at Shakamaxon (now Kensington) and concluded a treaty of lasting friendship with them. Penn's colony in its infancy escaped the horrors of Indian warfare which befell some of the other American settlements, and under the wise and liberal government of its founder made immense progress during the next few years. Not only Quakers, but persecuted members of other religious sects, sought refuge in his new colony, where, from the first, the principle of toleration was established by law. Having called the colonists together, he gave the colony a constitution in twenty-four articles. Almost from the beginning Delaware, which was secured by a grant from the Duke of York, formed part of the Pennsylvania colony. In 1682 Penn and other Quakers bought East Jersey. Neither West Jersey nor East Jersey, however, remained permanently in the possession of the Quakers, the whole region being surrendered to the Crown in 1702. Toward the end of the reign of Charles II., in 1684, Penn returned to England to exert himself in favor of his persecuted brethren at home, leaving behind a prosperous colony of 7000 inhabitants. His influence with James II.—an old friend of his father—was so great that his exertions in favor of the Quakers secured in 1686 a proclamation by which all persons imprisoned on account of their religious opinions were released, and more than 1200 Quakers were set free. In the April following, largely as a result of the same influence, James issued an edict for the repeal of all religious tests and penalties, but the mass of nonconformists distrusted his sincerity, and refused to avail themselves of it. After the accession of the Prince of Orange as William III., Penn was twice accused of treason as a result of his relations with the exiled monarch, but was acquitted. In 1690 he was arrested on a charge of conspiracy, but was again acquitted for lack of evidence. Nevertheless in the following year the charge was renewed, and for a time he was deprived of the government of Pennsylvania. Nothing further appears to have been done for some time, but at last, through the kindly offices of his friends, Locke, Tillotson, and others, the matter was thoroughly investigated, and he was finally and honorably acquitted November, 1693, and restored to the government of his province. In 1699 he paid a second visit to the New World, and found Pennsylvania in a prosperous condition. His stay, which lasted two years, was marked by many useful measures, and by efforts to ameliorate the condition both of the Indians and of the negroes. Penn departed for England toward the end of 1701, leaving the management of his affairs to a Quaker agent named Ford, by whose dishonesty he was virtually ruined. When the agent died, he left to his widow and son false claims against his principal, and these were so ruthlessly pressed that Penn allowed himself to be thrown into Fleet Prison in 1708 to avoid extortion. His friends afterwards procured his release, but not until his health had been fatally impaired. Later he was stricken with paralysis and in this condition lingered until his death in 1718. He was twice married and left issue by both marriages. The works of Penn were published in 1782 in five volumes, and again in 1825 in three volumes. An important biography of Penn is that of Janney (Philadelphia, 1852). His *Memoirs*, in two volumes, were edited by Clarkson (Philadelphia, 1813). A biography refuting charges made against him by Lord Macaulay was written by Dixon (new ed., Philadelphia, 1856). A small popular biography is that by Hodges (Boston, 1901). Consult also Fisher, *The True William Penn* (Philadelphia).

WILLIAM PENN

AFTER THE PAINTING BY BENJAMIN WEST

PEN'NACOOK (nut place, or crooked place). A confederacy of Algonquian tribes formerly occupying the Merrimac River basin and adjacent region in New Hampshire, Massachusetts, and southern Maine. They occupied a middle ground between the Southern New England tribes, with whom the English had dealing, and the Abnaki and others of the north, who were under French influence. Their early treaties were with the English, but their later alliances were with the French. The capital of the confederacy and the residence of the head chief, Passaconaway, was at Amoskeag, the present Manchester, New Hampshire. Wamesit village, with Pawtucket Falls, was the great rendezvous during the fishing season. When first known to the English they were estimated at 3000, which was probably below their real number, under the rule of the noted chief and medicine man, Passaconaway. He was friendly to the whites and invited the English to settle upon the Merrimac. Before his death, about 1669, he saw almost his whole country in the hands of the whites and was himself obliged to petition for enough ground to live upon. In the mean time his people had been reduced by smallpox and other introduced diseases to about 1200. On the outbreak of King Philip's War in 1675, one or two of the Pennacook bands joined the hostile Indians, but the greater portion, under Wanalancet, the son of Passaconaway, remained on friendly terms with the English until, angered by the treacherous seizure of a number of their people, they abandoned their country and fled, part to the French in Canada, others to the Mohican on the Hudson. Those who removed to Canada were finally settled at Saint Francis, Quebec Province.

PENNAMITE-YANKEE WAR. See WYOMING VALLEY.

PENNANT (variant of *pennon*, with excrescent *t*, possibly associated by popular etymology with *pendant*, from OF., Fr. *pennon*, sort of flag, augmentative of OF. *penne*, from Lat. *penna*, feather, wing). A narrow flag or streamer tapering from the "hoist" to the "fly" or tip. In the signal codes pennants are two to five times as long as they are wide. The old commodores' 'broad pennant' was a 'swallow-tail' flag. The pennant of the 'senior officer present' is blue and nearly equilateral. The narrow pennant worn by all vessels commissioned in the Government service is carried at the main and signifies that she is of a public character. See Colored Plates of FLAGS OF THE UNITED STATES, and INTERNATIONAL SIGNAL CODE with the article SIGNALS, MARINE.

PEN'NANT, THOMAS (1726-98). A British naturalist, born at Downing, near Holywell, in Flintshire, and educated at Queen's College, Oxford. In 1754 he visited Ireland, and about this time began those tours of the British Islands, the published accounts of which contributed greatly to his reputation. In 1761 he began his *British Zoölogy*, the first part of which was published five years later. This work and his *History of Quadrupeds* (1781) were long held in the highest esteem by scientists. Among his other writings are: *Tour in Scotland* (1771); *Tours in Wales* (1810); *Arctic Zoology* (1784-87); and *Outlines of the Globe* (1798-1800). Consult: *The Literary Life of the Late Thomas Pennant, Esq., By Himself* (London, 1793); Parkins, *Memoir*, in Rhys's edition of the *Tours in Wales* (1883); and Jardine, *Memoir*, in "The Naturalists' Library," vol. xv.

PENNANT'S MARTEN. See FISHER.

PENNANT-WINGED NIGHTJAR. A nightjar (*Macrodipteryx vexillarius*) of equatorial Africa, in which one of the quill feathers in each wing is greatly elongated and has a vane only near the end. The bird is rare and little known; but has been observed in the daytime seated upon the ground with the two modified wing-feathers held perfectly erect, their feathery tips fluttering among the grass heads, from which they were scarcely to be distinguished. Compare STANDARD-WING.

PENN COLLEGE. A coeducational Friends' college at Oskaloosa, Iowa, founded in 1873, and comprising collegiate and preparatory courses, with departments of biblical instruction and a summer school. It had in 1902 an attendance of 242 collegiate and 124 preparatory students, 15 instructors, and a library of 6000 volumes. The college property was valued at $200,000, and the grounds and buildings at $150,000. The endowment was $100,000, with an income of $15,000.

PENNELL, pĕn'ĕl, JOSEPH (1860—). An American etcher, illustrator, and author, born in Philadelphia. He was a pupil of the Pennsylvania Academy of Fine Arts and the Pennsylvania School of Industrial Arts. He showed the picturesque possibilities of old Philadelphia in a series of clever etchings, and also executed many Italian and several English subjects, such as the "Thames Embankment," and the "Nelson Monument." He is one of the best of American etchers. His work is clean, strong, and intelligent, and is characterized by sharp contrasts of light and shade. He received honorable mentions and medals at Paris, Philadelphia, and Chicago, and a first class gold medal at the Paris Exposition of 1900. Some of the books which he illustrated, and the text for which usually was prepared by his wife, Elizabeth Robins Pennell, include *A Canterbury Pilgrimage* (1885); *An Italian Pilgrimage* (1886); *Our Sentimental Journey through France and Italy* (1888); *Pen Drawing and Pen Draughtsmen* (1889); *Our Journey to the Hebrides* (1889); *To Gipsy Land* (1893); *Modern Illustration* (1895); *The Illustration of Books* (1896); and *The Alhambra* (1896).

PENNI, pĕn'ē, GIANFRANCESCO, called 'Il Fattore' (c.1488-c.1528). An Italian painter, born in Florence. He was one of the favorite pupils and a friend of Raphael, and with Giulio Romano was his legatee and artistic executor. He painted from Raphael's designs in the Loggia of the Farnesina, and the Vatican, completed the "Coronation of the Virgin" for Montelucc, and copied the "Transfiguration" and the "Entombment." Besides these paintings he is said to have worked on the cartoons, and to have executed the "Visitation" in the Madrid Museum, and the "Madonna del Passeggio," in the Bridgewater Gallery, after Raphael's designs. His original work is of little importance.

PENNINE ALPS. See ALPS.

PENNINE CHAIN. A range of hills in Northern England. See GREAT BRITAIN.

PENNSYLVA'NIA (from *Penn* + Neo-Lat. *sylvania*, woodland, from Lat. *silvanus, sylvanus*, relating to a forest, from *silva, sylva*, wood, forest; named in honor of William Penn). A North

Atlantic State of the United States, situated at the apex of the arch formed by the coast States from North Carolina to New England, whence it is popularly called the 'Keystone State.' It lies between 39° 43′ and 42° 15′ north latitude, and between 71° 43′ and 80° 31′ west longitude. It is bounded on the north by New York State, and for about 50 miles in the west by Lake Erie, on the east by New York and New Jersey, on the south by a small part of Delaware and by Maryland and West Virginia, and on the west by West Virginia and Ohio. In shape it forms a rectangle. The north and south boundaries are straight lines running along parallels 157¾ miles apart, except for the small projection of the northwestern corner. The western boundary is a straight line running along the meridian, but the eastern boundary is formed by the Delaware River, which forms two large and regular zigzag bends, making the extreme length of the State 302 miles. The area is 45,215 square miles, of which 44,985 square miles, or 28,790,400 acres, are land surface. The State ranks twenty-ninth in size among the United States.

Topography. Three of the four topographical belts which form the Eastern United States may be recognized in this State, running across its territory from southwest to northeast. The Atlantic coastal plain does not come within the State limits, so that the first of the three belts is the Piedmont Plain (q.v.), which occupies the southeastern portion between the lower course of the Delaware and the Blue or Kittatinny Mountain range. It has a width of about 60 miles, and ascends by gentle undulations from sea-level at the Delaware estuary to an elevation of 500 feet at the base of the mountains. It is broken, however, by several low ridges in the southeast, and farther inland by the interrupted chain of semi-isolated groups of hills known as the South Mountain, which farther north becomes the Highlands of New Jersey and New York. The second belt is the Appalachian Mountain region. It crosses the State toward the northeastern corner as a system of more or less parallel ridges, together from 50 to 80 miles wide. The eastern ridge is the Blue Mountain, known farther north and in New Jersey as the Kittatinny Range. It rises abruptly from the plain to a uniform height of a little over 1000 feet, or about 1500 feet above the level of the sea. It is broken by but few river gaps, notably that of the Susquehanna (which pierces the entire mountain belt), and the Delaware Water-Gap, on the eastern boundary of the State. West of the Blue Mountain there follows a succession of low ridges bearing various names, and intersected here and there by transverse river valleys. They appear almost like waves on the ocean, turning their steep faces southeastward and sloping gently toward the northwest, and they inclose a number of fertile and populous valleys. North of the Susquehanna they pass in the west into irregular masses which merge with the western plateau, but in the southern half the undulating belt is sharply limited on the west by the high and steep face of the Allegheny Range. The western slope of the latter falls gradually toward the plateau, though it is flanked by a few minor ridges, the extreme western outliers of the system, chief among which is Laurel Hill in the southwestern part of the State. The highest point in the State is North Knob, 2684 feet above the sea. The third topographical region is the broad Allegheny Plateau, covering the entire western half of the State. Its horizon has an elevation of 1000 to 2000 feet, sloping gently to the south and west. But it has been reduced by erosion to a complicated hill-country, or rather valley-country, being intersected in all directions by river-valleys, some broad and open, others narrow, with abrupt slopes 500 to 800 feet deep. The line of 1000 feet elevation is only two to five miles from the shore of Lake Erie, so that there is here no lake-shore plain.

Hydrography. The three chief river systems are, in the order of their drainage areas, the Susquehanna, the Ohio, and the Delaware. These together drain over 90 per cent. of the State. An insignificant area in the south belongs to the Potomac system, and in the north to the Genesee, while the extreme northwestern corner is drained by short streams flowing into Lake Erie. The Delaware, which is navigable for the largest ships to Philadelphia, and for small steamers some distance above, drains the eastern slope through its right tributaries, chief of which are the Lehigh and the Schuylkill. The Susquehanna traverses the State in a large zigzag from north to south, receiving its two main tributaries, the West Branch and the Juniata, from the west. It is broad, but shallow and unnavigable. The western part of the State is drained by the Ohio and its two great headstreams, the Allegheny and Monongahela, both of which are navigable for some distance above their junction at Pittsburg.

Climate. The climate in the southeastern part along the Delaware is much warmer, both in summer and in winter, than in the western upland. The mean temperature for January at Philadelphia is 32.3°, and for July 76.2°. The corresponding figures for Wilkesbarre, among the mountains, are 27° and 72°; for Pittsburg, 31° and 75°; and for Erie, on the lake shore, 27° and 70°. The summer heat south of the Blue Mountain has been as high as 107°, and is prolonged far into autumn. Northwest of the mountains the snow sometimes lies several feet deep throughout the winter, and the temperature may fall to 28° below zero. The average annual rainfall for the State is 44.6 inches. It is evenly distributed both as to season and through the larger regions of the State, though it may range from 35 to 50 inches in isolated localities.

Soil and Vegetation. The soils are on the whole somewhat more fertile than those of the average Atlantic State, there being no Tertiary sand area, and comparatively small areas of primary rocks. The soil is to a large extent decomposed limestone material, which is a good grain soil, and, where least fertile, is well suited for pasturage. Pennsylvania was originally one of the most densely forested States, and there are still considerable forest areas on the western plateau. The predominating trees on the lowlands are white oak, hickory, chestnut, walnut, and cherry; on the higher ground are the white pine, hemlock, pitch pine, maple, beech, and black and yellow birch; and on the mountains above 1800 feet the black and red spruce, balsam fir, and larch predominate. On the western plateau the forests are mostly deciduous, with chestnut and oak abundant, and in the southwest the common trees of the State mingle with those characteristic of Kentucky, such as the honey locust and Kentucky coffee tree. The sugar-maple is

still one of the most common trees all over the State.

For FAUNA see this section under UNITED STATES.

GEOLOGY. The great Archæan belt which forms the entire eastern flank of the Appalachian system from Alabama to Canada crosses the southeastern corner of the State in a band about 50 miles wide and consisting chiefly of gneisses with tracts of serpentine. It is exposed in two sections, one ending in a point near Trenton, and broadening southwestward along the Delaware, forming the hills near Philadelphia, the other running southwest from the confluence of the Lehigh River with the Delaware, and forming the South Mountain chain. Between these two outcrops the Archæan belt is crossed by a band of Triassic red sandstone, which runs northeastward and extends across New Jersey. Both this and the Archæan belts are crossed by numerous dikes of trap-rock. Against the western flank of the South Mountain rests the lowest stratum of the great Paleozoic series which covers the entire remainder of the State as well as the whole of the Ohio and Upper Mississippi Valley. On the western plateau these strata lie nearly horizontal, but in the Appalachian uplift they are much tilted, folded, and broken, so that they outcrop in narrow successive bands. Here the hard sandstone strata generally form the ridges, while the softer limestone forms the valley floors. The series begins with a narrow belt of Cambrian running along the edge of the Archæan outcrop. West of this, between the South and the Blue or Kittatinny Mountains, the Kittatinny Valley runs across the State as a belt of Lower Silurian limestone, from which rise the Appalachian ridges of Devonian rocks, with some belts of Silurian. The great Devonian area of southwestern New York extends across the whole length of the boundary, and is especially prominent in the northeastern part of the State. It is overlaid with Carboniferous strata, which, with the exception of the Triassic belt in the east, is the most recent formation in the State, and covers the entire southwestern and west central regions, with isolated patches east of the Susquehanna.

MINERAL RESOURCES. In these isolated Carboniferous areas in the Appalachian valleys the coal seams were subjected to metamorphosis by the folding and crushing action of the older strata during the great upheaval, and were changed into invaluable beds of anthracite, while on the western plateau, where the strata were undisturbed, they remained in the bituminous form. The underlying Devonian sandstone strata in the west are heavily charged with petroleum and natural gas. Iron is found as brown hematite in the Silurian slates in the region of the Lehigh River, and as magnetite in the metamorphic rocks, while it is also imbedded with the Carboniferous strata. Other minerals found are zinc, cobalt, nickel, lead, copper, tin, chrome iron, salt, and soapstone. White marble is quarried in the Silurian limestone beds, and building stone, such as the trap and red sandstone in the east, is abundant.

MINING. No State in the Union compares with Pennsylvania as to mining. Its mineral wealth has been in a large measure the basis of its diversified and highly developed industrial life. The annual output of coal alone exceeds in value the total mineral product of any other State, and has annually, since 1880, been equal in amount to that of all the coal mined in the other States. Anthracite has been mined continuously since 1820. The demand and the output rapidly increased, particularly after 1840, when it came into use for smelting iron ore. The annual output of anthracite coal much more than doubled in both bulk and value from 1880 to 1901. The amount in short tons for 1880 was 28,649,811; for 1890, 46,468,641; and for 1901, 67,471,667, the value for the year 1901 being $112,504,020. The anthracite coal fields of Pennsylvania yield almost the entire product for the United States, and represent the only high-grade anthracite producing region in the world. These mining districts fall principally into three sections in the northeastern part of the State—the Northern Field, in the Wyoming and Lackawanna valleys, the Middle or Lehigh and Mahonoy Fields, and the Southern or Schuylkill Field. The bituminous coal is mined chiefly in six parallel valleys west of the Allegheny slope, in the southwestern corner of the State. It was not until about 1875 that bituminous coal began to be extensively used in iron-smelting, but since then it has far exceeded anthracite in annual tonnage. The tonnage increased from 19,416,171 short tons in 1880 to 82,305,496 in 1901, the value for the latter year being $81,397,586. In 1900 there were 92,692 employees engaged in coal-mining.

Pennsylvania has always ranked first in the production of coke, usually yielding about two-thirds of the total for the United States. The yield increased from 2,821,384 tons in 1880 to 8,560,245 in 1890 and to over 13,000,000 tons in 1900. The coal used requires little or no preparation before charging into the ovens, and the greater part of it is unwashed run-of-mine. Nearly three-fourths of the total product of coke is made in the Connellsville district.

The utilization of petroleum in the United States began in Pennsylvania in 1859. The output increased almost constantly until 1882, when the yield was 30,053,500 barrels. This figure was not exceeded until 1891, when the output was 33,009,236 barrels. The yield has since fallen off over half, being 12,625,378 barrels in 1901, valued at $15,430,609. Prior to about 1885 Pennsylvania produced almost the whole product for the United States, and up to 1900 had produced 60 per cent. of the total output for the country. However, since 1894 Ohio has annually outranked Pennsylvania, and it was also outranked by West Virginia in 1900. The first oil pipe lines were laid in 1865, and have been extended until they reach numerous distant points. Natural gas became prominent as a fuel in Pennsylvania earlier than in other gas States, and its annual sales of gas exceed those of any other State. Gas came into general use from 1880 to 1885, reaching its climax in 1888, in which year the sales amounted to $19,282,375. As the supply in certain regions became exhausted, the receipts decreased to less than $6,000,000 in 1895 and 1896; but the growing scarcity has resulted in a considerable rise in price, and this fact has largely been responsible for a recent gain in receipts, which amounted in 1900 to $12,688,161.

Iron mining began early in the colonial period, and until 1850 the local product supplied the iron furnaces of the State with all the raw material required. And though the greater part of

the iron used in the latter part of the nineteenth century came from outside regions—especially the Lake Superior mines—the output within the State has not decreased, and Pennsylvania takes fourth rank among the iron-mining States. The yield in 1901 amounted to nearly 1,040,684 long tons, valued at $1,890,100. Over 771,000 tons were of the magnetite variety, for which the Cornwall hills, near Lebanon, are noted. Brown and red hematites and a small quantity of carbonate are also mined.

Pennsylvania is without a rival in the stone-quarrying industry. The values of the product in 1901 for limestone, slate, and marble, respectively, were $5,081,387, $2,984,264, and $157,547, each figure being larger than the corresponding one for any preceding year. The production of slate is about two-thirds that for the whole country. Pennsylvania also ranks first in the amount of limestone quarried. About two-fifths of the limestone is used for flux, and a somewhat less amount is burned into lime. The value of the granite for the same year was $396,271, but from year to year the value of the output fluctuates greatly. The value of sandstone has recently increased enormously, being put in 1901 (including bluestone) at $2,063,082, and giving the State second rank. Pennsylvania stands second in the value of its clay products and first in the output of brick, the value of which in 1900 was $12,000,875. The State produces in value over half the total product of Portland cement for the United States. This industry is rapidly developing, the value of the product having increased from $3,142,711 in 1898 to nearly $6,382,350 in 1901. Some rock cement is also produced. Other products worthy of note are metallic paint, mineral water, salt, and ochre.

Agriculture. Farming is carried on more or less extensively in all sections, there being many arable and fertile valleys, even in the more mountainous regions. Districts too hilly to be readily cultivated are admirably adapted for grazing. In the southeastern counties the soil is an exceedingly rich loam, and agriculture is highly developed. About 67 per cent. of the area of the State is included in farms, and of this 68 per cent. is improved. The area of improved land increased rapidly until 1880, since when it has not materially changed. The average size of farms decreased in each decade between 1850 and 1900, being reduced from 117 acres in 1850 to 86.4 in 1900. Seventy-four per cent. of the farms are operated by owners. Pennsylvania leads the Atlantic States in the production of cereals. It yields considerably over twice as much corn and about three times as much wheat as New York. The acreage for each of these in 1900 exceeded that in 1880 and in 1890. Oats, which are only a little less important, decreased slightly in acreage during the same period. Oats are grown most extensively in the eastern section, and corn and wheat in the southeastern. The State leads in the production of rye, and is exceeded by New York alone in the area of buckwheat, having over a third of the total acreage for the United States. The acreage of hay is greatly exceeded in New York and slightly in two or three Western States. Potatoes form one of the chief money crops. Other varieties of vegetables are also abundantly grown, particularly sweet corn and cabbage, the acreages separately reported in 1900 being respectively 12,879 and 10,851. Tobacco is a very important crop in Lancaster and York counties. Pennsylvania is a large producer of orchard fruits. Between 1890 and 1900 the number of trees increased 59.4 per cent., the increase in the peach trees being particularly noteworthy. Of the total number of trees, 11,774,211, or 66 per cent., were apple. Grapes and small fruits are grown in considerable quantities, and floriculture is extensively carried on.

The following table shows the acreages of the leading farm crops:

	1900	1890
Hay	3,269,441	3,323,689
Corn	1,480,833	1,252,399
Wheat	1,514,043	1,318,472
Oats	1,173,847	1,310,197
Rye	310,048	336,041
Buckwheat	249,840	210,488
Potatoes	227,867	291,992
Tobacco	27,760	26,655

Stock-Raising. The adaptability of the State for grazing has resulted in an extensive dairying industry. In every decade between 1850 and 1900 there was an increase in the number of dairy cows. Only three other States have a larger number, and in only one is the value of the product as great. The yield of milk in 1900 was 32 per cent. greater than in 1890. In 1900 $17,274,430 was received from the sale of milk, and $9,466,575 from the sale of butter. There was a large gain between 1890 and 1900 in the number of 'other neat cattle,' and of mules and asses, but a decrease in horses, swine, and particularly sheep. The annual income from poultry products is important. The following table of live-stock holdings is self-explanatory:

	1900	1890
Dairy cows	943,773	927,251
Other cattle	953,074	779,164
Horses	590,981	618,660
Mules and asses	38,635	29,563
Sheep	959,483	1,612,107
Swine	1,107,981	1,278,029

Manufactures. Between 1850 and 1900 Pennsylvania ranked second as a manufacturing State. In the development of the factory system proper as indicated by the amount of power used it easily ranks first. The per cent. of the wage-earning population increased from 6.3 in 1850 to 11.6 in 1900. Between 1890 and 1900 this increase amounted to 28.7 per cent. The value of manufactured products for 1900 was $1,834,790,860. Pennsylvania has the advantage of navigation on the ocean, Great Lakes, and the Mississippi River. The Mississippi system was of great moment in the early period of development, enabling Pennsylvania to supply the frontier with manufactured products, while the Lake system more recently played a similar important part in rendering accessible vast resources of raw materials. An important network of canals and canalized rivers also figured early, and an elaborate system of railways figured in the later period. Furthermore, the manufacturing interests have been carefully fostered by a number of societies, which owe much to the activities and inspiration of one man, Benjamin Franklin.

No other industry has contributed so greatly to the reputation of the State as that of iron and steel. Although it developed earlier in other

colonies, it was spoken of as 'most advanced' in Pennsylvania as early as 1756. In 1900 it furnished 54 per cent. of the total product for the United States. The localization of the industry is determined by the accessibility to ore and fuel, and consequently until about 1850 the industry was most extensive in the eastern anthracite coal and iron ore district. (Charcoal, however, had been universally used prior to 1840.) Since then the Pittsburg district, in the western part, has far surpassed the eastern district. This change is coincident with the substitution of bituminous coal and coke and natural gas for anthracite coal, and with the development of the Lake Superior ore region. The pig iron produced in 1900 by the use of bituminous coal and coke amounted to 76 per cent. of the total for the State. The ore used in this part of the State comes from the Lake Superior district, having the advantage of cheap water transportation. From 1890 to 1900 the increase in iron and steel was 64.2 per cent. Although the industry is largely centered in the towns of Allegheny County, it is important in almost every large town. The manufacture of Bessemer steel began in 1867. Within the last two decades, however, the Bessemer process has been largely supplanted by the open-hearth process.

In foundry and machine-shop products the State ranks first. For instance, it made in 1900 more than one-half the total number of steam locomotives made in the United States. Since 1845 locomotives of Pennsylvania make have been shipped in constantly increasing numbers

INDUSTRIES	Year	Number of establishments	Average number wage-earners	Value of products, including custom work and repairing
Total for selected industries for State	1900	15,665	478,780	$1,291,000,950
	1890	12,613	381,760	935,303,641

	1890	72	2,951	7,858,299

to other countries. Also important is the production of iron and steel pipe and electrical apparatus and supplies, the latter industry having grown up almost entirely since 1890. The same advantages, together with the large railroad interests of Pennsylvania, have led to the most extensive car-construction and general shop works of steam railroad companies of any State. Altoona, Reading, and Philadelphia are the chief centres of this industry.

An entirely different group of industries, less dependent upon the material resources of the State, is the manufacture of textiles, in which the State takes second rank. Philadelphia, the principal seat of the industry, is the largest textile centre in the country. In 1900 the silk product amounted to 29 per cent. of the total for the United States, and the State was exceeded only by New Jersey. In recent years the operations are confined largely to 'throwing,' the thrown silk being sent to other States to be woven into cloth. Pennsylvania ranks second in the manufacture of woolen goods and hosiery. Both industries were begun at an early period, the former having been introduced by the English and the latter by the German settlers. A lower rank is held in the manufacture of worsteds and cottons. In 1900 Pennsylvania manufactured 48 per cent. of the total carpet product of the United States. More ingrain carpets are probably made in Philadelphia than in any other city in the world.

The agricultural resources supply materials for the flour and grist milling, slaughtering, and butter-making industries, and the manufacture of liquor and tobacco products. Prior to the Whisky Rebellion in western Pennsylvania large quantities of distilled liquors were made in that part of the State, but more recently the product is mainly malt liquors, in the output of which the State took second rank in 1900. The tobacco products are mainly cigars and cigarettes, the State ranking second also in this industry. The large tanning business, in which Pennsylvania stands first, with 27.3 per cent. of the total product for the United States, is due to the large quantities of hemlock bark attainable from the large forests of this tree. The manufacture of glass is a long established industry. The utilization of natural gas in the western part of the State gave great impetus to its manufacture. In 1900 the product amounted to 38.9 per cent. of the total for the country. The resources of petroleum have given the State first rank in the refining of oil. Pennsylvania has always held an important rank in the printing and publishing business. Other important industries are sugar and molasses refining, and the manufacture of chemicals. The preceding table shows the relative importance of the leading industries. It will be seen that the per cent. of increase for the value of products is more than twice as great as the per cent. of increase for the number of establishments. Among the industries showing the greatest tendency toward centralization are those connected with the production of iron and steel, coke, and leather.

Forests and Forest Products. Pennsylvania has always been one of the leading States in the lumber industry. In 1900 three of the lake States exceeded it in the value of lumber products, but for more than half a century Pennsylvania had taken a higher rank, being first in 1860. The figure in 1900, however, exceeded that of any previous census year. The manufacture of wood pulp is growing in importance, as shown in the table above, but the planing-mill industry scarcely holds its own. The woodland has been reduced (1900) to about 23,000 square miles, or 51 per cent. of the total area, and the merchantable timber has been removed from a large part of the region specified as woodland. The hemlock is the most abundant merchantable species and the one most extensively drawn upon at present. The white pine is next in importance. Hard woods are common in the southeast corner of the State.

Transportation and Commerce. Pennsylvania is exceeded in railroad mileage by only one other State. There was an increase from 2598 miles in 1860 to 8638 miles in 1890 and 10,310 miles in 1900. For the fiscal year ending in 1900 the number of passengers carried was 216,603,748 and the receipts per passenger per mile averaged 1.852 cents. During the same year there were 478,684,683 tons of freight carried, for which the receipts per ton per mile averaged .6 of a cent. A large number of the smaller lines have fallen into the hands of the Pennsylvania Railroad, which operates 2912 miles in the State.

Other important roads are the Philadelphia and Reading; the Lehigh Valley; the Pittsburg, Cincinnati, Chicago and Saint Louis; the Baltimore and Ohio; the Erie; the Philadelphia, Wilmington and Baltimore; the Delaware, Lackawanna and Western; the Western New York and Pennsylvania; and the Pittsburg, Fort Wayne and Chicago. The canal and slack-water navigation facilities are mostly controlled by railroad and coal-mining corporations. The State expended large sums in canal construction, but the rapid extension of the railroad system has caused many such waterways to be abandoned.

Philadelphia and Erie are the ports of entry, and control a considerable amount of foreign commerce. Philadelphia ranks third among the Atlantic Coast ports in the value of its foreign trade. Erie has one of the best harbors on Lake Erie, and carries on a large import trade in Michigan iron and Canadian lumber, and exports large quantities of coal. Pittsburg also, at the eastern head of navigation on the Western rivers, has an immense inland trade, while its local shipyards build large numbers of steamboats for use on the Western streams.

Banks. The Bank of North America, originally chartered by Congress in 1781, was the first bank in Pennsylvania, where it obtained a charter in 1782. In 1793 the Bank of Pennsylvania was incorporated as the official agent of the State, which was heavily interested in it. A few other banks were chartered by individual acts of the Legislature. In 1814 there were six banks, and the State owned stock in the most important ones. In 1814 the State policy toward the banking business underwent a radical change. The Commonwealth was divided into twenty-seven banking districts, each of which was allotted a definite number of banks. Unincorporated banking was prohibited and a comprehensive banking law passed. This could not avert the injurious results of the speculative inflation, and in 1816 many banks had to suspend specie payments. Banking became the object of popular disfavor and was held responsible for the critical times. A law

was passed in 1819 providing for forfeiture of charter in case of suspension of specie payments, and it somewhat reduced the number of banks. The period of extensive internal improvements that followed stimulated the banking business as well as all other business of the State, and for ten years the banks were exceptionally prosperous. In 1836 the second United States Bank, at the expiration of its national charter, became a Pennsylvania State institution, paying heavily for the privilege. The crisis of 1837 again caused a suspension of specie payment, and in 1840 after a hard struggle the United States Bank failed, ruined by its heavy investments in the State improvements and its heavy contributions to the State treasury. This failure, together with financial difficulties of the State treasury between 1840 and 1845, was felt by the other banks, and the stocks of most of them were sold far below par. Efforts were made to correct this by special legislation, by the levying of a tax on banking stock below par, and by making specie payments obligatory; but this last provision was frequently suspended by necessity. A slight improvement between 1850 and 1855 was followed by the severe crisis of 1857, when several Pennsylvania banks failed and a general suspension followed.

An agitation for a free banking system, with guaranteed circulation, was started, and in 1860 a free banking act was passed which was very similar to the New York Banking Law of 1837, but before the value of this act could be tested the national banking system came into existence. There was a marked demand for the national charters, which were supposed to exempt the banks from State taxation. By 1868 only 12 State banks remained, as against 198 national banks. In 1870-73 more than 90 State banks were chartered by special acts, but the Constitution of 1874 prohibited the organization of banks, except under the general law. At present State banking is regulated by the law of 1876 as amended in 1891, when a Banking Department was established. National banks remain by far the more important ones. Trust companies are conducted mostly in conjunction with the banks, and take care of business which the law prohibits the banks from doing. Savings banks have existed in Pennsylvania for almost a century. The first savings bank was chartered in 1819. Before the Civil War there were 14 of them. A general law for their regulation, strictly limiting their avenues for investment, was passed in 1889. A clearing house was established in Philadelphia in 1858, or five years later than the one in New York. The condition of the banks in 1902 is shown as follows:

	National Banks	State Banks	Trust Companies	Private Banks	Savings Banks
Number	550	105	158	23	13
Capital	$68,501,000	$9,460,000	$22,797,000	$920,000	
Surplus	70,455,000	8,990,000	36,829,000	361,000	$8,294,000
Cash, etc	51,394,000	2,779,000	7,758,000	445,000	2,453,000
Deposits	453,710,000	100,165,000	259,327,000	7,424,000	120,441,000
Loans	447,736,000			6,630,000	

There were 396,877 depositors in the savings banks and the average deposits amounted to $303.

Constitution and Government. The State Government was organized in 1776. The convention, of which Benjamin Franklin was president, signed the State Constitution September 28th of that year. In 1790 a new Constitution, of a more democratic cast, was adopted. The Constitution, as amended in 1838, vested the legislative power in a General Assembly, consisting of a Senate and a House of Representatives. An amendment to the Constitution, adopted in 1850, made the judiciary elective. An amended Constitution was adopted in 1873, by a popular vote of 253,744 against 108,594, and went into force January 1, 1874. If a proposed amendment receives a majority vote of both Houses at two successive regular sessions, it will be submitted to the people, and if approved by a majority of those voting, it becomes a part of the Constitution. No amendments can be submitted oftener than once in five years. A voter must have been a citizen of the United States one month, a resident of the State one year, and of the election district two months, and have paid State or county taxes. No elector can be deprived of the privilege of voting because he has not registered. The general election is held annually on the Tuesday next following the first Monday in November. The State has thirty-two members in the National House of Representatives.

Legislative. The Senate is limited to 50 members chosen for four years, and the House to a varying number, apportioned after each Federal census, chosen for two years. No city or county is entitled to more than one-sixth the whole number of Senators. Sessions are biennial, on the first Tuesday of January, without time limit. The Governor is empowered to call extra sessions for urgent business, and required to do so in case of a vacancy in the office of a United States Senator occurring during the recess. No bill can contain more than one subject, and revenue bills must originate in the Lower House. The power of impeachment rests with the Lower House, the trial of impeachment with the Senate.

Executive. The executive department consists of a Governor and a Lieutenant-Governor, both elected for four years, and a Secretary of Internal Affairs, an Auditor-General, elected for three years, and a Treasurer, elected for two years, an Attorney-General, a Secretary of the Commonwealth, and a Superintendent of Public Instruction, appointed for four years by the Governor, with the consent of two-thirds of the Senators. The Governor is not eligible for two consecutive terms. He is empowered to commute sentences and grant pardons within clearly defined limits, and vested, besides the ordinary veto powers, with the prerogative of a partial veto on appropriation bills. The department of the Secretary of Internal Affairs embraces a bureau of industrial statistics, and maintains the supervision of corporations, charitable institutions, and the agricultural, mineral, timber, and other interests of the State. The Lieutenant-Governor and the president pro tempore of the Senate are in the line of succession to the Governorship in case of vacancy.

JUDICIARY. The judiciary embraces a Supreme Court, consisting of seven judges, elected by the people for 21 years, ineligible for reëlection, with the judge the oldest in commission as Chief Justice. The court holds annual sessions at Philadelphia, Harrisburg, Sunbury, and Pittsburg. Other courts are a Superior Court, courts of common pleas, of oyer and terminer and general jail delivery, of quarter sessions of the peace, magistrates' and orphans' courts. Judges of the Supreme Court, and those of the Common Pleas, are justices of oyer and terminer and general jail delivery in the respective counties; the latter discharge also the functions of judges of quarter sessions of the peace and of orphans' courts in districts where special provision for them has not been made. Criminal matters of the respective districts belong likewise to their cognizance. There are 51 judicial districts in the State, in each of which the people elect one or more common pleas judges for ten years.

LOCAL GOVERNMENT. The creation of new or alteration of old counties is conditioned on a minimum population limit of 20,000 and a minimum area limit of 400 square miles for all counties affected. Each county elects sheriffs, coroners, prothonotaries, register of wills, recorder of deeds, treasurer, surveyor, clerk, three auditors, and three commissioners, all for three years. Towns of over 10,000 may be chartered upon the approval of one-half the electors. The State has classified the cities for charter purposes into four classes.

FINANCES. The first direct State tax was levied in 1785, but was discontinued in 1789. Taxes were very unpopular and the State expected to cover its expenditures by income from public property, sale of public lands, etc. Some taxes were introduced in the beginning of the nineteenth century, but in 1810 the revenue from them amounted only to 20 per cent. of the total receipts. In 1825 there were no direct State taxes. About this time the construction of public improvements, which had been going on in a quiet way since 1789, became the cry of the day. Loans were the only available source of necessary means. In 1821 the public debt incurred during the War of 1812 amounted only to $1,230,000, but new loans followed one another in great rapidity. Canals, roads, bridges, and railroads were built. Between 1789 and 1828 more than $22,000,000 was spent on these improvements. In 1834 the system of canals and railroads to connect Pittsburg and Philadelphia was completed at the cost of more than $14,500,000, and lateral canals were added in 1838 at the cost of almost $6,500,000. The large sum (more than $12,000,000) which the United States Bank furnished in 1837, partly as a bonus and partly as a loan to the State, in exchange for a State charter, further stimulated this feverish activity. The State debt was $24,500,000 in 1835 and in 1842 reached $40,000,000. Expecting large returns from these improvements, the State did not provide a thorough system of taxation. Interest had to be paid by means of further loans. The credit of the Commonwealth was therefore so much impaired in 1840 that failure was threatening. The income from the improvements did not even cover their expenses, and a law was passed in 1840 imposing small taxes on banks, personal property, and salaries. The revenue from this law did not cover even a tenth part of the expenditures, and the interest on the bonds continued to be paid by issue of special bonds. In 1844 a radical change was made in the financial system. A comprehensive tax was imposed upon all property, stocks, incomes, etc., and cash payment of interest was resumed the next year. For 15 years the debt remained on the same level; the State was not able to cancel any of its obligations and kept on refunding the maturing bonds. In 1857 and 1858 the State works, which were built at the expense of over $75,000,000, were sold for $11,000,000 to the Pennsylvania Railroad Company and Sunbury and Erie Railroad Company, and a gradual reduction of the State debt dates from that time.

In 1860 the debt decreased to $38,000,000, but the military loan of 1861 increased it by $3,000,000. A steady decline came after the war. In 1870 the debt was $28,980,071; in 1880, $21,561,990; in 1890, $12,349,920; and from 1895 to 1902 it remained $6,815,299. In 1902 bonds to the amount of $2,008,650 were bought at a nigh premium by the sinking fund and the debt was reduced to $4,806,649, against which the sinking fund had $4,432,023. These results were only possible by vigorous taxation. The law of 1844 taxed all property, but real estate was released from State taxation in 1867. The income tax survives, but contributes a trifling sum. The taxes on personal property and inheritances are productive of more revenue. The main sources, however, are the taxes on corporation stocks and receipts and various licenses, Pennsylvania having introduced the high-license principle.

During the fiscal year 1901-02 the receipts were $22,947,890 and expenditures $17,787,106. Discounting the operations of the sinking fund, the receipts were $19,374,093, and the expenditures $15,210,793. The cash balance in the sinking fund was $3,717,440, and in the general fund $9,151,366. Of the expenditures more than 50 per cent. was for schools and 17 per cent. for charitable institutions.

MILITIA. In 1900 there were 1,405,916 men of militia age. The number of the militia in 1901 was 9343.

POPULATION. The following figures show the growth of the population: 1790, 434,373; 1820, 1,047,507; 1850, 2,311,786; 1860, 2,906,215; 1870, 3,521,951; 1880, 4,282,891; 1890, 5,258,014; 1900, 6,302,115. The State has nearly always ranked second in population. The absolute increase in each decade has been greater than that of the decade preceding. The per cent. of the increase between 1890 and 1900 was 19.9, as compared with 20.7 for the United States. The State ranks second in the number of foreign born, with a total of 985,250. This element is not so greatly centralized in the large cities as in some of the other Eastern States, being found in large numbers in the mining districts. The Irish, Germans, and English are the most numerous; but there are, besides, a larger number of Welsh and natives of Hungary than in any other State. In 1900 the negroes numbered 156,845. Of the total population 51 per cent. is urban—i.e. they live in places which contain over 4,000 inhabitants, there being, in 1900, 119 such places, or more than in any other State. The average number of inhabitants to the square mile in 1900 was 140.1.

CITIES. The population of the 18 largest cities in 1900 was as follows: Philadelphia, 1,293,697; Pittsburg, 321,616; Allegheny, 129,896;

Scranton, 102,026; Reading, 78,961; Erie, 52,733; Wilkesbarre, 51,721; Harrisburg, the capital, 50,167; Lancaster, 41,459; Altoona, 38,973; Allentown, 35,416; Johnstown, 35,936; McKeesport, 34,227; Chester, 33,988; York, 33,708; Williamsport, 28,757; Newcastle, 28,339; Easton, 25,238.

RELIGION. The Roman Catholics form over one-eighth of the population. The principal Protestant denominations are the Methodist, Presbyterian, and Lutheran, each with over one-sixth of the total number of church members. Then follow in order the Baptists, the Protestant Episcopalians, the Disciples of Christ, and the Congregationalists.

EDUCATION. The first settlers of Pennsylvania, the Swedes and the Dutch, usually relegated the matter of education to the ministers. William Penn, in his Frame of Government, provided that the "Governor and Provincial Council shall erect and order all public schools" and "that the children within this province of the age of 12 years shall be taught some useful trade or skill." This provision was subsequently strengthened by the clause in the second Frame, adopted by the second Assembly in 1683, which provided for compulsory instruction in reading and writing, as well as in some manual trade. With the passing of the control of the colony from the hands of the Quakers, education received very little attention from the Legislature. It was left entirely to the Church and private initiative during the first three quarters of the eighteenth century. Private schools were meanwhile being established all over the province, and the agitation for a higher educational institution in Philadelphia, carried on by Benjamin Franklin, resulted in the foundation of the Academy and Charitable School of the Province of Pennsylvania (now University of Pennsylvania) in 1749. The first free public schools in Pennsylvania were opened by the settlers from Connecticut in 1769. The provisional Constitution of 1776 provided for the establishment of a school in each county, but it was only in 1834 that a free school system was successfully established.

The public school system is under the supervision of a State Superintendent, appointed by the Governor. The county superintendents are elected by the school directors, and the latter are elected by the people. Pennsylvania has no permanent school fund, the school revenue being obtained principally from local taxations and State appropriations. School attendance is compulsory between the ages of 8 and 16, and text books are free. In 1900 Pennsylvania had illiterates amounting to 6.1 per cent. of the total population of 10 years of age and over, being 2.1 per cent. for the native white population, 19.9 per cent. of the foreign white, and 15.3 per cent for the colored population. Of the school population 68.22 per cent. were enrolled in the public schools in 1901. The number of public schools in the same year was 29,046, including 16,625 graded, and the average attendance was 847,445, or about 73 per cent. of the total enrollment. In the same year there were employed in the public schools 30,044 teachers, of whom the male teachers formed 30.6 per cent., as against 45.5 in 1880. The average monthly salaries were $44.14 for male and $38.23 for female teachers, being considerably below the salaries paid in most of the North Atlantic States. Also the length of the school term was 165.6 days in 1901, as compared with an average of 177.2 days for the entire North Atlantic division. An attempt to solve the rural school problem by centralization has so far been attended with little success, owing to the poor condition of the roads. Pennsylvania suffers in common with other States in the low professional standing of the teachers, especially in the rural districts. For normal education the State maintains thirteen normal schools, which had a total attendance of 7987 in 1901, including 4664 female students. In that year the school revenue amounted to $26,159,774, consisting of $5,250,000 derived from State taxes, $15,482,898 from local taxes, and $5,426,876 from other sources. The expenditure amounted in the same year to $22,813,395, or $26.92 per pupil in average attendance. The 391 public schools had a total attendance of 32,438 in 1901. In the same year there were in the State 137 private high schools and academies, with a total attendance of 11,236. Commercial and professional education is provided by numerous commercial colleges, schools of law, medicine, dentistry, etc., and theological seminaries.

The principal institutions of higher education, besides the University of Pennsylvania, are the Western University of Pennsylvania (non-sectarian), at Allegheny; Lafayette College (Presbyterian), at Easton; Lehigh University (nonsectarian), at South Bethlehem; Bucknell University (Baptist), at Lewisburg; Dickinson College (Methodist Episcopal), at Carlisle; Haverford College (Friends), at Haverford; Swarthmore College (Friends), at Swarthmore; Pennsylvania State College, at State College; and Washington and Jefferson College (Presbyterian), at Washington. The principal college for women is Bryn Mawr (q.v.).

CHARITABLE AND PENAL INSTITUTIONS. The State maintains hospitals for the insane at Harrisburg, Danville, Norristown, Warren, Dixmont, and Warrensville, which together with the State aided asylums contained 7411 inmates on September 30, 1900. On the same date the hospitals for the sick and wounded, and homes for children, etc., held a population of 21,665. The four institutions for the deaf contained 408 persons, the two blind asylums 271, and the two institutions for feebleminded 1655. The almshouses for that date had a population of 12,168. The State maintains a soldiers' and sailors' home at Erie. There are State penitentiaries located at Philadelphia and at Allegheny, a House of Correction at Philadelphia, a Workhouse in Allegheny County, a House of Refuge at Philadelphia, a Reform School at Morganza, and an Industrial Reformatory at Huntingdon; the aggregate population of these institutions together with the 3493 inmates of county jails was, in 1900, 9108. The aggregate for all classes remaining in institutions September 30, 1900, was 41,908. Besides those, about 40,800 had received public outdoor relief during the year. The total public expenditure incurred for all the foregoing was $16,050,406. The foremost Indian training school in the country is maintained by the National Government at Carlisle.

HISTORY. Henry Hudson in the *Half Moon* anchored in Delaware Bay, August 28, 1609, and founded the Dutch claim to the bay and river, though he did not land. After 1614 exploring parties were sent out and trading posts founded on the eastern side of the river. Gustavus Adolphus, of Sweden, planned to found a colony in

America, and under his daughter, Queen Christina, Peter Minuit, formerly Governor of New Netherland, built Fort Christina within the present limits of Delaware, in 1638, and began to trade with the Indians. John Printz arrived with other colonists in 1643, and built New Gottenburg on Tinicum Island, the first settlement within the present limits of Pennsylvania. The Dutch looked with jealousy upon these and other Swedish settlements afterwards founded, and to offset the advance made by the Swedes, built Fort Casimir, at the site of the present town of New Castle, Del. This was captured by the Swedes in 1654; but in September, 1655, Governor Stuyvesant, of New Netherland, appeared in the bay with seven vessels and overthrew the Swedish authority. The city of Amsterdam had furnished much of the money for this conquest, and in return the southern settlements were assigned to that city under the name of New Amstel. The 'Company' colony was left in charge of Governor Stuyvesant, but in 1663 the two were reunited. When the Duke of York took possession of New Netherland in 1664 the settlements on the Delaware were included and remained attached to New York until 1682. On March 4, 1681, William Penn (q.v.), in return for a debt of £16,000, owed to his father by Charles II., secured a grant of the territory west of the Delaware River between 40° and 43°, extending to the west five degrees, at an annual rent of two beaver skins and one-fifth of the gold and silver ore discovered in the region. As New Castle was supposed to be on or near the 40th degree, the eastern boundary was to begin where a circle, having its centre at that settlement, twelve miles in radius, intersected the Delaware River and the southern boundary at the point where that circle intersected the 40th degree. Full feudal rights, both to the soil and to the government, were granted. On December 6, 1682, Penn secured from the Duke of York the grant of the soil of the lower settlements, and by consent assumed governmental rights. These settlements were within the original Maryland patent, but Lord Baltimore complained in vain. They remained attached to Pennsylvania, though with separate legislatures after 1703, until the Revolution, under the names 'the Lower Counties' or 'the Territories.' The southern boundary caused much trouble later. When it was found that the 40th degree was north of the present site of Philadelphia, the ingenious theory was announced that the beginning of the 40th degree was at 39°. The matter was finally settled by a compromise in 1760 (see MASON AND DIXON'S LINE), when also the northern boundary was fixed at 42°.

Upon receiving the grant Penn sent over his kinsman, William Markham (q.v.), as Deputy Governor, and followed himself in 1682, arriving at Uplands (now Chester) October 27th. A few days later he concluded a treaty with the Indians, though the purchase of the lands could not have taken place until later. The 'Frame of Government' previously published in England was submitted to the first General Assembly in December, 1682, and was adopted together with the 'great law,' made up largely of the suggestions of the Proprietor. Universal suffrage and entire religious toleration made the scheme notable. Settlers came over in great numbers, chiefly Quakers and Germans from the Palatinate. Philadelphia, which had been planned before Penn left England, grew rapidly, and before 1683 contained more than five hundred inhabitants, while more than 3000 settlers had come to the province. Land was offered at forty shillings the hundred acres, subject to a quit rent of a shilling a year. Penn returned to England in 1684, leaving the Council in charge, but its authority was soon disputed by the Lower House, which had a veto power on legislation, though it could not originate measures. Slanders were circulated in England, and in 1693 the province was resumed by William III., and attached to New York. Governor Fletcher met with little success in his attempts to secure aid for his Indian wars, and had several contests with the Legislature. The province was restored to Penn in August, 1694, and in 1696 a new and more democratic constitution was adopted with the Proprietor's consent. Penn's second and last visit to the province lasted from December, 1699, to October, 1701. During this time he granted the 'Charter of Privileges,' adopted October 26, 1701, which served as a constitution until the Revolution. The governors whom Penn appointed were involved in frequent disputes with the Assembly, and in consequence the Proprietor grew discouraged. In 1712 he was on the point of selling the province to the Crown for £12,000, but a paralytic stroke prevented the completion of the sale. Though the province was a constant source of expense to him, it made his descendants rich. After Penn's death in 1718, the disputes between the Assembly and the Proprietors continued with renewed vigor.

Immigration was large. There were Scotch-Irish in the province as early as 1698, and after 1730 they came in great numbers. These generally pushed on to the frontier, as did also the later influx of Germans. The first years were free from Indian warfare, but after 1740 the Indians were restless and soon became openly hostile. The efforts of the French were successful, and forts were established on the Ohio. The province sent few men to the aid of General Braddock in his expedition against Fort Duquesne in 1755; but his defeat aroused the Assembly, and a chain of forts was erected at a cost of £85,000. Until after 1764 danger from the Indians was constant. Meanwhile, in 1753, Connecticut laid claim to a tract of land on the Susquehanna, seventy miles west of the Delaware, under the charter of 1662, which granted to Connecticut the land to the 41st degree. A company was formed, the land was purchased from the Indians in 1754 (though previously purchased by Pennsylvania), and Susquehanna County was formed. Settlers went in and the formation of a distinct colony was considered. The Indians claimed that the purchase was made by fraud and protested vigorously. Armed forces were sent from eastern Pennsylvania and brought on the so-called Pennamite War; the dispute had its influence in causing the Wyoming Massacre in 1778. See WYOMING VALLEY.

The colony's agent, Benjamin Franklin, vigorously resisted the Stamp Act, and in July, 1774, a Provincial Congress met at Philadelphia, adopted resolutions, and elected delegates to the first Continental Congress, to be held at Philadelphia. The Provincial Convention in 1775 authorized the Committee of Safety to prepare a system of defense for the colony. Troops were raised

and boats were built. After the Declaration of Independence the Proprietary government ceased in Pennsylvania, and a State constitution was drawn up, September 28, 1776. It provided for a Supreme Executive Council, one Legislative House, and a Board of Censors. The Royal Charter was annulled by the King in 1778, and the State secured the commutation of the quit-rents in 1779. During the Revolution the eastern part of the State was the scene of important operations. Philadelphia was at different times the seat of the Continental Congress and the British headquarters. The question of the western boundary was settled in 1784, with the consent of Virginia, by measuring five degrees west from the Delaware River and then due north. The possession of the Wyoming lands was given to the State by decision of Congress in 1782, but when it was found that the line of 42° excluded Lake Erie, Congress, in 1788, authorized the addition of the triangle bordering upon the lake. In 1787 the State ratified the Federal Constitution. In 1790 a new constitution was adopted. The growth and prosperity of the State was marked, though the population was turbulent. The Whisky Rebellion (1794) grew out of the unwillingness of the Scotch-Irish to submit to the excise tax. The imposition by the National Government of the window tax led to the 'Hot-water Rebellion' among a part of the German population in 1798. Internal improvements were projected early, and the Schuylkill Canal was begun in 1815 and completed in 1825. From 1829 to 1836 the projected improvements called for the construction of 292 miles of canal and 126 miles of railroad, at a total cost of $35,000,000. The first bill for a public school system was passed in the face of violent opposition in 1834. Though both iron and coal had been known to exist before the Revolution, it was not until 1839 that anthracite was successfully applied to the manufacture of iron. The first oil well was sunk near Titusville in 1859.

At the outbreak of the Civil War five companies of Pennsylvania troops were the first to arrive in Washington under President Lincoln's call for troops on April 15, 1861, and twenty-five regiments were formed during the month. The draft was necessary before the end of the war, but troops were furnished. The State was three times invaded, twice at Chambersburg and once by General Lee's army, which fought the battle of Gettysburg (q.v.). Since the war the chief events of importance have been the rapid growth of the steel, oil, and coal industries and frequent labor troubles. In 1877 a great strike of railroad employees led to violence and the defeat of the militia at Pittsburg. The despatch of regular troops was necessary to quell the disorder. On May 31, 1889, a dam at the outlet of Conemaugh Lake broke and a great wall of water overwhelmed Johnstown (q.v.) and several smaller towns, drowning more than 2000 people and destroying property to the value of $10,000,000. The strike at the Carnegie Company's mills at Homestead, near Pittsburg, July 6, 1892, was one of the most serious ever known in America. Martial law was declared, and the entire militia force was called out. An extensive strike of coal-miners in Hazleton region in 1900 was followed by a general strike in the anthracite region in 1902.

In national elections the State was at the outset Federalist, but in 1796 fourteen of its fifteen votes were cast for Jefferson. Eight votes were cast for him again in 1800, while seven went to the Federalist candidate. From this time until 1840 the State was Democratic. In 1835 the Anti-Masonic party succeeded in electing the Governor and the agitation gave the State to the Whig electors in 1840. In 1838 a dispute between the Democrats and Whigs concerning the results of an election in one of the State Congressional districts caused much excitement, each party contending that it had elected not only the Congressman, but the members of the State Legislature in that district. The disturbance, which was later known as the 'Buck-Shot War,' was, however, short-lived, and the dispute was settled in favor of the Democrats. The State gave its vote to Polk in 1844, to Taylor in 1848, and in 1852 and 1856 to the Democratic candidates. Since 1860 the State has been overwhelmingly Republican in national affairs, though, on account of factional fights in the Republican ranks, a Democratic Governor has been twice elected.

Governors of Pennsylvania.

Under the Swedes	
Peter Minuit	1638-41
Peter Hollandaer	1641-43
John Printz	1643-53
John Pappegoya	1653-54
John Claudius Rysingh	1654-55
Under the Dutch	
Peter Stuyvesant, Director General of the New Netherland	1655-64
Derck Smidt, Schout Fiscal	1655
John Paul Jacquet, Vice-Director	1655-57
Colony of the City	
Jacob Alricks, Director	1657-59
Alexander d'Hinyossa	1659-63
Colony of the Company	
Goeran Van Dyck, Schout Fiscal	1657-58
William Beekman, Vice-Director	1658-63
Alexander d'Hinyossa, Director of united colony	1663-64
Under the English	
Richard Nicolls	1664-67
Francis Lovelace	1667-73
Recaptured by the Dutch 1673	
Anthony Calve, Governor-General	1673-74
Peter Alricks, Commander	1673-74
Under the English	
Sir Edmund Andros	1674-81
Proprietary Government	
William Markham, Deputy Governor	1681-82
William Penn, Proprietor	1682-84
The Council (Thomas Lloyd, President)	1684-88
The Five Commissioners	1688
Capt. John Blackwell	1688-90
The Council (Thomas Lloyd, President)	1690-91
Thomas Lloyd, Deputy Governor William Markham, Dep'y Governor Lower Counties	1691-93
Under the Crown	
Benjamin Fletcher, Gov. of New York, Governor William Markham, Lieutenant-Governor	1693-95
Proprietary Government	
William Markham, Lieutenant-Governor	1695-99
William Penn, Proprietor	1699-1701
Andrew Hamilton, Lieutenant-Governor	1701-03
The Council (Edward Shippen, President)	1703-04
John Evans, Lieutenant-Governor	1704-09
Charles Gookin, "	1709-17
Sir William Keith, "	1717-26
Patrick Gordon, "	1726-36
The Council (James Logan, President)	1736-38
George Thomas, Lieutenant-Governor	1738-47
The Council (Anthony Palmer, President)	1747-48
James Hamilton, Lieutenant-Governor	1748-54
Robert Hunter Morris, "	1754-56
William Denny, "	1756-59
James Hamilton, "	1759-63
John Penn, "	1763-71

The Counc. (James Hamilton, President)	1771
Richard Penn, Lieutenant-Governor	1771-73
John Penn, "	1773-76
Council of Safety (Thomas Wharton, President)	1776-77

PRESIDENTS OF THE SUPREME EXECUTIVE COUNCIL

Thomas Wharton, Jr	1777-78
George Bryan (acting)	1778
Joseph Reed	1778-81
William Moore	1781-82
John Dickinson	1782-85
Benjamin Franklin	1785-88
Thomas Mifflin	1788-90

GOVERNORS OF STATE

Thomas Mifflin	Federalist	1790-99
Thomas McKean	Democratic-Republican	1799-1808
Simon Snyder	"	1808-17
William Findlay	"	1817-20
Joseph Heister	Independent Democrat	1820-23
John Andrew Shulze	Democratic-Republican	1823-29
George Wolf	"	1829-35
Joseph Ritner	Anti-Masonic	1835-39
David Rittenhouse Porter	Democratic	1839-45
Francis Rawn Shunk	"	1845-48
William Freame Johnston	Whig	1848-52
William Bigler	Democratic	1852-55
James Pollock	"	1855-58
William Fisher Packer	"	1858-61
Andrew Gregg Curtin	Republican	1861-67
John W. Geary	"	1867-73
John F. Hartranft	"	1873-79
Henry M. Hoyt	"	1879-83
Robert E. Pattison	Democratic	1883-87
James A. Beaver	Republican	1887-91
Robert E. Pattison	Democratic	1891-95
Daniel H. Hastings	Republican	1895-99
William A. Stone	"	1899-1903
Samuel W. Pennypacker	"	1903—

PENNSYLVANIA, HISTORICAL SOCIETY OF. An association organized in Philadelphia December 2, 1824, and incorporated June 2, 1826. Its object is the elucidation of history, with special reference to that of Pennsylvania. It has a valuable historical library and a museum at Philadelphia. The society has a subscribed publication fund of $40,000, the revenue from which is expended in printing matter of historic interest. This fund has published 14 volumes of *Memoirs of the Society*, and 26 volumes of *The Pennsylvania Magazine of History and Biography*, issued in quarterly numbers. The society has also published an historical map of the State, a volume of *Collections*, and one on *Pennsylvania and the Federal Constitution*.

PENNSYLVANIA, UNIVERSITY OF. An institution of higher learning in Philadelphia, Pa., established in 1740 as a charitable school, and raised to the grade of an academy in 1751 through the efforts of an association of citizens formed in consequence of a pamphlet published by Benjamin Franklin, entitled, "Proposals Relative to the Education of Youth in Pennsylvania." The academy, consisting of an English, a mathematical, and a Latin school, each under a master, with subordinate tutors and ushers, proved so successful that in 1753 it received a charter from the Proprietors, Thomas and Richard Penn. Two years later it had attained a standard which justified the granting of degree conferring powers, and in 1755 the institution was converted into the College and Academy of Philadelphia. During the agitated times of the wars with the French the provost, Rev. William Smith, opposed so vehemently the non-resistance policy of the Pennsylvania Legislature that he was arbitrarily thrown into prison, where he faithfully received his classes. He was subsequently sent to England to raise funds for an endowment, and there met the commissioner from King's (Columbia) College on a similar mission. Through the influence of the Archbishop of Canterbury they received a circular letter from the King, and succeeded in raising a considerable endowment for each college. On Doctor Smith's return a letter to the trustees from the Archbishop of Canterbury, Thomas and Richard Penn, and Rev. Samuel Chandler represented that the institution was originally founded and carried on for the benefit of a mixed body of people; that at the time of making the collection its officers included representatives of various Christian denominations; and, since jealousies had arisen between parties, it was recommended to the trustees to make a fundamental declaration to prevent inconveniences of this kind. Accordingly, in 1764, the trustees bound themselves and their successors to retain the original wide plan of the institution and "to use their utmost endeavors that the same be not narrowed, nor the members of the Church of England, or those dissenting from them (in any future election to the principal offices), be put on any worse footing in this seminary than they were at the time of receiving the royal brief." In 1779 this resolution was construed by the Legislature into a "narrowing of the foundation," and seized as a pretext for confiscating all the rights and properties of the college, which were bestowed upon a new organization, called in the charter the "Trustees of the University of the State of Pennsylvania." Ten years later these rights and properties were restored, and in 1791 an act was passed amalgamating the old college with the new university under its present title. In 1872 the university was removed to the present site.

The departments of the university are the college, including the School of Arts, the Towne Scientific School, and the courses for teachers; the Departments of Philosophy (Graduate School), Law, Medicine, Dentistry, Veterinary Medicine, and Archæology; the Wistar Institute of Anatomy and Biology; the Laboratory of Hygiene; the Veterinary Hospital; the Library, and the Flower Astronomical Observatory; Physical Education. The School of Arts offers courses in arts and science, finance and commerce, biology and music. The Towne Scientific School offers courses in architecture, science and technology, mechanical, electrical,

civil; and chemical engineering, and chemistry. Candidates are admitted on passing the examination set by the college, or by the Entrance Examination Board of the Middle States and Maryland, or on the diplomas of the public high schools. Free tuition is offered through the 2 Penn scholarships, filled by the Governor of the State, 50 Philadelphia free city scholarships, 5 competitive State scholarships, a General Alumni Society scholarship, and 31 scholarships not confined to special localities. The college courses in arts and sciences, finance and commerce, and biology are planned to enable the student to complete his work in three, four, or five years, at his option, the successful completion of 60 units of work being required for graduation. Students are not permitted to take less than 12 units a year, a unit being defined as one hour's work a week for one year in lectures or recitations, or two hours' work a week in laboratory practice. In the course in arts and sciences the prescribed studies amount to 22 units and group studies to 18 units, the remaining 20 units being made up of free electives. Provision is made for a senior composite year in which eight units are credited to the work of the first year class in medicine. In the Scientific School, the architectural course covers four years. The courses in science and technology cover five years. The Graduate Department offers eight scholarships on the Harrison Foundation, entitling the holder to free tuition and an income of $100, 30 university scholarships, providing only free tuition, and 29 fellowships, with incomes ranging from $200 to $800. The Graduate Department for women offers 5 fellowships.

Of the professional schools of the university, that of medicine is best known and has always been one of the strong departments. The Dental School especially has a wide reputation in Australia and in Spanish American countries. The Flower Astronomical Observatory is situated two miles beyond the city limits, and there is a small working observatory in the college grounds. The university buildings, 29 in number, stand on Woodland Avenue, on property covering over 56 acres in the city proper, and provide dormitory accommodations for about 500 students. They include a University Hospital, with a training school and home for nurses, and the Howard Houston Hall, a students' club.

The university confers the degrees of Bachelor of Arts, Laws, Music, and Science, Master of Arts and Science, Doctor of Philosophy, Medicine, Dental Surgery, and Veterinary Medicine, and the technical degrees of Civil, Mechanical, Electrical, and Chemical Engineer. In 1902 the faculty numbered 281, and the student body 2578, distributed as follows: School of Arts, 476; Scientific School, 431; Teachers' Courses, 206; Graduates, 192; Law, 339; Medicine, 475; Dentistry, 403; Veterinary Medicine, 62. The library contained 212,861 volumes. The university grounds and buildings were valued at about $4,500,000 and extensive plans were undertaken in the early part of 1903 for a group of new buildings to be erected outside the present limits of the university grounds. The first step toward this end was the announcement of a new building for the Wharton Scientific School, to cost $200,000, the gift of Joseph Wharton, the founder. The endowment of the university in 1902 was $9,000,000 and its income was $1,490,000. The heads of the university, since its beginning as a collegiate institution in 1755, have been: William Smith (1755-80); John Ewing (1780-1802); John McDowell (1807-10); John Andrews (1810-13); Frederick Beasley (1813-28); William Heathcote de Lancey (1828-33); John Ludlow (1834-53); Henry Vethake (1854-59); Daniel Raynes Goodwin (1860-68); Charles Janeway Stillé (1868-80); William Pepper (1881-94); Charles Custis Harrison (1894—).

PENNSYLVANIA, Western University of. An institution at Allegheny, Pa., the second oldest institution of learning west of the Appalachian Mountains, founded as the Pittsburg Academy in 1786, incorporated in 1787, and reincorporated under its present name in 1819. Since 1895 women have been admitted on the same terms as men. The university comprises collegiate, engineering, medical, and law departments, and colleges of pharmacy and dentistry. Several of the schools are institutions formerly independent. The Medical School became a part of the university in 1892, and the Law School in 1895. The Allegheny observatory was founded in 1859 by the Allegheny Astronomical Society, and in 1867 was transferred to the university. It has achieved an international reputation through the work of its successive directors, Professors Langley and Keeler, in the fields of solar physics and astronomical spectroscopy. New buildings for this department were erected in 1901. In 1902 the university had 892 students, 116 instructors, and a library of 20,000 volumes.

PENNSYLVANIA COLLEGE FOR WOMEN. An institution for the higher education of women in Pittsburg, Pa., founded in 1869, under the auspices of the Presbyterian Church. Besides the collegiate department it has a preparatory school and departments of music and art, with a total registration in 1902 of 185 and 20 instructors. In that year the income was $40,000 and the college property was valued at $250,000. The library contained 3000 volumes.

PENNSYLVANIA DUTCH, or **Pennsylvania German.** The language of the Germans who emigrated to Pennsylvania between 1683 (when Pastorius settled in Germantown) and the middle of the eighteenth century. During this time some 100,000 settled principally in the southeastern counties of the State, such as Lancaster, York, Franklin, Cumberland, Berks, Schuylkill, and Lehigh. The emigration was due partly to the ravages of the armies of Louis XIV., and partly to religious persecution. The settlers came principally from the Rhenish Palatinate, Württemberg, and Switzerland, with a sprinkling from the Lower Rhine, Bavaria, Alsace, and Saxony. As most of the dialects spoken by these people belonged to the Alemannic and Franconian groups (see German Language), the idiom of the Pennsylvania Dutch is really High German, and the confusion with Dutch is due to the fact that the settlers called their language 'Deitsch' (German). Although a variety of dialects were originally represented, that of the Rhenish Palatinate (Rhenio-Franconian) so predominated and influenced the others that the language may be regarded as fairly homogeneous. Owing to their segregation in religious communities, the emigrants clung tenaciously to their mother tongue, but were gradually compelled by force of circumstances to accept many English words, especially

the names of objects in daily use, until the dialect can best be described as a fusion of Franconian and Alemannic with an admixture of English varying from one per cent. in the rural districts to a large percentage in the towns.

The language exhibits the characteristic dialectic darkening of *a* to *o* (*schlof* for *Schlaf*; *jor* for *Jahr*), further the fronting of *ö* to *e* (*here* for *hören*; *bes* for *böse*) and of *ü* to *i* (*bicher* for *Bücher*). German *ei* and *äu* generally appear as *ē* (*del* for *Teil*; *bom* for *Bäume*). The consonants *p*, *pp*, and *d* are not shifted (*pund* for *Pfund*; *kloppe* for *klopfen*; *kopp* for *Kopf*; *dag* for *Tag*; *mudder* for *Mutter*). Final vowels and inflectional *n* are dropped (*mid* for *müde*; *bom* for *Bäume*; *finne* for *finden*; *gfunne* for *gefunden*).

The writings of the Pennsylvania Germans have been mainly of a religious character, such as hymns and polemical pamphlets. They were written as a rule in the High German literary dialect, with, however, a number of exceptions. Within the last forty years, however, a number of poems in the dialect have been written. Consult: Seidensticker, *Bilder aus der deutsch-pennsylvanischen Geschichte* (2d ed., New York, 1886); id., *The First Century of German Printing in America* (Philadelphia, 1893); Cobb, *Story of the Palatines, an Episode in Colonial History* (New York, 1897); Sachse, *The German Sectarians of Provincial Pennsylvania, 1694-1800* (ib., 1895-1900); Haldeman, *Pennsylvania Dutch* (ib., 1872); Learned, *The Pennsylvania German Dialect* (Baltimore, 1889).

PENNSYLVANIA-GERMAN SOCIETY, The. An association organized in Lancaster, Pa., April 15, 1891, to collect, preserve, and publish documents relating to the history of the Pennsylvania Germans, and cause original papers to be prepared and read before the society. Its regular members, who now number about 400, must be direct descendants of the early German or Swiss emigrants to the colony of Pennsylvania. The society holds an annual meeting in some one of the smaller cities of eastern Pennsylvania, and publishes annually a volume of *Proceedings*, including the papers read at each meeting.

PENNSYLVANIA STATE COLLEGE. A coeducational institution of higher learning at State College, Pa., organized on a collegiate basis as the Farmers' High School in 1859. In 1862 the name was changed to The Agricultural College of Pennsylvania, and in 1874 to its present title. The principal income of the college is derived from the sale of public lands held in trust by the State. The grounds contain 400 acres, of which the campus covers 60 acres, the remainder being devoted to a model farm. The courses of instruction occupy four years. The general courses offered are a classical general science, a Latin scientific, and a philosophical course. The technical courses include agriculture, biology, chemistry, civil, electrical, mechanical, and mining engineering, mathematics, and physics. All courses, except the classical, lead to the B.S. degrees. In the graduate courses the degrees of C.E., M.E., E.M., E.E., and M.S. are conferred. In 1902 the faculty numbered 48; the college was attended by 602 students, of whom 420 were in the School of Engineering; 1800 persons took correspondence courses in agriculture. The endowment was $517,000, the income was $137,992, and the value of the college grounds, buildings, and equipment was $850,000. The library contained 19,181 volumes.

PENNY (AS. *penig*, *pennig*, *peneg*, *pening*, *pæning*, *pending*, OHG. *phantinc*, *pfentinc*, *pfending*, *phenning*, Ger. *Pfenning*, *Pfennig*, penny; perhaps connected with OHG. *phant*, *pfant*, Ger. *Pfand*, pawn, pledge, or less plausibly with OHG. *pfanna*, *phanna*, *panna*, Ger. *Pfanne*, AS. *panne*, Eng. *pan*, from ML. *panna*, from Lat. *patina*, shallow bowl). A British coin and money of account. After the sceattæ (q.v.) it is the most ancient of the English coins, and was the only one generally current among the Anglo-Saxons. The penny is first mentioned in the laws of Ina, King of the West Saxons, about the close of the seventh century. It was at that time a silver coin, and weighed about 22½ troy grains, being thus about $\frac{1}{240}$ of the Saxon pound weight. This relation to the pound weight is evidently derived from the usage of the early Franks, who retained the Roman division of the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii* (the denarius being thus the 240th part of the libra or pound). (See MARK.) Half-pence and farthings were not coined in England till the time of Edward I., but the practice previously prevailed of so deeply indenting the penny with a cross mark that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI., and silver half-pennies under the Commonwealth. By this time the penny had steadily decreased in weight; it was 18 grains under Edward III., 15 and 12 under Edward IV., 8 under Edward VI., and under Elizabeth it was finally fixed at $7\frac{23}{31}$ grains, or $\frac{1}{62}$ of an ounce of silver, a value to which the subsequent copper pennies, which till 1860 were the circulating medium, closely approximated. In 1672 an authorized copper coinage was established, and half-pence and farthings were struck in copper. The penny was not introduced till 1797, and at the same period the coinage of twopenny pieces was begun; but these latter, being found unsuitable, were withdrawn. The penny of the present bronze coinage is of only about half the value of the old copper penny. The German *pfennig* was also originally a silver coin, bearing the same relation to the German pound of silver as the English penny to its pound. And in the twelfth century it was made so broad, in imitation of the Byzantine coins, that it would no longer bear to be struck with a die on each side as before, but was struck on one side only. In the beginning of the fourteenth century the mark of silver was anew divided into 60 parts or coins, which, to distinguish them from the old coins, were called *grossi denarii*, whence the term *groschen*. In the modern monetary system of Germany, the pfennig is a nickel coin, the hundredth of the mark, the latter being equal to a shilling or about $0.25.

PENN YAN. A village and the county-seat of Yates County, N. Y., 45 miles north by west of Elmira; on Lake Keuka, and on the Northern Central and the New York Central railroads (Map: New York, C 3). It has an attractive location on the lake, the shores being covered with cottages and the hills with vineyards. There are Penn Yan Academy, a public school library, and a fine county court house and jail. The village is situated in a noted grape-growing region, and has extensive agricultural, fruit, and wine-making

interests, as well as manufactures of flour, hubs and spokes, grape baskets, malt, and paper. The manufacturing industries are promoted by excellent water power derived from the lake. Penn Yan is governed by a village president and board of trustees. The water-works are owned and operated by the village. Penn Yan was settled about 1800 and was incorporated as a village in 1833. The early settlers were partly Pennsylvanians and partly New Englanders (Yankees); hence the name. Population, in 1890, 4254; in 1900, 4650.

PEN'NYPACK'ER, GALUSHA (1844—). An American soldier, born in Chester County, Pa. He received an academic education, and on April 22, 1861, enlisted for three months in the Federal service as a quartermaster-sergeant in the Ninth Pennsylvania Infantry. On August 22d he reentered the service as a captain in the 97th Pennsylvania; served throughout the war, and on February 18, 1865, was commissioned a brigadier-general of volunteers. Until April, 1864, he was principally engaged in the operations along the Atlantic coast. He was then transferred to the Army of the James, and participated in the action at Drury's Bluff (May 13-16, 1864), where he was wounded, and led a brigade at the capture of Fort Harrison, where he was again wounded. He recovered in time to participate in the final assault on Fort Fisher (January 15, 1865), but was again wounded, this time so severely that he was confined to the hospital until April, 1866, when he resigned from the service. During this time he received his commission as brigadier-general of volunteers and the Congressional medal for bravery in battle. The following July he was appointed colonel of the 34th regular infantry, and on March 2, 1867, was brevetted major-general U. S. A. In 1869 he was transferred to the 16th Infantry, which he commanded until his retirement, in 1883.

PENNYROYAL (variant, influenced by popular etymology with *penny*, of obsolete *puliol-royal*, ME. *puliall real*, from ML. *pullium regale*, Lat. *pulcium regale*, royal fleabane, from *pulcium*, fleabane, from *pulex*, flea, and *regale*, royal, from *rex*, king). A species of mint (q.v.). In North America a small plant (*Hedeoma pulegioides*), also bears this name, and having, like the mints, a pleasant aromatic smell and a warm pungent taste, it is used as an infusion in domestic medicine to promote perspiration. The plant is common from New England to the Dakotas and southward. The name is also sometimes applied to *Mentha Canadensis*, which resembles the English pennyroyal (*Mentha Pulegium*).

PENOB'SCOT. A former leading tribe of the Abnaki confederacy (of the Algonquian stock). They claimed the entire basin of the Penobscot River, Maine, and had their principal village, of the same name, about the present Veazie or Bangor. A French mission was established there in 1688. When first known to the whites the Penobscot, under their chief, Bashaba, seem to have had dominion over all the New England tribes southward to or beyond the Merrimac River. They took active part on the French side in all the colonial wars on the New England frontier up to 1749, when they made a treaty of peace with the English and have remained quiet ever since. This treaty brought them into disfavor with the Abnaki and other refugees at Saint Francis, who continued hostilities in the French interest, for which reason very few of the Penobscot ever joined their emigrant brethren in Canada, but remained in their old homes. For their services on the American side in the Revolution they were confirmed in possession of a small reservation on the Penobscot above Bangor, where they still reside, their principal settlement being Oldtown, upon an island in the river. They number now about 400, still preserving their language and subsisting by hunting, fishing, lumbering, and basket-making.

PENOBSCOT BAY. An inlet of the Atlantic Ocean indenting the coast of Maine (Map: Maine, F 7). It is 28 miles wide at the mouth and penetrates an equal distance inland, narrowing gradually to its head, where it receives the Penobscot River. It contains several large and a number of small islands, and on its shores are numerous coves with deep water.

PENOBSCOT RIVER. The principal river of Maine. It rises on the northwestern boundary of the State, and flows east to Lake Chesuncook, then southeast through Pamedumcook Lake at the foot of Mount Katahdin, and finally southward until it empties into the Atlantic Ocean through Penobscot Bay (Map: Maine, F 5). It is nearly 300 miles long, and is navigable for large vessels to Bangor, 55 miles from its mouth. Above Bangor there are falls supplying power to sawmills, and the upper course of the river is used for floating large numbers of logs from the forests of northern Maine.

PENOLOGY (from Lat. *pœna*, punishment + Gk. λογία, *-logia*, account, from λέγειν, *legein*, to say). A term defined by Dr. F. H. Wines, one of the foremost penologists of the United States, as the treatment of crime for its repression and prevention, and of criminals for their extirpation or rehabilitation. The oldest form of the forcible repression of crime and treatment of criminals is execution. The death penalty naturally suggested itself to primitive peoples as the simplest, surest means of ridding society of its dangerous members. With the advance of civilization, however, the number of offenses for which the death penalty is inflicted has steadily decreased. (See CAPITAL PUNISHMENT.) A later important form of forcible repression is that of transportation, or the establishment of penal colonies, to which criminals are removed. England, Russia, and France have employed this system with more than doubtful success. England, indeed, has abandoned it. (See TRANSPORTATIONS PENAL.) A third and later form is the prison. The idea of punishment by imprisonment does not seem to have entered the mind of the rulers of antiquity, although the prison was as a matter of fact, from its crowded and filthy condition, its want of ventilation, the foul fevers and plagues engendered there, and the starvation inflicted upon its hapless inmates, a place of torture and speedy death. It was primarily a place for the sequestration of persons obnoxious to the despotic ruler, as well as of debtors, and for the detention of persons charged with other crimes, until they were tried. It is only in comparatively recent times that the prison itself has come to be regarded as a place of punishment, a place for the confinement of condemned persons; and the name 'jail' is now generally employed to designate the place where persons under accusation are com-

pelled to abide pending the determination of their guilt or innocence. Of all the institutions of this kind in the United States the county jails are the most unsatisfactory: they are generally breeding places of crime and licentiousness, because prisoners of all grades, of all ages, and sometimes even of both sexes, are herded together.

The idea of reformation has for a century played an increasingly important part in our modern prison systems. In 1773 John Howard, an English country gentleman, having been appointed high sheriff of Bedford, found so many abuses in the jails of his county that he was moved to call the attention of all England to its prisons everywhere. Up to this time the management of jails in England was under no public supervision whatever. It was the custom of the jailer, who was not even paid by the community for the performance of his duties, to collect his fees from the prisoners in his custody. Howard's life was henceforward spent in attempts to improve the conditions of the prisoner, but his reforms were mainly those which looked to the humane treatment rather than to the reformation of the criminal.

The problem of the restoration of the criminal to society is a later work of the penologist. As to the method of its solution penologists do not all agree. Two distinct systems of prison discipline, which are commonly known as the Pennsylvania, or Philadelphia, and Auburn systems, have grown up in the United States. The first, or 'separate system,' insists upon the separation of prisoners by day and by night; the second, by night only. From these two a third has been evolved, which is in a certain sense a combination of the two, but has also distinct features of its own. It is known as the Irish system, because it has been most fully and successfully applied in Ireland, under Sir Walter Crofton.

The essential principle of the separate system is the complete physical separation of prisoners. It rests upon the conviction that mutual contact between them is necessarily corrupting, and that classification upon any basis except that of individual character is impossible. At first, solitary confinement, without labor or recreation or mental contact with any human being, even with the officers of the prison, except in case of necessity, was the form which this experiment assumed. But the severity of this rule has been relaxed on account of the injury which it wrought in some cases both to the body and the mind of the subject. Now the prisoner is not excluded from a degree of companionship with the prison officials and authorized visitors. The convict, however, sleeps, eats, and works in his cell alone, and takes his exercise in an adjoining space outside. It is claimed for this system that it removes a man from evil associates; trains him as an individual, and increases the personal influence of the authorities and teachers; that it gives greater opportunity for reflection; that the convict who reforms under it cannot afterwards be identified by professional criminals and so led back to evil ways; and that discipline may be varied according to the needs of individual convicts. The objections to this system are: that it necessitates a large ground area and costly buildings; that it unfits a man for ordinary methods of work, because he has worked alone, and under exceptional conditions, such as do not prevail in the outside world where men coöperate; that loneliness is injurious to morals and to mental and physical health. It is claimed, however, that this system has produced excellent results; its friends maintain that, more than any other system, it reduces the number of recidivists, that is, of discharged convicts who lapse again into crime. The International Prison Congress of 1900 reached the conclusion that this method must be regarded with favor as having checked criminality.

The prison at Auburn, in the State of New York, represents the 'congregate' or 'silent' system, which now prevails throughout the United States. Prisoners sleep in separate cells, but are brought together during the day in large workshops; separation between them, the necessity for which was acknowledged, is secured by a rule forbidding them to communicate with one another or with visitors. The difficulty of enforcing this rule has led to its relaxation. The Eastern Penitentiary in Philadelphia was intended to be a strictly cellular prison for convicts of the higher grades in the United States, but it has long since ceased to be such, because of its seriously overcrowded condition. Among the causes which have contributed to the general adoption of the Auburn system are: The comparative cheapness of construction and maintenance of congregated prisons; the ease with which profitable labor may be introduced into them, especially in connection with machinery of all sorts; the facilities which they afford for contracting out the labor of convicts, thus relieving the administration of financial responsibilty.

The Irish system was, in its origin, an outgrowth of the experience of Captain Maconochie as governor of the penal settlement of Norfolk Island. Maconochie devised the 'mark system,' which is added to the 'ticket of leave' system, or conditional liberation (also an Australian invention), and the 'progressive' classification and the 'intermediate' prison, to constitute the four elements of the Crofton system. Briefly described, this system consists of four stages, of which the first is not less than eight months of strictly cellular confinement in the Mountjoy Prison, Dublin, with short rations and no employment but picking oakum for the first half of the time. The second is an indefinite period, not less than one year, of associated imprisonment, at Spike Island, where the prisoners are divided into four classes, and are promoted from one to the other according to their demeanor, labor, and study—an account being kept with them by the use of marks, and their promotion depending upon their record. The third is a short period of probationary detention in a condition intermediate between imprisonment and freedom, at Lusk, where the men are trained for entire freedom, and their capacity for it is tested prior to their liberation; the fourth is conditional liberation with police supervision. This system is supplemented by a scheme for obtaining employment for liberated prisoners.

The first American institution managed along these lines is the Elmira Reformatory (q.v.) opened in 1876 in the State of New York, and known as the New York State Reformatory. Prisoners received here are such as are convicted of their first offense for felony, and are held under what is known as the indefinite or indeterminate sentence; that is, they are not sentenced for a specific period of time, but may be held for the maximum period for which they might have been sentenced for the crime committed, and cannot be

discharged until they have served the minimum period provided by statute for such offense. Having served such minimum period, they may be allowed by the Board of Managers to leave the prison on parole, but must remain while on parole under the control of the Board and subject to be taken back to the institution.

Concerning the 'indeterminate sentence,' it should be noted that eminent penologists have favored this device on the ground that it is impossible for courts of justice to know just how long a period of incarceration is necessary to produce the desired effect upon an offender. Of two criminals sentenced to 10 years' imprisonment, one may be at the expiration of this period entirely unfit to be released, while another may have become ready and willing to assume the duties and responsibilities of citizenship. The fixed sentence, they claim, is as absurd as it would be for a physician to prescribe medicine for a period of ten days, and then omit to inquire what effect this treatment has produced in the patient at the expiration thereof. With an indeterminate sentence the prisoner is virtually his own custodian. When he understands this, his reformation—assuming him to be a reformable person and not a criminal by instinct—is rendered far more probable. The hope of freedom is the one stimulus to which he may be depended upon to respond. When the criminal in convinced that this hope is to be realized, not through some vague chance of pardon or escape, but whenever by his conduct in prison he makes it apparent to those in charge that society has nothing to fear from him, the work of his reformers is comparatively easy. Most penologists, therefore, see in this almost certain means of securing the coöperation of the criminal—a principle of reform of the greatest importance.

By means of the indeterminate sentence, a prisoner may be liberated conditionally, on parole. It is this actual experience with the out-side world which establishes a man's powers and intentions. Within the prison walls he cannot steal or murder or forge signatures, or otherwise menace the life or property of his fellow-man.

The indeterminate sentence has been tried in more than a quarter of the American commonwealths since 1876, but it has met with much opposition from the courts, judges very generally regarding it as an infringement of their prerogative of sentence, and finding constitutional objections to it unless the statute creating it is drawn with extreme care to fix a definite period for the expiration of sentence, and in some cases unless the release on parole is specifically described as a commutation for good behavior.

See Criminology; Juvenile Offenders; Prisons; Punishment; Reformatories; Recidivists.

PEN'RITH. A market town in Cumberland, England, in a picturesque and fertile valley, with rich and striking scenery in the vicinity, 17 miles southeast of Carlisle (Map: England, D 2). It has ruins of a fine old castle and in the parish churchyard is a monument of great antiquity known as the 'Giant's Grave,' formed of two pyramidal stones about 12 feet high. The town contains an ancient free grammar school. There are tanneries, saw-mills, and breweries; the trade is chiefly agricultural. Population, in 1901, 9180.

PEN'ROSE, Boies (1860—). An American political leader, born in Philadelphia. He graduated at Harvard in 1881, was admitted to the bar in 1883, and the next year was elected to the Pennsylvania State Legislature. From 1887 to 1895 he was a member of the State Senate, and from 1897 until 1903 a member of the United States Senate. He wrote a *History of the City Government of Philadelphia* (1887) and contributed to the *American and English Encyclopædia of Law*.

PENROSE, Francis Cranmer (1817-1903). An English architect, born at Bracebridge, near Lincoln. He studied under the architect Edward Blore and graduated at Magdalene College, for which he was traveling bachelor from 1842 until 1845. His *Principles of Athenian Architecture* (1851), a valuable work, was published by the Society of Dilettanti. In 1852 he became surveyor of the fabric of Saint Paul's Cathedral, which position he occupied until 1897. He was awarded the royal gold medal of the Institute of British Architects in 1883, and was president of that body in 1894 and 1895. In 1886 he was made director of the British Archæological School at Athens. Other works by him include *Graphical Method of Predicting Occultations of Stars and Solar Eclipses* (1869) and "Orientation of Greek Temples," in the *Transactions of the Royal Society* (1893-97).

PEN'RY, John (1559-93). A Puritan writer. He was born in Wales, and graduated B.A. at Cambridge, 1584; M.A. Oxford, 1586. Although always a layman, he was deeply interested in controversial theology on the Puritan side. It is, however, as the moving spirit of the little company of writers and printers who brought out the Martin Marprelate tracts (q.v.) that he is remembered. The excitement caused by these bitter attacks upon the alleged evils of the Church of England made it necessary for Penry to seek refuge in Scotland (1590-92). He was well received by the Presbyterian ministers and preached there. In September, 1592, he ventured to return to England, and settled in London. The following year he was arrested, brought to trial, and found guilty of treason. He was hanged on May 29, 1593. Consult his *Life* by Waddington (London, 1854).

PENRYN, pĕn-rĭn'. A municipal borough and market town in Cornwall, England, in a richly productive valley bordering on Falmouth Harbor, two miles northwest of Falmouth (Map: England, A 6). The famous Penryn granite is obtained here; 20,000 tons have been exported in the year. The rental of corporate property covers all principal expenses, and the town levies no local rates. Its incorporation dates from 1216. Population, in 1901, 3200.

PEN'SACO'LA. The second city of Florida, a port of entry, and the county seat of Escambia County, 204 miles west of Tallahassee; on the Louisville and Nashville and the Pensacola, Alabama and Tennessee railroads (Map: Florida, A 1). Situated on Pensacola Bay about six miles from the Gulf of Mexico, it has a land-

located, deep, and commodious harbor, the entrance to which is defended by forts Pickens, Barrancas, and McRee. There is a large navy yard here; and the remains of the Spanish fortresses San Miguel and San Bernardo are of interest. Among the fine structures in the city are the State Armory, opera house, court house, and the Federal Government building, the last having cost $250,000. There are public parks of considerable beauty. Pensacola is chiefly a commercial centre, its lumber interests being notable. It has a trade also in fish, coal, cotton, naval stores, grain, etc. The commerce of the port in 1901 included exports valued at $13,456,000 and imports to the amount of $238,000. Because of the increased trade, especially with the West Indies, extensive improvements are being made in connection with the railroad terminal facilities. Population, in 1890, 11,750; in 1900, 17,747.

Pensacola was permanently settled in 1696 by Spaniards from Vera Cruz. It was captured by the French in 1719, was restored to Spain in 1723, and passed into the hands of the British in 1763. In 1781 it was captured by a Spanish force under Governor Bernardo Galvez. During the War of 1812, owing to the assistance given here to the English, it was taken (1814) by General Jackson, who again in 1818 captured it on account of Spanish encouragement of hostile Indian attacks. The United States took formal possession in 1821, in pursuance of the treaty of 1819. In 1861 the Confederates seized the navy yard here, but were unable to capture Fort Pickens, and in 1862 they evacuated the city. A destructive fire occurred in 1864.

PENSACOLA BAY. An inlet of the Gulf of Mexico on the coast of Florida near the western boundary of the State (Map: Florida, A 1). Across its entrance lies the long, narrow island of Santa Rosa, leaving a passage only a mile wide, but deep and navigable. The inner bay is from 4 to 12 miles wide, and divides into two large branches, which penetrate about 25 miles inland. The entrance is fortified, and on the west shore lies the city of Pensacola (q.v.).

PEN'SERO'SO, IL (It., the pensive). A poem by Milton, written probably in 1632 at Horton. It is the complement of *L'Allegro* (q.v.) and is the unrivaled description of the impressions made by scenes of nature, art, and music on the mind of a thoughtful cultivated man.

PENSILE NESTS (from Lat. *pensilis*, hanging, from *pendere*, to hang). Nests of birds woven in the form of a bag, cup, or hammock, and suspended by the rim from the twigs of a tree, bush, or other plant. Many birds construct such nests, which are not only safer than in most other situations, but usually most skillfully and beautifully made. Prominent American examples are the nests of the Baltimore and orchard orioles, of the vireos, and of certain warblers. In South America, the caciques and some hummingbirds; in Europe, the titmice; and in Asia, the tailor-birds and weaver-birds, afford other examples in a great variety of forms and materials. See articles under the names of these birds; and Plates under NIDIFICATION and WEAVER-BIRD.

PENSION (Lat. *pensio*, payment, weight, from *pendere*, to weigh out). A pension is an annual income granted by public authority, usually for an antecedent public service, military or civil. In earlier days the granting of pensions was a royal prerogative which was frequently abused. At the present time in England civil list pensions are granted by the free grace of the sovereign and are frequently bestowed upon men of letters. Hereditary pensions granted in former times to national heroes and their descendants have been almost entirely commuted. Pensions are bestowed upon officers of the army and navy and to judges, as in the United States. Like most of the countries of Europe, England has a system of pensions for civil servants. A similar system is widely advocated for the United States. The theory of such pensions is generally that the assured provision for old age is a compensation for the low rates of pay which attach to the Government service. In some of the European countries a system of pensioning workingmen is now in force. (See OLD AGE PENSIONS.) In the ordinary service of the United States retiring pensions are confined to the Federal judges and the officers of the army and navy. The former at the age of seventy, after ten years of judicial service, may retire on full pay. The maximum pay on the retired list for officers of the army and navy is 75 per cent. of the active pay of their respective ranks. Congress has also by special act granted pensions to some of the widows of the Presidents.

MILITARY PENSIONS IN THE UNITED STATES. The system of military pensions in the United States had its germ in the colonial epoch. The necessity of calling upon the inhabitants for armed defense against the Indians and other foes seemed to impose the necessity of providing at public expense for those who were disabled, and for the families of those who perished in the struggles. In the Revolutionary struggle the troops were promised similar pensions, and officers who should remain in the service till the end of the war were promised half pay for life. The Continental Congress was unable to fulfill this obligation. After the adoption of the Constitution Congress took up the matter of pensions, and passed in 1792 a general pension law. Successive laws were passed improving the machinery for granting pensions, and enlarging the number of claimants, but no increase of rate was granted until 1816, when the rate of a full pension was raised from $5 per month to $8. The application of the law was at the same time extended to those who had fought in the War of 1812.

The principle of service pensions was introduced by the act of March 13, 1818. All survivors of the Revolutionary army or navy who had served until the close of the war, or at any period of the struggle for at least nine months, were entitled, if in needy circumstances, to pensions for life. For privates the rate was fixed at $8 per month. The law was loosely worded and the door left wide open to fraud. The grants of pensions became a public scandal, and a law of 1820 required all pensioners and applicants to file a statement of property in proof of their alleged indigence. Many were stricken from the rolls. Up to September, 1822, as many as 18,880 claims had been admitted, but at that time the number of pensioners was only 12,331, owing to the effect of the law of 1820. In 1832 a law was passed which granted full pay for life to all who had served at least two years in the Revolutionary War, and proportional payments to those

who had served less than two years but more than six months.

In 1836 began a long series of acts in favor of the widows of Revolutionary soldiers, restricted at first to those who had married before the close of the Revolution, but gradually growing more liberal until pensions were granted to all, irrespective of the date of marriage.

A similar development of legislation occurred with respect to pensions growing out of the War of 1812, and of the Mexican War. A part of this legislation is of recent date and was affected by the more liberal views as to pension legislation which followed the Civil War.

The first law pensioning soldiers of the Civil War was a disability pension law of July 14, 1862. It provided for the disabled survivor, and for the widows, orphan children, and dependent mothers of those who died by reason of any wound received or disease contracted while in the service of the United States and in the line of duty. Rates for total disability ranged from $8 to $30 a month, according to rank, and these were the rates accorded to widows. Successive laws beginning July 4, 1864, have increased the rates, adopting fixed rates for various kinds of disability.

A powerful stimulus was given to pensions expenditure by the passage of the Arrears Act in 1879. This provided that all pensions which had been granted or might hereafter be granted should date from the time of disability, provided application were made prior to the first of July, 1880. The operation of the law is shown by the fact that in 1881 the average of first payments to army invalids was $953.62, and $1,021.51 to army widows.

A bill to establish service pensions for persons in dependent circumstances was vetoed in 1886 by President Cleveland. A similar bill was passed June 27, 1890, providing that all persons who had served ninety days in the war and who were suffering from any mental or physical disability of a permanent character which incapacitated them from performing manual labor may receive pensions of from $6 to $12 a month, proportioned to the degree of inability to earn a support. Widows of soldiers who served ninety days who are dependent upon their daily labor for support may receive $8 per month.

In addition to the pensions granted under general laws, many claims, often rejected by the Pension Bureau, have been granted by special legislation. From 1861 to 1902 no less than 9296 acts have been passed granting such pensions. A large part of the activity of Congress is devoted to such measures, though a legislative body is ill-adapted to the proper investigation of claims. Elaborate rules which have been framed by the committees of the two Houses for their guidance offer, however, a certain guaranty for the justice and reasonableness of their procedure.

The provisions of the general pension law were of course applicable to the war with Spain, and this brief struggle has already brought forth a considerable number of pensions. Up to 1902 50,071 applications had been filed. There were on the roll July 1, 1902, 6611 Spanish War invalids and 2854 Spanish War widows.

The development of the pension system in the United States can be seen from a few typical figures taken from the Reports of the Commissioner of Pensions:

	Number of pensioners	Paid for pensions
1866	126,722	$15,450,550
1870	198,686	29,351,489
1875	234,821	29,270,407
1880	250,802	56,689,229
1885	345,125	65,171,937
1890	537,944	106,094,250
1892	876,068	139,394,147
1895	970,524	139,807,789
1900	993,529	138,462,431
1901	997,735	138,531,484
1902	999,446	137,504,268

This table indicates the considerable increase of pension expenditure between 1875 and 1880, due to the Arrears Act. This is brought out more fully by separating the first pension payments from the others, as is done in the following statement:

PENSION PAYMENTS

	First payments	Payments exclusive of the first
1878	$2,992,352	$23,598,439
1880	12,468,191	44,558,803
1883	29,906,754	29,915,481
1889	21,442,949	66,832,764
1890	38,721,866	66,806,314
1892	45,114,168	94,045,188
1896	11,289,278	126,925,484
1902	8,677,548	128,826,720

This statement shows the great increase in first payments immediately following the passage of the Arrears Act and its subsidence until 1890, when the great number of new pensioners increased such payments to a large extent. Our first table showed the rapid increase of the pension roll after 1890. At present we have in fact two systems of pensions—one under the general law, and the other under the law of 1890. Under the first there were 372,268 pensioners on the rolls in 1902 on account of service in the Civil War, and under the second 597,319 pensioners.

The Commissioner of Pensions gives in his report for 1902 the following statement of the aggregate cost of pension expenditures since July 1, 1790:

Revolutionary War (estimated)	$70,000,000 00
War of 1812 (service)*	45,025,297 09
Indian wars (service)*	5,814,206 53
Mexican War (service)*	31,861,377 57
War of the Rebellion	2,744,878,276 16
War with Spain	3,275,184 10
Total	$2,900,854,341 45

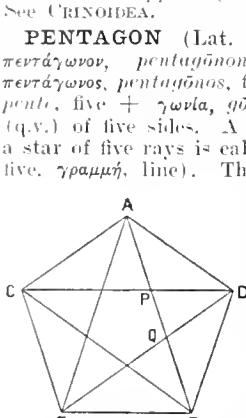
* Pensions on account of disabilities and deaths due to these wars are included under War of the Rebellion.

Consult: *Reports of the Commissioner of Pensions*, *Laws of the United States relating to army and navy pensions* (Washington, 1902), and Glasson, *History of Military Pension Legislation in the United States* (New York, 1900).

PENTAC'RINUS (Neo-Lat., from Gk. *πέντε*, *pente*, five + *κρίνον*, *krinon*, lily). A genus of stalked crinoids living in the deeper waters of the modern ocean and found fossil in rocks of Triassic to Pliocene age. The calyx is small, with slender arms that branch innumerable times to form a beautiful feathery head. The stem is long, pentangular in section, and provided with numerous prehensile cirri which constitute organs of attachment to various foreign objects. Pentacrinus was extremely abundant in the Jurassic

seas of Europe, and many slabs bearing numerous fine examples have been obtained from the Liassic rocks of Württemberg. The stems seem to have been of great length, one of them having been traced through many convolutions for about seventy feet. Though of such large size, the entire structure was extremely delicate. In some cases several individuals of various degrees of development and age have been found attached to pieces of fossil wood which must have been originally floating logs drifting about the surface of the ocean and supporting the sessile pentacrinids. See CRINOIDEA.

PENTAGON (Lat. *pentagonium*, from Gk. *πεντάγωνον*, *pentagōnon*, pentagon, neu. sg. of *πεντάγωνος*, *pentagōnos*, five-cornered, from *πέντε*, *pente*, five + *γωνία*, *gōnia*, angle). A polygon (q.v.) of five sides. A pentagon in the form of a star of five rays is called a *pentagram* (*πέντε*, five, *γραμμή*, line). This figure was used as a badge by the members of the Pythagorean school, and is said to have symbolized health. In the figure, if A, D, B, E, C, A are connected in order, a regular *convex* pentagon is formed and the sides of the pentagram become diagonals of the pentagon, and divide one another in golden section (q.v.). Whence in the pentagram Q divides AB, and P divides BA in golden section, and the figure may be constructed from this relation.



PENTAGRAM. See PENTAGON.

PENTAM'ERON (Neo-Lat., from Gk. *πέντε*, *pente*, five + *ἡμέρα*, *hēmera*, day), THE. One of the best of the *Imaginary Conversations*, by Walter Savage Landor (1837). The participants are Petrarch and Boccaccio, who discuss the great Italian writers of the fourteenth century. There is an appreciative setting of Tuscan scenery.

PENTAM'ERUS (Neo-Lat., from Gk. *πενταμερής*, *pentamerēs*, having five parts, from *πέντε*, *pente*, five + *μέρος*, *meros*, part). A group of hinged fossil brachiopods in which the shells are characterized by a more or less distinctly marked division of their interiors into five chambers by radiating septa that arise from the umbonal region. The type of the genus is *Pentamerus oblongus*, an oval to oblong smooth-surfaced shell that is very characteristic of the Upper Silurian rocks of North America and Europe. With this typical species have been associated a number of forms that are now recognized as more properly belonging in other genera. Such are: *Gypidula galeata*, a very characteristic species of the Lower Helderberg limestone; *Pentamerella arata*, a strongly plicate shell of the Lower Devonian; *Camerophoria*, an Upper Devonian to Permian genus which strongly resembles the rhynchonellids; and *Capellinia*, *Clorinda*, *Amphigenia*, *Conchidium*, *Stricklandinia*, all of which are important horizon-markers in the hands of the expert paleontologist.

PENTAM'ETER (Lat., from Gk. *πέντε*, *pente*, five + *μέτρον*, *metron*, measure). The name of a verse composed of five feet or measures. Its most frequent use is in iambic verse. The iambic pentameter is employed for the dialogue of Greek plays, and in English is used for two of the most popular forms, blank verse and the heroic couplet. In the Spenserian stanza, also, it supplies all verses except the last. The dactylic hexameter in Greek and Latin poetry alternates with the pentameter to make up the common form known as elegiac verse.

PENTATEUCH, pĕn'tă-tûk (from Lat. *Pentateuchus*, *Pentateuchum*, *Pentateuch*, from Gk. *πεντάτευχος*, *pentateuchos*, consisting of five books, from *πέντε*, *pente*, five + *τεῦχος*, *teuchos*, tool, book, from *τεύχειν*, *teuchein*, to prepare). The name given by the Greek translators to the group of five books which tradition ascribed to Moses: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. Among the Jews these five books are known as *Book of the Law*, or *The Five Parts of the Law*. The division into five books (to which the division of the Psalms into five sections presents a parallel) was made before the Septuagint translation, apparently for liturgical purposes, though the division into 54 sections (known as *parshioth* or *sidre*) represents the more specifically Jewish division adopted for the distribution of the Pentateuch over the Sabbaths of the year. The division into books or into sections is arbitrary, and has merely conventional significance, for the Pentateuch is a continuous work. In the opinion of modern scholars the Book of Joshua must also be added as an integral part, and it is customary at the present time to speak of the Hexateuch (sixfold book) rather than the Pentateuch. This term Hexateuch, however, must not be understood as implying that the six books are sharply separated from those which follow. The theory regards that part of the Old Testament which extends from Genesis to the end of Kings as a unified historical compilation, brought to its present shape in the Greek period, and aiming to give a complete history of the Hebrews from the creation of the world to the Babylonian captivity in B.C. 586. The Hexateuch covers the portion of this history to the conquest of Canaan and the distribution of the territory among the tribes; the Pentateuch ends with the death of Moses.

Scholars who hold this view reject the opinion, traditionally held till the beginning of the nineteenth century, that the Pentateuch is essentially a law book and the work of Moses. They regard it as a compilation at which many different individuals have worked throughout a long period of time; various sources have been used in making the compilation, among them certain legal codes, originally independent, which have been incorporated and constitute the legal portions. For a statement of what these sources are believed to be and a history of the discussion by which the theory has been developed and strengthened until it has come to be accepted by well nigh all scholars, see the article HEXATEUCH. In addition to what is there said the following points may be here noted.

The difference in style and point of view between the Prophetic narrative (JE) and the Priestly document (P) is very marked. Both begin with the creation of the world and cover the same ground, but the Priestly compiler passes more rapidly over the histories of the earlier and later patriarchs, emphasizing only such incidents as have a bearing on the religious theory underlying his narrative. His chief interest is

theological and ceremonial; his style stilted and formal. The Elohist and Yahwist, on the other hand are genuine story-tellers; events are told for their own sake, in a style flowing and attractive, which makes some of their narratives models of story-telling. In the Book of Exodus, likewise, historical incidents are rapidly passed over by the Priestly compiler till the revelation at Sinai is reached. Here, beginning with chapter xxv., his real object reveals itself—the formulation of the various ordinances, the construction of the tabernacle, its furniture, the organization of the priesthood, the distinction between Levites and priests, duties of both, ceremonies of consecration, sacrificial laws, festival regulations, and the like. The greater part of Leviticus and Numbers is taken up with sections of the Priestly Code introduced by the narrator at the point which he regarded as appropriate.

The chronological order of the codes (Book of the Covenant, Deuteronomic Code, Law of Holiness, Priestly Code) rests upon the detailed study of their contents and language. For example, in the Book of the Covenant there is no restriction of the Yahweh cult to a single sanctuary, which is the distinguishing mark of Deuteronomy and the other codes. A general demarcation between Deuteronomy and the two remaining codes is the lack of a distinction between Levites and priests in the former. The Code of Holiness recognizes the Aaronites only as priests; the Priestly Code is distinguished by a sharp division between Levites and priests. Besides these general indications there are many special ones which go to confirm the thesis.

The chief difficulties are introduced by the complicated and long continued editorial processes involved in the combination of the sources and the additions and modifications introduced in the course of time, which, while of minor importance, yet have a bearing on the problems involved. Thus the Book of Deuteronomy, which is more of an independent work than any other part of the Pentateuch, contains, besides the laws, a series of farewell discourses delivered by Moses and two poems—the so-called Song and Blessing of Moses (chaps. xxxii., xxxiii.). These must have been the work of writers who flourished subsequent to the promulgation of the codes. Such additions involve a long continued process which was not brought to a close till after the Exile, and which produced finally, not only the Hexateuch, but its continuation from the conquest of Canaan to the Exile. It is but natural that the details of this complicated editing should escape us and that some of the problems involved should be incapable of definite solution.

The combination of the codes, the historical narratives of the Hexateuch, and the additional sources used in the books from Judges to Kings, was effected under the influence of a theory which is already evident in the earlier compilers and becomes more fully and consistently adopted by the later schools of redactors. It was believed that the Hebrew clans had been selected as the chosen people of Yahweh, the one God of the universe, and a covenant made between the people and the deity at Mount Sinai. This covenant had been foreordained by a personal one between Yahweh (under other names, e.g. El Shaddai) and the patriarchs, Abraham, Isaac, and Jacob, and a promise for the future of the people had been given to Abraham and confirmed to the two other patriarchs. In close connection with the covenant at Mount Sinai a body of laws had been received directly from Yahweh and promulgated through Moses. As a direct consequence of these views the pious writers who put the Hexateuch into its final shape looked upon the entire history of Israel subsequent to the revelation at Mount Sinai as a constant falling away from the teachings given to the nation at the outset of its career. Even the progress from the crude religious notions of the early time to the lofty monotheism of the post-exilic prophets is represented as a retrogression, not an advance. The struggles, trials, and misfortunes of the nation are punishments sent by Yahweh for disobedience to his decrees. The leaders of the people, notably the kings, are viewed favorably or unfavorably according as they represent an approach to the supposed commands of Yahweh or a departure from them. The natural difficulties encountered in dispossessing the Canaanites, the equally natural rivalry and quarrels between the Hebrews and surrounding peoples (Moabites, Edomites, Philistines, Amalekites), even a distinct social advance, the establishment of a definite political organization in the shape of a kingdom, are all forms of punishment sent by Yahweh. These punishments culminated in the destruction of the two kingdoms in B.C. 722 and 586. The Exile, when Yahweh could no longer be appealed to in his legitimate sanctuary, was the grievous atonement for past sins.

For the literature, see the article HEXATEUCH.

PENTATHLON (Gk. *πένταθλον*, quintuple contest, from *πέντε*, *pente*, five + *ἆθλον*, *athlon*, contest). A combination of running, jumping, wrestling, throwing the discus, and casting the javelin, which formed one of the contests in Greek athletic games. The victory in the five events was settled by the wrestling, in which only the contestants victorious in the preceding events took part.

PENTAUR (Egyptian *Pen-ta-uere(t)*). An Egyptian scribe, who was formerly regarded as the author of the poem celebrating the valor of Rameses II. in the battle fought against the Hittites at Kadesh on the Orontes. In this character he is the hero of Ebers's novel *Uarda*. It is now known, however, that he was merely the copyist of the papyrus (Sallier 3) in which the poem has been preserved. According to the first Sallier papyrus he was still living in the tenth year of Meneptah. Another Pentaur, who seems to have been a member of the royal family of Egypt, is mentioned in the Turin judiciary papyrus as being concerned in the conspiracy against Rameses III. He was found guilty by the commission appointed to try the case and was forced to kill himself. Consult Wiedemann, *Geschichte von Alt-Aegypten* (Stuttgart, 1891).

PENTECOST. pēn'tē-kŏst (OF. *pentecoste*, Fr. *pentecôte*, from Lat. *pentecoste*, from Gk. *πεντηκοστή*, *pentēkostē*, fiftieth, sc. *ἡμέρα*, *hēmera*, day, from *πεντήκοντα*, *pentēkonta*, fifty). The Greek name of the second of the three chief festivals among the Hebrews, in the Old Testament commonly called the Feast of Weeks. It received the name Pentecost from the fact that its celebration was determined by an interval of seven weeks or fifty days from the Passover. (See WEEKS, FEAST OF.) From the Jewish Church it was introduced into the Christian, and with spe-

cial solemnity, as being the day of the descent of the Holy Ghost on the Apostles, and of the first solemn preaching of the Christian religion (Acts ii.). From early times Pentecost has been regarded as one of the great festivals of the Christian year, and it was chosen as one of the times for the solemn administration of baptism. The English name of the festival, Whitsunday, is derived from the white robes in which the newly baptized were clad. It is regarded as specially sacred to the Third Person of the Trinity, to whose honor the services of the day are directly addressed. As a trace of its originally agricultural character, the practice prevails in the East as well as in the West of decorating the churches with evergreens and flowers, as is done in England at Christmas, and it is interesting to note also that the whole time intervening between Easter and Pentecost is celebrated in the Roman Catholic Church with great solemnity. See PASSOVER.

PENTECOST, GEORGE FREDERICK (1842—). An American Presbyterian clergyman and author, born in Albion, Ill. He left Georgetown College to enter the Union Army, in which he served as chaplain (1862-64). He then entered the ministry, and between 1864 and 1887 was pastor of churches in Indiana and Kentucky, in Brooklyn and Boston. After evangelical work in Scotland, and a special mission to English-speaking Brahmins in India, Dr. Pentecost was for six years pastor of Marylebone Church, London, and (1897-1902) pastor of the First Presbyterian Church of Yonkers, N. Y. In 1902 he was appointed a special commissioner to China, Japan, and the Philippines to examine the missionary work of the Presbyterian and Congregational churches of America. He wrote: *A South Window* (1886); *Bible Studies* (1881-91); *Birth and Boyhood of Christ* (1896); *Systematic Beneficence* (1897); and *Christian Imperialism* (1902).

PEN'THESILE'A (Lat., from Gk. Πενθεσίλεια, *Penthesileia*). The daughter of Ares and Queen of the Amazons. In the latter part of the Trojan War she aided Priam, and showed great valor. Achilles slew her, and, in admiration of her deeds, desired to honor her with a tomb. The ridicule and offensive words of Thersites at this suggestion so provoked Achilles that he killed him, whereupon Diomedes threw the Amazon's body into the Scamander.

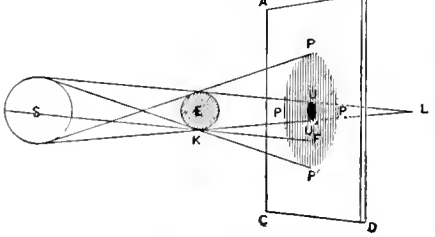
PEN'THEUS (Lat., from Gk. Πενθεύς). The son of Agave, daughter of Cadmus, and his successor on the throne of Thebes. He opposed the introduction of the Bacchic worship, and, being discovered watching the orgies of the Bacchanals, was torn in pieces by his mother and sisters on Mount Cithæron. The *Bacchæ* of Euripides is based on this legend.

PENT'LAND FIRTH. A channel connecting the Atlantic Ocean with the North Sea and separating the Orkney Islands from the mainland of Scotland (Map: Europe, C 3). It is 14 miles long, 6 to 8 miles wide, and crossed by a ferry-line. Its navigation is dangerous owing to strong currents, eddies, and rocks, but it is lighted by several lighthouses, and used by a large number of vessels.

PENTREMITES, pĕn'trĕ-mī'tēz (Neo-Lat. nom. pl., from Gk. πέντε, *pente*, five + Lat. *remus*, oar). A genus of fossil echinoderms typical of the class Blastoidea. The blastoids were crinoid-like animals that lived in abundance in the sea of late Paleozoic time. They resembled the crinoids in respect of the general plan of their organization, but they differed in that the calyx has only 13 principal plates arranged in very regular order, generally forming a bud-shaped head (whence the name), and in the absence of well-developed arms. In place of the arms there were very efficient pinnules that screened the food from the water. The calyx is usually small, pear-shaped, ovate, or globose in form and more or less pentangular in section. The stem is seldom found attached to the calyx. About 20 genera and 150 species of blastoids are known, by far the larger proportion of which are American only.

The blastoids appear to have been derived from some of the more regular cystideans of Ordovician time. The earliest member of the group is *Troostocrinus*, an elongate slender species from the Niagara group of Tennessee. *Elæaerinus* (*Nucleocrinus*) *verneuili* is a well-known index fossil of the Lower Devonian limestones of the Central States. The blastoids attained great prominence in the Subcarboniferous of North America, especially in the Saint Louis and Kaskaskia limestones of the Mississippi Valley. Here the most prominent genus is *Pentremites*, which seems to be unknown in Europe, where it is represented in the Devonian rocks by an ancestral form *Pentremitidea*. See Von Zittel and Eastman, *Textbook of Palæontology*, vol. i. (New York and London, 1900); and Etheridge and Carpenter, *Catalogue of the Blastoidea in the Geological Department of the British Museum*. The latter work contains a full bibliography to the literature of the group. See CRINOIDEA; ECHINODERMATA.

PENUM'BRA (Neo-Lat., from Lat. *pene*, *pæne*, almost + *umbra*, shadow). When the shadow of an opaque object is thrown upon a surface at some distance from it by a light of considerable apparent size, it is observed that the shadow is divided into two portions, a dark portion in the centre, and a lighter portion surrounding it. The former is known as the *umbra*, or complete shadow; the latter as the *penumbra*, or partial shadow. A reference to the figure will



at once make plain their origin and relation; for if S be the illuminating body, E the object whose shadow is cast on the surface, ABCD, it is seen that the small portion, UU′ receives (omitting all consideration of refraction, dispersion, etc., of light) *no* light from S, while the whole surface outside of PPPP′ is completely illuminated. The point P″ receives light from the whole of S; the point F is only half illumined, and that by the lower part of S, the illumination of the points becoming less and less as they approach U′, which

is unillumined. The portion within UU′ is the umbra, and that between the boundaries PPPP′ and UU′ is the penumbra, which, as we have seen, gradually shades from perfect light at the outer boundary to perfect darkness at the inner, so that it is almost impossible exactly to note its limits on either side. This phenomenon, it is evident, can only occur when the illuminating body is of such a size, real or apparent, as to make the angle, P′KU′, of sensible magnitude; and it is equally evident that the nearer the body E approaches the plane on which its shadow is cast, the larger is the umbra and the smaller the penumbra; while by increasing the distance between E and the plane, so that the point L shall fall between them, the umbra is made to vanish, and the penumbra is increased. This is well illustrated by natural phenomena: the shadow of a man cast by the sun on the ground presents almost no penumbra; the shadow of the earth thrown by the sun upon space at the distance of the moon gives a penumbra many times as large as the umbra; and sometimes, when the moon is new at her apogee, for instance, her shadow cast upon the earth exhibits no umbra. Spectators on the earth who see a partial eclipse of the sun are situated within the penumbra, but within the umbra when they observe a total eclipse; while if the eclipse be annular, the umbra does not exist in the shadow cast by the moon on the earth's surface. See ECLIPSE.

PENZA, pĕn'zä. A government of Central Russia, bounded by the Government of Nizhni-Novgorod on the north, Simbirsk on the east, Saratov on the south, and Tambov on the west (Map: Russia, F 4). Area, about 15,000 square miles. The surface is undulating, intersected by numerous ravines and sloping toward the northwest. The district is watered principally by the Moksha, a tributary of the Oka, and the Sura, an affluent of the Volga—both navigable. The climate is harsh, the mean annual temperature at Penza, the capital, averaging 39°. Agriculture, the chief occupation, is favored by a soil of remarkable fertility. Rye, oats, and wheat are the leading cereals raised. Flax is cultivated to a considerable extent, and gardening and stock-raising are well developed. Modern farm methods are making some progress among the peasantry. The manufacturing industries employed in 1895 over 12,000 men, and their products were valued at over $8,000,000. The chief manufactures are spirits, paper, flour, oil, and matches. Population, in 1897, 1,491,215, of whom about 90 per cent. were Great Russians and the rest Mordvins and Tatars.

PENZA. The capital of the government of the same name in Russia, at the confluence of the Penza with the Sura, 440 miles by rail southeast of Moscow (Map: Russia, F 4). It has a monastery and a convent, a mosque, three gymnasia, a real-schule, a seminary for teachers and one for priests, a technical school, a school of drawing, and a picture gallery. The municipality owns the waterworks and directs a pawn shop. Paper, lumber, flour, and various iron products are the chief manufactures. Penza was founded in 1666. Population, in 1897, 61,851.

PENZANCE, pĕn-zăns'. A municipal borough, market, and seaport town in Cornwall, England, on the northwest shore of Mount's Bay, 65 miles southwest of Launceston (Map: England, A 6). It is the most westerly town in England. The town, exceedingly picturesque in situation, stands on a finely curved shore, surrounded by rocky eminences, and is famous for its mild climate. Its esplanade, one of the finest in the west of England, commands charming land and sea views. The chief buildings are the town hall and corn market, and the chapels of Saint Paul and Saint Mary. Its educational institutions include mining and science schools, and a free library. Woolen yarns and cloths are made and the fisheries employ upward of 2000 persons. Agricultural produce, pilchards, china clay, granite, and tin and copper ores produced from the mines of the vicinity are exported; and timber, iron, hemp, and hides are the chief imports. The harbor has two piers, dry docks and wet docks, and a lighthouse. The town owns much remunerative property, wharfs, modern docks, quays, markets, public baths, and water supply. Penzance, meaning 'holy head,' originated in a chapel to Saint Anthony. Edward III. gave it the grant of a weekly market, and in the fifteenth century it was described as 'a place of ships and merchandise.' The Spaniards burned and sacked the town in 1595, and it suffered in the Civil Wars from Fairfax. It enjoyed the privilege of a coinage charter from 1663 to 1838. Population, in 1891, 12,430; in 1901, 13,120. Consult: Millett, *History of Penzance* (Penzance, 1876-80); Lach-Szyrma, *Short History of Penzance* (London, 1878).

PEONAGE. A term loosely used to denote the system of labor formerly prevalent in Spanish America, and especially in Mexico. The system originated in the desire of the Spanish Government to protect the natives from the rapacity of their conquerors. In Mexico the Indians were early given all the privileges of minors, and as such were exempt from compulsory military service, the payment of tithes, aside from a moderate annual tribute, and certain ecclesiastical and legal restrictions, and the royal officials were especially charged with their protection. These privileges and exemptions, however, served equally well as a mark of inferiority, and their natural protectors often took advantage of their helpless political and social condition to force them into virtual slavery. The labor required of the *peones*, as these Indians were called, was of two kinds; the free labor (*obrajes*), a system under which the laborer served by definite contract, with the days of service, tasks, compensation, etc., strictly regulated by the laws of the Indies; and forced labor, as punishment for crime or debt. With the administration of the law in the hands of corrupt officials, it was comparatively easy to extend almost indefinitely the number of the second class, and with the requirement that each Indian must perform a certain number of days' work each year, the condition of laborers of the first class was far from being one of free contract. During the latter period of the Spanish rule many restrictions were adopted to prevent the Indians from falling into debt, and the conduct of employers was so strictly regulated that the condition of the natives was much better than during the first years of Mexican independence.

The principal evils of the system arose from the strict segregation in separate villages of the Indians, which kept from them any opportunities to advance by more intimate contact with a

superior race, and which speedily nullified the first feeble efforts to educate them; and from the feeling of race contempt which their isolated and defenseless condition engendered in their masters. Though in a legal sense the institution itself long since disappeared, the name *peon* is still used to designate the laborer of native or mixed blood, and through his ignorance and credulity many of the worst features of the system are yet fastened upon him. The system as then prevailing in Mexico survived in New Mexico and Arizona a few years after the annexation of the Southwest to the United States, but was removed by national enactment March 2, 1867. Recent revelations have shown that the worst features of the convict labor system of the South, especially as applied to negro prisoners, closely parallel some of the most flagrant evils of early Spanish-American peonage, and consequently that term has been used, though not with strict accuracy, to designate the condition of these convicts.

PEONY (OF. *pione, pioine*, Fr. *pivoine*, from ML. *pœonia*, Lat. *pæonia*, from Gk. *παιωνία, paiōnia*, peony, from *Παιών, Paiōn, Παιάν, Paian*, the physician of the gods; so called because originally regarded as medicinal), *Pæonia*. A genus of plants of the natural order Ranunculaceæ, natives of Southern Europe, Northern Africa, and Asia. The species are large herbaceous or rarely half shrubby perennials often with tuberous roots. The half-shrubby species are known as tree peonies. On account of the beauty of their large flowers, some of the species are extensively cultivated in gardens, and many varieties and hybrids have been originated. The common peony (*Pæonia officinalis*), a native of Southern Europe, is the most generally cultivated species. It produces in early summer large solitary blossoms, usually red or crimson, but varying to white. The white peony (*Pæonia albiflora*), another favorite species, with beautiful white or pink and fragrant flowers, is a native of Siberia, where its roots are used by the Mongolian Tatars as a food. These two species are the parents of many cultivated forms. The Chinese peonies, a large group including many hardy double-flowered and fragrant varieties, are hybrids obtained by intercrossing various species. The term Chinese peony, however, is often applied to several different species. The less common tree peonies are derived mainly from *Pæonia Moutan* and *Pæonia lutea*, which latter is a comparatively recent introduction from China and is as yet not so well known as the other species. It begins to blossom in late spring and produces its yellow flowers for about a month. *Pæonia Moutan*, the commonest of the tree peonies and much larger than the foregoing, attaining a height of 3 or 4 feet, is a native of California and Japan. It blossoms in spring and produces very large and handsome flowers representing a wide range of shade and colors. It is often grown as a greenhouse plant for early spring blossoms. The tree peonies prefer a good, strong sandy loam. They require a rich soil and applications of well-rotted cow manure are very advantageous to the growing plants. They are rather tender, and in many localities require protection. The plants are propagated from cuttings at the base, usually made with a piece of the ripened stem, potted in sandy soil and placed in a cold frame or the greenhouse. They are also grafted in early fall on the roots of *Pæonia albiflora* and *Pæonia officinalis*. The shoots for grafting are without a flower bud and the grafts are potted in sand and kept in cold frames. The herbaceous peonies are commonly increased by divisions of the shoots in fall or spring. New varieties are grown from seed.

PEOPLE'S CHORAL UNION. See CHORAL SOCIETIES.

PEOPLE'S PALACE. An institution at Mile End, London, established to furnish the people of East London with facilities for education and recreation. In 1840 John B. Beaumont left a sum of money, the income of which was to be spent in promoting education and entertainment for the people in the neighborhood of Beaumont Square. This bequest was badly managed until Sir Edmund Hay Currie took the work in hand and added to the $60,000 which remained the quarter of a million he had raised for its extension. In 1882 Walter Besant published his story, *All Sorts and Conditions of Men*, describing a "Palace of Delight." This novel suggested the name for the new enterprise, created a wider interest in the work, and emphasized the recreation idea, for the further development of which the means soon offered. Besant, as trustee, was closely connected with the work. A central location was chosen and Queen's Hall was formally opened by Queen Victoria on May 14, 1887. Technical classes had already been started in temporary buildings in October. Other buildings were gradually added. The institution contains, in addition to Queen's Hall, with its large organ and stage, and a seating capacity of 4600, a library, class-rooms, laboratories, machinery rooms, social rooms, reading rooms, a gymnasium, a swimming tank, and a winter garden. The activities are educational and social. The only religious work is that carried on by voluntarily formed branches of the Young Men's Christian Association. The main object is to furnish boys with a technical training, an opportunity to learn a trade, and wholesome entertainment. There is a day school for boys, limited to 500, which prepares for the technical courses; evening polytechnic classes, scientific classes, language and commercial classes. The technical courses include music, dressmaking, and training for the civil-service examination. A school of art teaches design in relation to the crafts. Its aim is to elevate the taste and improve the skill. Social rooms provide sewing, music for the girls, and reading and billiard rooms for the boys. Debating, athletic, cycling, and rambler clubs are formed among the members. Balls have been given with success. Refreshments are served at a small charge. The library is open to all during the day, to members only in the evening. It is also open on Sundays from 3 to 10 P.M. Several concerts are given during the week to which a small admission fee is charged. There are also Sunday concerts of sacred music at half-past twelve to one o'clock, when the saloons open, and at half-past four and eight in the afternoon. The choral societies of the Palace sometimes give concerts. Exhibitions of pictures have greatly interested the people; as well as 'shows' of chrysanthemums, poultry and pigeons, dogs, cats and rabbits, donkeys and ponies, and exhibits of the work of London apprentices, where prizes and premiums are awarded. The Palace is primarily

for the young, membership being limited to persons from sixteen to twenty-five years; a junior section includes those from thirteen to sixteen. There is a small membership fee for which is received the privilege of attending concerts and other entertainments, the use of the library in the evening, and admission to clubs and classes. The membership the first year was 4200. In 1890 the Drapers Company took the management of the educational work and two years later decided to contribute £7000 annually, while the Charities Commission give £3500.

The *Maisons du Peuple* of Belgium have a similar purpose. They are, however, an outcome of the socialistic movement for coöperative production. They provide a gathering place open to all, where concerts, lectures, and entertainments are given, and books and companionship can be obtained. They are the people's temples.

Jersey City, N. J., has a People's Palace in connection with the People's Tabernacle. A day nursery, baths, swimming tank, a gymnasium, industrial training, and amusements (bowling, billiards, theatricals, dancing) are provided.

The social settlement of to-day is a later development of the People's Palace idea. Institutions like the Educational Alliance and the University Settlement of New York City are organized to meet the need for a more intimate acquaintance with the home life and interests of the poor.

Bibliography. Besant, *All Sorts and Conditions of Men* (London, 1882); *Century*, 18, 163 (1890); *Nineteenth Century*, 27, 344; *Contemporary*, 51, 226; *North American Review*, 147, 56. For Maisons du Peuple, consult Halévy, *Essais sur le mouvement ouvrier en France* (Paris, 1901).

PEOPLE'S PARTY. See Farmers' Alliance; Populist Party.

PEO'RIA. One of the five principal tribes of the Illinois Confederacy. Their home territory was in central Illinois, about the lake of the same name. They shared in the swift decline of the Illinois tribes, largely brought upon themselves by the murder of Pontiac, and were soon reduced to a mere remnant. In 1832 they and the Kaskaskia removed to Kansas, whence in 1854 they again removed to the reservation in the northeastern corner of Indian Territory, where they still reside, confederated with the remnant of the Kaskaskia, Wea, and Piankishaw, the entire body numbering only 180, all probably of mixed blood. See Illinois; Kaskaskia.

PEORIA. An important manufacturing city and railroad centre, the county-seat of Peoria County, Ill., 160 miles southwest of Chicago, on the Illinois River, at the outlet of the expansion called Peoria Lake, and on the Chicago, Burlington and Quincy, the Chicago and Alton, the Chicago, Peoria and Saint Louis, the Chicago, Rock Island and Pacific, the Iowa Central, the Lake Erie and Western, the Toledo, Peoria and Western, and other railroads (Map: Illinois, C 3). The city occupies an area of more than $8\frac{1}{4}$ square miles on a plateau, and is surrounded by a fine rolling country. There are 43 miles of paved streets (principally brick and asphalt), 50 miles of street railways, 75 miles of sewers, and a well-conducted system of parks and drives, the public park system comprising about 350 acres and including Glen Oak and Bradley parks. A soldiers' monument is among the attractions of the city, as is also a wagon bridge across the Illinois River. The city hall and court-house are handsome buildings. Peoria has a public library of 75,000 volumes and the Peoria Law Library, Bradley Polytechnic Institute, and Spalding Institute. It is an important commercial centre, controlling a large trade both by rail and river. It is also a great grain market, and its live stock and meat-packing interests are extensive. The manufacturing establishments include distilleries, glucose works, strawboard mills, wagon works, malting houses, breweries, wire-fence works, a peanut-roaster factory, agricultural implement works, foundries and machine shops, lumber mills of various kinds, and flouring mills. In the production of high wines Peoria ranks first among cities of the United States, the output of its distilleries, according to the census of 1900, being valued at $26,792,000. A very small amount of whisky is made in Peoria, the high wines being sent to rectifying establishments to be changed into whisky.

The government is vested in a mayor, elected every two years, a council, and in administrative officials who are all, with the exception of the treasurer, city clerk, city attorney, and police magistrate—these being chosen by popular vote—nominated by the executive, subject to the consent of the council. Peoria spends annually in maintenance and operation about $610,000 the principal items being $234,000 for schools, $80,000 for the fire department, $80,000 for the police department, and $37,000 for municipal lighting. The valuation of property (real and personal) is assessed at over $10,000,000. Population, in 1880, 29,259; in 1890, 41,024; in 1900, 56,100, including 8900 persons of foreign birth and 1400 of negro descent. Since the census of 1900, North Peoria, which had a population of 2358, has been annexed to Peoria.

In 1680 La Salle visited the site of Peoria and built near here Fort Crevecœur, which, however, was soon abandoned. Some time in the eighteenth century French traders settled here. In 1812 General Craig of the United States Army broke up their settlement, suspecting them of assisting the Indians. The present city really dates from 1819. In 1835 Peoria (named from the Peoria Indians) was incorporated as a town, and in 1845 it was chartered as a city. Consult Ballance, *The History of Peoria* (Peoria, 1870).

PEPI, pā'pē. The name of two Kings of Egypt of the Sixth Dynasty.—Pepi I., the greatest monarch of this dynasty, reigned for some twenty years about 2500 B.C. Memorials of him are found throughout Egypt from Elephantiné to Tanis, as well as in various mines and quarries. An inscription carved on the rocks of the Wâdi Maghâra, in the peninsula of Sinai, records the fact that he sent an expedition thither in the eighteenth year of his reign, and there is other evidence of his military activity. An official named Una, in an inscription found at Abydos, relates that, at the command of King Pepi, he gathered an army, chastised the Bedouins of the Sinaitic peninsula in several expeditions, and conducted an expedition against a more distant Asiatic country, whose name has not yet been identified. Pepi was the founder of Memphis (q.v.), which took its name from the King's pyramid Men-nofer, erected in the vicinity. This pyramid, which

is situated near the modern village of Sakkara, was opened in 1881, and its inner walls were found to be covered with religious texts. The successor of Pepi I. was his son, Mer-en-rē, and he, dying after a brief reign of four years, was succeeded by his brother Pepi II., of whose reign little is known. According to the Turin papyrus he reigned for ninety years, while Manetho, who calls him Phiops, states that he reigned for a hundred years. His pyramid at Sakkara was opened in 1881; it contains religious texts similar to those found in the other pyramids of this dynasty. Consult: Petrie, *A History of Egypt* (3d ed., New York, 1897); Budge, *A History of Egypt* (ib., 1902).

PEP'IN, or **PIP'PIN.** The name of several Frankish mayors of the palace, ancestors of the Carolingian kings. Pepin the Elder (died 639), also known as Pepin of Landen, was the first of the name to become prominent. He was *major domus* of King Dagobert I. of the Franks, and, together with his friend Arnulf, Bishop of Metz, controlled the policy of the State. The son of Arnulf was Ansegisel, and he married Bega, the daughter of Pepin. Their son was Pepin of Heristal (died 714), who became *major domus* in the eastern part of the Frankish realm, known as Austrasia, about 679. For several years he waged an unsuccessful war against Ebroïn, *major domus* of Neustria or West Frankland, until in 687 he won a decisive victory at Testry, which gave predominance to Austrasia, the Germanic part of the Frankish country, over Neustria, which on the whole was Celtic. Pepin became the ruler over all the Franks, completely overshadowing the various kings. His natural son was the famous Charles Martel (q.v.).—Pepin the Short (714-768) was King of the Franks from 751 to 768. He was the second son of Charles Martel, and hence a grandson of Pepin of Heristal. In 741 he and his brother Karlmann received the office of mayors of the palace. In 742 they found it necessary to place a Merovingian, Childerich III., upon the throne which their father had left vacant. For some years the two brothers ruled conjointly, but in 747 Karlmann abdicated and became a monk, and later abbot of Monte Cassino. In 751, supported by the Pope, Pepin was crowned king, thus becoming the first king of the Carolingian dynasty. Childerich was compelled to enter a monastery. In 754 Pepin was made patrician of Rome. Soon after he made an expedition into Italy against the Lombards, whom he conquered. The portion of the Exarchate of Ravenna which the latter had seized Pepin gave to the Pope. (See Aistulf.) In the following year he made another expedition against the Lombards, whom he subdued thoroughly, and renewed his gift to the Papacy. This is sometimes called the Donation of Pepin (q.v.). Besides overcoming the Lombards, Pepin conquered Aquitaine, took some cities from the Saracens, added Bavaria to his empire, and began the wars against the Saxons which his son Charles was to wage successfully. Pepin was closely associated with the great missionary Boniface (q.v.), and did much to strengthen the relations between the Papacy and the Franks. He died September 24, 768, and was succeeded by his sons Karlmann and Charles the Great (q.v.). Consult: Bonnell, *Die Anfänge des karolingischen Hauses* (Berlin, 1866); Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France* (Paris, 1892); Waitz, *Deutsche Verfassungsgeschichte* (Kiel, 1879-96); Oelsner, *Jahrbücher des fränkischen Reiches unter König Pepin* (Leipzig, 1871); Hodgkin, *Italy and Her Invaders*, vol. vii. (Oxford, 1899).

PEPIN, Lake. An expansion of the Mississippi River, forming the boundary of Pierce and Pepin counties, Wis., on the northeast, and Goodhue and Wabasha counties, Minn., on the southwest (Map: Minnesota, F 6). It is 27 miles long, extending from Red Wing south to the mouth of the Chippewa River, and from two to three miles wide. The lake is surrounded by bluffs of limestone, rising some 400 feet, weather-beaten into fantastic shapes.

PEPITA JIMENEZ, pā-pē'tä hē-mā'näth. A romance by Juan Valera (1874), the story of a young seminarist, whom the power of a natural love overcomes, in spite of his churchly training.

PEPOLI, pā'pō-lē, Gioacchino Napoleone, Marquis (1825-81). An Italian statesman, grandson of Murat. He was born at Bologna, and married at nineteen his cousin, Friederike of Hohenzollern-Sigmaringen. In 1848 he led the national guards with success against the Austrian troops, and when his native city was taken by the Austrians he fled to Tuscany. In 1859, seven years after his return, he was put at the head of the provisional government of Bologna. After the annexation of the Romagna, he entered the Italian Parliament as a member of the Left Centre, and was Ambassador to Saint Petersburg (1863-64) and to Vienna (1868-70). His close relations with the Hohenzollerns and Bonapartes were influential in securing recognition and assistance for the Italian kingdom. From 1868 to his death Pepoli was a Senator.

PEPPER (AS. *pipor*, *piper*, from Lat. *piper*, from Gk. *πίπερι*, *piperi*, *πέπερι*, *peperi*, pepper, from Skt. *pippala*, long pepper). *Piper*. A genus of plants of the natural order Piperaceæ (q.v.), with woody stems, solitary spikes opposite to the leaves, and covered with flowers on all sides, the flowers mostly hermaphrodite. The most important species is common pepper or black pepper (*Piper nigrum*), which is a native of the East Indies, cultivated also in many tropical countries, and extensively in some parts of the new world, its fruit being the most common and largely used of all spices. It is a rambling and climbing shrub, with smooth and spongy stems, 12 to 20 feet in length, and broadly ovate, acuminate, leathery leaves. The fruit is about the size of a pea, of a bright-red color when ripe, not crowded on the spike. In cultivation, the pepper plant is supported by poles, or by small trees planted for the purpose. It is propagated by cuttings, comes into bearing in three or four years after it is planted, and yields two crops annually for about twelve years. When any of the 'berries' of a spike begin to change from green to red, all are gathered, as when more fully ripe they are less pungent, besides being apt to drop off. Pepper was known to the ancients; Hippocrates used it as a medicine. In the Middle Ages pepper was one of the most costly spices, and in the thirteenth century a few pounds of it were reckoned a princely present. The *black pepper* of commerce consists of the dried berries. *White pepper* is the seed freed

from the skin and fleshy part of the fruit, to effect which the dried fruit is soaked in water and then rubbed. Pepper depends for its properties chiefly on an acrid resin and an acrid volatile oil; it contains also a crystalline substance called *piperin*. The fruit of *Piper trioicum*, a species very similar to the common pepper, is more pungent, and is cultivated in some parts of India. Red pepper is chiefly obtained from species of Capsicum (q.v.), especially *Capsicum annuum* and *Capsicum frutescens*, varieties of which are grown in gardens in temperate climates. The larger fruited sorts, green or ripe, furnish peppers for pickling; while the smaller sorts are used in making chili, capsicum, or cayenne sauce for meats, etc. The culture of red peppers is about the same as for eggplant (q.v.). See illustrations of VEGETABLES; FLAVORING PLANTS.

Jamaica pepper (or pimento) is a species of Eugenia, of the natural order Myrtaceæ, and Guinea pepper, or Meleguetta pepper, species of the natural orders Scitamineæ and Anonaceæ. See CAPSICUM; ALLSPICE; GRAINS OF PARADISE; and GUINEA PEPPER.

PEP'PER, WILLIAM (1843-98). An American physician. He was born in Philadelphia, the son of a physician of the same name, a professor in the University of Pennsylvania, and was graduated from that institution in arts (1862) and medicine (1864). His professional advancement was steady and rapid. After a resident hospital service, he became successively curator and pathologist to the Pennsylvania Hospital (1866), visiting physician to the Philadelphia Hospital (1867), pathologist to the latter (1867), lecturer on morbid anatomy at the University of Pennsylvania (1868), visiting physician to the Children's Hospital (1870). In this year he became lecturer on, and in 1876 professor of, clinical medicine, and shortly afterwards he succeeded Alfred Stillé in the chair of the theory and practice of medicine in the University of Pennsylvania. In 1881 he was elected provost of this institution, in which position he displayed conspicuous ability in reorganizing and building up the college. Dr. Pepper was widely noted as a clinician and teacher, and was always in demand as a consultant. He was a member of many medical societies, and was president of the first Pan-American Medical Congress in 1893. For his service as medical director of the Centennial Exhibition at Philadelphia in 1876 he was decorated by the King of Sweden. He was a prominent figure in the social life of Philadelphia. Besides a large number of articles on several medical topics, contributed to journals, Pepper published, with Meigs, a book on *Diseases of Children* (1870; 6th ed. 1877). His most important literary work was the editing of the *System of Medicine by American Authors* (1866), which bears his name. He established (1870) and was for a time editor of the *Philadelphia Medical Times*.

PEPPER BRAND. A disease of cereals. See BUNT.

PEPPER CORN. A disease of wheat. See EARCOCKLES.

PEP'PERELL, Sir WILLIAM (1696-1759). An American soldier, born at Kittery, Me. In 1726 he was elected a representative to the Massachusetts General Court, was next year made a member of the council, and in 1730 was appointed Chief Justice of the Court of Common Pleas. Upon the breaking out of King George's War (q.v.) he enthusiastically favored the attempt of the New England colonies to capture the French stronghold of Louisburg on Cape Breton Island, and lent £5000 toward equipping the expedition. As a result of his activity and influence he was made commander-in-chief. Aided by an English squadron under Commodore Warren, he landed his army, numbering about 4000 men, and began the siege of the fortress on the last day of April, 1745. On the 17th of the following June the place capitulated. Pepperell was in 1746 created a baronet by King George II., and he received other high honors while on a visit to England in 1749. When the French and Indian War began, he was active in raising troops, was commissioned a major-general in the English army, and commanded the forces defending the frontiers of New England. From 1756 to 1758 he was acting Governor of Massachusetts, and in February, 1759, was promoted to the rank of lieutenant-general, but died at Kittery in the following July. He published an account of the *Conference with the Penobscot Tribe* (Boston, 1753). Consult: Usher Parsons, *Life of Sir William Pepperell* (Boston, 1855); Parkman, *A Half-Century of Conflict* (Boston, 1892); and Brooks, *Sir William Pepperell* (New York, 1903), in the "Historic Lives Series."

PEPPER FAMILY. A natural order of plants. See PIPERACEÆ.

PEPPERGRASS (*Lepidium sativum*). A name synonymous with garden cress. See CRESS.

PEPPERIDGE. A North American tree. See BLACK GUM.

PEPPERMINT. A perennial herb. See MINT.

PEPPER-ROOT (*Cardamine diphylla*). A North American perennial herb, of the natural order Cruciferæ, with pairs of ternate leaves, racemes of white flowers, and pungent mustard-flavored roots, used as a condiment.

PEPPER-TREE (so called from the pungent drupes), or PEA-TREE (*Schinus*). A genus of South American and Mexican trees and shrubs of the natural order Anacardiaceæ. The leaves abound in a resinous or turpentine-like fluid, which is discharged when the leaves become turgid. After rain they fill the air with fragrance, and if thrown into water they jump about as if alive, discharging jets of this peculiar fluid. The twigs have also a strong odor of turpentine. One species, Schinus Molle, a rapidly growing tree, which attains a considerable size, has been extensively introduced into California. See Plate of POPPY AND PEPPER-TREE.

PEPSIN (Fr. *pepsine*, from Gk. πέψις, *pepsis*, a cooking, from πέσσειν, *peptein*, to cook; connected with Lat. *coquere*, Skt. *pac*, to cook). An active ferment present in the gastric juice, which has the property of converting the proteid elements of the food into peptones. Pepsin is known to be one of the albuminoids or nitrogenous organic substances, but has never been satisfactorily isolated, and its presence is known only by its effects. Pepsin requires for its action the presence of an acid and moderate warmth. As used in medicine it occurs in a fine yellowish-white amorphous powder, or in translucent grains

or scales. It is extracted from the glandular layer of the stomachs of freshly killed pigs, and should be capable of digesting not less than 3000 times its own weight of albumen. It has, however, been isolated in such a pure form as to be able to digest 25,000 times its own weight of egg albumen. The use to which it is put is to aid gastric digestion in very old or feeble persons where the gastric juice is deficient. The enzyme does not act on carbohydrates or fats, and is therefore perhaps inferior for general use to pancreatine (q.v.). See DIGESTION.

PEPTONES. See PROTEINS.

PEPYS, pēps, pēps, *or* pēp'is, CHARLES CHRISTOPHER (1781-1851). An English jurist, first Earl of Cottenham and Lord Chancellor. He was born in London, was educated at Harrow and Trinity College, Cambridge, and was called to the bar in 1804. In 1830 he was appointed Solicitor-General, and in the following year was elected to Parliament. In 1836 he was made Baron Cottenham and Lord Chancellor in the Melbourne Administration, resuming the post in Lord John Russell's first Government. In 1850 he was made Viscount Crowhurst and Earl of Cottenham.

PEPYS, SAMUEL (1633-1703). A well-known English diarist. He was born February 23, 1633, the son of a London citizen, a tailor, but was well educated, first at Saint Paul's School, and afterwards at Magdalene College, Cambridge. His cousin, Sir Edward Montagu (later Earl of Sandwich, q.v.), introduced him to public employment. In 1660 he was appointed clerk of the acts of the navy, and in 1673 secretary for the affairs of the navy. He was an excellent public servant, acute, diligent, and laborious; but during the fanatical excitement of the Popish plot (see OATES, TITUS), he was committed to the Tower on an unfounded charge of aiding in the design to assassinate the King and extirpate the Protestant religion. Having been discharged without a trial, Pepys was restored to his post in the Admiralty, which he retained till the Revolution of 1688. He subsequently suffered a short imprisonment on the charge of being a Jacobite (1689-90). For two years (1684-86) he held the honorable station of president of the Royal Society. He died May 26, 1703. Pepys wrote *Memoirs of the Royal Navy* (1690), and has been credited with *The Portugal History, 1667-68, by S. P. Esq.* (1677). He left to Magdalene College his large collection of books, manuscripts, and prints, including about 2000 ancient English ballads, forming five folio volumes. This curious collection was begun, he says, by Selden, and continued down to the year 1700, when the form peculiar to the old ballads, namely, the black letter with pictures, was laid aside for the simpler modern fashion. Pepys is now remembered for his *Diary*, deciphered by the Rev. J. Smith from the original shorthand manuscript in the Pepysian Library, Cambridge, and first published in a mutilated form under the editorial care of Lord Braybrooke in 1825. It begins January 1, 1660, and is continued for about nine years, when the diarist was obliged from defective eyesight to abandon his daily task. As a picture of the Court and times of Charles II. this *Diary* is invaluable; the events, characters, follies, vices, and peculiarities of the age are presented in true and lively colors, and the work altogether is one of the most racy, unique, and amusing books in the language. It has often been printed, but all the editions are fragmentary except the last by Wheatley in eight volumes (London, 1893-96), which is accurate and complete except for the omission of a few of the most offensive passages. The same editor has also published *Samuel Pepys and the World He lived In* (London, 1880). Some hitherto unpublished letters of Pepys are to be found in *The Academy*, vol. xxxviii. (ib., 1890), and *The Athenæum*, vol. xc. (ib., 1887). Consult also: Tanner, "Pepys and the Popish Plot," in *The English Historical Review*, vol. vii. (ib., 1892); Stevenson, "Samuel Pepys," in *Familiar Studies* (ib., 1892).

PE'QUOT (from *Paquatanog*, destroyers). A warlike Algonquian tribe formerly occupying the coast region of eastern Connecticut from the Rhode Island border westward to beyond the Thames. They were originally a part of the Mohegan of the Connecticut River, and appear to have acquired their later name by their successful invasion of the coast country until then held by the Niantic. The two tribes continued to be one people until the succession of Sassacus about the time of the English settlement, when a younger chief, Uncas, seceded with his party, who thenceforth acted as a distinct tribe, retaining the old name of Mohegan. By his diplomatic alliance with the English against his rival, Uncas was able to secure for himself and his tribe the dominant influence. Before the collision with the English, Sassacus had successfully enforced his rule over all the various bands of Connecticut from the Narraganset country westward to about the present New Haven, together with the greater part of Long Island. At the period of their greatest strength the Pequot probably numbered at least 3000. By the murder in July, 1636, of a trader, John Oldham, who had maltreated them, the Pequot became involved in a war with the English in 1637. Through the influence of Roger Williams and Uncas, the English secured the aid, or at least the neutrality, of the neighboring tribes, and then marched against the Pequot, who were thus left to fight their battles alone. On May 26 (O. S.), 1637, their principal fort, near Mystic River, was surprised and set on fire by a company of about 90 whites, under Capt. John Mason (q.v.), aided by a small force of Indians, and probably 600 Pequot men, women, and children perished in the flames or were shot down while trying to escape. The loss of the English was only two. The tribe was so crippled by the terrible slaughter that after a few desperate but unsuccessful efforts at resistance they determined to separate into small parties and abandon their country. The principal body, headed by Sassacus, attempted to escape to the Mohawk, but was intercepted and nearly every person was either killed or captured. The few who escaped to the Mohawk, including Sassacus himself, were killed by that tribe. Scattered fugitives were shot down wherever found until the few survivors at last came in and asked for mercy at the hands of the English. All prisoners taken had been sold into slavery, many to the West Indies, and those who now surrendered were distributed among the other neighboring tribes and forbidden any longer to call themselves Pequot. The Pequot given to the Indian allies of the colonists were treated so harshly by their masters that it

was finally necessary in 1655 to gather them into two villages in their old country and place them under direct control of the Colonial Government. Here they numbered about 1500 in 1674. They decreased rapidly, as did the other tribes, and in 1762 the remnant numbered only 140, who in 1832 had dwindled to 40.

PERA, pā'rà. The foreigners' quarter in Constantinople (q.v.).

PERACAMPOS, pā'rà-käm'pōs, Don Juan von Halen, Count of. See Halen, or Halem.

PERÆ'A (Lat., from Gk. Περαία, *Peraia*, from περαῖος, *peraios*, beyond, from πέραν, *peran*, on the other side). A name given to a part of Palestine, east of the River Jordan, anciently belonging to the tribes of Reuben and Gad. Josephus (*Bel. Jud.*, iii. 3, 3) bounds it on the north by Pella, east by Philadelphia, south by the castle of Machærus, and west by the Jordan. Elsewhere (ib., iv. 7, 3 and 6) he names Gadara as the capital. It is probable, however, that Peræa extended as far north as the Yarmuk and south to the Arnon. The district is a high tableland, cut up by deep watercourses. It is naturally a fertile region, provides good pasturage, and the olive and the vine flourish there. In the earlier days of the Maccabees it was inhabited chiefly by 'Gentiles,' but by the beginning of the Christian Era the population had become prevailingly Jewish, and Peræa sent a multitude of Jews to Jerusalem in the uprising against Sabinus. Peræa was the scene of a part of the ministries of John the Baptist and of Jesus, who, according to John x. 40, appears to have been baptized there, and from Peræa He made His last journey to Jerusalem. See Bashan; Gilead; Palestine.

PERAK, pā-rāk'. One of the Federated Malay States (q.v.), situated on the western coast of the Malay Peninsula, bounded by the British Province of Wellesley and the native State of Kedah on the north, the independent States of Petani and Kelantan and the protected State of Pahang on the east, the protected State of Selangor on the south, and the Strait of Malacca on the west (Map: Burma, Siam, etc., D 6). Its area is estimated at about 10,000 square miles. The region is traversed from northeast to southwest by two parallel mountain ranges inclosing the valley of the Perak River. The mountains are highly mineralized; they do not exceed 7500 feet in their highest peaks. There are a number of rivers outside of the Perak and its tributaries, but they are mostly unimportant for navigation. The climate is characterized by intense humidity and is unhealthful for Europeans. The chief mineral is tin, which is mined chiefly in the districts of Kinta and Larut. The output of tin increased in value from $12,339,909 in 1896 to $26,032,000 in 1900, the increase being due exclusively to the rise in the price of the metal. Besides tin Perak has also deposits of gold, silver, iron, lead, copper, arsenic, zinc, manganese, bismuth, etc. According to the census of 1901 mining employed about 78,000 persons, of whom about 76,000 were Chinese. Agriculture plays only a secondary part and a large portion of the region is still covered with forests. The agricultural population numbered nearly 76,000, including over 65,000 Malays. The principal agricultural products are rice, sugar, and coffee. Perak has greatly increased in commercial importance since the establishment of a British protectorate. In 1900 the total commerce of Perak (including interstate commerce) amounted to $43,931,811, of which $29,190,663 represented exports, principally tin, sugar, and coffee. Perak had, in 1900, 114 miles of State railways, connecting the port of Teluk Anson with the mining district of Kinta and Kuala Kangsar, the residence of the Sultan. The revenue of the State is derived principally from the export duty on tin. For the year 1900 the revenue and expenditures amounted to $7,636,126 and $6,144,774 respectively. Perak has increased in population for 1891-1901 from 214,254 to 329,665, or by nearly 54 per cent. The population in 1901 was composed of 150,235 Chinese, 142,168 Malays, 34,760 Tamils and other natives of India, 672 Europeans and Americans, 591 Eurasians, and 1235 belonging to other races. The number of aborigines is given as 7982. Taiping is the administrative capital. The first European settlement in Perak was established in 1650 by the Dutch, who were expelled by the British in 1795. In 1818 Perak fell under the rule of the Siamese, but it regained its independence with the assistance of the British in 1824, and was governed by its own sultans until 1874, when internal dissensions brought about British interference and the appointment of a British resident, who was soon murdered. British authority was reëstablished by means of a punitive expedition and no further manifestation of resistance to British protection has occurred since then. Consult the authorities referred to under Malay Peninsula.

PERAMBULATION OF PARISHES. An ancient custom conducted with much ceremony before the Reformation in England. It took place on one of the Rogation days (q.v.). The clergy, the lord of the manor, and many other persons walked in procession all around the boundaries of the parishes, returning to the church for prayer. The ceremonies were much curtailed at the Reformation, but the custom continued, and, on the plea of immemorial custom, has often afforded evidence in cases of disputed boundary. The origin of the custom has been referred to the Roman festivals of Terminalia and Ambarvalia.

PER CAPITA (Lat., according to heads). A legal term borrowed from the civil law, and employed to denote the kind of succession to the property of a deceased person by which his descendants take according to their number and as individuals, i.e. each takes an equal share. In most jurisdictions descendants in an equal degree of relationship, however remote, take *per capita*, that is, the estate is divided among them in equal shares. The manner of succession and descent is largely regulated by statute in the various States. See Descent; Distribution; Per Stirpes; Succession.

PERCEFORÉT, pārs'fō'rā' (Fr., pierce-forest). A French romance giving the fabled history of Britain before the days of King Arthur, and first printed in Paris in 1528. The time of its production is uncertain, but was probably the latter part of the thirteenth century. The writer hints that the romance was taken from a manuscript found in an English monastery in 1286. The hero, King Perceforêt, so called from his conquest of an enchanted forest, came to Britain with Alexander the Great, after the royal

line of Brut was extinct, and in fulfillment of an oracle was made King. Unlike most romances of chivalry, it deals with enchantments, dreams, and visions rather than with battles and tournaments. In its day it was the most popular romance of its class, and is now valuable for its descriptions of mediæval life and manners.

PERCEPTION (Lat. *perceptio*, from *percipere*, to perceive, from *per*, through + *capere*, to take). A term common both to epistemology and to psychology. The questions how, in general, we come to have knowledge of an 'external' world, and what is the validity of this knowledge when attained, are questions that lie outside of the psychological sphere. Psychologically regarded, perception is either a specific form of mental function or a complex of mental processes, a compound conscious content (percept).

Perception, in its functional significance, is defined by James as "the consciousness of particular material things present to sense." It is single and unitary. By a confusion of contents with function, it is often described as complex; but in the adult mind the impression comes to consciousness *as* perception; we are not conscious of the sum of sensations and of their assimilation and integration: we perceive. Logically, we may split up perception into the part-functions of sensation, reproduction, and integration, just as—from another point of view—we may split it up into discrimination, localization, and integral apprehension or object-intuition. Psychologically, such divisions do not assist us, while they may be dangerous as suggesting that there must be corresponding part-contents to carry the functions. "The perception is one state of mind or nothing." The problem of the psychology of perception, in this first sense, is to test the adequacy of perception to its stimuli, to trace the variation of the perceptive reaction under varying conditions of stimulation (to see, e.g. how it is that the perception of space is predominantly visual, and that of time predominantly auditory), and to follow the development of the perceptive function through the lower orders of mind up to man.

When we turn to the percept, that is, to the contents submitted to structural analysis, we find, on the other hand, an unmistakable complexity. A functionally simple intuition 'contains' a large number of sensation components. The components must not, it is true, be considered as forming a mere sum or aggregate; we do not get a percept by juxtaposing sensations. They are, on the contrary, put together on certain patterns, arranged in certain ways under the conditions laid down by the physiological organism whose sensations they are. In virtue of this arrangement they are, in some cases, intrinsically modified. (See FUSION.) Moreover, they do not remain constant at the different levels of mental development. Sensations that stood in the forefront of the percept at one stage of evolution have retired into the background, or dropped out altogether, at another, while the function of perception is still unchanged. We have, then, a threefold problem before us; to analyze the perceiving consciousness, and so reduce the percept to its lowest morphological terms; to trace the patterns or arrangements of the sense-constituents in perception—patterns of which we are not conscious, but a knowledge of which is necessary if our reconstruction of the percept is to be adequate; and to follow the course of development of percepts, from the simplest to the most highly evolved minds. The first two questions can be answered in the light of observable fact; the third presents greater difficulties than does the corresponding question of the development of function, and must always be answered by an hypothesis, based upon grounds of more or less probability.

Let us take as an illustration the temporal and spatial perceptions: perceptions of locality, magnitude, form, duration, time order, succession, etc. Our first question, as regards function, is: How nearly adequate are these perceptions to the time and space relations of the physical world? What is the least time or least space that we can cognize? What is the least temporal or spatial difference that we can perceive? What are the limits of our apprehension of complex form, of rhythm, etc.? Secondly, we have to explain the fitness of various qualitative and intensive contents (sights, sounds) to carry the spatial and temporal functions. Thirdly, we must trace the growth of these perceptions from childhood onward; and must, wherever possible, push our inquiry back, behind man, to the lower animals. Thus the homing instinct of bees, a localizing function, would come under investigation. On the side of structure the problems are different. In the adult mind extension and duration (qq.v.) are given as attributes of some or all sensations. All that we can do, then, is to trace out the conditions under which these aspects of sensation are turned to account for localization, form perception, perception of succession, etc. The question is one of minute and painstaking analysis. We then inquire if the spatial and temporal formations show any constant difference from (or resemblance to) other modes of perception, e.g. the qualitative; and we find that they represent a common type, the 'colligation' or external connection, sharply contrasted with the fusion of qualitative contents. We then have the genetic problem: the question whether mental process, from the very first, had a temporal and spatial attribute, or whether extension and duration themselves are not formations, constructions, which have by long use been so ingrained into the texture of mind that their mode of origin is no longer discoverable to introspection. So we arrive at the antithesis of 'nativistic' and 'genetic' theories of space and time which still divides psychologists into two distinct schools. The lines of inquiry, functional and analytical, are mutually helpful, but a confusion of their standpoints and problems can lead only to confusion of result.

BIBLIOGRAPHY. Perception is discussed at length in all works upon normal psychology. Consult: James, *Principles of Psychology* (New York, 1890); Wundt, *Physiologische Psychologie* (Leipzig, 1893); id., *Outlines of Psychology*, translated (Leipzig, 1898); Külpe, *Outlines of Psychology* (London, 1895); Titchener, *Experimental Psychology* (New York, 1901). PERCEVAL, pēr'sī-*val*. The hero of one of the most famous and widespread legends in the Arthurian Cycle. Speaking with the uncertainty which always attaches to any attempt to

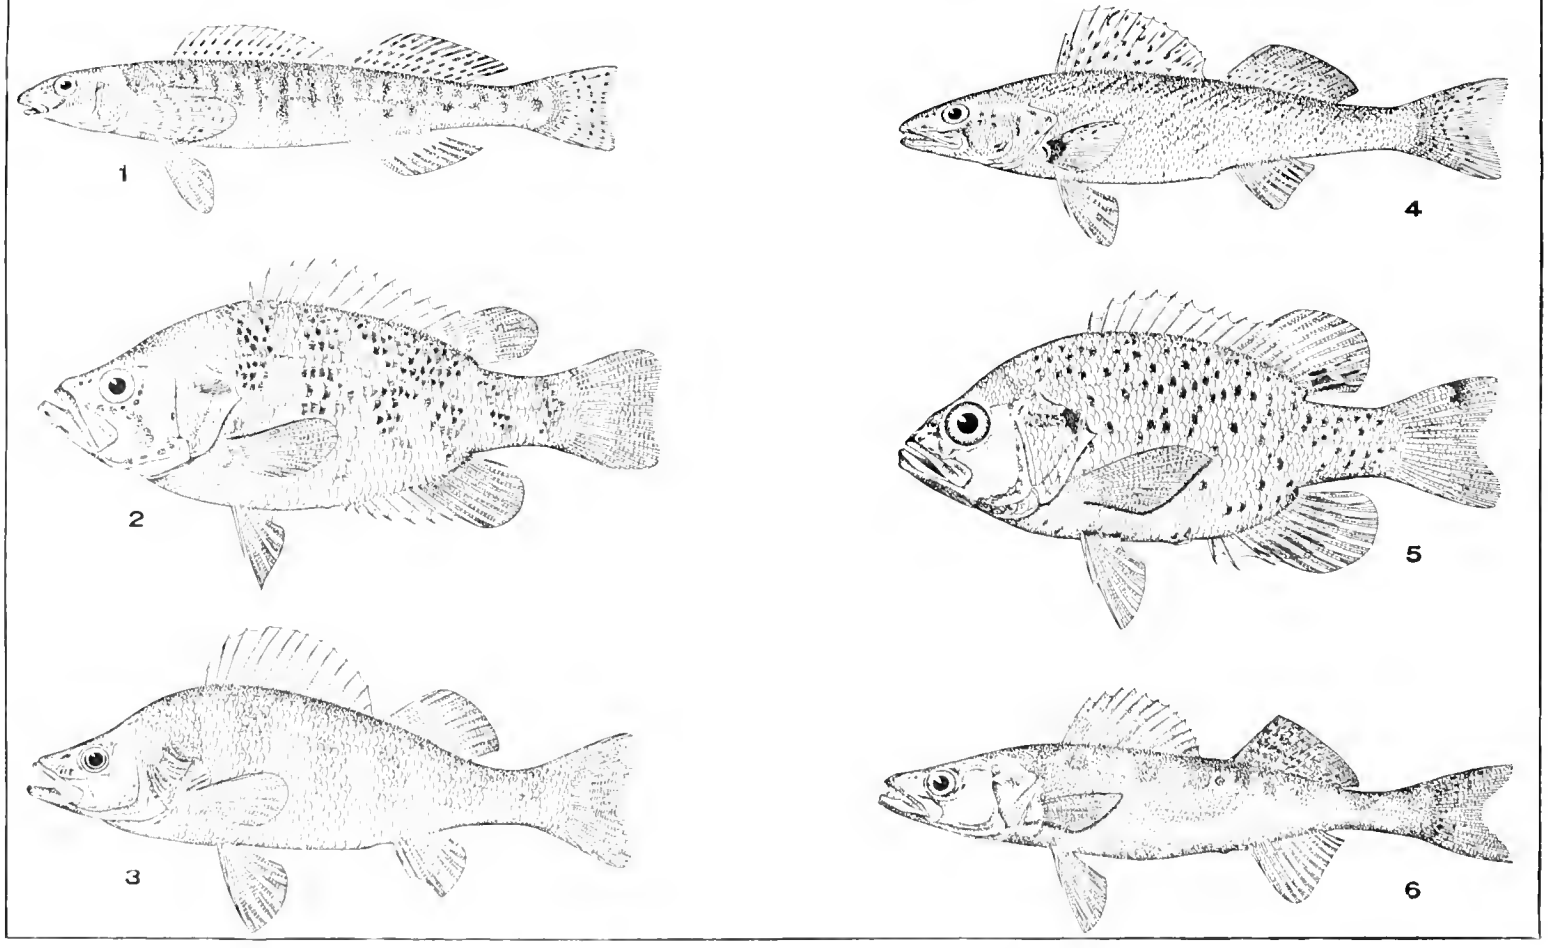
PERCHES OF NORTH AMERICA



1. LOG PERCH (Percina caprodes).
2. SACRAMENTO PERCH (Archoplites interruptus).
3. YELLOW PERCH (Perca flavescens).
4. SAUGER (Stizostedion Canadense).
5. WARMOUTH (Chænobryttus gulosus).
6. WALL-EYED PIKE (Stizostedion vitreum).

determine positively the history of these legends, it may be held that the version of the Grail story in which Perceval is the hero is earlier than that in which Galahad holds this place. Those scholars who maintain the theory of a Welsh origin for the whole cycle attempt with determination to identify Perceval with the Peredur of the *Mabinogion* and other Welsh legends; but it is only by straining a possible allusion that any reference to the Grail can be found in them. This feature becomes of prime importance in the romance of *Perceval le Gallois*, begun by Chrestien de Troyes, continued by Gauchier de Dordan, and finished by Manessier in the closing years of the twelfth century. This French version was taken by the great German poet Wolfram von Eschenbach, and adapted rather than translated. In his *Parzival*, the work of his highest genius, rendered additionally famous from its selection by Wagner as the basis of a libretto, we get further away from the Arthurian legend proper into regions of Germanic mysticism. Yet, though there are defects of dramatic structure in Wolfram's treatment as a whole, and though we find ourselves in a strange country and the Grail mountain, Montsalvatsch, is altogether in fairy-land, there is in him something higher and larger and more human than in the Western versions. For the Welsh theory consult Rhys, *Studies in the Arthurian Legend* (Oxford, 1891); for Chrestien's romance, the edition by Potvin (Mons, 1866-70); for Wolfram, Hertz, *Parzival* (Stuttgart, 1898), which contains good notes and a rich bibliography, and a rendering in English verse by Weston (London, 1894). See GRAIL; and, for the Wagner treatment, PARSIFAL.

PERCEVAL, SPENCER (1762-1812). An English statesman. He was the second son of John, Earl of Egmont, and was educated at Harrow, and at Trinity College, Cambridge. He was admitted to the bar and soon gained a reputation as an able lawyer. A clever pamphlet on the abatement of the impeachment of Warren Hastings made him favorably known to Pitt. Obtaining a seat in Parliament for Northampton in 1796, he supported Pitt in his policy of war with France and of a strong rule at home. In the Addington Administration he was made Solicitor-General in 1801, and Attorney-General in 1802. In 1807 he abandoned the legal profession to accept the post of Chancellor of the Exchequer under Portland. In this position he conceived and drafted the 'Orders in Council,' which became extremely unpopular. His well-known opposition to Catholicism assured him the favor of George III. He was in fact the real head of the Government; and on the death of the Duke of Portland in 1809, Perceval himself became Prime Minister, uniting to his office of Chancellor of the Exchequer that of First Lord of the Treasury. He was retained in power by the Prince of Wales on his accession to the regency. On May 11, 1812, as Perceval was entering the lobby of the House of Commons, he was shot and killed by a Liverpool broker named Bellingham, who believed that losses he had sustained while in Russia were the fault of the Government. Consult: Walpole, *Life of Spencer Perceval*, including his correspondence (London, 1874); Williams, *Life and Administration of the Right Honorable Spencer Perceval* (ib., 1856); Alison, *History of Europe* (Edinburgh, 1843-44); Jesse, *Memoirs of the Life and Reign of George III.* (London, 1867); Napier, *History of the War in the Peninsula* (ib., 1851); Massey, *History of England During the Reign of George III.* (ib., 1855-63).

PERCH (OF., Fr. *perche*, from Lat. *perca*, from Gk. πέρκη, *perkē*, perch; connected with πέρκνος, *perknos*, Skt. *pṛśni*, spotted). The name rather loosely applied to a large number of fishes having a perciform body. These often belong to very different families. The true perches belong to the family Percidæ and are all fresh-water fishes. In this family the body is elongated, either compressed or cylindrical, and covered with rather small ctenoid scales. There are two dorsals, usually quite distinct, the anterior spinous, and with six to fifteen spines, and the anal with one to two spines. The air bladder is small or entirely wanting. Perches are usually considered typical spiny rayed fishes. There are about 20 genera and 125 species. They are distributed in the cooler regions of the Northern Hemisphere, the majority of the species being confined to Eastern North America. The typical perches (genus Perca) contain the well-known yellow perches of Europe, Asia, and America, which closely resemble one another. The American species (*Perca flavescens*) is a fish well known to all anglers, abounding in the lakes and streams of all the eastern half of the country, as far north as the Saint Lawrence River and Nova Scotia. It reaches the length of a foot, is gamy, and admirable for eating. Its back is olivaceous in color, the sides golden yellow with six or eight broad dark bars, and the lower fins orange-red. It spawns in late winter and early spring, laying eggs in zigzag hollow strings, from two to seven feet long. These fish are carnivorous, and feed largely on smaller fishes, including the fry of some more valuable than themselves. They are extremely numerous in the Great Lakes, where they are caught near shore in seines and gill-nets in vast quantities, and shipped to interior markets to the value of about $300,000 annually. Other local names are 'ringed' and 'raccoon' perch. Other members of this family are the great tribe (subfamily Etheostominæ) of darters, the pike-perches, and log-perches (qq.v.).

Various other unrelated fishes are styled perches. Thus the salt-water 'perches' of California are surf-fishes (q.v.); the 'Sacramento perch' (q.v.) is a rock-bass; the 'white perch' may be a drumfish in the East or a surf fish in the West. See also PIKE-PERCH; PIRATE-PERCH; TROUT-PERCH. Consult: Günther, *Introduction to the Study of Fishes* (Edinburgh, 1880); Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898); Goode, *American Fishes* (New York, 1888). See Plate of PERCHES OF NORTH AMERICA.

PERCHERON HORSE, THE. A valuable species of horse. It is a native of the Department of Perche, in the northwestern part of France, and ranges from 14¾ to 16 hands in height. It is "of a sanguine temperament mixed in variable proportions with the musculo-lymphatic," according to the description given by the French Government reports. The Percheron closely resembles the Arab type, although in a heavier and grosser form, and were it not that it has been for ages employed for draught purposes, which have imparted to it a bony frame,

an anatomical structure adapted to the work it is called upon to perform, it would bear the nearest type relationship to the Arab horse.

PERCHLORIC ACID, $HClO_4$. A colorless corrosive liquid that may be prepared by distilling potassium chlorate with sulphuric acid, and cautiously redistilling the distillate. When brought in contact with organic substances, such as paper or wood, perchloric acid causes almost explosive combustion. It is a monobasic acid that combines readily with bases to form a series of salts called perchlorates. Perchloric acid and the perchlorates are very stable. The acid is the only one of chlorine acids containing oxygen that can be distilled, although partial decomposition does take place. Potassium perchlorate ($KClO_4$) is formed when potassium chlorate is heated (as in preparing oxygen). Further heating decomposes the perchlorate into potassium chloride and free oxygen. On the other hand, when potassium perchlorate is heated alone, it decomposes with the formation first of the chlorate and chloride of potassum and of free oxygen.

PERCIER, pār'syā', CHARLES (1764-1838). A French architect and designer, born in Paris. With Fontaine, his friend and afterwards his partner, he was a pupil in the atelier of Peyre, and he also drew with Chalgrin, and studied under Alexandre Guy de Gisors. He won the Prix de Rome in 1786. After his return to Paris, he designed furniture and scenery for the Opéra, all in the antique style. He did for furniture what David was doing in painting, and fairly introduced the classic revival of the Empire. Percier and Fontaine were appointed architects for the Opéra, the Louvre, and the Tuileries. They restored the Colonnade, and finished the second story of the buildings on the court in the Louvre; built the chapel, theatre, and other portions of the Tuileries; designed the Arc de Triomphe du Carrousel; the monument to Desaix, the stairway of the Museum of the Louvre (removed by Napoleon III.), and restorations and additions at Versailles, Saint Cloud, and other palaces. Percier also built the tomb of the Countess of Albany at Santa Croce in Florence (1824). About 1814 Percier gave up his connection with Fontaine and worked constantly in his atelier, where he had established a free school of architecture. Together Percier and Fontaine wrote many books on architecture, and Percier alone wrote *Restauration de la colonne Trajan* (1788).

PERCIVAL, pēr'si-val, JAMES GATES (1795-1856). An American poet, geologist, botanist, surgeon, musician, and linguist, born in Kensington Parish, Berlin, Conn. After graduating from Yale (1815) he followed his various callings in West Point, Boston, Philadelphia, Charleston, S. C.; Connecticut, and Wisconsin. He did good work in geology, and his poetry is generally fluent and occasionally striking. A complete edition of it, with a biographical sketch by Erastus North, was published in 1859. Consult Ward, *The Life and Letters of James Gates Percival* (Boston, 1866).

PERCLOSE (OF. *perclose*, *parclouse*, inclosure, from ML. *perclusus*, for Lat. *praeclusus*, p.p. of *praecludere*, to shut off, from *prae*, before + *claudere*, to close). A railing or other inclosure separating a tomb or chapel from the rest of a church.

PERCOIDEA, or **PERCOIDEI** (Neo-Lat., from Lat. *perca*, perch). A large group of spiny-rayed fishes, including the perches and their near relatives. It embraces the families Centrarchidæ, Percidæ, Cheilopteridæ, Centropomidæ, Serranidæ (sea-bass), and others, which are regarded by some ichthyologists as standing at the head of the fish class. The characteristics of this world-wide and important group are given under the names of its various representatives elsewhere described. See PERCH; SEA-BASS; etc. Consult: Jordan and Evermann, *Fishes of North America* (Washington, 1896); Boulenger, *Catalogue of the Pereiform Fishes in the British Museum* (London, 1897).

PERCOLATION (Lat. *percolatio*, from *percolare*, to strain through, filter, from *per*, through + *colare*, to filter, from *colum*, colander). A process used chiefly in pharmacy for extracting the soluble constituents of suitable substances by the gradual descent through them of a solvent liquid, usually alcohol or alcohol and water, technically known as the menstruum. The apparatus in which the operation is performed is called a percolator, and the finished product the percolate. The method is also called the process of displacement, because the solvent, after becoming charged with the soluble portions of the drug, is displaced by fresh portions of the menstruum, which, by its own weight and the pressure of the liquid above, continues downward and is discharged below.

PERCUSSION (Lat. *percussio*, from *percutere*, to strike through, from *per*, through + *quatere*, to strike). In medicine, the method of eliciting sounds by tapping or gently striking the surface of the body, its object being to determine by the nature of the sound the comparative density of the subjacent parts. This method of diagnosis is not of recent date, for we find it mentioned by Hippocrates. It was employed by Auenbrugger in the middle of the eighteenth century and later by Corvissart in the investigation of heart disease, and by Laënnec in diseases of the chest. But as the only way of practicing percussion was by striking the surface itself with the tips of the fingers or knuckles, technically known as *direct* or *immediate* percussion, its value was limited, and it was not until Piorry introduced the *mediate method*—the stroke being made not upon the surface itself, but upon some intervening substance applied closely to it—that the practice became useful. This flat intervening body, made of wood, ivory, or gutta-percha, is called a plexímeter. It is struck either with a small hammer or *plessor*, or with one or more finger-tips. Instead of an ivory or rubber plexímeter the left index or middle finger of the examiner may be used, with its flat surface fitted accurately to the part under investigation. The force of the stroke on the plexímeter—whether the stroke be made with the fingers or the hammer—must vary according as it is desired to elicit the sound from a superficial or a deep-seated part. The surface to be percussed should be exposed, or, at most, only covered with one layer of clothing; and the blow should fall perpendicularly on the plexímeter. When percussion is made over a considerable cavity filled with air—as the stomach or intestines—a hollow, drum-like, or *tympanitic* sound is produced. When any part of the surface of the chest is struck

below which there is a considerable depth of healthy lung-tissue, consisting of small cells filled with air, a clear sound, less loud and hollow than the tympanitic sound, and termed the *pulmonary percussion note*, depending partly on the vibrations of air in the lung-cells, and partly on the vibrations of the walls of the chest, is evolved. When the subjacent substance is solid (as the heart, liver, or spleen) or fluid (as when there is effusion into a closed sac), the sound is *dull* in proportion to the density and want of elasticity of the part struck.

Auscultatory percussion is practiced when, instead of listening to the percussion sounds as transmitted through the air, the stethoscope is placed upon the chest near the point of percussion and the sound conveyed through it to the examiner's ear. See AUSCULTATION.

PERCUSSION, CENTRE OF. See CENTRE OF PERCUSSION.

PERCUSSION CAP. See SMALL ARMS.

PERCY, pĕr'sĭ. The name of a noble family whose head, William de Percy, accompanied William I. to England, and obtained from him thirty knights' fees in the north of England. The representation of the house devolved in the time of Henry I. (1100-35) on Agnes, daughter of the third baron, who married Josceline of Louvain, who assumed the Percy name. The head of the family at the time was one of the chief barons who extorted Magna Charta from King John; and the ninth feudal lord in the reign of Edward I. (1272-1307) maintained, with others of the greater barons, the spiritual independence of the English Crown. This nobleman's great-grandson was a distinguished military commander under Edward III., and, acting as marshal of England at the coronation of Richard II., was created Earl of Northumberland. He subsequently, however, took up arms against Richard, and placed the crown on the head of Henry of Lancaster, who became Henry IV. Again dissatisfied with the Government, he joined in rebellion with his son, Henry Percy, surnamed Hotspur, for the purpose of transferring the crown to Mortimer, Earl of March. (See PERCY, SIR HENRY.) The Earl, with the other leaders of this rebellion, fell at Bramham Moor (1408), and his titles became forfeited. These, however, were revived in favor of his grandson, who became Lord High Constable of England, and who was killed at the battle of Saint Albans. This Earl's son and successor (the third Earl) met a like fate on Towton field, fighting in the van of the Lancastrian army. The fourth Earl was murdered by the populace in Northumberland, when ordered by Henry VII. to enforce a subsidy. The execution of the seventh Earl by Elizabeth is part of the history of England. The eighth Earl was committed to the Tower, on a charge of being concerned in a plot in favor of Mary Queen of Scots, and died a violent death in prison. The tenth Earl fought in the civil wars against Charles I., though he took no part with the regicides, and eventually joined in the general effort to bring about the Restoration. The eleventh Earl left an only child, who succeeded to the ancient barony of Percy, and marrying Charles, Duke of Somerset, became the mother of Algernon, Duke of Somerset, who was created Earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, of Stanwick, in the County of York, a gentleman of respectable lineage. Sir Hugh, succeeding to the earldom, obtained in 1766 his advancement to the Dukedom of Northumberland.

PERCY, FLORENCE. The pseudonym of Elizabeth Akers Allen (q.v.).

PERCY, GEORGE (1580-1632). A British colonial Governor, born at Lyon House, Northumberland. He was a younger son of the eighth Earl of Northumberland, and, when still young, served in the army in the Low Countries. He sailed for America with the first Virginia colony in 1606, and is said to have named the settlement James Fort. In 1609 he succeeded John Smith as President of the Council until the arrival of Sir Thomas Gates in 1610. In the latter year he was a member of Lord De la Warr's council, and served as Deputy Governor in charge from March, 1611, until the arrival of Sir Thomas Dale in May. He left Virginia in April, 1612, and in 1625 returned to the wars in the Low Countries, where he commanded a company in 1627. He was a bitter opponent of Capt. John Smith, and attempted to show his unworthiness in *A Trewe Relacyon of the proceedings and occurrentes of moment, which have happened in Virginia from the tyme Sir Thomas Gates was shipwracke vppon the Bermudos An. 1609 untill my departure out of the Country which was in Anno 1612* (1625).

PERCY, Sir HENRY (known as Hotspur) (1364-1403). An English military leader, the eldest son of Henry Percy, first Earl of Northumberland. He was knighted by King Edward III. at the same time as the future kings, Richard II. and Henry IV. The next year under his father's guidance he began that service on the Scottish border in which he won his greatest fame, and in 1385 became Governor of Berwick. Here his restless activity soon made him the terror of Scottish marauders and earned him the nickname of Hotspur. As this was the period of the Hundred Years' War, young Percy was several times sent across the Channel to take part in the Continental campaigns, but, though he earned the Garter by his achievements against the French, he always came back to the northern border, where he had been made warden of the marches, and it was there that in 1388 he met a host of Scotch invaders under Douglas, March, and Moray, and fought with them the famous battle of Otterburn, which has been immortalized by the ballad of Chevy Chase. Both armies claimed the victory, but probably what advantage there was lay with the Scots, who, though they lost in Douglas the most renowned of their leaders, succeeded in capturing Percy. In 1399 he joined Henry of Lancaster in his successful rebellion against Richard II.—indeed, the Percys claimed that they made the rebellion successful—and after the coronation of the new King as Henry IV., he was rewarded by the gift of offices and lands which made the already powerful nobleman almost a rival to the King. It was not long before Henry began to feel that the Percys were too powerful for the well-being of his kingdom, and when, as a contrast to an unsuccessful campaign of his own against the Welsh, Hotspur won a brilliant victory over the Scotch at Humbledon Hill, the King began to withdraw his favor from his formidable vassal. The Percys quickly resented this, and forming an alliance with Owen Glendower, the Welsh leader,

the Douglases, and other Scotch families, raised the standard of revolt in favor of the young Earl of March, whom they proclaimed King of England. Henry met the insurgents near Shrewsbury, and a desperate battle was fought in which Hotspur was killed and his forces defeated. Consult: Froissart, *Chronicles;* Wallon, *Richard II.;* Ramsay, *Lancaster and York;* Wylie, *History of Henry IV.;* and Percy, *Reliques of Ancient English Poetry.*

PERCY, John (1817-89). An English metallurgist, born at Nottingham. He studied medicine at Paris and Edinburgh, but afterwards devoted himself to metallurgy, and in 1851 was appointed lecturer in the Metropolitan School of Science, now the Royal College of Science. He published: *Iron and Steel* (1864); *Lead* (1870); and *Silver and Gold* (1880).

PERCY, Thomas (1729-1811). An English antiquary, editor of the *Reliques of Ancient English Poetry*, born in Bridgnorth, Shropshire, April 13, 1729. He graduated from Christ Church, Oxford, B.A., in 1750, and M.A. in 1753; and proceeded D.D. from Emmanuel College, Cambridge, in 1770. In 1753 he was given the vicarage of Easton-Maudit, Northamptonshire, where he remained twenty-nine years. In 1782 he was appointed Bishop of Dromore in Ireland, where he resided till his death, September 30, 1811. Percy published two most important works. While visiting his friend Humphrey Pitt at Shifnall in Shropshire, he found a folio manuscript (early seventeenth century) "lying dirty on the floor under a bureau in the parlour." This manuscript he made the basis of *Reliques of Ancient English Poetry* (1765), a collection of English ballads, which has been aptly called the Bible of the romantic movement. It marks the first decisive return in England to the ballad measure, afterwards to be so beautifully employed by Coleridge. The publication exerted, too, great influence in Germany. To the awakened interest in Norse mythology Percy contributed *Northern Antiquities* (1770), which was a translation of the *Introduction à l'histoire de Dannemarc* (1755) of Paul Henri Mallet. He also edited *The Household Book of the Earl of Northumberland in 1512* (1768), and thus set the example for many similar publications. As a poet he was best known for *The Hermit of Warkworth*, and the ballad "O Nanny, wilt thou gang with me?" Of interest, too, as showing Percy's curiosity, is a translation of a Chinese novel from a Portuguese manuscript (1761). Percy's portrait was painted by Sir Joshua Reynolds, and he was honored by a group of scholars who gave his name to the Percy Society (1840-52), founded for the publication of old ballads. Consult: the *Reliques*, ed. by Wheatley (London, 1891); and the *Folio Manuscript*, ed. by Hales and Furnivall (ib., 1867-68). See also Romanticism.

PERCY ANECDOTES. A collection of popular anecdotes which appeared in forty-four monthly parts (20 vols., 1821-23). They professed to have been written by "Sholto and Reuben Percy, brothers of the Benedictine monastery of Mount Benger." The real authors, who assumed these pen-names, were Thomas Byerley (d. 1826), editor of the *Mirror of Literature*, and Joseph Clinton Robertson (d. 1852), editor of the *Mechanics' Magazine*. The name of the collection was taken from the Percy coffee-house in Rathbone Place, London, where Byerley and Robertson were accustomed to meet. Consult the *Percy Anecdotes*, ed. by Timbs (new ed., 4 vols., London, 1887).

PERDIC'CAS (Lat., from Gk. Περδίκκας, *Perdikkas*). The name of several Macedonian kings.—Perdiccas I., the founder of the Macedonian dynasty, an Argive of the Heraclid or Temenid race, who emigrated to Macedonia about 700 B.C.—Perdiccas II., son and successor of Alexander I., reigned from probably 454 to 413. He was friendly to the Athenians in the early part of his reign, but more or less at enmity with them later on and in the course of the Peloponnesian War.—Perdiccas III., brother of Philip of Macedon, was the successor of Alexander, son of Amyntas, and reigned from 365 to 360.

PERDICCAS. A general of Alexander the Great, a prince of the Macedonian royal line, son of Orontes. He took part in nearly all the important battles fought by Alexander, and, in the distribution of honors at Susa, received for his services a crown of gold and the daughter of the Median satrap for his wife. Alexander, on his death-bed, gave to Perdiccas his signet ring, which was the symbol of royal power. Arrhidæus, the natural son of Philip, being recognized as king, Perdiccas was appointed to the chief military command under the new sovereign. He soon, however, established his influence over Arrhidæus and obtained virtual control of the government. A league was at length formed against him by Antipater, Antigonus, Craterus, and Ptolemy. He marched into Egypt to oppose Ptolemy, but was assassinated in B.C. 321, near Memphis, by his own soldiers.

PERDIDO, *Sp. pron.* pĕr-dē'dō. A small river flowing through Perdido Bay into the Gulf of Mexico on the boundary between Florida and Alabama (Map: Alabama, B 5). In 1803, when the United States came into the possession of Louisiana, the Perdido was claimed by the United States as the eastern boundary. Spain protested and was supported by France. The question was finally settled in 1819 by the Treaty of Washington, when West Florida was ceded to the United States.

PERDITA. The daughter of Leontes, King of Sicily, in Shakespeare's *Winter's Tale*, brought up by a shepherd, and married to Prince Florizel.

PEREDA, pā-rā'dā, José María de (1834—). A Spanish novelist, born in the Province of Santander. He was trained to become a civil engineer, but, being a man of means, he devoted himself to literature, after the publication of his first volume of sketches of manners, the *Escenas montañesas* (1864). In his chief works Pereda gives pictures of mountaineer and seaside life that can hardly be surpassed for detail and charm of description. The *Escenas montañesas* (consult the second series of them, entitled *Tipos y paisajes*, 1871) were long left unnoticed by the general public, yet some of the sketches in the volume, and especially that entitled *La leva*, are among his best works. There came next the *Ensayos dramáticos*, versified dialogues containing studies of manners, and the volume of sketches, *Bocetos al temple* (1876). The collection *Tipos trashumantes* (1877) ex-

hibits various common types of the Province of Santander. *El buey suelto* (1877), an account of the life of an egotistical rake, is interesting as first showing in a marked way the author's inclination to adopt some of the methods of naturalism in the novel. In *Don Gonzalo González de la Gonzalera* (1878) the author sets forth the grotesque character of an electioneering campaign in Spain. In the *Pedro Sánchez* (1884) he portrays the Spanish capital as it was in 1854, and makes us follow his hero through a career of political intrigue and ugly married life. The *Sotileza* (1885) is often deemed his masterpiece, and it is certainly a masterly description of life at the seaside and among the fishing folk. Pereda's later works include: *La Montálvez* (1888); *La puchera* (1889); *Nubes de estío* (1891); *Al primer vuelo* (1891); *Pachín González* (2d ed. 1896). Consult the *Prólogo* of Menéndez y Pelayo, prefacing the first volume of the *Obras completas* of Pereda (Madrid, 1887 et seq.).

PÈRE DUCHESNE, pâr dy'shăn'. See HÉBERT, JACQUES RENÉ.

PÈRE GORIOT, pâr gō'rē'ō', LE. A novel by Balzac (1835). The title character is an old man devoted, to the point of mania, to his unworthy daughters, who forsake him on his deathbed.

PEREGRINE FALCON (OF. *peregrin, pelerin*, Fr. *pèregrine*, from Lat. *peregrinus*, foreign, stranger, from *peregr*, being in foreign places, from *per*, through + *ager*, field; ultimately connected with English *acre*). A species of falcon (*Falco peregrinus*) found in almost all parts of the Northern Hemisphere, and in Africa and South America. The female is about 18 inches long, the male only about 15 inches. The female is the 'falcon' of falconers, and the male the 'tercel.' The peregrine falcon of America is popularly known as the 'duck hawk,' and is regarded by ornithologists as a subspecies (*anatum*) of the European bird; the form from the northwest coast of America is also regarded as another subspecies (*Pealei*). The back, wings, and tail are bluish-gray, the feathers barred with a darker tint; the crown, neck, and a spot below the eye, nearly black; the throat white, with dark longitudinal lines; the breast, belly, and legs, whitish, with dark bars. The wings reach almost to the tip of the tail; and the bird is remarkable for its power of flight. The peregrine falcon can easily fly with a bird or quadruped fully its own weight. Its ordinary prey consists of ducks, grouse, woodcocks, and rabbits. Owing to the quantity of preserved game the peregrine falcon captures, it is ruthlessly destroyed in Great Britain and is in danger of extermination. It makes its nest on ledges of high rocks and lays from two to four eggs. It nested on the Palisades of the Hudson as late as 1899. Numerous localities in Great Britain have long been noted as breeding places of the peregrine falcon, and some of them are regularly visited for the young birds, which are still trained in certain places for the sport of falconry. For the American bird, consult Fisher, *Hawks and Owls of the United States* (Washington, 1893). See Plates of EAGLES AND HAWKS; FALCONS AND FALCONRY.

PEREGRINE PICKLE, THE ADVENTURES OF. A novel by Tobias Smollett (1751). The hero is a savage, coarse fellow, fond of rude practical jokes, outrageous in his behavior to Emilia, and ungrateful to his uncle, Captain Trunnion, who adopted him. The Captain and Lieutenant Hatchway supply the humor of the story.

PEREIRA, pe-rā'rȧ, JONATHAN (1804-53). An English pharmacologist, born in Shoreditch, London. He studied medicine and was licensed by the apothecaries in 1823; became apothecary and chemical lecturer at the Aldersgate Dispensary in the same year; fellow of the Royal College of Surgeons in 1825; professor of materia medica at the Aldersgate Street Dispensary in 1832; professor of chemistry in London Hospital in 1833; took the degree of doctor of medicine in 1840 at Erlangen; was licensed to practice in London in 1841; and became physician to the London Hospital in 1851. Pereira's attention turned early in the direction of the science of pharmacology, in which he became famous. He published many papers on the properties and adulteration of drugs, and many monographs and several text-books on chemistry. His most important work was the *Elements of Materia Medica and Therapeutics* (1839-40), remarkable for the extent of its research, variety of information, and exactness. He also published a *Treatise on Diet* (1843) and *Lectures on Polarized Light* (1854). His other works include a translation of the *London Pharmacopœia* (1824) and *Manual for the Use of Students* (1826).

PEREIRA DA SILVA, pȧ-rā'rȧ dȧ sêl'vȧ, JOÃO MANOEL (1817—). A Brazilian historian, biographer, and literary critic, born at Rio de Janeiro. He studied law in Paris, traveled in Europe, and returned to Brazil in 1841 an ardent Liberal, but after entering politics became a Conservative. He wrote the valuable historical works: *Historia da fundação do Imperio Brazileiro* (1864-68); *Segundo periodo do reinado de Dom Pedro I. no Brazil* (1875); and *Historia do Brazil durante a menoridade de Dom Pedro II. 1831-40* (1882); the biographical sketches *Plutarcho brazileiro* (1866); and in literary criticism, *La littérature portugaise, son passé, son état actuel* (1866) and *A poesia epica* (1889).

PÈREIRE, pȧ'rȧr'. EMILE (1800-75) and ISAAC (1806-80). French bankers, distinguished for having instituted schools for the deaf and dumb in France. They were born at Bordeaux. They early carried on at Paris a small brokerage business. By the construction of the railway from Paris to Saint Germain, the first in France, they established their reputation. In 1852 they founded the Société du Crédit Mobilier (see CRÉDIT MOBILIER), and at its collapse in 1867 lost a large part of the great fortune acquired in its management. Isaac published: *La Banque de France et l'organisation du crédit en France* (1864); *Questions financières* (1877); and *Politique financière* (1879).

PÈRE-LACHAISE, pâr lȧ'shăz'. A cemetery of Paris. See LACHAISE.

PERENNIALS (from Lat. *perennis*, lasting throughout the year, from *per*, through + *annus*, year). Plants whose duration is more than two years, contrasted with annuals and biennials.

PEREYASLAV, pā-rā-yäs'lȧf. A town in the Government of Poltava, Russia, 176 miles west-northwest of Poltava (Map: Russia, D 4). There are ruins of ancient fortifications. The Church of the Assumption was founded in 1010,

although the present structure dates from the seventeenth century. The grain trade is important. The town was conspicuous in the history of Little Russia. Population, in 1897, 14,609.

PÉREZ, pā'rāth, Antonio (1539-1611). A Spanish statesman, minister of Philip II., born at Monreal de Ariza, Aragon. He was a natural son of Gonzalo Pérez, one of the ministers of Charles V. and of Philip, and entered upon administrative duties in 1567, after studying at Louvain, Venice, and Madrid. He was the trusted agent of Philip. In 1578 Juan de Escovedo arrived at Madrid to solicit aid for John of Austria, then engaged in the struggle against the Netherlands. Escovedo incurred the hatred of the King and of Pérez, and with the consent of Philip Pérez brought about his assassination (March, 1578). The family of Escovedo denounced Pérez as the murderer, and all his enemies joined against him. The King at first sought to shield him, but on learning of the relations between Pérez and the Princess of Eboli, mistress of Philip, caused his arrest in 1579. He was tortured and forced to confess his crime. In 1585 he was found guilty of embezzlement while in office and was condemned to a long term of imprisonment. In 1590 he succeeded in escaping to Aragon and demanded protection in the courts of that privileged kingdom. The *justicia major*, or highest court of justice in Saragossa, refused to deliver him up. The King applied to the Inquisition for aid in 1591, and the Aragonese court surrendered him to its agents, but the people rose and liberated him. At last, in September, 1591, Philip II. entered Aragon with a powerful army, abolished the old constitutional privileges of the country, and executed a number of the leaders. Pérez, however, escaped, avoiding the plots which the King laid for his assassination. He was condemned in Spain as a heretic, but was well received in Paris and London. He spent the later years of his life in Paris, and died there November 3, 1611, in great poverty. Pérez wrote an account of his experiences, which was published under the title of *Relaciones* (London, 1594), and other works. Consult: Mignet, *Antoine Pérez et Philippe II.* (Paris, 1845); Muro, *Vida de la princesa de Eboli* (Madrid, 1877).

PÉREZ DE HITA, dā ē'tä, Ginés. A Spanish soldier and author, of the second half of the sixteenth century. Neither the date nor the place of his birth or death is known, but he probably was a native of Murcia. He served under Philip II. during the Alpujarra insurrection, but is better remembered as the author of *Historia de las guerras de Granada* (1595), which covers the period from the battle of Alporchones to the death of Alfonso of Aguilar (1501). There is an edition in Rivadeneyra's "Biblioteca de autores españoles," vol. iii. (Madrid, 1876). Pérez de Hita's history has served as the basis of many subsequent works, notably Irving's *A Chronicle of the Conquest of Granada*.

PÉREZ GALDÓS, gäl-dōs', Benito (1845—). A Spanish novelist, born in the Canaries. In 1863 he went to Madrid to study law. Galdós is one of the most prolific of modern Spanish men of letters. His works are marked by out-and-out revolutionary tendencies. One of the most important divisions of his labors was the composition of the collection of tales that form the *Episodios nacionales*. Of these historical romances, the first two series, embracing some twenty stories, were completed in 1883. Writing them under the inspiration of the *romans nationaux* of Erekmann-Chatrian, Galdós gives with historic fidelity and in great detail an account of the struggle for Spanish independence of the Napoleonic invader. The last novels of the second series bring his treatment of political events down to some fifteen years after the return of Ferdinand VII. In a third series he continues his epopee down to even more recent times, dealing with the Carlist War of 1833-40. Galdós ranks well in the domain of realism and psychology, having written several works generally grouped together as *Novelas de la primera época* and *Novelas españolas contemporáneas*. Of the former group are *Doña Perfecta* (1876), *Gloria* (1877), *La familia de León Roch* (1878), and *Marianela* (1878); of the latter are such stories as *El amigo Manso* (1882), *El doctor Centeno*, *Fortunata y Jacinta* (1887), *Miau* (1888), *Angel Guerra* (1891), etc. The vogue of these novels has been even greater than that of his *Episodios nacionales*. In general, they exhibit the contrast between old and blindly conservative elements of Spanish life on the one hand and the new revolutionary ideas of the modern world on the other. The plays of Galdós are inferior to his novels. Chief among them are: *Realidad* (1892); *La loca de la casa* (1893); *La de San Quintín* (1894); *Los condenados*; *Voluntad*; *Doña Perfecta* (1900); *La Fiera*; *Electra* (1900). Consult: Alas, *B. Pérez Galdós, estudio crítico-biográfico* (2d ed., Madrid, 1889); Pardo Bazán, *Polémicas y estudios literarios* (ib., 1892).

PERFALL, pēr'fäl, Anton, Baron (1853—). A German novelist, born in Landsberg. He was educated at Munich, there married an actress, Magda Irschik, and later settled at Schliersee, in Bavaria. Among his novels treating social-political themes, and several collections of stories, may be mentioned: *Ueber alle Gewalten* (1889); *Dämon Ruhm* (1889); *Truggeister* (1892); *Die Sünde* (3d ed. 1896); *König Erfolg* (1899); *Verkauftes Genie* (1900); *Die Uhr* (1901); and *An der Tafel des Lebens* (1902).

PERFECTIONISTS. The name adopted by John Humphrey Noyes (q.v.) and his early followers. Their first settlement was at Putney, Vermont, the native place of Noyes, whither he retired soon after beginning to preach his peculiar views in 1834, and where he gradually gathered about him a small school of believers, beginning with the members of his own family. A Bible-school was begun in the winter of 1836-37, a chapel was erected, and the members of the community spent much time in study and were active in writing and publishing in advocacy of their belief. In accordance with the teaching of Noyes, they held that Christ had actually returned to earth before the close of the Apostolic Age, that His work of saving from sin was complete, and consequently all who were willing to accept His divine reign lived "no longer under law, but under grace," and could do no wrong. The aim being to live together as one family, all possessions were held in common, and a system of complete communism was gradually worked out, involving the institution of 'complex marriage.' The community was broken up in 1847 by the opposition of their

neighbors. The members who held together founded the Oneida Community (q.v.). Consult Hinds, *American Communities* (Chicago, 1902).

PERFECT NUMBER. A number equal to the sum of its aliquot parts; e.g. 6 is such a number since $6 = 1 + 2 + 3$. If the sum of the aliquot parts is greater or less than the number itself, then the latter is called *redundant* or *defective* ($8 > 1 + 2 + 4$; $12 < 1 + 2 + 3 + 4 + 6$). This classification is due to the Pythagorians.

PERFUMERY (from *perfume*, OF. *perfumer*, Fr. *parfumer*, to perfume, from Lat. *per*, through + *fumare*, to smoke, from *fumus*, smoke; connected with Skt. *dhūma*, smoke). A substance which is prepared for use on account of its agreeable odor. Perfumes have been used from the earliest times. Among the nations of antiquity an offering of delicate odors was regarded as a token of respect and homage. The burning of incense formed a part of the Hebrew as of pagan rituals, and hence its use is frequently referred to in the Old Testament. This practice still continues, particularly in the ceremonials of the Roman Catholic Church. The use of perfumes was common among the Greeks and Romans, and both Pliny and Seneca possessed considerable knowledge respecting perfume-drugs. Among the Athenians perfumes were used at feasts, at funerals, and in theatres, the odor of the violet being generally preferred. Both nations learned the use of the still from the Egyptians and applied it to the manufacture of perfumes. The Arabs were skilled in the preparation of fragrant waters; and it was from them, through the Crusaders, that the art was reintroduced into mediæval Europe. The discovery of the process of distillation, which seems to have been forgotten, gave, in the fifteenth century, fresh impetus to this industry, and at its close distilled oils of benzoin, cedar, cinnamon, rose, and rosemary were articles of commerce.

Perfumes may be divided into two general classes, viz. natural perfumes and the artificial or synthetic perfumes. Natural perfumes are of animal or of vegetable origin; artificial perfumes are chemical compounds which resemble natural perfumes in their odor. Artificial perfumes are also of two general classes. In one, the compounds which produce the perfume in nature have been discovered and then reproduced synthetically; this is the case with vanillin. In the other, only the odor of the natural perfume is imitated in a substance which is itself unlike the substance whose odor it possesses; this is true of artificial musk.

The four principal animal perfumes are musk, civet, ambergris, and castor. *Musk* is the dried secretion of the preputial follicles of the musk deer. A similar substance is secreted by the musk-ox, muskrat, and the Florida alligator. *Civet* is secreted by the Viverra civetta and Viverra zibetha. It is found in a double pouch under the tail, from which it is taken from the living, caged animal, two or three times a week. *Ambergris*, a biliary secretion of the spermaceti whale, is supposed to be produced by a diseased conditions of the organs. It is found floating on the water. *Castor* is a glandular secretion of the beaver. When fresh it is in a semi-liquid condition and is prepared for commerce by drying in smoke. The animal perfumes are valuable for the permanence which their presence imparts to the more evanescent vegetable odors.

The list of vegetable perfumes, if complete, would be very long. The odor of plants may be found in the leaves, as in sage, thyme, and mint; in the bark, as in cinnamon and cassia; in the wood, as in cedar and sandalwood; in the flower petals, as in the rose and violet; in the seeds, as in anise and caraway; in the roots, as in the orris; in the fruit-rind, as in the orange; or it may be secreted in the form of resinous gum from the tree itself, as the camphor and myrrh. Perfumes of the last named class have been used from time immemorial.

A series of patient experiments conducted during the latter half of the nineteenth century by Grimaux, Lauth, and other chemists, resulted in the discovery that natural odors could be reproduced in the laboratory by combining the substances which produce such odors in nature. The synthesis of vanillin, the active odorous ingredient of the vanilla pod, by Tiemann and Haarman, marked the beginning of the manufacture of artificial perfumes on a commercial basis. Tiemann discovered that coniferin, the glucoside found in the sap of the pine, could be split up, by means of dehydrating agents, into glucose and coniferylic alcohol, of which vanillin is the aldehyde. Later it was found that the same substance could be produced more cheaply by the oxidation of eugenol, the chief constituent of the oil of cloves, and it is from this source that artificial vanillin is manufactured. The industry has acquired considerable importance both in Europe and America. Another important perfume is ionone, or the artificial odor of violets. It is obtained by condensing citrol with ordinary acetone in the presence of an alkali, the resulting product being then treated with dilute acids. Mirbane oil, the artificial oil of bitter almonds, is derived from benzene. The benzene is treated in a still with two parts of fuming nitric acid and one part of concentrated sulphuric acid. These acids are added slowly and at the end of the chemical reaction the liquor, on adding water, separates into two layers, one of which, on further purification, produces the mirbane oil. Many other synthetic perfumes have been discovered, some of which are produced as the by-products of other industries, or from what were formerly regarded as purely waste materials. The manufacture of artificial musk was introduced by Baur in 1888. A mixture of isobutyl chloride and toluene is heated with aluminum chloride ('Friedel and Crafts's reaction'). Water is added to the product of this reaction, the compound is distilled, and the distillates are collected, and treated with nitric and sulphuric acids, and the product is washed with water. When treated with alcohol, crystals having a marked odor of musk are produced.

The processes employed in obtaining natural vegetable perfumes are described under OILS (section, *Volatile or Essential Oils*).

The centre of the natural perfumery industry has for many years been in Grasse, France, in whose factories, it is said, the product of 5,500,000 pounds of orange blossoms, 4,400,000 pounds of roses, 400,000 pounds of jasmine, and 330,000 pounds each of violets, cassia, and tuberoses are consumed. The culture of flowers for perfumery is carried on chiefly in Turkey, Bulgaria, Arabia, India, and Syria. In the United States,

according to the Census of 1900, there are 266 establishments engaged in the manufacture of perfumery and cosmetics. The total capital invested is reported at $3,499,168; the total number of employees, 1768, and the total value of the product, $7,095,713 annually. According to the United States Statistical Abstract for the same year the value of perfumeries and other toilet preparations imported was $553,411, and ten years earlier was $444,964.

Consult: Askinson, *Perfumes and Their Preparation* (New York, 1892); Perry, *The Chemistry of Essential Oils and Artificial Perfumes* (London and New York, 1900); Durvelle, *Fabrication des essences et des parfums* (Paris, 1893); Mierzinski, *Die Riechstoffe* (Weimar, 1894); Sawers, *Odorographia: A Natural History of Raw Materials and Drugs Used in the Perfume Industry, Intended for Growers, Manufacturers, etc.* (London, 1894).

PER'GAMON, or **PERGAMUS** (Lat., from Gk. Πέργαμον, *Pergamon*, Πέργαμος, *Pergamos*, Pergamos). An ancient city of Mysia, in Asia Minor, the capital of the kingdom of the same name. The city was situated in the valley of the Caïcus, about 15 miles from the coast. The Acropolis is a lofty hill, about 1000 feet in height, situated between the streams Selinus and Cetius, of which the former flowed through the later lower city, now partly covered by the modern town of Bergama. The early history of the place is lost in legend, which declared that the Greek inhabitants came from Arcadia under Telephus, son of Heracles by Auge, and that the name was derived from Pergamos, grandson of Achilles. In the fourth century B.C. it was the seat of a Greek population, but it was not till the early third century that it rose to prominence. Its impregnable Acropolis was chosen by Lysimachus as a hiding place for his treasure of 9000 talents (about $10,000,000), which he intrusted to a certain Philetærus. In B.C. 283 a revolt of Asiatic cities against Lysimachus enabled Philetærus to become master of the place, and the defeat and death of Lysimachus, two years later, enabled him to consolidate his power at first in dependence upon the Seleucidæ of Syria, but later as independent ruler of the neighboring regions of Mysia and the Troad. In B.C. 263 he was succeeded by his nephew Eumenes I. (B.C. 263-241), who maintained his power against the attacks of Antiochus I. of Syria, and developed the resources and prosperity of his little kingdom, which he ruled under the title of Dynast. His cousin and successor, Attalus I. (B.C. 241-197), really placed the new principality on a firm basis through his victories over the Gauls and Antiochus II., whereby he became master of a great part of Northwestern Asia Minor, and though later he was compelled to relinquish part of his conquests, his wise policy of allying himself with the distant power of Rome against his neighbors of Syria and Macedon, enabled him to leave a well-established kingdom to his son Eumenes II. In addition to his military and political ability, Attalus, who assumed the royal title after his defeat of the Gauls, did much to make his capital the centre of the artistic and literary life of Asia. He erected near the city a splendid temple and grove in honor of Athena Nikephoros (Bringer of Victory) and also splendid artistic monuments of his triumphs. To these groups belonged the bronze originals of the well-known Dying Gaul of the Capitol and the Gaul and his Wife of the Ludovisi Collection in Rome. At Athens he erected the stoa of Attalus and placed on the Acropolis a series of small bronze figures representing the battles of the Athenians with the Amazons and Persians, the Gods with the Giants, and the Pergamenes with the Gauls, possibly reduced copies of his monuments in Pergamum, and now known to us in part through a series of small marble figures in Naples, Rome, Venice, and Paris. Eumenes II. (197-159) continued the Roman policy of his father, and was rewarded after the defeat of Antiochus the Great with the greater part of Asia Minor, except Lycia and Caria. To his reign belong the great altar of Zeus and the development of the great library which seems to have been founded by Attalus I. The former was erected near the summit of the Acropolis, at the north end of the Agora. Here rose a great foundation 16 feet high and about 124 by 114 feet square, crowned with an Ionic colonnade which surrounded the altar proper, a mass of earth and ashes inclosed by a wall with cornice and architectural decorations, and ascended by steps. The platform was reached by a broad flight of steps on the west side of the basis. Around the basis was the great work of the Pergamene artists, a colossal frieze about 400 feet long and 7½ feet high, containing a representation in very high relief of the battle of the Gods and Giants, executed with amazing technical skill and full of variety and vigor of composition, though lacking the ideal dignity and nobility of the best Greek art. A small frieze representing the legend of Telephus adorned the Ionic colonnade. The library was established by the King in the halls which surrounded the Temple of Athena Polias above the Agora, and was enriched with a collection of books rivaling the foundation of Ptolemy at Alexandria. Here, too, was gathered a band of scholars about Crates of Mallos, who developed a school of grammatical study, which in opposition to the Alexandrians, emphasized the anomalies rather than the analogies of language. To Pergamum was attributed the invention of a fine parchment for use in books when the jealousy of the Egyptians endeavored to check the activity of the Pergamenes by prohibiting the export of papyrus paper. Under the brother of Eumenes II., Attalus II. (B.C. 159-138), the traditional policy of friendship with Rome was continued and the prosperity and power of the little kingdom increased by successful wars with Bithynia and Thrace. His nephew, Attalus III. (B.C. 138-133), was a student and writer, especially on agriculture, zoölogy, and botany. He left no heirs, and by his will bequeathed his kingdom freedom under Roman protection. An attempt of a pretender, Aristonicus, to seize the power, led to Roman intervention, and in B.C. 129 the Province of Asia was organized with Pergamum as its capital. The city long remained in this position, the seat of a provincial council, and an important centre of Asiatic trade. On the summit of the Acropolis was the Temple of Augustus and Rome, and later a temple to Trajan was added. It seems to have declined under Byzantine rule, though its strategical importance led to the fortification of the hill with a strong wall. Under Turkish rule this fortress was abandoned, but the unfortified town in the plain continued to exist

and is now a thriving place of some 20,000 inhabitants, bearing the name of Bergama. The recovery of Pergamum is due to Carl Humann, a German civil engineer, whose attention was attracted to the place during a visit in 1864, when he observed the destruction of the ancient remains. After much effort, he induced the Berlin Museum to begin excavations in 1878, and when the third campaign closed in 1886, the upper Acropolis had been cleared, including the site of the altar and the library. In 1901 new explorations were begun on the lower slopes of the hill, with the avowed intention of recovering so far as possible the city of Eumenes. The sculptures recovered are partly in Berlin, where the Great Altar has been set up in its old form, and partly in Constantinople. (Berlin, 1885-1895); Haehtmann, *Pergamon* (Gütersloh, 1900); and Dörpfeld, *Führer durch die Ruinen von Pergamon* (Berlin, 1902).

PERGOLESE, pĕr'gō-lā'zā, Giovanni Battista (c.1710-36). An eminent composer of the Neapolitan school. Evidence regarding the date and place of his birth is conflicting; probably the correct account is that of the Marchese di Villarosa, his biographer, who states that he was born at Jesi, near Ancona. In 1717 he was admitted into the Conservatorio dei Poveri di Gesù Cristo at Naples, where he studied the violin under Domenico di Matteis, and composition under Gaetano Greco and Durante. Under the conviction that melody and taste were sacrificed to learning by most of the masters of his time, he abandoned the style of Scarlatti and Greco for that of Vinci and Hasse. His first great work was the oratorio of *San Guglielmo d'Aquitania*, composed in 1731. Two years later appeared his opera *La serva padrona*, which gained him universal fame, and which has remained one of the finest examples of its genre; strangely enough, it was practically his only stage success. In the same year he composed *Il prigioniero superbo* and *Il frate innamorato;* in 1734, *Adriano in Siria;* in 1735, *Il Flaminio* and *L'Olimpiade*. In 1734 he received the appointment of *maestro di capella* of the Church of Loretto. In consequence of delicate health, induced, it is supposed, by irregular habits, he removed to Pozzuoli, where he composed the cantata of *Orfeo* and his pathetic *Stabat Mater*. Besides the above-mentioned works, Pergolese composed a number of pieces for the Church, which were better appreciated during his lifetime than were his secular compositions; also a violin concerto, and thirty trios for violin, violoncello, and harpsichord. His works are all characterized by sweetness and freedom of style. His orchestration was particularly simple, confined chiefly to the strings, reënforced occasionally by the horns and trumpets. An undoubted reason for the contemporary failure of much of his operatic music was his innovation in style, wherein he abandoned the old contrapuntal accompaniments, and supported his melodies and voices with harmonically written accompaniments. He died of consumption at Pozzuoli.

PERI, pā'rē (Pers. *parī*, fairy, Av. *pairikā*, female demon). In Persian folk-lore, a class of fairies, both male and female, of surpassing beauty. In the old Iranian religion, on the other hand, the Peri was a female demon or enchantress of the utmost malignancy. Such a change of concept of a godling from maleficent to beneficent as is found in this instance is a rare phenomenon in comparative religion, although the transformation of the gods of one religion into the demons of another frequently takes place.

PERIAGUA, pĕr'ē-ä'gwä. See Pirogue.

PERIANDER (Lat., from Gk. Περίανδρος, *Periandros*). A tyrant of Corinth from about B.C. 625 to 585. He was a son and successor of the tyrant Cypselus. He was energetic as a warrior, and distinguished as a patron of poetry and music, and is by some reckoned as one of the Seven Wise Men of Greece. He was, however, cruel and despotic. He is said to have put to death his wife, Melissa, while his son Lycophron was sent to reside at Coreyra, which was then under Periander's rule. Later, when Periander, wishing to see his son, undertook to visit Corcyra, the Coreyreans, terrified at the prospect and hoping to avert the visit, put Lycophron to death. Periander, as tyrant, had under his sway, besides Corinth, also Coreyra, Ambracia, Leucas, and Anactorium. Among other forms of literature he is said to have cultivated elegiac poetry especially. Psammetichus, son of Gordius, the last of the Cypselid dynasty, succeeded him.

PERIANTH (from Gk. περί, *peri*, around + ἄνθος, *anthos*, flower). A general name of the outer leaves of a flower. See Flower.

PERIBLEM (from Gk. περίβλημα, *periblēma*, cloak). The embryonic region in stems and roots which lies outside of the plerome (q.v.) and develops into the cortex. In seed-plants (spermatophytes) it is covered by the dermatogen, the embryonic layer which develops the epidermis; but in fern-plants (pteridophytes) it forms the outside of the stem tip. See Stem.

PERIBONCA. A northern tributary of Lake Saint John (q.v.), Canada, over 400 miles long.

PERICARDITIS (Neo-Lat., from *pericardium*, from Gk. περικάρδιον, *perikardion*, membrane around the heart, neu. sg. of περικάρδιος, *perikardios*, surrounding the heart, from περί, *peri*, around + καρδία, *kardia*, heart; connected with Lat. *cor*, Lith. *szirdis*, OChurch Slav. *sridice*, Goth. *hairtō*, OHG. *herza*, Ger. *Herz*, AS. *heorte*, Eng. *heart*, and probably with Skt. *hṛdaya*, Av. *zaraδaya*, heart, or with Skt. *śraddhā*, Lat. *credere*, to trust). An inflammation of the membranous sac investing the heart—the pericardium. This membrane is composed of two layers, a serous one closely attached to the substance of the heart and a fibrous layer loosely enveloping the whole. The surfaces of these two layers are normally in contact and secrete a thin serous fluid which acts as a lubricant and prevents irritation from the constant movement of the surfaces upon each other. The intervening space, which exists only in pathological conditions, is called the pericardial cavity. In common with all serous membranes (q.v.), the pericardium is subject to two varieties of inflammation—the dry or plastic form and that characterized by

effusion of fluid. In the dry variety, which is most common and least dangerous, there is first a dulling of the surfaces involved, due to a fibrinous exudation; constant rubbing roughens these fibrin-coated surfaces; the plastic, sticky material is thrown into ridges or drawn out into shreds, and presents a curiously shaggy appearance—the so-called *cor villosum* or hairy heart of the older writers. This form of pericarditis may terminate by absorption of the fluid, always leaving, however, an adhesion between the two layers; or the process may go on to the 'moist' form—pericarditis with effusion. Here an extravasation of fluid occurs into the pericardial cavity amounting from a few drams to two quarts. This fluid is at first sero-fibrinous or hemorrhagic, but in some cases becomes rapidly purulent. When the amount of fluid is considerable the heart's action is mechanically interfered with, and death may take place from this cause in a few days.

Pericarditis may arise from many causes. The primary form, unassociated with any other disease, is comparatively rare, and occurs only in children. As a secondary process, it is a common affection. Rheumatism is responsible for more than 50 per cent. of the cases; septic processes in other parts of the body are frequent causes; tuberculosis, gout, Bright's disease, scurvy, diabetes, and the eruptive fevers such as scarlatina and typhoid may be complicated by it; and, lastly, it may take place by extension from neighboring structures, as in pleuropneumonia or septic endocarditis, or it may result from a wound.

The symptoms of pericarditis are pain in the situation of the heart, increased by a full inspiration, by pressure upon or between the ribs in the cardiac region, and especially by pressure upward against the diaphragm by thrusting the fingers beneath the cartilages of the false ribs; palpitations; a dry cough and hurried respiration; discomfort or pain on lying on the left side; restlessness; great anxiety of countenance; and sometimes delirium. The pulse usually beats from 110 to 120 in a minute, and is sometimes intermittent; and febrile symptoms are always present. Pericarditis is a disease which occasionally runs a very rapid course, and terminates fatally in forty-eight hours or less. In ordinary cases, however, which terminate in apparent recovery, the disease generally begins to yield in a week or ten days, and excepting that adhesion remains, the cure appears to be complete in three weeks or less. But although these patients *apparently* recover, the pericardial adhesion commonly occasions other structural changes of the heart sooner or later to develop themselves, and in those cases that the physician has the opportunity of subsequently watching, it is observed that fatal disease of the heart, primarily due to the pericarditis, almost always supervenes.

In this disease the patient must be kept absolutely quiet, so as to throw as little work upon the heart as possible. The diet should be light, dry, and nutritious. In the early stages and in robust people, leeches may be applied over the pericardial area, or ice bags may be used to limit effusion. When effusion has taken place a blister will sometimes cause it to be absorbed. In suitable cases diuretics may be given to promote the action of the kidneys, and mild purgation will be of service. When the effusion is so extensive as seriously to embarrass the heart's action it may be drawn off by paracentesis. If the fluid be purulent, however, an incision must be made into the sac, through the chest wall, and the cavity drained.

PER'ICAR'DIUM (Neo-Lat., from Gk. *περικάρδιον*, *perikardion*, membrane around the heart). A conical membranous sac, containing the heart and the commencement of the great vessels, to the extent of about two inches from their origin. It is placed with its apex upward behind the sternum, and to its left side, in the interval between the pleuræ—the serous sacs in which the lungs are inclosed; while its base is attached to the diaphragm. It is a fibro-serous membrane, consisting of an external fibrous and an internal serous layer. The fibrous layer is a strong, dense, fibrous membrane; the serous layer invests the heart, and is then reflected on the inner surface of the fibrous layer. Like all serous membranes, it is a closed sac; its inner surface is smooth and glistening, and secretes a thin fluid which serves to facilitate the natural movements of the heart. It is inflammation of this serous sac which constitutes the disease known as pericarditis. See HEART.

PERICARP (from Gk. *περικάρπιον*, *perikarpion*, pod, from *περί*, *peri*, around + *καρπος*, *karpos*, fruit). The transformed wall of the ovary in the fruit. For example, a pea pod without the peas is the pericarp. See FRUIT.

PER'ICLES (Lat., from Gk. *Περικλῆς*, *Periklēs* (?B.C. 429). The greatest statesman of ancient Greece. His father was Xanthippus, victor over the Persians at Mycale in B.C. 479. His mother was Agariste, the niece of Clisthenes, the lawgiver. He received a careful education and was especially influenced by his two teachers, Damon, a famous sophist and master of music, and the philosopher Anaxagoras of Clazomenæ, to whose teaching he undoubtedly owed the independence of thought and freedom from superstition which raised him above the multitude. Throughout his life Pericles was conspicuous for his singular dignity and aloofness. He avoided convivial gatherings and seldom walked abroad among his fellow citizens. But his eloquence, sagacity, uprightness, and patriotism won recognition from a large part of the Athenians, and for more than thirty years he was the most influential leader in Athens. When he entered on public life, Aristides had only recently died. Themistocles was an exile, and Cimon was engaged in fighting abroad. Pericles from the first attached himself to the democratic party, and under his leadership the complete democratization of Athens was accomplished. Hitherto only the nobler and richer elements in the State had had access to the higher offices, but under his direction all offices were eventually opened to the entire body of citizens. The first step in this new course was the limitation of the functions of the Areopagus, at that time the chief court at Athens. Through the agency of his associate Ephialtes in the year 462-461 measures were passed which deprived the Areopagus of all its important political powers. To it were left jurisdiction only in cases of homicide, the care of the sacred olive trees of Athena, and a share in the supervision of the land sacred to the Eleusinian divinities. Its former functions passed to the Athenian Senate of 500, the popular assembly, and the law courts. Pay for archons was introduced, and later all

officials received a salary for their services. About 458 the third class of citizens, the Zeugitæ, were made eligible to the archonship, and it cannot have been many years before this office was open to all, even the lowest citizens. Furthermore, the members of the Senate were now chosen absolutely by lot from the entire body of Athenians. Thus in the few years after Pericles became prominent most important constitutional changes were carried through at Athens. The opposition of Cimon had been avoided by his ostracism. Pericles's foreign policy seems to have been based on a desire to extend the power and influence of Athens as widely as possible over the Greek States, and he confidently hoped to consummate an Hellenic League which should embrace all Greek States. His attempt to hold a congress for this latter purpose in 448 was unfortunately defeated.

The Athenians, elated by their victories over the Persians and fired by the splendid empire established under the name of the Confederacy of Delos, were eager for foreign conquest. As their naval empire grew, and their trade increased, they came into rivalry with Corinth and Ægina. In 460 they had seized Megara, which led to war with the Spartans, and during the next four years Athens successfully resisted the attacks of Corinthians and Spartans, and in 459-456 reduced Ægina, which was made a tributary member of the Confederacy of Delos. Athens had seized Naupactus also, which gave her a naval station by which she could command the Corinthian Gulf. She also extended her conquest to the north, and by the battle of Œnophyta (457) gained the greater part of Bœotia, only to lose it again ten years later by the battle of Coronea. The war with Persia had continued in the East under the direction of Cimon, who had been recalled at Pericles's suggestion. After Cimon's death in 449, Pericles seems to have thought the struggle against Persia too severe a tax on Athens if she was to continue her efforts against her rivals in Greece, and so in 448 a peace was concluded with the Persians. Athens was now free to attend to her cares at home. She had gradually extended her territory so that, aside from her allies on the mainland, she embraced, under the Confederacy of Delos, as equal or subject allies, nearly all the larger islands of the Ægean, and she furthermore possessed important cities in the north and in the Thracian Chersonese. In 446-445 a thirty years' peace was concluded between Athens and her allies on the one side and the Peloponnesians and their allies on the other. There was, however, strong opposition to Pericles's policy. The party opposed to him was led by Thucydides, whose ostracism in 444 left Pericles the undisputed leader. He apparently had the power to persuade the people to do whatever he thought good, and for fifteen years after his opponent's ostracism he was annually elected to the office of general. Under his direction Athens had been made supreme within her naval empire, and his purpose was to aggrandize Athens even at the expense of her subject States. With the great wealth which came to her treasury Pericles restored the temples destroyed by the Persians and erected new monuments which made Athens the most magnificent city of the ancient world. Most prominent among these monuments were the bronze statue of Athena Promachos, which was erected about 448 at the west end of the Acropolis, and a new temple to Athena Polias. The Parthenon was also built on an enlarged and more magnificent scale and was completed about 438. At the west entrance to the Acropolis a new propylæa was erected and near it the Temple of Athena Nike. The city was also adorned with many other temples and monuments. In the period of Pericles's leadership Athens became a great centre of literature as well as of the fine arts, and philosophy was also transplanted from Ionia and Italy to the soil of Athens, which was destined to be its home for a thousand years. Pericles was not only a great political leader, but was also able in the field, as was shown by his successful reduction of the revolt of Samos in 439.

Athens's prominence at length made her an object of jealousy. In 433 she formed an alliance with Corcyra, a recalcitrant colony of Corinth, and in the winter of 432-431 the Peloponnesians under the leadership of Sparta decided on war against Athens. Pericles summoned the country residents of Attica within the walls of Athens, and allowed the Peloponnesian army to harry the country at will during the summers of 431 and 430. In the latter year the plague broke out in the city and caused many deaths and great dejection. Pericles was deposed from his office, tried, and fined, but soon reinstated through a revulsion of feeling. In the following year he died after a lingering sickness. While Pericles undoubtedly contributed greatly to Athenian brilliancy, his imperialistic schemes made the Peloponnesian War inevitable. (See ASPASIA.) Consult the histories of Greece by Grote, Abbott, Holm, Busolt, and Meyer; Filleul, *Histoire du siècle de Périclès* (Paris, 1873); A. Schmidt, *Das Perikleische Zeitalter* (Jena, 1877-79); and Evelyn Abbott, *Pericles and the Golden Age of Athens* (New York, 1891).

PERICLES, PRINCE OF TYRE. A play remodeled by Shakespeare, probably from one by George Wilkins and Rowley about 1607, when it was produced and printed in 1609, but not in the folio of 1623. The earliest form of the story is Greek in the sixth century. Gower introduced it as "Apollonius of Tyre" in the *Confessio Amantis* (1332). Shakespeare's part is evidently acts iii., v., and partly iv.

PERICYCLE (from Gk. περικύκλος, *perikyklos*, all around, spherical, from περί, *peri*, around, + κύκλος, *kyklos*, circle). A sheath of cells in plants forming the outer layer of the pleirome (q.v.). It is usually continuous, but is sometimes interrupted by projections of vascular tissue, and in a few cases is altogether lacking. The term 'pericambium' was formerly used to designate it.

PERIDIN'IUM. See RED WATER.

PERIDOT Fr. *péridot*, of unknown etymology). A variety of chrysolite used as a gem. It is usually of an olive, pistachio, or leek-green color. It is found in abundance and of good quality in the form of small, olive-green, pitted grains or pebbles, especially in the sands of Arizona and New Mexico, where they are called locally 'Job's tears.' The best quality for gems comes from the Levant.

PERIDOTITE. An igneous rock of ultrabasic composition, essentially free from quartz and feldspar, but consisting mainly of olivine and of one or more of the following minerals: augite,

hypersthene, hornblende, magnetite, and rarely biotite. The peridotites are sometimes known as the magnesian rocks (see also PERKNITE), and as they are poorest in silica and richest in magnesia of any terrestrial rocks, they form a connecting link with celestial (meteoritic) bodies. From the family of the pyroxenites peridotites differ chiefly by containing olivine. Usually of small extent, they occur as more basic masses within areas of gabbro (q.v.) and norite. The average composition of peridotite is: silica, 41 per cent.; alumina, 4 per cent.; sesquioxide of iron, 6 per cent.; protoxide of iron, 6 per cent.; oxide of lime, 6 per cent.; magnesia, 30 per cent.; oxides of the alkalies, 1 per cent.; water, 6 per cent. By processes of weathering, of which evidence is rarely lacking in specimens, peridotites take up water and form serpentine (q.v.), so valuable as a building and ornamental stone.

PÉRIER, pā'ryā', CASIMIR (1777-1832). A French statesman, born at Grenoble, Department of Isère, October 21, 1777. He was educated at the College of the Oratory at Lyons, and served in the Army of Italy during the campaigns of 1798-1800. Returning to Paris, he helped his father and brother to found a banking house, which soon had a large and prosperous business. In 1817, as the result of an attack on the financial policy of the Government, Casimir Périer was chosen as one of the Deputies from Paris, and being repeatedly reëlected, he became one of the leading members of the Opposition under Charles X. In 1828 he was Minister of Commerce and Finance under Martignac. After the overthrow of the Bourbon monarchy, by the Revolution of July, 1830, Périer became a member of the new Government and acted as Prime Minister to Louis Philippe from March 13, 1831, until his death, May 16, 1832. During his tenure of office he repressed Republican outbreaks at Paris and at Lyons, and the Legitimist movement in the South. He also directed the foreign policy of France against Austria with sagacity and ability, and sustained ministerial responsibility against the King and in the Chamber of Deputies. In his efforts to control the cholera epidemic of 1832 he became infected with the disease and his already broken constitution rapidly succumbed. The most prominent disciple of his constitutional policy of *juste-milieu* was Guizot, who has given a picture of his predecessor in his *Mémoires*. Périer's son, Auguste, adopted the name of Casimir-Périer (q.v.).

PÉRIERS, pā'ryā'. JEAN BONAVENTURE DES (c.1500-44). A French poet and philosopher, born at Arnay-le-Duc, Bourgogne. His known literary work began in 1534 with collaboration in the first French translation of the Bible, and two years afterwards he assisted Dolet in his *Commentaries de la langue latine*. He entered into the service of Marguerite, Queen of Navarre (1536), but in the following year fell out of favor with her on the publication of his *Cymbalum Mundi*, a collection of allegorical dialogues, wherein man's philosophy and religion are ridiculed. The book, denounced by Catholic and Protestant alike, was publicly burned, its author ostracized, and it is supposed that he committed suicide. His friends published *Œuvres diverses* (1544), and the *Nouvelles récréations et joyeux devis* (1558). A later edition of his works was published in Paris (1866) and a special one of the *Cymbalum* in 1874.

PERIGEE (from Gk. *περί, peri*, around + *γῆ, gē*, earth). That point in the moon's orbit which is nearest to the earth. The opposite point is the apogee (q.v.). See MOON.

PÉRIGORD, pā'rē'gôr'. A former county of France, forming a part of the Province of Guienne (q.v.), and now included within the Department of Dordogne. It was divided into Upper and Lower Périgord, and the principal town was Périgueux. It was the land of the ancient Petrocorii; was overrun by the Franks in the beginning of the sixth century, and with the rest of Guienne came into the possession of England by the marriage of Henry II. and Eleanor of Aquitaine. In 1454 it was acquired by the House of Albret, and upon the accession of Henry IV. in 1589 was united to France.

PÉRIGUEUX, pā'rē'gē'. The capital of the Department of Dordogne, France, on the Isle, 42 miles southeast of Angoulême (Map: France G 6). It consists of the ancient city of Périgueux, along the river bank—gloomy of aspect, with narrow streets, but large and solidly built houses—and the Puy Saint Front on rising ground, which until 1240 was a separate town. In the old town there are many curious remains of mediæval architecture. The ramparts have been demolished and replaced by boulevards. The Cathedral of Saint Front, dating from the eleventh century, a majestic edifice of Byzantine design in the form of a Greek cross, largely rebuilt since 1853, resembles Saint Mark's at Venice. Other interesting features are the old cathedral of Saint Etienne, the remains of a sixth-century basilica, and the ruins of Roman origin of a vast amphitheatre, of ancient aqueducts, baths, temples, and the remarkable *Tour de Vesone*. The city has a museum of antiquities, a library with over 30,000 volumes, and a handsome seminary. Quarries of building stone are worked in the vicinity, and many hands are employed in cutting and polishing marble. Paper, woolen cloths, silk, cutlery, tools, and tobacco are manufactured and there is a trade in wine, grain, swine, and oxen. The celebrated *pâtés de Périgueux*, made of partridges and truffles, are largely made and exported. Population, in 1891, 31,439; in 1901, 31,976. Périgueux, the *Vesunna* and capital of the Petrocorii, mentioned by Cæsar, was a city of much importance in ancient times. See PÉRIGORD.

PERIGYNY, pēr-ij'i-ni (from Gk. *περί, peri*, around + *γυνή, gynē*, woman, pistil). A condition in flowers in which the sepals, petals, and stamens are borne upon the margin of a cup-like outgrowth around the pistil, as is well shown in the flower of the common cherry. Perigynous flowers are specially characteristic of certain genera of the rose family. See FLOWER.

PERIHE'LION (Neo-Lat., from Gk. *περί, peri*, around + *ἥλιος, hēlios*, sun). That point in its orbit at which a planet is nearest the sun. The point of the orbit opposite to it is called the aphelion (q.v.). The position of the perihelion, i.e. its longitude east or west of the vernal equinox, is one of the seven elements of a planet's orbit. See ELEMENTS; ORBIT.

PERIM, pā-rēm'. An island in the Arabian Sea about 2 miles from the southwestern coast of Arabia, in the Strait of Bab-el-Mandeb (Map: Asia, D 7). Area, about 7 square miles. It is

under British control and has a small garrison and a lighthouse.

PERIM'ETER (Lat. *perimetros*, from Gk. *περίμετρος*, circumference, from *περί*, *peri*, around + *μέτρον*, *metron*, measure). The length of the boundary of a plane figure. See ISOPERIMETRIC FIGURES.

PERINÆUM (Neo-Lat., from Lat. *perinæon*, *perinæon*, from Gk. *περίναιον*, *perinaion*, *περίνεον*, *perineon*, *περινός*, *perinos*, perinæum). The part of the human body which forms the floor of the true pelvis is by anatomists divided into two portions. Of these, the anterior one, situated in front of the anus, is called the *true perinæum*, or urethral (or, in the female, the vaginal) portion of the perinæum; the posterior portion, which contains the anus or termination of the rectum, is called the rectal or anal portion of the perinæum. The anterior portion, or true perinæum, is triangular in form, the apex being in front; the sides, about three inches in length, are formed by the rami of the pubes and ischium, and the base by an imaginary line joining the tuberosities of the ischium, and passing about half an inch in front of the anus. Through this space the urethra passes through a layer of strong fascia—the deep perinæal fascia—to communicate with the bladder, and in this space the opening is made in the operation of lithotomy.

In the female the space usually referred to as the perinæum lies between the vagina in front and the anal orifice behind. Its most important constituent is the anterior portion of the levator ani muscle. The perinæum, including a greater or less extent of this muscle and sometimes also the sphincter ani muscle, is often torn during parturition, and requires suturing for its repair.

PERIOD (Lat. *periodus*, from Gk. *περίοδος*, a going round, circumference, circuit, cycle, sentence, period, from *περί*, *peri*, around + *ὁδός*, *hodos*, road). A term used in chronology in the same sense as cycle, to denote an interval of time after which the astronomical phenomena to which it refers recur in the same order. It is also employed to signify a cycle of cycles.

The Chaldeans invented the *Chaldaic period* or *Saros*, from observing that, after a certain number of revolutions of the moon round the earth, her eclipses recurred in the same order and of the same magnitude. This period consists of 223 lunations, or 6585.32 days, and corresponds almost exactly to 19 'eclipse years.' The eclipse year is the time required for the sun, in his apparent motion among the stars, to complete a circuit from one of the nodes (q.v.) of the lunar orbit back again to the same node. On account of the motion of the lunar nodes, the eclipse year contains only 346.62 days, and 19 such years contain 6585.78 days. The error of the *Saros* is thus only 0.46 day (about 11 hours) in 223 lunations, or 19 eclipse years.

Various important periods or cycles are used in the calendar (q.v.) for predicting the dates of new and full moon. These phases recur on the same dates every nineteen years (except that leap years may change the dates one day), which fact was discovered by Meton, an Athenian, who invented (B.C. 432) a lunar period of 6940 days, or 19 years, called the *Metonic cycle* (q.v.), also the *lunar cycle*. The *calippic* period consists of 76 years, or four Metonic periods, and is thus able to take account of leap years. The period of the *heliacal* or *solar cycle*, after which the same day of the month falls upon the same day of the week, consists of 28 Julian years of $365\frac{1}{4}$ days each. If the year had regularly consisted of 365 days—that is, one day more than an exact number of weeks—it is evident that at the end of seven years the days of the month and week would again correspond; but the introduction of an intercalary day into every fourth year causes this coincidence to recur at irregular periods. (To ascertain when the same days of the week and month will recur in the Gregorian calendar, see CALENDAR, section on *Perpetual Calendar*.) The *Julian* period is a cycle of cycles, and consists of 7980 (28 19 15) years, after the lapse of which the solar cycle, lunar cycle, and the indiction (q.v.) commence together. The time of its commencement was arranged so that it will expire at the same time as the other three periods from which it is derived. The year B.C. 4713 is taken as the first year of the period, consequently A.D. 1 is the 4714th year of it. (See CHRONOLOGY; CALENDAR; CYCLE.) Astronomers also use the term period to designate the quantity of time required by a planet or other celestial body to complete a revolution in its orbit. (See ELEMENTS.) In this sense there may be different periods for the same body, according to the point selected as the beginning and end of the periodic orbital motion. The location of the position from which the motion is supposed to be viewed may also change the period materially.

PERIODICAL. In a wide sense, a publication issued, at more or less regular intervals, in successive numbers, which are not related to one another as volumes or parts of a single book or series of books. The word, however, is commonly employed—and is here considered—in a narrower sense which excludes on the one hand newspapers (see NEWSPAPER), or periodical summaries of current, and especially of political, events, and on the other such periodical publications as the transactions of learned societies, year-books, almanacs, and so on. Even within these limits the term includes a great variety of publications which differ so much in object and character that concise description of them is impossible; but it may be said of them in general that they are designed to furnish either information about matters of more than ephemeral interest, or entertainment, or both. They deal either with a single subject—such as literature, or a particular science or industry—or with a group of allied subjects, or with material of the most heterogeneous character. The most important special groups of them are *reviews*, or periodicals devoted especially to the criticism of books, and *magazines*, which are designed to furnish miscellaneous and entertaining reading. In the most popular of the latter class fiction forms an important part of the contents, and pictorial illustrations, often of fine artistic quality, are frequently employed.

EARLY FORMS. The periodical, as thus defined, originated in France in the seventeenth century, and in the form of the critical literary journal. The first example of it is also one of the most famous and the longest lived, for its publication has continued, though with many interruptions, until the present day—namely the *Journal des Savants*. The idea which it embodied was conceived about 1663 by the historian Mézeray, who

proposed to establish a weekly journal in which should be "made known what was happening in the republic of letters." His project came to nothing; but in 1664 Denis de Sallo, Sieur de la Coudraye, under the name of Sieur de Hédouville, obtained the privilege of issuing a periodical of this kind, and the first number of the *Journal des Savants* appeared on January 5, 1665. Its plan included reviews of new books, reports of scientific discoveries, obituary notices, and general information of interest to the learned world. Sallo associated with himself a number of scholars, among them the Abbé Gallois, who succeeded him as editor. The freedom —or, as it appeared to an age not accustomed to the ways of the reviewer, arrogance—with which the new journal criticised both books and (what was more serious) ecclesiastical affairs promptly brought it into trouble, and after the appearance of the thirteenth number it was suppressed. Colbert, however, who recognized its value, decided to reëstablish it, and on Sallo's refusal to consent to the demanded abridgment of his freedom, placed it (1666) in the hands of the Abbé Gallois, who conducted it negligently, issued it very irregularly and practically abandoned it in 1674. In 1675 publication was resumed under the editorship of the Abbé de la Roque, who was succeeded in 1687 by L. Cousin. In 1701 it passed under the editorial control of a commission of literary men and was conducted in this way until 1723. After a year of suspended animation it was reissued under the auspices of the Abbé Bignon and the Abbé Desfontaines. Another interruption of publication was caused by the Revolution in 1792, and an attempt to revive it in 1796 was a failure. It was finally reëstablished (April 15, 1816) under the Restoration and placed under the supervision of a commission representing the different classes of the Institute. Seven years after the appearance of the *Journal des Savants* was founded the second French literary periodical, the *Mercure Galant* of Jean Donneau de Vizé, which, under a variety of titles, continued—with interruptions—to exist until 1825; in 1717 it received the name of *Mercure de France*, by which it is commonly known. In addition to criticism, poetry, and other literary material, it dealt with topics of the most diverse kinds, including current news; and it has, accordingly, a place in the history of journalism. Among its editors were Thomas Corneille, whom Vizé associated with himself in 1690, and Marmontel. In the same year (1672) with the *Mercure Galant*, Claude Blondeau and Gabriel Guéret began the first legal periodical, the *Journal du Palais;* in 1679 appeared the *Nouvelles découvertes sur toutes les parties de la médecine* (3 vols.) of Nicholas de Blegny—memoirs published by an 'academy' at whose head Blegny had placed himself—which may be regarded as the first medical journal; and in 1680 was issued by the Abbé Jean-Paul de la Roque the first prospectus of a religious periodical—the *Journal ecclésiastique*. The publication of the last named was forbidden, and in 1690 La Roque began the *Mémoires sur l'histoire ecclésiastique*, of which however, only one volume was issued. A medical journal—*Les Journaux de Médecine, etc.*—which he started in 1683 was equally unfortunate. Other notable periodicals of French origin (but printed in Holland) dating from the seventeenth century are the *Nouvelles de la république des lettres*, founded by the celebrated Pierre Bayle in 1684, and conducted by him for three years (it survived until 1718); the *Histoire des ouvrages des savants* of Henri Basnage de Beauval, begun in 1687 and continued until the middle of 1709; and the *Bibliothèque universelle et historique* of Jean Leclerc, the noted critic, which was issued in 1686-93.

Beginnings in England. The last quarter of the same century saw the beginnings of the literary and of the scientific periodical in England also. As the first example of the former is commonly reckoned the *Mercurius Librarius; or a Faithful Account of All Books and Pamphlets*, the first number of which appeared in April, 1680. It was announced as a 'catalogue' to be published "weekly, or one in fourteen days at least," and it was in fact nothing more; it contained advertisements, or paid notices of new books, and possessed nothing of the literary character. Of greater importance was the *Weekly Memorials for the Ingenious*, issued 1681-83, which obtained much of its material from the *Journal des Savants*. Between 1685 and 1700 appeared for brief periods several learned publications of the periodical type, derived chiefly from Continental sources. Of a more strictly English character was the *Athenian Gazette* (later called the *Athenian Mercury*)—a kind of 'Notes and Queries'—published weekly from March, 1689-90, to February, 1695-96, by the bookseller John Dunton, with the assistance of Richard Sault and others. The *Gentleman's Journal, or the Monthly Miscellany*, of Peter Anthony Motteux, a forerunner of the modern literary magazine, was issued 1692-93 (2 vols.); it contained verses by Prior, Sedley, Mrs. Behn, Oldmixon, D'Urfey, and others, and miscellaneous prose. The *History of the Works of the Learned*, a review dealing mainly with Continental books, was issued from 1699 to 1712. Its publication was resumed in 1737 and was continued until 1743.

Early German Periodicals. In Germany a beginning was made in 1663 with the *Erbauliche Monatsunterredungen* of Johann Rist, which was followed in 1670 by the first scientific annual, the *Miscellanea Curiosa Medico-Physica* of the Academia Leopoldina. But the most celebrated of all the periodicals which date from this period is the first German literary journal, the *Acta Eruditorum Lipsiensium* (written in Latin), founded by Prof. Otto Mencke in Leipzig, the first number of which appeared in 1682. It was modeled after the *Journal des Savants* and the Italian *Giornale de' Letterati* (see below), and included extracts from new books, reviews, and independent articles. Mencke associated with himself in this work many of the most learned men of the time, among them Leibnitz, Seckendorff, and Thomasius, and the *Acta* became the supreme critical authority in German literature. On Mencke's death in 1707 he was succeeded in the editorship by his son, J. B. Mencke; and in 1732 his grandson, F. O. Mencke, began a new series under the title *Nova Acta Eruditorum*. The *Acta* came to an end in 1782, when the belated volume for 1776 appeared. Outside of the countries above mentioned, Italy alone has possessed learned periodicals dating from this period—the *Giornale de' Letterati* of Francesco Nazzari, founded in 1668 and published until 1679, another with a similar title issued from 1686 to 1697 by Bacchini and Ro-

berti, and the *Biblioteca volante* of Cinelli and Sancassini (1676-1718 and 1733-47).

Modern British Periodicals. From the beginning of the eighteenth century new periodicals have appeared in these and in other countries in ever-increasing numbers and diversity. In England, Daniel Defoe began in 1704 *A Review of the Affairs of France and of All Europe, as Influenced by That Nation*, issued at first weekly, then twice, and later thrice a week. It came to an end, in its original form, in 1712, but was carried on in a new series, called simply *The Review*, until June, 1713. One feature of this review—the contributions of an imaginary 'Scandal Club'—doubtless suggested the periodical essay which became important in the history of English literature. Of these essay-periodicals the most noted are *The Tatler* (1709-10-11) written chiefly by Steele and Addison; *The Spectator* (1710-11-14) of Addison, Steele, Budgell, and others; *The Rambler* (1750-52) of Dr. Johnson. A French Protestant refugee, Michel de la Roche, a friend of Bayle, started in 1710 the *Memoirs of Literature*, a review, independent of foreign sources for its material, though modeled after French works of the kind, which he issued until the end of 1714. In 1725 he began another review, the *New Memoirs of Literature*, which lived for two years, and in 1730 *A Literary Journal*, a continuation of the *Memoirs of Literature*, which came to an end in about half that time. A classical periodical, entitled *Bibliotheca Literaria, Being a Collection of Inscriptions, Medals, Dissertations*, etc., was brought out in 1722 by Samuel Jebb and ran through ten numbers, ending in 1724. La Roche's work was taken up by Andrew Reid, who issued (1728-36) *The Present State of the Republick of Letters*, a review of considerable merit; and by Archibald Bower, whose *Historia Literaria* appeared monthly (1730-34). At this time (January, 1730-31) was published the first and one of the most famous of English magazines, the *Gentleman's Magazine, or Trades' Monthly Intelligencer . . . by Sylvanus Urban, Gent.*, founded by the printer Edward Cave. His original plan, afterwards much widened, was that of a collection or 'magazine' (the first use of the word in this sense) of the essays and news which appeared in the London papers; the title was in other points suggested by Motteux's periodical mentioned above. The magazine met with great success—due chiefly to Cave's energy and practical (not literary) ability—its circulation rising within a few years to over ten thousand copies. In it, in 1732, was begun the publication of Parliamentary debates (of both Houses), under the—necessary—disguise of "Reports of the Debates of the Senate of Lilliput;" Johnson was employed during several years in writing out (largely from his own imagination) the speeches reported. His association with Cave and the Magazine is the chief title of both to fame. After Cave's death, in 1754, it was conducted by his brother-in-law, and later by John Nichols and his son. In 1868 it became a magazine of light literature. It soon had numerous imitators and rivals, the most successful of which was the *London Magazine* (1732-81), established by leading London publishers. Among the most important of the other magazines established during the eighteenth century are: *The Scots Magazine* (1739-1817, from that date to 1826, the *Edinburgh Magazine*); the *Royal Magazine* (1759-71); the *Oxford Magazine* (1768-82); the *European Magazine* (1782-1826); the *Monthly Magazine* (1796-1843); and the *Philosophical Magazine* (1798—). To return to reviews: the *History of the Works of the Learned* found a successor in *A Literary Journal* (Dublin, 1744-49), the first review published in Ireland. *The Museum*, projected by the poet and bookseller Robert Dodsley, appeared in March, 1746, and was issued fortnightly until September, 1747. It was as much a magazine as a review, comprising besides notices of books, essays, mainly upon historical and social topics, by writers of repute, including Spence, Warburton, Horace Walpole, Akenside, and Campbell. From this time on the distinctive characteristics of the modern literary review became more and more prominent and before the end of the century were firmly established.

A notable advance in this direction was made in the *Monthly Review*, founded by Ralph Griffiths (1749) and conducted by him until his death in 1803. It included scientific and literary material as well as criticism, and among its writers (1757-58) was Oliver Goldsmith. The *Review* was carried on after Griffiths's death by his son (until 1825) and others until 1845. The Whig politics and non-conformity of Griffiths led to the founding of the Tory *Critical Review* (1756-1817) by Archibald Hamilton, to which Smollett, Johnson, and Robertson contributed; and this was followed by a number of others, including *The London Review* (1775-80); *A New Review* (1782-86); the *English Review* (1783-96), combined in 1797 with the *Analytical Review* (1788-99); *The Antijacobin Review and Magazine* (1798-1821); and the High Church *British Critic* (1793-1843), begun by Nares and Beloe. An epoch in the history of the English review was made by the establishment of the *Edinburgh Review or Critical Journal*—'to be continued quarterly'—the first number of which appeared in October, 1802. It was designed to be the organ not only of literary, but also of political (Whig) opinion, and was planned so broadly and edited so ably that it almost immediately attained a position of authority which soon became, as Carlyle said, that of "a kind of Delphic oracle and voice of the inspired for great majorities of what is called the 'intelligent public.'" The first of the really great English reviews, it established a standard of reviewing which (though its literary criticism, especially in the early days, has often been inferior) its rivals during the century and more of its existence have not been able to surpass. In it the English review became for the first time a really potent influence in the formation of literary taste and the shaping of political views. Its original projector was Sydney Smith, and he also edited the first number; with the second the editorship was transferred to Francis Jeffrey (later Lord Jeffrey), who retained it until 1829, when he resigned on his election as Dean of the Faculty of Advocates. Among the other earlier contributors were Brougham, who largely determined its political opinions, Scott (during the first few years), Carlyle, Hazlitt, and (from 1825) Macaulay, whose influence upon its character was probably second only to that of Jeffrey. After Jeffrey's retirement the editorship was held successively by Macvey Napier (1829-47), William

Empson (—1852), George Cornewall Lewis (—1863), Henry Reeve (—1895), and Arthur S. Elliot (1895—). In 1902 the *Review* celebrated its centennial.

The great success and rapidly growing influence of this champion of Whiggism caused the Tories to bestir themselves, and in February, 1809, appeared the first number of *The Quarterly Review*, which soon attained a position hardly second to that of its great rival. Its first editor was William Gifford, and among its first contributors were Scott, Southey, Dr. Young, Canning, John Wilson Croker, and Heber. Gifford resigned in 1824, and was succeeded by John Taylor Coleridge, who gave place in 1826 to John Gibson Lockhart, who retained the editorial control of the *Review* until 1853; he was followed by the Rev. Whitwell Elwin (—1860), William Macpherson (—1867), Sir William Smith (—1893), Rowland Prothero (1894-99), and George W. Prothero (1899—). The *Westminster Review* (styled from 1836, when it was combined with the *London Review*, until 1851 the *London and Westminster Review*) was founded in 1824 to promulgate the views of the Utilitarians, Bentham and the Mills. The great quarterlies above mentioned were partisan in their origin and in their principles of editorial management: they were designed to promulgate definite views, literary and political, with which the opinions of their contributors must be in harmony; their articles were accordingly anonymous (though the *Westminster* has not been consistent in the matter). This policy was abandoned by the *Fortnightly Review*, established in 1865 (issued monthly from 1866), which was designed to allow the freest expression of individual opinion with individual responsibility. Its first editor was George Henry Lewes, who was followed in 1867 by John Morley, who resigned in 1882. Among its early supporters were Bagehot, George Eliot, Sir John Herschel, Mill, Huxley, and Spencer. The policy of the *Fortnightly* in these particulars has been followed by other monthly reviews—the *Contemporary Review*, established in 1866, the *Nineteenth Century* in 1877, and the *National Review* in 1883.

Weekly journals dealing wholly or partly with literature, science, and art have existed by the side of the quarterlies and monthlies, among them *The Examiner* (1808-81), *The Literary Gazette* (1817-62), *The Athenæum* (1828—), *The Spectator* (1828—), *The Saturday Review* (1855—), *The Academy* (1869—), and *The Speaker* (1890—).

Hardly less notable than the development of the review during the nineteenth century was that of the magazine. *The New Monthly Magazine* (1814) numbered Campbell, Theodore Hook, and Bulwer Lytton among its editors. A brilliant production was *Blackwood's Edinburgh Magazine* (1817—), which "created a sensation unparalleled in magazine history," due to the wit and audacity of its anonymous contributors, among whom were Lockhart, Hogg, Scott, and John Wilson, the editor. Its most important feature, in those early days, was the famous *Noctes Ambrosianæ*, "in which the leading contributors discoursed with irresponsible wit and incisiveness upon the books, the people, and the events of importance in their day." *Fraser's Magazine* (1830-82, when it became *Longman's Magazine*) is associated with the names of Carlyle and Thackeray. Others of note are *The British Magazine* (1832-49), *The Dublin University Magazine* (1833—), *Tait's Edinburgh Magazine* (1832-61), *Bentley's Miscellany* (1837-68), *Notes and Queries* (1849—), *Macmillan's Magazine* (1859—), *The Cornhill Magazine* (1860—), *Saint James Magazine* (1861—), *The English Illustrated Magazine* (1883—), *Cassell's Magazine* (1877—), *Temple Bar* (1860—), *Review of Reviews* (1890—), *The Strand Magazine* (1891), and *The Pall Mall Magazine* (1893—). These are only a selection from a long list.

Periodicals in the United States. The history of the periodical in the United States begins in colonial times with *The American Magazine*, issued at Philadelphia, February 13, 1741, by the printer Andrew Bradford, a business rival of Franklin's, and edited by John Webbe. The idea was due to Franklin, who had planned an imitation of *The Gentleman's Magazine*, and had incautiously divulged his scheme to Webbe. Franklin's own periodical, *The General Magazine*, was issued on February 16, 1741, its projector thus losing by three days the honor of having edited and published the first monthly in America. Both publications were short-lived, Webbe's perishing with its second number and Franklin's with its sixth. Throughout the entire subsequent development of periodical literature in this country the magazine has taken the first place, reviews having been comparatively few in number and decidedly inferior in quality. The magazines published down to the Revolution number sixteen. Among them were *The American Magazine and Historical Chronicle* (Boston, 1743-46), *The Boston Weekly Magazine* (1743), *The Christian History* (Boston, 1743-44), *The Independent Reflector* (New York, 1752-53), *The New England Magazine of Knowledge and Pleasure* (Boston, 1758), *The American Magazine and Monthly Chronicle* (Philadelphia, 1757-58), *The New American Magazine* (Woodbridge, N. J., 1758-60), *The American Magazine* (Philadelphia, 1769), *The Royal American Magazine* (Boston, 1774-75), and *The Pennsylvania Magazine, or American Monthly Museum* (1775-76). Between the close of the war and the end of the century about forty others appeared, among them *The Columbian Magazine, or Monthly Miscellany* (Philadelphia, 1786-92; from March, 1790, entitled *The Universal Asylum and Columbian Magazine*), *The American Museum, or Repository* (1787-92), of considerable value as a source of historical information; *The Massachusetts Magazine* (Boston, 1789-96), *The New York Magazine* (1790-97), *The Political Censor, or Monthly Review* (Philadelphia, 1796-97), edited by William Cobbett, and *The Farmer's Weekly Museum* (Walpole, N. H., 1790-99). The last was edited from 1795 by Joseph Dennie, the founder, in 1801, of *The Port Folio*. Charles Brockden Brown established in 1799, in New York, *The Monthly Magazine and American Review*, which, with a change of name to *The American Review and Literary Journal*, survived until 1802. He later edited *The Literary Magazine and American Register* (Philadelphia, 1803-08).

At the end of the first decade of the nineteenth century the periodicals published in the United States amounted to nearly thirty in number. Only two of them, however, were in any way notable: *The Port Folio* (Philadelphia) above mentioned, which survived until 1827—up to that

time a phenomenally long life for an American magazine; and *The Anthology and Boston Review* (Boston, 1803-11), which included Ticknor, John Quincy Adams, and Everett among its contributors. From this time on the number of literary periodicals—to say nothing of religious and other special publications—increased rapidly, with a corresponding improvement in quality. The following are perhaps the most noteworthy: *The Analectic Magazine* (Philadelphia, 1813-20), founded by Moses Thomas, with Irving (its editor, 1813-14), Paulding, and Wilson the ornithologist among its contributors; *The Atlantic Magazine* (New York, 1824-25; continued until 1827 as *The New York Monthly Review*), which was edited by Robert C. Sands and had the support of Bryant; *The New York Mirror* (1823-42), of which N. P. Willis was one of the editors; *The Illinois Monthly Magazine* (Vandalia, 1830-32), the first publication of the kind in the West; *The American Monthly Magazine* (New York, 1833-38), edited 1837-38 by Park Benjamin; *Graham's Magazine* (1840-50), a widely and deservedly popular periodical; *The Dial* (Boston, 1840-44), the organ of the New England Transcendentalists, edited by Ripley and Margaret Fuller, and then by Emerson; *The International Magazine* (New York, 1850-52), edited by R. W. Griswold; *The Knickerbocker Magazine* (New York, 1833-60), founded by the novelist Charles Fenno Hoffman, and edited for some time by Louis Gaylord Clark; *Putnam's Monthly Magazine* (New York, 1853-57, and 1867-69); *The Atlantic Monthly* (Boston, 1857—), perhaps the foremost of American periodicals from a literary point of view, having as editors Lowell, Fields, Howells, Aldrich, Scudder, Page, and Perry, and among its contributors Holmes, Longfellow, Whittier, and most of the notable American men of letters; *Harper's New Monthly Magazine* (New York, 1850), an illustrated monthly of high standing and wide popularity; *Scribner's Monthly* (New York), an illustrated monthly founded in 1870 by Dr. J. G. Holland (as editor), Roswell Smith, and Charles Scribner, and from 1881 published, with Richard Watson Gilder as editor, as *The Century Magazine: The Galaxy*, incorporated with the *Atlantic Monthly* in 1878 (New York, 1866—); *Lippincott's Magazine* (Philadelphia, 1868—); *Scribner's Magazine* (New York, 1887—), an illustrated monthly; *The New England Magazine*, illustrated (1889—); *The Cosmopolitan*, illustrated (New York, 1886—); and *McClure's Magazine*, illustrated (New York, 1893—). In the periodicals just mentioned, beginning with *The Atlantic*, the popular literary magazine has reached its highest point of development, not only in the United States, but in the world. Especially important has been the impetus given to developing the art of illustration, and the support given to the obsolescent art of wood-engraving by *The Century* and *Harper's*; it may almost be said that the art was revived by these periodicals.

Of American reviews less need be said. Although some of these are excellent, they do not, as a whole, compare favorably with those that have been published in England and on the Continent. Their history begins with *The American Review of History and Politics* (Philadelphia, 1811-13), a quarterly founded by Robert Walsh. This was soon followed by *The North American Review* (Boston, 1815), which has continued until the present day; among its editors have been many eminent men—A. P. Peabody, H. Adams, Dana, Edward Everett, Sparks, Bowen, Lowell, and Norton. Among later publications of the kind—overlooking those that were merely ephemeral—are: *The Southern Quarterly Review*, first published 1828-32 (Charleston, revived 1842-55); *The United States Magazine and Democratic Review* (New York, 1837-52), later *The United States Review* (1853-55); *The New Englander* (New Haven, 1843-92); *The International Review* (New York, 1874-83); *The Forum* (1886—); *The Arena* (1890—).

Modern French Periodicals. In France the periodicals originating in the eighteenth century begin with *Mémoires pour servir à l'histoire des sciences et des arts* (1701-67), founded by the Jesuits Michel le Tellier and Philippe Lallemant at Trévoux (whence it is known as the *Journal de Trévoux*); it gained a high and well-deserved reputation as a critical authority. In 1703 Jean Leclerc began, in continuation of his *Bibliothèque universelle et historique* (see above), a review entitled *Bibliothèque choisie*, which was issued until 1713 and was followed by his *Bibliothèque ancienne et moderne* (1714-27). These, as well as various other periodicals edited by Frenchmen in this period, were printed in Holland. Among them are to be noted reviews of particular foreign literatures, as the *Bibliothèque anglaise* (1717-19), and the *Mémoires littéraires de la Grande Bretagne* (1720-24) of Michel de la Roche (see above), and the *Bibliothèque germanique* (1720-40) of Jacques Lenfant. About this time the English periodical essay found imitators in France; Marivaux published in 1722 the *Spectateur français*, which was followed by a number of other publications of a similar character. Other literary journals were the *Mémoires secrets de la république des lettres* (1744-48); the *Observations sur les écrits modernes* (1735-43) of Desfontaines; the *Lettres sur quelques écrits de ce temps* (1749-54) and *L'année littéraire* (1754-90) of Fréron; and the *Observations sur la littérature moderne* (1749-52) and *L'observateur littéraire* (1758-61) of the Abbé de la Porte. In 1754 a review, the *Journal étranger*, designed to deal with foreign literature in general, was founded by Fréron, Grimm, Prévost, and others; it ceased to appear in 1762. This was followed by the *Gazette littéraire* (1764-66), in the editing of which Voltaire and Diderot had a hand. The *Mémoires secrets pour servir à l'histoire de la république des lettres* (1762-87), also called *Mémoires de Bachaumont*, from its founder, are an important record of contemporary social and literary conditions; the same is true of the *Correspondance littéraire secrète* (1774-93). Of a more general character were the magazines *Décade philosophique*—later the *Revue philosophique*—(1795-1807), of P. L. Ginguené, the most important French periodical of its time, and the *Magasin encyclopédique*, founded in 1792 and continued from 1817 as the *Annales encyclopédiques* and the *Revue encyclopédique*, until 1832. During the second half of this century appeared a number of periodicals dealing with special subjects, such as agriculture, commerce, political economy, military and naval affairs, and so on. In the early part of the nineteenth century, under both the Empire and the Restoration, the periodical as well as the newspaper press was ham-

periodicals many restrictions and but little progress was made. In 1828 Guizot, Rémusat, and others started the *Revue française*, in imitation of the English reviews; it lived, however, only two years. In 1829 appeared the *Revue de Paris*, which was issued until 1846. The same year (1829) saw the founding of the *Revue des Deux Mondes*, by Ségur-Dupeyron and Mauroy; during 1830 it was not published, but in 1831 it reappeared, and ever since has maintained the high reputation which it at once attained. Pierre Leroux and George Sand started the *Revue Indépendante* in 1841; it ceased to appear in 1848. Many others, equally short-lived, followed it. Among the later literary periodicals are the *Nouvelle Revue* (1879—); *La Livre* (1880—); the *Revue de Paris* (1894—); and the *Revue Britannique* (1825-1901).

Modern German Periodicals. In Germany since the beginning of the eighteenth century development has been mainly in the direction of the learned, and, especially in recent times, of the scientific periodical. An extraordinary number of these have been published, many of them of great value. Literature, however, has also been well represented. Only a few of these journals can be mentioned. One of the earliest and most important was the *Neue Zeitungen von gelehrten Sachen*, founded by J. G. Krause in 1715 and carried on until 1797. "It was the first attempt to apply the form of the weekly political journal to learned subjects." Still more notable is the *Göttingische gelehrte Anzeigen*, founded 1739 as the *Zeitungen von gelehrten Sachen*, and conducted from that time until the present by members of the faculty of the University of Göttingen, among whom have been Haller, Heyne, and Eichhorn. In 1706 the publisher Nicolai founded the *Allgemeine deutsche Bibliothek*, which was issued until 1806. Lessing and Mendelssohn aided in conducting the *Briefe die neueste Litteratur betreffend* (1759-65), also founded by Nicolai. Wieland founded *Der deutsche Merkur* (1773-89; revived 1790-1810). The *Allgemeine Litteraturzeitung*, established by Bertuch in 1785 and issued until 1848, was one of the most important of German literary periodicals; the same may be said of the *Jenaische allgemeine Litteraturzeitung* (1804-84), founded by Eichstädt. The *Wiener Jahrbücher der Litteratur* (1818-48) enjoyed a high reputation, as did, for its learning, *Hermes* (1819-31), founded by W. T. Krug. The *Jahrbücher für wissenschaftliche Kritik* (1827-46), published by Cotta, and the *Heidelberger Jahrbücher der Litteratur* (1808) should also be mentioned. Of more recent date are the *Deutsche Vierteljahrsschrift* (1838-70); *Die Grenzboten* (1841—); *Unsere Zeit* (1857—); *Preussische Jahrbücher* (1858—); *Die Gegenwart* (1872—); the *Litteraturzeitung* (Jena, 1874—); *Deutsche Rundschau* (1874—); *Die Neue Zeit* (1872—); *Nord und Süd* (1878—); *Die Nation* (1888—); *Die Zukunft* (1892—).

Periodicals in Other Countries. The development in other European countries has been similar, though less extensive. Italy, in which, as was stated above, the history of periodical literature dates back to the seventeenth century, exhibits a long list of notable literary journals. Among them are the *Frusta letteraria* (1763-65) of Giuseppe Baretti; the *Novelle letterarie* (1740-70) of Giovanni Lami; the *Biblioteca italiana* (Milan, 1816-40); the *Progresso delle scienze* (Naples, 1832-45); the *Rivista contemporanea* (Turin, 1853—); the *Giornale degli eruditi* (1883—); the *Rivista internazionale* (1869-83); and the *Giornale storico della letteratura italiana* (1883—). Spain and Portugal, Belgium, Holland, the Scandinavian countries, Russia, Greece, and the Slavic countries, are all represented by literary periodicals of prominence.

In all the countries mentioned above, periodicals dealing with theology or the interests and practical work of the various religious denominations; with science, either in general or in one or more of its special branches; with the arts or trades, or with other special themes (including periodicals of humor), multiplied greatly during the nineteenth century. Their history cannot be given here even in the briefest summary.

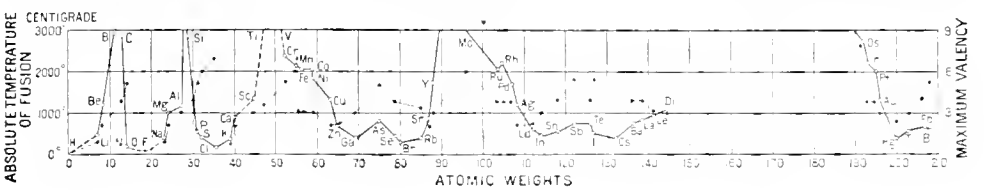
PERIODIC FUNCTION. See Function.

PERIODIC LAW. The generally accepted embodiment of the relations existing between the various properties of the chemical elements, so far as they can be compared with one another. It may be stated as follows: *If the elements are arranged in the order of their atomic weights, each of their properties varies as a periodic function of the atomic weight.*

Ever since the work of Richter, Proust, and Dalton had established the idea of fixed numerical values attaching to the ingredients of compounds, an idea which was deduced by Dalton from the hypothetical existence of individual atoms, identical in size, mass and other properties for any one element, chemists sought to deduce a closer relationship between the various elements from a comparison of the masses of their respective atoms. (See Chemistry and Atomic Weights.) The first attempt was that made by Dr. Prout in 1815 to prove that all the atomic weights were even multiples of the atomic weight of hydrogen, and that the latter was the only primitive element, from which the others were derived by processes of condensation. It was soon found that very few elements possessed atomic weights that could be expressed by integers, when the atomic weight of hydrogen was set at unity, and Prout's law was gradually modified to state that one-half the atomic weight of hydrogen, then that one-quarter, should be taken as the real standard. Refinements of investigation have since established the relative atomic weights to the second place of decimals, and it can now be asserted that the number of exact coincidences with Prout's law, as compared with that of deviations from it, is not much greater than what would be expected by the theory of chances. Prout's law has, therefore, been practically abandoned. On the other hand, interesting relations were found to exist between the atomic weights of similar elements. Thus Dœbereiner established, in 1829, his so-called triads, sets of three closely related elements whose atomic weights were approximately in arithmetical progression, as lithium (7), sodium (23), and potassium (39); calcium (40), strontium (88), and barium (136); sulphur (32), selenium (79), and tellurium (127); chlorine (35.5), bromine (80), and iodine (127); iron (56), nickel (57), and cobalt (58). These triads were later extended to include longer sets, and it was also pointed out that the constant differences were in many cases multiples of 16, the atomic weight of oxygen, whence it was assumed that the heavier elements of a group might

be oxides of the lightest, thus reducing the number of primordial elements considerably. The idea of connecting all the atomic weights in a single progression wherein similar elements recurred at regular intervals seems to have first struck de Chancourtois, and shortly afterwards Newlands; but the law in its complete form is due to Mendeléeff and Lothar Meyer, who reached the same conclusion independently in 1869. As Mendeléeff's exposition was by far the more convincing, he has been given the greater share of the credit.

A good idea of the fundamental principle can be obtained from the accompanying figure, in which the maximum valencies of the elements and their melting-points are shown to be periodically related to the atomic weights. The latter are laid off as abscissas, and the valencies and melting-points as ordinates, on perfectly arbitrary scales. It will be seen that the two curves connecting



the respective points are undulatory, with well-defined maxima and minima, which occur at regular intervals. The curves for most of the other properties which are capable of precise measurement are found to have a similar character; the maxima and minima, of course, do not always coincide with the same elements in one curve as in another, but the elements which occupy similar positions on one curve are also found to be similarly located on another. It is especially noticeable, moreover, that such curves indicate a relationship between the groups of elements, as well as between the elements themselves of each single group. Thus the properties of the alkaline-earth metals are always found to be intermediate between those of the alkalies and those of the aluminum group. Breaks in the continuity of the curves indicate lack of sufficient experimental data.

The arrangement of the elements, as shown in the accompanying table, is the one generally adopted at present, and includes all the well-known elements. An asterisk marks the elements discovered since 1869. Hydrogen occupies a unique position, and is generally omitted from the classification. Argon, helium, neon, and krypton cannot be properly included as yet, because their chemical behavior is still unknown. The vertical columns include the elements most closely associated with one another, and are known as *Groups* I., II., etc.; horizontally we have the *Series* 1, 2, 3, etc., in which the similarities are not great, excepting that a parallelism exists between the elements of one series as compared with those of another. The elements in odd-numbered series bear a closer resemblance to one another than they do to the elements of the intervening even-numbered series, and vice versa, so that it has been found expedient to make two divisions of each group, as will be seen in the table, the odd-numbered series being set to one side, the even-numbered to the other. In the eighth group occur triplets of closely analogous elements to be discussed below. Arrangements into fifteen or more individual groups, in place of the twin and triple groups here shown, have been suggested, but not generally adopted. Mention should also be made of the fact that this table can be constructed by writing the elements in the order of their atomic weights along a screw line of slight pitch upon the surface of a cylinder, and then, as it were, unrolling the cylinder. Various efforts have been made to connect all the atomic weights by a graphic equation, which would provide for an arrangement on some other kind of a spiral curve, either on a plane or in space, but they have been only moderately successful.

Before proceeding with a discussion of the details of the table, it may be well to inquire what significance can be attached to this periodic variability of properties as functions of the atomic weight. The many attempts to connect the atomic masses themselves in arithmetical relations would indicate a widespread opinion that the substances now called elements are really compounds of simpler substances, whose particles have a finite mass and represent individuals of distinct chemical properties, so that the chemical elements in each of the periodic groups might be likened to one of the 'homologous series' of organic compounds. (See, for example, HYDROCARBONS.) This view really antedates the periodic law, but fails in large measure to account for the resemblance existing between adjacent members of different groups. Others, especially Sir William Crookes, have held that the atoms are really fortuitous agglomerates of an indifferent primordial element, and that atoms of approximately the same mass behave similarly because they vibrate similarly, while atoms of greater mass might vibrate harmoniously with the smaller ones. It is difficult to explain, according to this hypothesis of the 'genesis of the elements,' why their number should be as limited as it is. But some facts are known vaguely pointing to the idea that the atoms of elements within the same periodic group are capable of vibrating at harmonically related rates, and that the great majority of chemical and physical properties depend upon atomic vibrations. It may, however, be argued that just as violin-strings may be composed of different materials and yet vibrate together according to common laws, so may the elements be composed of as many individual materials and still exhibit a periodic recurrence of properties, if the latter depend upon the harmonic vibrations of the atoms. Until much additional proof has been brought, the periodic law, while furnishing a vague indication, cannot be taken as positive evidence of the qualitative unity of matter.

In the table it will be found that the first group contains the univalent elements, the second group those which are divalent, and so on up

PERIODIC ARRANGEMENT OF THE ELEMENTS ACCORDING TO INCREASING ATOMIC WEIGHTS

Series	Groups I	II	III	IV	V	VI	VII	VIII		
								a	b	c
1	Hydrogen 1.008									
2	Lithium 7.03	Glucinum 9.1	Boron 11.	Carbon 12.	Nitrogen 14.04	Oxygen 16.	Fluorine 19.			
3	Sodium 23.05	Magnesium 24.3	Aluminum 27.1	Silicon 28.4	Phosphorus 31.	Sulphur 32.07	Chlorine 35.45			
4	Potassium 39.11	Calcium 40.	Scandium* 44.1	Titanium 48.1	Vanadium 51.4	Chromium 52.1	Manganese 55.	Iron, 56.	Nickel, 58.7	Cobalt, 59.	Copper 63.6
5	(Copper) 63.6	Zinc 65.4	Gallium* 69.9	Germanium* 72.5	Arsenic 75.	Selenium 79.2	Bromine 79.95			
6	Rubidium 85.4	Strontium 87.6	Yttrium* 89.	Zirconium 90.4	Columbium 93.7	Molybdenum 96.		Ruthenium, 101.7	Rhodium, 103.	Palladium, 106.4	Silver 107.92
7	(Silver) 107.92	Cadmium 112.4	Indium 113.8	Tin 119.	Antimony 120.4	Tellurium 127.5?	Iodine 126.85				
8	Cæsium 132.9	Barium 137.4	Lanthanum 138.6	Cerium 139.4	Præseodymium* 140.5	Neodymium* 143.6					
9											
10			Erbium 166.3		Tantalum 182.8	Tungsten 184.8		Osmium, 191.	Iridium, 193.1	Platinum, 194.9	Gold 197.2
11	(Gold) 197.2	Mercury 200.	Thallium 204.1	Lead 206.9	Bismuth 208.1						
12				Thorium 232.6	Uranium 239.6						

to the seventh, where the maximum valency is seven. The maximum valency of the elements of the eighth group may be set at eight, but their compounds rarely exhibit so high a valency, and in many other respects this eighth group is rather anomalous and is taken as a transition group between the seventh and the first. Thus the three elements copper, silver, and gold belong, with respect to many of their properties, especially when uncombined, in the eighth group; but their valency is usually low, and many of their salts are so similar to those of sodium that it is often found expedient to place them in the first group, in the positions occupied in the table by their names inclosed in parentheses. These valencies refer especially to the stable oxides. Stable compounds of hydrogen occur only in the fourth, fifth, sixth, and seventh groups, four atoms of hydrogen combining with one of each element of the fourth group, and this amount decreasing until we find the halogens in the seventh group univalent toward hydrogen. The first group includes the most electro-positive elements, and there is a steady transition toward the electro-negative end of the series in the seventh group, while the eighth group shows a rather sudden return toward the electro-positive side. The majority of the compounds derived from elements at the left end of the table are soluble, colorless, and volatile, whereas these properties change from left to right until we find the maximum of insolubility, color, and resistance to heat in the lower right hand of the table. It is also possible to select analogous compounds of the different elements and find those of similar properties fall within a well-marked zone upon the chart. Mendeléeff, in his original essay, added the following: (1) The elements which have the lowest atomic weights are those most widely distributed in nature, and also represent the most typical characteristics found in the second series of the table; (2) the atomic weight determines the character of an element; (3) from a consideration of their position in the system new analogies can be discovered between elements; (4) it may be expected that new elements should be discovered to fill blank spaces within the table, and their properties can be predicted from a consideration of those of the adjacent elements; (5) errors in the assumed atomic weights may be detected through an irregularity in the position of the element in the periodic system.

All of these statements have been verified, and the immediate acceptance of Mendeléeff's views was facilitated especially by the sensational discovery of a number of elements whose properties agreed accurately with those predicted by Mendeléeff. Thus gallium, germanium, and scandium had been completely described with respect to their own properties and those of their compounds before they were actually discovered. Success has also attended the attempts to correct atomic weights in several cases where the elements appeared misplaced in the original tables and were assigned to positions more in accordance with their properties, but necessitating the assignment of new atomic weights. (See ATOMIC WEIGHTS.) The weakest point of the table lies in the position of tellurium, which should fall in the sixth group, but is found to have a higher atomic weight than iodine, which undoubtedly belongs to the same series in the seventh group. Efforts to explain this discrepancy have been so far unavailing. There are also a number of elements derived from the so-called rare earths whose place in the system is not readily assignable. In the latter case, however, it may be said, as well as in that of the atmospheric gases, argon, helium, neon, and krypton, that their properties and atomic weights are not so well established as to cast doubt upon the theory through their failure to coincide with it. One interesting result of the theory is that of limiting the probable number of chemical elements to about 120, since the actual number of blank spaces is limited, and since it is extremely unlikely that any elements remain to be discovered with an atomic weight less than that of hydrogen or greater than that of uranium.

Among the *physical properties* which appear as periodic functions of the atomic weight may be mentioned the densities of the uncombined elements and of their oxides, fusibility, atomic volume, crystalline structure of the compounds, coefficient of expansion, refractive index, conductivity for heat and electricity, color, and velocity as ions.

As an indication of some purely *chemical periodicities* the following conspectus has been arranged, in which the elements are indicated by their positions in the above table, and are generally enumerated in such order that the one which shows the property in the most marked degree has precedence. The maximum valency of the elements toward *oxygen* is indicated throughout by the Roman numeral of each group, omitting the 'peroxides,' in which the oxygen appears to be linked in a different manner.

Maximum valency toward hydrogen in stable volatile compounds:

- Univalent: VII.; 2, 3, 5, 7; powerfully acid hydrogen compounds.
- Divalent: VI.; 2, 3, 5, 7; faintly acid hydrogen compounds.
- Trivalent: V.; 2, 3, 5, 7; basic acid hydrogen compounds.
- Quadrivalent: IV.; 2, 3, 5; neutral acid hydrogen compounds.

Maximum number of hydroxyls in basic compounds:

- One: I.; 1, 2, 3, 6, 8. III.; 11. VIII.; 6 (c and d).
- Two: II.; 2, 4, 6, 8, 3, 5, 7, 11. IV.; 11. VIII.; 4 (bcd).
- Three: III.; 3, 4, 5, 6, 7, 8, 10, 12. V.; 11. VII.; 4. VIII.; 4a.

Minimum valency in oxygen acids:

- One: VII.; 3, 5, 7.
- Three: V.; 2, 3, 5, 7. VI.; 3, 5, 7.
- Four: IV.; 2, 4, 3, 5, 7, 11.
- Five: V.; 4, 6, 10.
- Six: VI.; 4, 6, 10. VII.; 4. VIII.; 4a.

Tendency to liberate hydrogen from water below red heat:

I.; 2, 3, 4, 6, 8. II.; 2, 3, 4, 6, 8. VIII.; 4a.

Tendency to liberate oxygen from water:

VII.; 2, 3, 5.

Elements whose chlorides are unstable toward water:

V.; 3, 5, 7, 11, 4, 6, 10, 12. VI.; 10, 6, 4.

Elements whose sulphides can be precipitated from dilute acid solution:

VIII.; 4d, 6 (abcd), 10 (abcd). II.; 11, 7. III.; 11, 7. IV.; 11, 7, 5. V.; 11, 7, 5. VI.; 12, 10, 6.

[illegible] form alums with the sulphates of I., [illegible]
[illegible] 2, 4, 6, 10. VI.: 4. VII.: 4. VIII.: 4a.
[illegible] to form volatile compounds with organic radicles:

With one methyl group: I.: 3. vii.: 2, 3, 5, 7.

With two methyl groups: II.: 3, 5, 7, 11. VI.: 2, 3, 5, 7.

With three methyl groups: III.: 2, 3, 5, 7, 11. V.: 2, 3, 5, 7, 11.

With four methyl groups: IV.: 2, 3, 5, 7, 11.

Ability to form complex bases with ammonia: VIII.: 4 (ed), 6 (abed), 10 (abed). VI.: 4. II.: 3, 11.

O., 1884); Bebr, *Das periodische Gesetz und das natürliche System der Elemente* (Laibach, 1897); Mendeléeff, "The Principles of Chemistry," in *A Library of Universal Literature* (New York, 1901); Venable, *A Bibliography of the Periodic Law* (Easton, Pa., 1896).

PER'IŒ'CI (Lat., from Gk. Περίοικοι, *Perioikoi*, dwellers round, i.e. round about some particular locality or city, from περιοικεῖν, *perioikein*, to dwell around, from περί, *peri*, around + οἰκεῖν, *oikein*, to dwell, from οἶκος, *oikos*, house). The subject population of Laconia and the Spartan territory. They were not slaves like the Helots (q.v.), and seem to have been allowed to govern their own towns, under Spartan oversight; but they could hold none of the higher offices of State, had no share in the general government, and, we are told, could be put to death by the ephors without a trial. They paid a contribution to the kings, but otherwise seem to have been only taxed, like the Spartans, in time of war. As the choicest lands belonged to Spartans, the Perioeci seem to have devoted themselves largely to manufacture and trade, which were forbidden to the Spartans. Their work in metal, especially armor, wood, and leather, was celebrated and found a ready sale in foreign parts, and their coast towns seem to have enjoyed a flourishing commerce. Their numbers must have been considerable, even though the hundred cities of Strabo were probably most of them of no great size. They were always more numerous than their superiors, the Spartans, and this disparity increased greatly during the fourth century B.C.; but, though chafing under their inferiority, the Perioeci remained loyal till the Theban invasion after the battle of Leuctra (B.C. 371), when many of them joined the victors. They were evidently trusted by the Spartans, for they not only served as light-armed troops, but formed no small part of the heavy-armed forces, while the Spartan fleet must have been almost wholly dependent upon them, and in some cases we find one of their number in command of a squadron or an allied fleet. As the acquisition of the Spartan territory was a gradual conquest, it is not likely that all the Perioeci had the same position. It may also be regarded as certain that while there may have been an Achæan element in some communities, the bulk of the Perioeci were Dorian. They are called Lacedæmonians, but not Spartans.

PER'IOS'TEUM (Neo-Lat., from Lat. *periostion*, from Gk. περιόστεος, *periosteos*, surrounding the bones, from περί, *peri*, around + ὀστέον, *osteon*, bone). A tough fibrous membrane which surrounds each bone. It is highly vascular, and is the means by which the outer layers of the shafts and the greater part of the spongy portions of the bones are supplied with blood. It consists of an outer or fibrous layer and an inner or osteogenetic layer. The inner layer is very vascular and contains many protoplasmic cells called *osteoblasts*. Numerous experiments show that the formation of bone is essentially due to the action of the periosteum; and that, by transplanting detached portions of periosteum into muscular or other tissues, bony tissue is generated in those parts. In most cases in which this membrane has become detached in consequence of a wound or of disease, the exposed bone (except in the instance of the skull, which derives most of its nutrient matter from the dura mater, which is really the periosteum of the inner surface of the skull) perishes; but this is not invariably the case. Among its other offices, it serves, by isolating the bone from the surrounding tissues, to prevent the spread of disease from them to it. The shin-bone, or tibia, is thus indebted to the periosteum for its ordinary immunity in cases of ulcer in that region.

PER'IOSTI'TIS (Neo-Lat., from *periosteum*). An inflammation of the periosteum (q.v.). It occurs generally on the surface of thinly covered bones, such as the tibia, clavicle, or cranial bones. It may be caused by injury, and is part of acute osteomyelitis (q.v.); and like this disease, it is often brought on in boys and young men by bathing in cold water after violent exercise, or by similar forms of exposure. When the affection is caused by syphilis, oval swellings called nodes (q.v.) are produced, and there is considerable nocturnal pain. Rheumatism and tuberculosis are also causes. The acute form of periostitis must be treated with poultices and antiphlogistic remedies, and opiates given to relieve the severe pain. Severe cases must be incised freely in order to relieve pressure and allow of drainage if pus has formed. The treatment of the chronic forms of this affection must be mainly directed to the diseases which originated them.

PERIPATETIC PHILOSOPHY (Lat. *peripateticus*, from Gk. περιπατητικός, *peripatētikos*, given to walking about, from περιπατεῖν, *peripatein*, to walk about, from περί, *peri*, around + πατεῖν, *patein*, to walk, from πάτος, *patos*, path). A name applied to the philosophy of the school of Aristotle, derived, according to some, from the name of the building in which Aristotle lectured. As a school, the Peripatetics had comparatively little interest in metaphysical problems, and spent most of their effort on the study of nature and on an attempt to popularize the study of ethics. Some of them modified to a great extent the teaching of Aristotle, chiefly in a naturalistic direction. The later members of the school were in general faithful to his teachings, and derived much of their importance from their careful work in the arrangement and explanation of his writings. The two most prominent leaders, after Aristotle's death, were Theophrastus of Lesbos and Eudemus of Rhodes, who developed his syllogistic methods of reasoning, and in the main did little more than supplement his work. Theophrastus was suc-

ceeded as head of the school in B.C. 288 or 287 by Strato of Lampsacus, who held the position for eighteen years, and whose teaching was in the direction of a consistent naturalism. Andronicus of Rhodes, about 70 B.C., did much for the study of Aristotle; and to him is probably due the received arrangement of his works, beginning with the Logic as a necessary foundation. The Peripatetics of the period following this, while they did much for exegesis, showed a leaning toward Stoicism, and by their eclectic tendency prepared the way for the combination of various systems characteristic of Neo-Platonism.

PERIP'ATUS (Neo-Lat., from Gk. *περίπατος*, a walking around, from *περιπατεῖν*, *peripatein*, to walk around). This strange creature stands alone, with no animals intermediate between itself and the worms on the one hand, and the true Arthropoda on the other. Originally supposed to be a worm, it is now referred to a class by itself, the Malacopoda of Blainville, or Protracheata of Haeckel. It lives in the tropics, in damp places under decaying wood. In general appearance it somewhat resembles a caterpillar, but the head is soft and worm-like, though it bears a pair of antenna-like tentacles. It may be said rather to resemble superficially a leech with clawed legs, the skin and its wrinkles being like those of a leech. There is a pair of horny jaws in the mouth, but these are more like the pharyngeal teeth of worms than the jaws of arthropods. The numerous legs end each in a pair of claws. The ladder-like nervous system is unlike that of annelid worms or arthropods, but rather recalls that of certain mollusks, as well as that of certain flatworms and nemertine

PERIPATUS.

worms. Its annelid features are the large number of segmentally arranged true nephridia, and the nature of the integument. Its arthropodan features, which appear to take it out of the group of worms, are the presence of tracheæ, of true salivary and slime glands, of a pair of coxal glands, as well as of claws at the end of the legs. The heart is arthropodan, being a dorsal tube lying in a pericardial sinus with many openings. This assemblage of characters is not to be found in any marine or terrestrial worm.

The tracheæ are fine unbranched tubes, without a spiral thread, and are arranged in tufts, in *Peripatus Edwardsii*, opening by simple orifices or pores (stigmata), scattered irregularly over the surface of the body; but in another species (*Peripatus Capensis*) some of the stigmata are arranged more definitely in longitudinal rows on each side, two dorsally and one ventrally. The stigmata in a longitudinal row are, however, more numerous than the pairs of legs.

The salivary glands, opening by a short common duct into the under side of the mouth, in the same general position as in insects, are evidently, as the embryology of the animal proves, transformed nephridia, and, being of the arthropodan type, explain the origin and morphology of those of insects. It is so with the slime glands, these, with the coxal glands, being transformed and very large dermal glands. Those of insects arose in the same manner, and are evidently their homologues, while those of Peripatus were probably originally derived from the setiparous glands in the appendages (parapodia) of annelid worms.

The genital glands and ducts are paired, but it is to be observed that the outlets are single and situated at the end of the body. In the male the ejaculatory duct is single; in its base a spermatophore is found. It will be seen, then, that Peripatus is not only a composite type, and a connecting link between worms and tracheate arthropods, but that it may reasonably be regarded, if not itself the ancestor, as resembling the probable progenitor of chilopods, myriapods, and insects, though of course there is a very wide gap between Peripatus and the other antennate, air-breathing Arthropoda.

Consult: Moseley, "On the Structure and Development of Peripatus Capensis," in *Philosophical Transactions of the Royal Society* (London, 1874); A. Sedgwick, "The Development of Peripatus Capensis," parts i., ii., iii., in *Quarterly Journal of Microscopical Science* (London, 1885-87); Packard, *Text-Book of Entomology* (New York, 1898).

PER'IPLUS (Lat., from Gk. *περίπλοος*, *periploos*, *περίπλους*, *periplous*, voyage round, from *περίπλειν*, *periplein*, to sail round, from *περί*, *peri*, around + *πλεῖν*, *plein*, to sail). A name for various ancient maritime itineraries, as that of Hanno (q.v.).

PERIPNEUMONIA (Neo-Lat., from Gk. *περιπνευμονία*, inflammation of the lungs). An old term for pneumonia (q.v.).

PERIP'TERAL (from Lat. *peripteros*, from Gk. *περίπτερος*, with a single row of columns around, from *περί*, *peri*, around + *πτερόν*, *pteron*, wing, row of columns). A term applied to temples or like buildings entirely encircled by a row of free-standing columns. The Greek temples were nearly always peripteral, while the Roman temples were not.

PERISPERM (from Gk. *περί*, *peri*, around + *σπέρμα*, *sperma*, seed). The nutritive tissue in seeds outside of the embryo-sac. It is derived from the tissue of the nucellus which has not been destroyed by the encroachment of the sac. The ordinary nutritive tissue of seeds is developed within the embryo-sac, and is known as 'endosperm.' See SEED.

PERISSODAC'TYLA (Neo-Lat. nom. pl., from MGk. *περισσοδάκτυλος*, *perissodaktylos*, having an odd number of toes, from Gk. *περισσός*, *perissos*, beyond the regular number or size, odd + *δάκτυλος*, *daktylos*, finger, toe). A suborder of the Ungulata, containing all those forms which have an odd number of toes, as distinguished from the even-toed ungulates, Artiodactyla. The third digit is always the largest and sometimes the only functional one. The carpal, metacarpal, tarsal, and metatarsal bones are correspondingly modified. The stomach is simple and non-ruminant. In all living forms the horns, if present, are median and not lateral. Many fossil forms are known, but the living species are comparatively few, and are naturally and easily grouped in three families—the tapirs, rhinoceroses, and horses. See UNGULATA.

PERISTALTIC MOTION (from Gk. *περισταλτικός*, *peristaltikos*, compressive, from *περιστέλλειν*,

peristaltic, to wrap around, from περι, *peri*, around + στελλειν, *stellein*, to place, to compress). The terms *peristaltic* and *vermicular* are applied to the peculiar wave-like motion or action of the stomach and intestines by which the food is regularly moved onward. Peristalsis takes place from one end of the intestinal tract to the other, but it is seen at its best in the small intestine. Peristaltic movements are effected by the alternate contraction and dilatation of successive portions of the muscular coats. These coats are two in number, an external longitudinal and an internal circular layer of fibres, under the control of the sympathetic nervous system through the agency of the *ganglionic plexus* situated in the intestinal walls. In peristalsis the longitudinal fibres contract first, and draw the intestine backward over the substance to be propelled, shortening and dilating the tube at this point, while the circular fibres of the same part contract in succession from above downward, forcing the substance into the next portion of the intestine, where the same process is repeated.

Under ordinary circumstances peristalsis gives rise to no sensation, the presence of food being just sufficient stimulus for a gentle and normal action. In the presence of irritating substances, however, peristalsis becomes painful, violent, and spasmodic. When the intestinal canal is empty there is probably little or no movement. See DIGESTION.

PERISTOME (from Gk. περι, *peri*, around + στοα, *stoma*, mouth). The fringe of teeth around the mouth of a moss capsule. See MUSCI.

PERISTYLE (from Lat. *peristylum*, Gk. περιστυλον, *peristylon*, a building with columns around). In architecture, a line of columns about a building or a court.

PERIT, PLATIAH (1785-1864). An American merchant and philanthropist, born in Norwich, Conn., of Huguenot ancestry, and educated at Yale College, where he graduated in 1802. After acting as a clerk in a Philadelphia importing house (1805-09), he went to New York City, where he entered the firm of Goodhue & Co., shipping merchants, in 1817. From 1853 to 1863 he was president of the Chamber of Commerce, and in the latter year retired from business. Perit was prominent in many charities, especially in behalf of seamen, as a member of various boards of the Presbyterian Church, and as an officer of the American Bible Society. In 1857, during the war between the New York 'municipal' and 'metropolitan' police, he was police commissioner and did much to restore order. His projected history of American commerce, begun after his retirement from business, was not completed.

PERITONE'UM (Lat. *peritonæum*, *peritonæum*, from Gk. περιτόναιον, *peritonaion*, neu. sg. of περιτόναιος, *peritonaios*, stretched around, from περιτείνειν, *periteinein*, to stretch around, from περί, *peri*, around + τείνειν, *teinein*, to stretch). A serous membrane which more or less completely invests all the viscera lying in the abdominal and pelvic cavities, and is then reflected upon the walls of the abdomen, so that there is a visceral and a parietal layer. Numerous folds are formed by the visceral layer as it passes from one organ to another. They serve to hold the parts in position, and at the same time inclose vessels and nerves. Some of these folds are termed *ligaments*, from their serving to support the organs. Thus we have ligaments of the liver, spleen, bladder, and uterus formed by peritoneal folds. Others are termed *mesenteries*, and connect the intestines with the vertebral column. They are the mesentery proper (q.v.), which has been already described, the ascending, transverse, and descending meso-colon, and the meso-rectum. Lastly, there are folds called *omenta*, which proceed from one viscus to another. They are three in number—viz. the *lesser* or *gastro-hepatic omentum*, which extends from the under surface of the liver to the lesser eurvature of the stomach; the *gastro-splenic omentum;* and the *great* (or *gastro-colic*) *omentum*, which consists of four layers of peritoneum, the two which descend from the stomach, and the same two returning upon themselves, and ascending as high as the transverse colon, where they separate, and inclose that organ. These separate layers may be easily seen in the young subject, but in the adult they are more or less blended. The great omentum always contains some adipose tissue, which in corpulent persons often accumulates to an enormous extent. Its use appears to be (1) to protect the intestines from cold and from injury by covering them anteriorly as with an apron, and (2) to facilitate their movement upon each other during their vermicular action. In the female the peritoneal cavity is not completely closed, as the Fallopian tubes open into it by their free extremities. Inflammation of the peritoneum is termed peritonitis (q.v.).

PERITONI'TIS (Neo-Lat., from Lat. *peritonæum*, *peritonæum*, peritoneum). An inflammation of the peritoneum (q.v.).

Peritonitis may be acute or chronic, primary or secondary. Primary or idiopathic inflammation of the peritoneum occurs after exposure to cold or wet, and is sometimes known as rheumatic peritonitis. Its rarity is rather remarkable, considering how frequently the pleura, pericardium, and similar structures are affected. Secondary peritonitis is due to an extension of inflammation from or perforation of one of the abdominal viscera. By extension it may follow an inflammation of the stomach or intestines, or extensive ulcerations of these parts, abscess of any of the solid organs, or of the retroperitoneal tissues. Perforative peritonitis commonly arises from penetrating wounds, or ulcer of the stomach or bowels. An important cause is perforating appendicitis, which is responsible more often than any other single cause, and especially in young adult males. A more liberal blood supply renders the appendix of the female less liable to damage, but, on the other hand, the generative organs are a frequent means of introducing an infection into the peritoneal cavity.

Acute peritonitis generally presents well-marked symptoms. It commences with a chill, or severe pain in the abdomen may be the first symptom. The pain is at first confined to particular spots (usually in the lower part of the abdomen), but it soon extends over the whole abdominal region. It is increased, on pressure, to such an extent that the patient cannot even bear the weight of the bedclothes; and to avoid, as far as possible, internal pressure upon the peritoneum, he lies perfectly still, on his back, with the legs drawn up, and breathes by means of the ribs, in consequence of the pain occasioned by the descent of

the diaphragm in inspiration. The breathing is shallow, and, less air being admitted at each movement of respiration, the number of those movements is increased. There are 40 or even 60 respirations a minute, instead of 18 or 20. The pulse is very frequent, often 120 or more in the minute, and small and tense, though occasionally strong and full at the commencement of the attack. The temperature may rise rapidly after the chill to 104° or 105°, but is subsequently lower. Some very severe cases have no fever throughout the attack. Vomiting is an early and prominent symptom and causes great pain. After the disease has continued for a certain time, the belly becomes tense and swollen, the enlargement being caused at first by flatus, and afterwards also by the effusion of fluid.

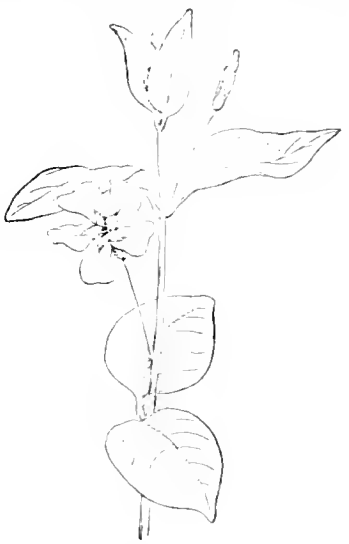
The appearance of the patient when at the height of the disease is very characteristic. The 'Hippocratic countenance' is more often observed in peritonitis than in any other disease except cholera—"a sharp nose, hollow eyes, collapsed temples; the ears cold, contracted, and their lobes turned out; the skin about the forehead being rough, distended, and parched; the color of the whole face being brown, black, livid, or lead-colored." Acute diffuse peritonitis is usually fatal in from two to ten days. Often death occurs with great suddenness, due to cardiac paralysis.

Chronic peritonitis may result from an attack of the acute form, producing adhesions, either local or general, between the peritoneal surfaces. The intestines may be matted together or compressed at particular points by fibrous bands. Often there are no symptoms, but if the intestine is constricted colicky pains will be felt. Tuberculosis may cause either acute or chronic peritonitis, but usually the latter. It occurs at all ages and presents symptoms of extraordinary complexity and diversity. Sometimes the condition is discovered by accident, during an operation for some other trouble. Caseous masses form, the mesenteric glands are enlarged, and the omentum is irregularly thickened. These masses can be felt through the abdominal walls. Cancerous peritonitis is usually an extension from some other organ.

The treatment of acute peritonitis must be prompt, vigorous, and persistent. In the earliest stage it may be aborted or limited by the use of ice bags locally, and a saline or calomel purge. Complete rest is demanded at all stages of the disease. The intestinal movements may be quieted and pain allayed by the administration of opium, and in the height of the disease this is the only drug worth considering. Tolerance to opium in peritoneal inflammation is great, and comparatively large doses must be given. When due to perforation, as in appendicitis, prompt operation will often prevent the spread of the infection. Tubercular peritonitis is often cured by simply opening the abdomen, exposing the tuberculous masses to the air, and flushing out the cavity with saline or antiseptic solutions. General treatment is unsatisfactory, but fresh air, tonics, cod-liver oil, and creosote may effect a cure.

PER'ITYPHLI'TIS (*Neo*-Lat., from Gk. *περί*, *peri*, around + *τυφλός*, *typhlos*, blind, with allusion to the cæcum). An inflammation of the peritoneal covering and the loose connective tissue attaching the cæcum and ascending colon to the iliac fascia. Formerly what is now known as appendicitis was thought to be due to inflammation of the cæcum, or typhlitis, and of the peritoneum covering it, or perityphlitis; but these conditions are now believed to exist independently of appendicitis only in exceptional cases. See CÆCUM; COLON; VERMIFORM APPENDIX.

PERIWINKLE (AS. *pervinca*, *pervince*, *perwinke*, from Lat. *pervinca*, periwinkle, from *per*, through + *vinca*, twist, from *vincire*, to bind), *Vinca*. A genus of plants of the natural order Apocynaceæ, having a five-cleft calyx and a salver-shaped corolla, bearded at the throat, with five obliquely truncated segments, opposite evergreen leaves, and flowers which grow singly or in pairs from the axils of the leaves. The lesser periwinkle (*Vinca minor*), growing in woods and thickets of Europe, is a half-shrubby plant with trailing stems, which root at their extremities, ovate-lanceolate leaves, and pale blue or sometimes white or reddish-purple flowers. The



GREATER PERIWINKLE.

greater periwinkle (*Vinca major*), which has much larger flowers and ovate-cordate ciliated leaves, is a native of the south of Europe. These species are commonly planted in shrubberies and gardens because they rapidly cover unsightly objects with pleasing green foliage, and produce beautiful flowers at almost all seasons of the year, even in mild winters. They have escaped in the United States. The former is very commonly found and the latter, which is less hardy, occasionally. The herbaceous periwinkle (*Vinca herbacea*), an Hungarian species, is remarkable for the abundance of its flowers. The rose-colored periwinkle (*Vinca rosea*), a native of Madagascar, is a favorite greenhouse plant.

PERIWINKLE. A small gastropod mollusk of the genus Littorina, characterized by the shell being top-shaped, solid, the columella thickened, the lip of the aperture simple, not toothed, and the round aperture closed by a horny operculum. The animal has long tentacles, with an eye at the base of each tentacle. Periwinkles

[illegible] or are ovoviviparous. They [illegible] vast numbers on the rocky shores of the North Atlantic between tide marks, and especially near low water mark. They feed on seaweeds. Our two native species are *Littorina rudis*, rather elongated with a high spire, and *Littorina palliata*, which has a low spire, with

AMERICAN PERIWINKLES.

1 *Littorina rudis*. 2. *Littorina littorea*. 3. *Littorina palliata*.

the body-whirl rather swollen. The latter varies greatly in color from pure olive green to yellow or even bright red, with revolving black lines, the colors more or less simulating that of the seaweeds among which it lives.

A much larger species, and now more abundant on the coast north of New York than any other, is *Littorina littorea*, which in 1857 was introduced from Europe into Nova Scotia and now abounds in vast numbers all along the coast. It lives nearer low tide than the native species, and frequents exposed rocks not covered by seaweeds. It is a much larger and heavier shell than the others, and varies much in the height of the spire. Bumpus has shown that since its introduction into America, where it has been subjected to a new environment, this shell differs from those of England in being more elongated, lighter in weight, more bulky, while the color-markings are less pronounced. It also appears that there are already many local races on the New England coast. These mollusks are able to live for days and even weeks out of the sea, in one case four months. The power of resisting dryness seems to be still greater with tropical species. In Jamaica *Littorina muricata* lives among grass and herbage at the top of low cliffs. At Panama three large species were found on trees at and above high-water mark. The eggs of those Littorinæ which are not ovoviviparous are deposited on seaweeds, rocks, etc., enveloped in a glairy mass just firm enough to retain its shape.

The name 'periwinkle' is given popularly to almost any small spiral shell, especially along the shores of the Great Lakes to the turret-shaped pulmonates of the genus Melania. In the shortened form 'winkle' it is applied by the oystermen in the neighborhood of New York to the conchs (Fulgur) which feed upon the oyster beds.

PERJURY (Lat. *perjurium*, false oath, from *perjurus*, one who swears falsely, from *perjurare*, to swear falsely, from *per*, through + *jurare*, to swear, from *jus*, right, law). The crime of knowingly and willfully giving false testimony, which is material to the questions in issue in a judicial proceeding. The offense is committed whether the testimony is given under an oath or affirmation, provided either is administered by a competent authority. If a witness makes a misstatement through inadvertence or mistake he is not guilty of the crime. If he recklessly and knowingly makes a statement as to the truth or falsity of which he has no knowledge, it has been held to constitute perjury. A witness may be convicted of perjury under such circumstances even though the facts he testifies to subsequently prove to be true. It is not essential to constitute the offense that the testimony be believed, or that it cause a perversion of justice in the cause in which it is given. Where a witness honestly states his opinion as to a fact, if it is not correct, he is not liable; but if the fact is material to the issue, and he makes a willfully false statement as to it, he is guilty of perjury.

In most jurisdictions a voluntary oath, taken outside a judicial proceeding, cannot be made the basis of a charge of perjury, as the law does not punish criminally prevarication in private matters. An exception to this exists under the laws of the United States. See OATH.

At the early common law the testimony of two witnesses was necessary to convict a witness of perjury. However, to-day in most jurisdictions the testimony of one witness and proof of corroborating circumstances is sufficient, if credible.

Perjury has always been severely punished, as it tends to the perversion and obstruction of justice. In ancient times in England the penalty was death; subsequently banishment or cutting out the tongue; after the Norman era, forfeiture of goods and imprisonment; and at present in England and the United States it is punished by fine or imprisonment, or both. In a few States a person so convicted is thereafter incompetent to give testimony in judicial proceedings.

Subornation of perjury consists in inciting or procuring another to commit perjury. The witness must have actually committed perjury in order to render the person who incited him to do so guilty of the crime. An attorney calling a witness who he believes will not tell the truth does not thereby become liable if the witness does in fact commit perjury, if he did not actually connive at it, or solicit him to do so. Subornation of perjury is usually punished with as much severity as perjury itself. See OATH; WITNESS. Consult the authorities referred to under CRIMINAL LAW and EVIDENCE.

PER'KINS, CHARLES CALLAHAN (1822-86). An American art-historian, born in Boston. After graduating from Harvard he lived for a time in Rome, then studied painting in Paris under Ary Scheffer, and on a subsequent visit in 1865 took up etching under Bracquemont and Lalaime. He was one of the founders and honorary director of the Boston Museum of Fine Arts, and in 1868 became a corresponding member of the French Institute. He also cultivated music, was president of the Handel and Haydn Society in 1870-83, and occasionally conducted its performances. Through his writings and lectures he contributed much to the promotion of art in this country, and enjoyed wide reputation as a critic. He published: *Tuscan Sculptors* (1864), *Italian Sculptors* (1868), both with etchings by the author; *Art in Education* (1870); *Raphael and Michelangelo* (1878), a biographical and critical essay; *Sepulchral Monuments in Italy* (1883); and *Ghiberti et son école* (1885). *The Historical Handbook of Italian Sculpture* (1883) is practically a new edition of *Tuscan Sculptors* and *Italian Sculptors*. He was also critical editor of the *Cyclopædia of Painters and Painting*, edited by Champlin (1885-87).

PERKINS, ELISHA (1741-99). An American physician, born in Norwich, Conn. He is chiefly known for the invention in 1796 of Perkins's

metallic tractors, pins or bars of iron and brass, supposed to possess curative virtues, which were drawn in a certain way over the affected parts in rheumatism, gout, neuralgia, and local inflammations. This method of treatment was called Perkinism and for a time it enjoyed a certain vogue both in Europe and America. Perkins afterwards invented a medicine for fevers, whose efficacy he undertook to prove during the yellow-fever epidemic in New York in 1799, but he himself fell a victim to the disease.

PERKINS, Frederic Beecher (1828-99). An American librarian and author, born at Hartford, Conn. He left Yale before graduation to study law, and was admitted to the bar in 1851. For three years he was associate editor of *Barnard's American Journal of Education*. After some experience as secretary of the Boston Public Library, he was librarian of the free library at San Francisco from 1880 to 1887. His publications include: *Scrope, or the Lost Library*, a novel (1874); *Check List of American Local History* (1876); *Devil Puzzlers, and Other Studies* (1877); *My Three Conversations with Miss Chester* (1877); and a *Life of Dickens* (1877).

PERKINS, George Henry (1844—). An American naturalist, born at Cambridge, Mass. He was educated at the Knox Academy, Galesburg, Ill., and at Yale (1867). In 1869 he was appointed professor of natural history in the University of Vermont, and in 1898 dean of the natural science department. He served as State entomologist from 1880 until 1895, when he was made State geologist. His publications include State reports *On the Injurious Insects of Vermont* (3 vols., 1876-78); *Parasites Infesting Man and the Lower Animals* (1880); *The Flora of Vermont* (1888); and *The Marble, Slate, and Granite Industries of Vermont* (1898).

PERKINS, Jacob (1766-1849). An American inventor, born at Newburyport, Mass. While still a boy serving his apprenticeship to a goldsmith, he invented a process of plating shoebuckles. In 1787 the Massachusetts State Government engaged him to cut dies for its mint. Later he improved bank-note engraving by substituting steel plates for copper, and in 1800 he invented a machine by which nails could be cut and headed at the same time. When 52 years of age, he went to London, where he secured remunerative contracts. He supplied plates to the Bank of Ireland, built steam-engines, and completed a number of inventions, among which were a process for transferring engravings from one steel plate to another; the pleometer, an instrument to measure the speed of ships; the bathometer, an instrument to measure the depth of water; and a rapid firing gun, which could discharge nearly 1,000 rounds per minute.

PERKINS, James Breck (1847—). An American historian and politician, born at Saint Croix, Wis. He graduated at the University of Rochester in 1867, was City Attorney there from 1874 to 1878, and became a member of the New York Assembly in 1898, and of the United States House of Representatives in 1901. His publications include: *France Under Richelieu and Mazarin* (1887); *France Under the Regency* (1892); *France Under Louis XV.* (1897); and *Richelieu* (1900), in the "Heroes of the Nations" series.

PERKINS, Justin (1805-69). An American missionary. He was born at West Springfield, Mass.; graduated at Amherst College in 1829; studied theology at Andover; embarked at Boston, 1833, as a missionary of the American Board; and established the Nestorian mission at Urumiah, Persia, in 1834. He was joined by Dr. Asahel Grant (q.v.) in 1835. In 1842 he visited the United States, accompanied by Mar Yohannan, the Nestorian bishop. Besides a translation of the Bible into modern Syriac (2 vols., 1846-52), and commentaries on Genesis and Daniel (1869), Dr. Perkins published *Eight Years in Persia* (1843); *Missionary Life in Persia* (1861).

PERKINS, Thomas Handasyd (1764-1854). An American merchant and philanthropist; born in Boston. In 1785 he entered into partnership with his brother James in Santo Domingo, and was later representative of the firm in the United States. In 1789 he went to Batavia and Canton, to familiarize himself with the Chinese and East Indian trade, and after his return settled in Boston, where he became very successful. He was one of the originators of the Quincy Railroad, the first in the United States, founded the Perkins Asylum for the Blind, contributed liberally toward the erecting of the Bunker Hill Monument, and was one of the chief benefactors of the Boston Athenæum and the Massachusetts General Hospital. Consult Cary, *Memoirs of Thomas Handasyd Perkins* (Boston, 1856).

PER'KIN WAR'BECK. A pretender to the throne in the reign of Henry VII. of England. See Warbeck, Perkin.

PERKIN WARBECK, The Chronicle History of. A tragedy by John Ford (1634), on the career of the pretender of that name, and the most faultless of Ford's plays. The source was probably Bacon's *Life of Henry VII.*

PERKNITE (from Gk. *περκνός, perknos*, dark; connected with Skt. *piśan*, spotted). An igneous rock of granitic texture, composed essentially of augite or hornblende. The term is applied rather to a family of rocks than to an individual species. Perknites are rich in lime and magnesia and low in silica, alumina, and the alkalies. They have generally been included under the family name pyroxenite (q.v.), which has a wider scope of meaning, and includes magnesian as well as lime-magnesian rocks.

PERLES, pĕr'lĕs, Joseph (1835-94). A German rabbi and Orientalist. He was born at Baja, in Southern Hungary, and studied there and at Breslau, where he graduated, having already contributed to the *Monatsschrift für Geschichte und Wissenschaft des Judenthums*, a valuable thesis, "Meletemata Peschitthoniana" (1859). This monograph advanced the theory that the Peshitto version, though preserved only by the Christian Church, is Jewish in tone and influence. In 1862 he became rabbi at Posen, whence he went to Munich in 1871. Besides the dissertation already mentioned, Perles published valuable papers on the history of the Jews during the Middle Ages, and on Hebrew etymology and philology.

PERM, pĕrm. A government of Eastern Russia, bounded by the Government of Vologda on the north, Tobolsk on the east, Orenburg and Ufa on the south, and Vyatka on the west (Map: Russia, J 3). Area, about 128,300 square miles. While politically a government of European Russia, geographically Perm belongs partly to Asia. The centre of the region is occupied by the Ural

Mountains [illegible] which traverse the district from north to south. They hardly exceed 5000 feet in their highest points. The eastern part of the government is lower than the western. (For geology, see PERMIAN SYSTEM.) Perm is watered by the Kama, Petchora, and Sosva, with their tributaries. The largest of these streams are navigable.

The climate is continental and harsh, especially in the mountainous districts of the centre. In regard to its mineral deposits Perm exceeds every other government of European Russia. The chief minerals are gold, silver, iron, copper, platinum, nickel, zinc, coal, and salt. Precious stones, such as sapphires, jacinths, topazes, and many others, are also found in considerable quantities. The mining of iron and copper employs over 190,000 persons. The value of the annual output is estimated at over $28,000,000. The annual output of gold exceeds $2,500,000, while the output of coal is as yet slight.

Agriculture is carried on all over the district, but only in the black-soil region of the south is the supply equal to the demand. Stock-raising is especially developed among the Bashkirs. Perm has extensive forests which cover over 80 per cent. of the total area. Lumbering and shipbuilding are carried on to some extent. The house industry is favored by the abundance of natural resources. The products of that industry include hardware, pottery, wooden articles, yarns, coarse cloth, ropes, trunks, etc. The manufacturing industries are chiefly in connection with the mineral industries, namely, the manufacturing of steel, iron, etc. The fairs of Irbit (q.v.) are of considerable importance in the trade with the eastern possessions of Russia, but since the construction of the Trans-Siberian Railway the commerce has fallen off to a perceptible extent. Population, in 1897, 3,003,208, including a considerable number of Bashkirs, Permiaks, Tatars, Tcheremisses, and Voguls. The exploitation of the mining resources of the region was begun by the Stroganoffs in the sixteenth century. Capital, Perm.

PERM. The capital of the government of the same name in Eastern Russia, on the Kama, 300 miles northeast of Kazan (Map: Russia, J 3). It is regularly laid out; the houses are mostly of wood. Its educational institutions comprise two gymnasia, a realschule, a museum, a meteorological station, and a number of scientific societies. There are several machine works, tanneries, etc., and the port carries on an extensive transit trade during the navigable season. Population, in 1897, 45,403. The town was founded on the site of a mining settlement in 1781.

PERMANGANIC ACID. See MANGANIC AND PERMANGANIC ACIDS.

PERMEABILITY, MAGNETIC. See MAGNETISM.

PERMIAN SYSTEM. A name first applied by Murchison in 1841 to a group of rocks occurring in the Province of Perm, Russia. The strata which he included under this name had up to that time been considered as a division of the Triassic. In Russia the Permian strata occupy an area twice the size of France, and they are also largely developed in Germany and in England. In Germany, where the strata are naturally divided into two great series, the name Dyas is commonly applied to the system. Equivalents of the Russian deposits have been described from West Virginia, Kansas, Utah, and Nebraska. While attempts have been made to consider the Permian as coequal with the Carboniferous, still the more common custom is to look upon it as the upper division of the Carboniferous. Consult: Williams, "Correlation Papers—Devonian and Carboniferous," *Bulletin 80 of the United States Geological Survey* (Washington, 1891). See CARBONIFEROUS SYSTEM.

PERMIT (corruption of Sp. *palometa*). A West Indian fish, the great pompano (*Trachinotus Goodii*), also called palometa. See POMPANO.

PERMOSER, pĕr'mō-zĕr, BALTHASAR (1650-1732). A German sculptor, born at Kammer, Bavaria. He was a pupil of Weisskirchner at Salzburg, and of Knacker in Vienna. Afterwards he lived many years in Florence. On his return from Italy in 1704 he lived principally in Berlin and Dresden. His work is able, though tinged by the artificial style of the time. He executed several groups and statues, which were destroyed in the Seven Years' War. His remaining works include a fine pulpit, an "Ecce Homo," and a statue of John the Baptist, in the Catholic church at Dresden, and the monument to Prince Eugene of Savoy in the Vienna Belvedere.

PERMUTATIONS AND COMBINATIONS (Lat. *permutatio*, from *permutare*, to change entirely, from *per*, through + *mutare*, to change, frequentative of *morere*, to move, Skt. *miv*, to push). The different groups of r things which can be selected from a collection of n different things, without reference to their arrangement, are called the *combinations* of n things taken r at a time. For example, the combinations of the four letters *a*, *b*, *c*, *d*, taken 3 at a time, are *abc*, *abd*, *acd*, *bcd*; taken 2 at a time, *ab*, *ac*, *ad*, *bc*, *bd*, *cd*. The different groups of r things which can be selected from n different things, varying the arrangement in every possible manner, are called the *permutations* of n things taken r at a time. E.g. the permutations of the letters *a*, *b*, *c*, taken 2 at a time are *ab*, *ba*, *ac*, *ca*, *bc*, *cb*. The number of combinations of n things taken r at a time is indicated by the symbol C_r^n. The number of permutations of n things taken r at a time is indicated by the symbol P_r^n. The chief properties of permutations and combinations are: (1) The number of permutations of n different things taken r at a time is $n(n-1)(n-2)\ldots(n-r+1)$. E.g. the number of permutations of the letters of the word *courage* taken three at a time is $7 \cdot 6 \cdot 5 = 210$. (2) The number of permutations of n things taken all together is $n(n-1)(n-2)\ldots 3 \cdot 2 \cdot 1 = n!$ (3) The number of permutations of n different things taken r at a time, when each of the n things may be repeated, is n^r; e.g. the number of ways of selecting 3 numbers from 50 on a combination lock, repetitions being allowed, is $50^3 = 125{,}000$. (4) The number of combinations of n different things taken r at a time is $\frac{n(n-1)(n-2)\ldots(n-r+1)}{r!}$, or $\frac{n!}{r!(n-r)!}$. E.g. 3 persons can be selected from a class of 20 in $\frac{20 \cdot 19 \cdot 18}{3!} = 1140$ different ways.

The formulas of permutations and combinations express many relations of both algebra and geometry and possess a peculiar interest in mathematics. E.g. the coefficients in the binomial expansion for a positive integral exponent may be expressed by formulas of combinations thus, $(a+b)^n = a^n + C^n_1 a^{n-1}b + C^n_2 a^{n-2}b^2 + C^n_3 a^{n-3}b^3 + \ldots$. The maximum number of vertices of a general polygon of n sides is expressed by C^n_2. Also, such problems as those of combination locks, of the number of signals with a given system of signs, and of forming all possible numbers from given digits, are solved with unusual brevity by means of the formulas of permutation and combination. This subject was known to the Hindus, particularly to Bhaskara (b.1114), and is related to the subject of probability (q.v.). Its principles are often explained in text-books under the title Choice. By *cyclic* permutation is meant the interchange of the elements of a function in cyclic order. E.g. $(a-b)+(b-c)+(c-a)$ becomes $(b-c)+(c-a)+(a-b)$ by the cyclic interchange of a for b, b for c, and c for a.

PERNAMBUCO, pĕr'năm-bōō'kō. An eastern State of Brazil, bounded by Parahyba and Ceará on the north, Piahuy on the west, Bahia and Alagôas on the south, and the Atlantic Ocean on the east (Map: Brazil, K 5). The area is 49,560 square miles. The coast region is low and the interior is occupied by barren plateaus known as sertãos, which pass into mountain ranges near the western frontier. A long reef of sandstone extends along the coast and forms a great hindrance to navigation. The rivers are mostly short and flow toward the São Francisco, which forms the southern boundary of the State. The low strip of coastland is covered with fine forests and is the centre of population as well as of agricultural activity. In that region are cultivated sugar, cotton, coffee, tobacco, beans, mandioca, and grain. Cattle are raised in the interior. Agriculture in Pernambuco has suffered greatly with the abolition of slavery and the Government has spent large sums in loans and subsidies in order to improve the agricultural conditions of the State. The exports in 1899 were valued at the sum of $12,330,000, and consisted chiefly of cotton, sugar, and coffee. Sugar-refining is the principal industry. Pernambuco has good railway facilities on the coast, where a number of lines lead to the capital and chief seaport of the State, Pernambuco (q.v.). The population was estimated in 1894 at 1,254,159.

PERNAMBUCO, or Recife. The capital of the State of Pernambuco, Brazil, situated on the Atlantic coast at the easternmost point of the continent (Map: Brazil, I, 5). It consists of three parts connected by bridges and causeways; the oldest, or Recife proper, is built on an outlying peninsula, connected with the mainland by an isthmus, and is the principal commercial section; the central part, called São Antonio, stands on an island between a reef and the mainland, and contains most of the public buildings; the third portion, Boa Vista, is built on the mainland, and is the new residential section, with broad streets and beautiful gardens. There are several street-car lines, one of which runs to the suburb of Olinda (q.v.), the former capital of the State. Pernambuco has some of the finest churches and public buildings of the country, and numerous charitable and educational institutions, the latter including a celebrated law school and an excellent secondary college. The harbor proper is inclosed by a reef cut by several navigable passages, but the largest ships have to anchor in an open roadstead. Yet, since Pernambuco is the nearest to Europe of the important ports of Brazil, and owing to its extreme eastern position in the path of nearly all South Atlantic commerce, it has a very considerable shipping, amounting to over 1,000,000 tons annually. It is a station for several lines of Atlantic steamers, and is the outlet for the products of the State, the chief of which are sugar, cotton, rum, skins, and various forest and colonial products. It is the seat of a United States consul. The population by the census of 1890 was 111,556, and in 1898 it was estimated at 190,000, including the suburbs. Recife was founded in 1504. It was held by the Dutch from 1630 to 1654, but it was then a mere village and did not acquire much importance until it superseded Olinda as capital.

PERNAMBUCO WOOD. See Brazil Wood.

PERNAU, pĕr'nou (Russ. *Pernov*). A town in the Government of Livonia, Russia, on both banks of the River Pernau, a short distance from the Gulf of Riga, and 100 miles north by east of Riga (Map: Russia, B 3). It is a well-built town with public gardens, a gymnasium, and a number of benevolent institutions. The trade in grain is still considerable, but the commercial importance of the port has decreased owing to the competition of the other Baltic ports. The town was founded in 1255 by the Bishop of Oesel, and was a flourishing centre in the Middle Ages. It was taken by the Russians in 1710; its fortifications have since been demolished. Population, in 1897, 12,856.

PÉRONNE, pā'rŏn'. A fortified town and the capital of an arrondissement in the Department of Somme, France, on the Somme, 94 miles northeast of Paris (Map: France, J 2). It is historically important: Charles the Simple and Louis XI. were imprisoned here. It was unsuccessfully besieged by the Imperialists under the Count of Nassau in 1536, and acquired the name of La Pucelle, or the 'impregnable,' but in 1815 it surrendered to the English under Wellington. The town was almost destroyed by the Germans, to whom it surrendered, in 1871; it has since been rebuilt. Population, in 1901, 4661.

PERONOSPORACEÆ (Neo-Lat. nom. pl., from *Peronospora*, from Gk. *περόνη, peronē*, brooch, pin + *σπόρος, sporos*, seed). Downy Mildews. An order of 6 or 7 genera of oöphytic fungi parasitic upon higher plants such as tomato, potato, grape, lettuce, etc., which from the abundance of their aerial conidia give an appearance of frost on the under sides of the attacked leaves. Hence the popular name. Their mycelium penetrates every part of the host, and warm moist weather favors their growth. The principal genera are Phytophthora, Plasmopara, Bremia, and Peronospora.

PEROSI, pā-rō'zē, Lorenzo (1872—). An Italian composer of sacred music, born in Tortona. The greater part of his musical education was obtained at the Milan Conservatory, though he went subsequently to Haberl's *Domchorschule* at Regensburg. Meanwhile he had studied for the priesthood and was admitted to the order. In 1897 he produced a sacred trilogy,

La Passione di Cristo, which made him famous throughout Italy. His music is the exact opposite of the English and German oratorio style, which undoubtedly accounts for his lack of success in the musical cities of those nations. In 1898 he became honorary master of the Papal Chapel. Other compositions include *La Trasfigurazione del nostro Signore Gesù Cristo* (1898), *La resurrezione di Lazaro* (1898), *Il natale del Redentore* (1899), and many important masses.

PÉROUSE, *pā'rooz'*, LA. A French navigator. See LA PÉROUSE.

PEROWNE, *pe-roun'*, JOHN JAMES STEWART (1823-1904). An English prelate and author, born at Burdwan, Bengal, where his father was a missionary of the Church Missionary Society. He was educated at Corpus Christi College, Cambridge, and graduated (1848) as Tyrwhitt Hebrew scholar, and in the same year became a priest in the Church of England. He lectured on divinity at King's College, London, and in 1875 was appointed honorary chaplain to the Queen and Hulsean professor of divinity. A member of the Old Testament Revision Committee (1870-84) and Bishop of Worcester (1890-1901), he edited the *Cambridge Bible* (and *Greek Testament*) *for Schools* and *Rogers on the Thirty-Nine Articles*, and wrote *The Book of Psalms, a new Translation* (1864), *Immortality* (1868), the Hulsean Lectures, and an elementary Arabic grammar, *Al Adjrumiieh*.

PEROXIDE OF HYDROGEN. See HYDROGEN DIOXIDE, HYDROGEN.

PERPENDICULAR (Lat. *perpendicularis*, vertical, from *perpendiculum*, plumb line, from *per*, through + *pendere*, to hang). A line is said to be perpendicular to another line when it makes a right angle with it. A line is said to be perpendicular to a plane when it makes a right angle with every line in the plane passing through the point of intersection. One plane is said to be perpendicular to another when their dihedral angle (see ANGLE) is a right angle. See NORMAL.

PERPENDICULAR. The name given to the style of Gothic architecture in England which succeeded the Decorated style. It prevailed from the last quarter of the fourteenth century to the middle of the sixteenth century, and was thus contemporary with the Flamboyant style in France. These styles have much in common, but they derive their names from the features peculiar to each. Thus the Flamboyant (q.v.) is distinguished by the flowing lines of its tracery, while the Perpendicular is remarkable for the stiff and rectilinear lines from which its name was derived. The lines of the window tracery are chiefly vertical, and the mullions are frequently crossed by horizontal bars. The moldings are usually thin and hard. The same feeling pervades the other features of the style; the buttresses, piers, towers, etc., are attenuated, and present in their hollow recesses and meagre lines a great contrast to the deep shadows and bold moldings of the earlier style. The art of masonry was well understood during the Perpendicular period, and the vaultings were admirably built. Fan tracery vaulting (q.v.) belongs to this style. The depressed or four-centre arch is another of its peculiar features. This arch, over doorways, has the moldings generally arranged in a square form over the arch, with spandrels containing shields, quatrefoils, etc. Paneling was also much used, the walls being frequently almost entirely covered with it, as in Henry VII.'s chapel at Westminster. There are many well-known buildings of this style. Most of the colleges at Oxford and Cambridge belong to it, and in almost every cathedral and church of importance there are some specimens of it. Open timber roofs are very common in the Perpendicular style, and are among the peculiar and beautiful features of the architecture of this country. The roof of Westminster Hall, built by Richard II., was the largest example ever erected. Consult the authorities referred to under EARLY ENGLISH.

PERPET'UA, SAINT. See FELICITAS, SAINT.

PERPETUAL MOTION (Lat. *perpetualis*, permanent, universal, from *perpetuus*, continuous, universal, from *per*, through + *petere*, to seek). Under the name of perpetual motion is understood a mechanism which of and for itself, without outside aid, would continue to operate until it wore out. A water wheel under Niagara is not such a machine, because it is the sun which makes the wheel go, by raising the water. Such a machine is incompatible with the principle of the conservation of energy, for some energy would always be converted into heat by friction and this would ultimately stop the machine unless its equivalent were supplied from somewhere. The most varied attempts have been made to disregard this principle and construct such a machine. A large class is that which includes all possible combinations of levers and wheels and worms and pumps, and which invariably reduces to the possibility of a man lifting himself by his bootstraps. Many have tried to employ magnetism in some way, and would have succeeded "if they could find a substance through which magnetism would not act," but an insulator for magnetism is not known, nor will it be as long as energy is conserved. The forces of capillarity and gravitation have been harnessed in the most roundabout ways, but whatever means or agents are employed the aspect of the situation cannot be changed. See ENERGETICS.

PERPETUITY (Lat. *perpetuitas*, continuity, from *perpetuus*, continuous, universal). In a general and inexact sense, a perpetuity is such a limitation of property as suspends the ordinary full ownership and power of disposition beyond the period allowed by law. Properly the 'rule against perpetuities' is a common law rule against the creation of future interests in real or personal property, subject to such contingencies that they may not become vested within a reasonable limited time, arbitrarily fixed by law. It is, therefore, a rule against remoteness of vesting, designed to prevent indefinite control of property by a present owner, by means of provisions in a will or deed to take effect after his death. However, through a misconception of the original object of the rule, the same name has also been applied, though inaccurately, to laws prohibiting the suspension of the absolute power of alienation of property for a prescribed period.

The historical legal conditions under which the rule was developed bear out the conclusion that it was devised by the courts to prevent a present owner from dictating the disposition and extent and method of enjoyment of his property by future generations. By the early English law, a

man might create future interests in his property to vest at any period after his death, and the influence of the feudal system and the doctrine of primogeniture (q.v.) tended to induce the proprietors of the great landed estates to regulate the disposition of their property to remote periods. This practice was gratifying to family pride and was favored by the King and Parliament, as the traditions of a long line of ancestors made loyal subjects of the landed gentry. However, besides making the absolute ownership of land impossible in many cases, thus affecting all classes of people, the practice created great dissatisfaction among younger sons and spendthrift older ones, and as a consequence there were frequent attempts to set aside wills and deeds making such dispositions, which finally resulted in the establishment of the above rule.

The first important case on the point was known as the 'Duke of Norfolk's Case,' in 1685, and it established the limitation that while a future interest might be limited to commence on any contingency, yet the latter must happen within a life or lives in being at the time of the creation of the estate. The period within which springing or shifting uses or executory devises must take effect was later extended to include a gross term of 21 years, in addition to a life or lives in being. For example, if A devises property to his son B for life, remainder to his grandson C for life, and that the property then go to the eldest son of C when he shall attain the age of 21 years, the devise will be held good if C is born prior to the death of A, the testator, as the will takes effect then, and the estate will finally vest absolutely within the period prescribed by the rule, that is, lives in being and 21 years. However, if the property is devised to B for life, and after his death to his eldest son when the latter shall marry, assuming that B has no son at the death of A, the devise is bad, because if a son is born to B, he may not marry within 21 years after the death of B, and as B is the only life in being at the time of A's death, the estate must vest within 21 years after B's death. The possibility that B's eldest son may marry within 21 years will not save the devise as its validity is determined by the possibilities which may happen under its terms, tending to make it bad, and not by the fact that in the course of actual events the estate may become vested within the prescribed period. The same principle applies also to personal property.

The attempt of an English gentleman, Mr. Thellusson, to create an enormous fortune by directing the accumulation of the income of his property during the lives of his children, grandchildren, and great-grandchildren, led to a statute, known as the 'Thellusson Act' (39 and 40 George III., c.98), which forbids the accumulation of income for a longer time than the life of the grantor or settler, or 21 years from his death.

The English common law rule against perpetuities above stated is still the law there, and in most of the United States. However, in several States the common law rule has been radically altered by statute, in that their statutes forbid a suspension of the absolute power of alienation for a longer period than two lives in being and 21 years. In New York the statute fixes the period at two lives in being and a period of a minority, as distinguished from a gross term of 21 years. For a more comprehensive treatment of the subject, see Gray, *Rules Against Perpetuities* (Boston, 1886); also consult the authorities referred to under REAL PROPERTY.

PERPIGNAN, pĕr'pē'nyäN'. The capital of the Department of Pyrénées-Orientales, France, and a fortress of the first rank, on the Têt, five miles from the Mediterranean, and 35 miles south by west of Narbonne (Map: France J 9). It commands the passage to the Eastern Pyrenees from Spain into France, and is defended on the south by a citadel and by ramparts flanked with bastions, and protected by raised works. The houses are of semi-Moresque construction, and there are many evidences of Spanish influence. The Spanish Cathedral of Saint Jean, a massive building, begun in the fourteenth century, has elaborately decorated altars, and a large nave. The belfry of Saint Jacques and the Castillet now used as a military prison, with its battlements and machicolations, are interesting. The old university building contains a museum and a city library of over 20,000 volumes. Perpignan has a college and is the see of a bishop. There are vineyards, olive groves, orchards, and gardens in the vicinity; manufactures of woolen clothes, paper, chocolate, corks, hats, and furs are carried on. Population, in 1891, 33,878; in 1901, 36,157. Perpignan is first heard of in the tenth century. As capital of the former County of Roussillon, it remained long in the hands of the kings of Aragon and of Spain. The town was taken by the French in 1642, and united to France in 1659.

PERRAUD, pâr'rō', JEAN JOSEPH (1819-76). A French sculptor, born at Monay, in the Jura. He was a pupil of the Ecole des Beaux Arts in Lyons, and of the Ecole des Beaux Arts in Paris under Ramey and Dumont, and won the Prix de Rome in 1847. His work is classic, but mannered. His sculpture includes "Adam;" "Adieux;" "Justice," in the Palais de Justice, Paris; "Caryatides," in the National Library, Paris; "Lyric Drama," on the facade of the Opera House, Paris; "Despair" and "The Infancy of Bacchus," in the Louvre. He received a first-class medal in 1855, and was made officer of the Legion of Honor in 1867.

PERRAULT, pâr'rō', CHARLES (1628-1703). A French critic best known for his *Mother Goose Stories*, the classic nursery tales of France. He was born January 12, 1628, in Paris, and was prepared for the bar, but soon forsook the bar for letters, winning distinction and an election to the Academy through his verses and the patronage of Colbert, who made him head of the Royal Bureau of Architecture. He achieved notoriety in 1687 by a poem on *Le siècle de Louis le Grand*, which praised new writers at the expense of the old and so brought on the controversy between the Ancients and Moderns. Attacked by Boileau (q.v.), he defended his position in a series of dialogues, *Parallèle des anciens et des modernes* (1688-96), of more ingenuity than critical value. Better are his 200 studies of *Les hommes illustres qui ont paru en France pendant ce siècle* (1696-1701). But all these, with his *Mémoires* (1749) and two comedies are insignificant beside the *Mother Goose Stories* (1697) through which the literary world first learned to know the *Sleeping Beauty, Little Red Riding Hood, Blue Beard, Puss in Boots, Cinderella* and *Tom Thumb*, which, with Madame d'Aulnoy's

Goldilocks and Madame de Beaumont's *Beauty and the Beast* and *Prince Darling*, form a large and indispensable part of the nursery stock of the world. Perrault published these stories under the name of his son, Pierre Perrault d'Armancour, and called them *Histoires ou contes du temps passé*, with the subtitle *Contes de ma mère l'oie*. Perrault no more invented his stories outright than the Grimm Brothers did theirs; nor did he intend to make a contribution to the knowledge of folk lore. He drew on oral tradition, but he treated his matter in French fashion, and set off fairy fancies with touches of playful realism.

There are many editions of Perrault's *Contes*. The best is probably that of Andrew Lang (London, 1888), with a careful introduction of 115 pages. Consult, also, Deulin, *Contes de ma mère l'Oye avant Charles Perrault* (Paris, 1879).

PERRENOT, pâr'nō', Antoine. A Spanish statesman. See Granvella.

PERRENS, pâr'rāx', François Tommy (1822-1901). A French historian, born at Bordeaux. He received his early education in his native place and was a pupil at the École Normale from 1843 until 1846, when he went to teach at Bourges, then at Lyons (1847), and at Montpellier (1850). From 1853 he was professor at the Bonaparte Lyceum, Paris, and he was inspector of the Academy from 1873 until his retirement in 1891. The thesis *Jérôme Savonarole* (1854), which he wrote for his degree (Doctor of Letters), was crowned by the Academy, and he published also *Etienne Marcel et le gouvernement de la bourgeoisie au XIVème siècle* (1860); *Les mariages espagnols sous le règne de Henri IV.* (1869); *La démocratie en France au moyen âge* (1873); *Histoire de Florence jusqu'à la domination des Médicis* (1877-84); *Histoire de Florence depuis la domination des Médicis jusqu'à la chute de la république* (1888-90); *La civilisation florentine du XIIIème au XVIème siècle* (1893), and *La littérature française au XIXème siècle* (1899).

PERRERS, pēr'ērz, Alice (called also De Windsor) (?-1400). The mistress of Edward III. of England. She is said to have been the daughter of Sir Richard Perrers, of Hertfordshire, and probably married William de Windsor in 1376. She acquired her influence over the King during the lifetime of Queen Philippa, to whom she was lady of honor. The King made her valuable presents, but she became engaged in constant disputes with the courts in her endeavors to acquire maintenance and landed property, and she also used her influence politically to overthrow her enemies or uphold her favorites. She was sentenced to banishment by Parliament, but the decree was not enforced. After Edward's death her sentence of banishment was confirmed by Richard II.'s first Parliament, but was revoked in the following year, and she subsequently regained favor at Court. Her quarrels with the Abbey of Saint Albans led to scurrilous attacks on her character by the monastic chroniclers, but she is praised by the historians Barnes, Carte, and Cotton, and has never lacked defenders. See Edward II.

PERRET, pâr'rā', Aimé (1847—). A French genre painter, born at Lyons. He was the pupil of the Lyons School of Fine Arts, and of Vollon in Paris, and first exhibited in 1872. He paints subjects similar to those of Millet, but his brush shows the brighter side of peasant life. His works, which are very numerous, include "Noce bourguignonne au XVIIIème siècle" (1876); "Baptême bressan" (1877), in the Lyons Museum; "Le saint viatique," in the Luxembourg; "La cinquantaine" (1888); "Noël des vieux;" and "L'heure de l'angélus." He received a second-class medal in 1888, and the cross of the Legion of Honor in 1894.

PERRIER, pâr'ryā', François (called Le Bourguignon) (c.1584-1656). A French painter and engraver, born probably at Saint Jean de Losne (Burgundy). He went to Rome, and there became a pupil of Lanfranco. In 1630 he returned to France and painted some pictures for the Carthusian monks at Lyons. During a second visit to Rome in 1635 he engraved several antique statues and bas-reliefs. These are included in the collections *Statuæ Antiquæ Centum Edente Francisco Perrier* (1638) and *Icones et Segmenta Illustrium e Marmore Tabularum quæ Romæ adhuc Exstant* (1645). He also engraved plates after the old masters. He was one of the twelve founders of the Académie Royale de Peinture et de Sculpture, in 1648. His oil paintings include "Orpheus Before Pluto" and "Æneas and Warriors Fighting the Harpies" in the Louvre. He was an indifferent colorist.

PERRIER, Jean Octave Edmond (1844—). A French zoölogist. In 1867 he became professor in the Lycée d'Agen, in 1872 maître de conférence at the École Normale in Paris, and in 1876 professor of zoölogy at the Museum of Natural History. He was elected to the Académie des Sciences in 1892. He has published *Les colonies animales et la formation des organismes* (1881, 1898); *Les principaux types des êtres vivants* (1882); *La philosophie zoölogique avant Darwin* (1884); *L'intelligence des animaux* (1887); *Eléments d'anatomie et de physiologie animales* (1888).

PER'RIN, Bernadotte (1847—). An American classical scholar, born at Goshen, Conn. He graduated at Yale in 1869 and was a student at the universities of Leipzig and Berlin (1876-79). From 1881 to 1893 he held the position of professor of Greek in Western Reserve University, Cleveland, Ohio. In 1893 he became professor of Greek in Yale University. His published works include an edition of Cæsar's *Civil War* (New York, 1882); Homer's *Odyssey* (i.-iv., Boston, 1889; v.-viii., Boston, 1894); Plutarch's *Lives of Themistocles and Aristides*, trans. with introduction and commentary (New York, 1901). He is also joint editor of the "Twentieth Century Series of Text-Books."

PERRON, pâr'rōn', Anquetil du. See Anquetil Duperron.

PERRONE, pâr-rō'nā, Giovanni (1794-1876). An Italian theologian. He was born at Chieri, in Piedmont, and, after completing his education with the doctor's degree in theology at the University of Turin, he was (in 1815) one of the first to enter the Society of Jesus after its re-establishment. He was professor of dogmatics at Orvieto, and from 1833 to 1848 at the Roman College. At the outbreak of the Revolution in the latter year he took refuge in England, but returned to his professorship when order had been restored, and became rector of the college in 1853. He acquired a reputation for great theological learning, was theologian to several of the Roman

congregations, and had an important share in the condemnation of Hermesianism (see HERMES, GEORG), and in formulating the doctrine of the Immaculate Conception. His most famous work, *Prælectiones Theologicæ* (9 vols., 1835-42), has gone through some 50 editions and been used as a text-book all over the world. Other important works are: *De Immaculato B. V. Mariæ Conceptu* (1847); *Il protestantismo e la regola di fede* (1853); *De Domini Nostri Jesu Christi Divinitate* (1870); *De Romani Pontificis Infallibilitate* (1874).

PER'RONET, EDWARD (1721-92). An English hymn-writer. He was born at Sundridge, Kent, a son of Vincent Perronet (q.v.). He became an itinerant preacher under the Wesleys in 1749, but joined Lady Huntingdon's connection in 1771. He left it shortly after and became minister of a small independent chapel at Canterbury, where he died. He is remembered as the author of the hymn "All hail the power of Jesus' name," which first appeared anonymously in *The Gospel Magazine* (1780). Collections of his hymns and poems have been published, including a satire on the Church of England called *The Mitre* (1757). Consult the article by Grosart in Julian's *Dictionary of Hymnology* (London, 1892).

PERRONET, VINCENT (1693-1785). An English clergyman. He was born in London, of Swiss-French descent; was educated at a school in the north of England and at Christ College, Oxford, where he graduated in 1718; he took orders in the Church of England and became curate in the Parish of Sundridge, Kent. Nine years later he received the vicarage of Shoreham, which he retained for over half a century. In 1744 he became acquainted with John Wesley and later identified himself with the Methodist movement to such an extent that Charles Wesley called him "the Archbishop of Methodism." Perronet wrote several works in defense of the Methodists, also two in vindication of John Locke. His other works deal with the opinions of Hobbes, the Quakers, the subjects of infant baptism, original sin, and recreations.

PERROT, pâr'rô', GEORGES (1832—). A French archæologist, born in Villeneuve-Saint-Georges (Seine-et-Oise), and educated at the normal school and the French school at Athens. In 1861 he went on an archæological expedition to Asia Minor; in 1863 became a professor in the lyceum Louis-le-Grand, in Paris; in 1877, professor of archæology in the university; and in 1883, director of the higher normal school. The most important fruit of his first journal in Asia Minor was the reconstruction of the text of the *Monumentum Ancyranum*. With Chipiez he wrote the valuable *Histoire de l'art dans l'antiquité* (1882 sqq.). Alone he wrote, apart from contributions to reviews, and especially to the *Revue archéologique*, of which he became an editor, *Essai sur le droit public et privé de la république athénienne* (1867), *Les peintures du Palatin* (1872), and *Mémoires d'archéologie, d'épigraphie et d'histoire* (1875).

PER'ROT, Sir JOHN (c.1527-92). An English general, Lord Deputy of Ireland. He was born Harroldston and was probably a natural son of Henry VII. A bold, powerful young fellow, he was made a Knight of the Bath by Edward VI., and under Mary was imprisoned for his Protestant sympathies. Elizabeth, in 1570, made him president of Munster, and with much bravery and energy, but little prudence or tact, he attempted to establish the English Crown in Munster. For a time he was held to have accomplished the task, and in 1584 he was appointed Lord Deputy to carry out the work throughout all Ireland. Under his rule, the western province was pacified, but in the north he was quite unsuccessful. In 1588 he was removed from office, charged with treasonable offers to Philip of Spain, and with contemptuous speech in regard to the Queen. The first charge was entirely groundless, but on the latter count he was clearly guilty, and, although it seems that the Queen purposed to pardon him, he was condemned. He died in the Tower before the sentence could be carried out. His son JAMES (1571-1637) was a prominent member of the Addled Parliament.

PER'RY. A city and the county-seat of Noble County, Okla., 30 miles north northeast of Guthrie; on the Atchison, Topeka and Santa Fe Railroad (Map: Oklahoma, F 2). It is important principally as a commercial centre, being the distributing and shipping point for an extensive farming and stock-raising district. A United States land office is situated here. There are public parks. Population, in 1900, 3351.

PERRY, ARTHUR LATHAM (1830—). An American economist, born at Lyme, N. H. He graduated at Williams College in 1852 and was professor of history and political economy there from 1853 to 1891, when he became professor emeritus. He advocated free trade, and in 1868-69 publicly debated this question with Horace Greeley in Boston and New York. Among his publications are *Political Economy* (1865, 20 editions); *International Commerce* (1866); *Introduction to Political Economy* (1877, 5 editions); *Principles of Political Economy* (1891), and *Williamstown and Williams College* (1900).

PERRY, BLISS (1860—). An American educator, author, and editor, born at Williamstown, Mass. He graduated at Williams College in 1881, was an instructor there in 1881-86, studied in Germany at Berlin and Strassburg universities, and became professor of English at Williams in 1888. From 1893 to 1899 he occupied the chair of English at Princeton University, and in the latter year was appointed editor-in-chief of the *Atlantic Monthly* of Boston. He prepared editions of selections from Burke, and Scott's *Ivanhoe* and *Woodstock*, and edited also a handy selection of representative extracts from the works of English and American writers, entitled *Little Masterpieces*. In addition to addresses on educational topics, he published a series of works of fiction, *The Broughton House* (1890), *Salem Kittredge* (1894), *The Plated City* (1896), and *The Powers at Play* (1899); the chapter on poetry in *Counsel upon the Reading of Books* (1900), a collaborative volume; and *A Study of Prose Fiction*, an essay in literary criticism (1902).

PERRY, EDWARD DELAVAN (1854—). An American scholar and educator, born in Troy, N. Y. He graduated at Columbia in 1875, and studied at Leipzig and Tübingen. Between 1880 and 1895 he was successively tutor in Greek and instructor and professor of Sanskrit at Columbia. In the latter year he became professor of Greek there, and in 1897 he was chosen president of the New York Branch of the American Archæological

Inst[illegible] member of the managing committee [illegible] American Classical School in Athens. I[illegible] 1902 [illegible] became dean of the School of Philosophy at Columbia. An authority on the subject of Greek dialects and inscriptions, he is also known as the author of a *Sanskrit Primer* (3d ed. 1902) based on Bühler's *Leitfaden*.

PERRY, JOHN (1850—). An English physicist and engineer. He was born in Ulster, Ireland, and was educated at Queen's College, Belfast. He was appointed professor of engineering in the Imperial College, Tokio, Japan, in 1875, and, two years after his return to England, professor of engineering and mathematics in the Finsbury Technical College. This position he left after fifteen years, in 1896, and was appointed professor of mechanics and mathematics in South Kensington Royal College of Science. Perry wrote *The Steam Engine* (1874), *Practical Mechanics* (1883), *Spinning Tops* (1890), *Hydraulics* (1892, the Cantor Lectures), *Calculus* (1897), *Applied Mechanics* (1897), *Steam* (1899), *Practical Mathematics* (1899), and *England's Neglect of Science* (1901), besides many contributions to English scientific periodicals.

PERRY, MATTHEW CALBRAITH (1794-1858). An American naval officer, brother of Oliver Hazard Perry (q.v.). He was born at Newport, R. I., entered the navy as a midshipman in 1809, and early in the War of 1812 was one of the officers of the frigate *President*. In 1813 he was transferred to the *United States*, which was blockaded in the harbor of New London until the conclusion of peace. He was then for several years engaged in the merchant service, but having reëntered the navy, he was in 1819 appointed executive officer of the *Cyane*, which convoyed the *Elizabeth* with her band of pioneers to Liberia. Two years later he was again on the African coast as commander of the *Shark*, and recommended the removal of the Liberian colonists from Sherbro to Monrovia. On his return from this voyage, and again in 1822, he took an active part in extirpating piracy in the West Indies. In 1824 he was appointed executive officer of the *North Carolina*, Commodore Rodgers's flagship on the Mediterranean station. He was promoted to the rank of commander in 1826, and in 1832 was again sent to the Mediterranean as captain of the *Concord*. From 1833 to 1843 he was stationed at the Brooklyn navy yard. Under his superintendence was built the *Fulton*, a 'steam battery' designed for the defense of New York Harbor, and the first steam vessel in the United States Navy. When she was completed in 1837 he took command of her, organized her personnel, and so thoroughly demonstrated the practical utility of steam as a motive power for war vessels that he earned the title of "Father of the Steam Navy." In this same year he was commissioned captain and in 1839 was sent abroad to study the latest English and French steam warships. In 1841 he was promoted to be commodore and two years later was assigned to the command of the squadron on the African coast maintained by the United States for the suppression of the slave trade. During the early part of the Mexican War he served under Commodore Conner in the Gulf, but on Conner's recall in 1847 Perry succeeded him in the command of what was then the largest fleet of warships ever assembled under the American flag. In 1852 he was sent by President Fillmore with a squadron of warships to Japan to induce that country to enter into relations with the nations of the West. His flagship, the *Mississippi*, was the first United States steam war vessel to circumnavigate the globe. He arrived in Kurihama, in the Bay of Yedo, on July 7, 1853, and on the 14th delivered to representatives of the Shogun the letter addressed to the ruler of Japan, which declared the nature of his mission. He then went to China, and returning in February, 1854, concluded a treaty with the Japanese by which they agreed to receive an American consul at one of their ports. This treaty, which was followed by one between Japan and Great Britain, inaugurated a new era in the history of Japan. Perry's report was printed by the Government in three volumes, under the title *The Report of Commodore Perry's Expedition to Japan* (1856). He died in New York City. A monument to his memory was unveiled at Perry Park, Kurihama, Japan, on July 14, 1901. Consult Griffis, *Matthew Calbraith Perry, a Typical American Naval Officer* (Boston, 1887).

PERRY, NORAH (1832-96). An American poet, journalist, and writer of juvenile stories, for some years Boston correspondent of *The Chicago Tribune*. She was born in Dudley, Mass. Her verse is collected in *After the Ball* (1875), *Her Lover's Friend* (1879), *New Songs and Ballads* (1886), *Legends and Lyrics* (1890). Her fiction, chiefly juvenile, includes *The Tragedy of the Unexpected* (stories, 1880), *For a Woman*, a novel (1885), *A Book of Love Stories* (1881), *A Flock of Girls and Their Friends* (1887), and many other volumes. These are briskly told and, like her verses, appeal to the sentiment of the broader reading public.

PERRY, OLIVER HAZARD (1785-1819). A distinguished American naval officer. He was born at South Kingston, R. I., and received his education partly from his mother and partly in private schools in Newport and elsewhere. He entered the navy as a midshipman in 1799, served in the war against Tripoli, and in 1807 was commissioned lieutenant. In 1811, as commander of the schooner *Revenge*, he had the misfortune to lose his vessel off Watch Hill, R. I., but a court of inquiry, which at his request investigated the circumstances connected with the wreck, reported him guiltless of any neglect of duty. During the first few months of the War of 1812 Perry commanded a flotilla of gunboats in Newport Harbor, but was later transferred to Sackett's Harbor, N. Y., and thence was soon ordered to Presque Isle (now Erie) to take charge of the construction of a fleet, with which the Americans hoped to wrest from the British the control of Lake Erie. By great exertions he succeeded by the end of the summer of 1813 in building and manning a squadron of nine vessels, with which, on the 10th of September, he won the celebrated battle of Lake Erie. (See ERIE, BATTLE OF LAKE.) He was then able very materially to assist General Harrison in the operations culminating in the battle of the Thames. As a reward for Perry's brilliant victory, he received from Congress a vote of thanks, a gold medal, and the rank of captain. By the people he was regarded as one of the chief heroes of the war, and his laconic despatch announcing his success is today known to every American. Later a very bitter controversy arose between Perry and

Elliott, the commander of the *Niagara*, one of Perry's vessels, over the question of whether Elliott did his duty in supporting the flagship. A court of inquiry, called at Elliott's request, made a somewhat ambiguous report. Subsequently Perry preferred charges against Elliott, but no action was ever taken upon them by the Navy Department. After the close of the war Perry was placed in command of the frigate *Java*, and cruised with Decatur's squadron in the Mediterranean. In 1819 he was sent with a small squadron to the West Indies to protect American commerce against pirates. While performing this duty, he was seized with yellow fever, and died on his birthday, the 23d of August, 1819. He was buried with military honors at Port of Spain, Trinidad, but in 1826 his body was, by order of Congress, removed in the sloop-of-war *Lexington* to Newport, where it was re-interred with great honors. The State of Rhode Island later erected a granite monument to his memory, and there are also statues of him at Newport, and at Cleveland, Ohio. His life has been written by Niles (Hartford, 1820), by Mackenzie (New York, 1843), by James Fenimore Cooper (in *Lives of Distinguished American Naval Officers*, Auburn, N. Y.), and by Barnes (New York, 1898).

PERRY, Stephen Joseph (1833-89). An English astronomer, born in London. He studied theology at Douai and Rome, entered the Society of Jesus in 1853, and studied mathematics at Stonyhurst, at the University of London, and at that of Paris. In 1868 he began a magnetic survey of France. Two years afterwards, as fellow of the Royal Society, he was stationed at San Antonio, Cadiz, to observe the total eclipse of that year; in 1874 he directed the observations of the transit of Venus on Kerguelen Island; and in 1882 was sent to Southwestern Madagascar with another transit of Venus expedition. Perry died in the Salut Islands, where he caught a severe cold in attempting to photograph the total eclipse of December 22, 1889. His generosity fitted up the Stonyhurst Observatory. Perry was an able and popular lecturer. In 1881 he discovered, independently of Trouvelot, the veiled sun spots. Consult Cortie, *Father Perry, the Jesuit Astronomer* (London, 1890).

PERRY, Thomas Sargent (1845—). An American educator and critical historian of literature, born in Newport, R. I. Perry graduated at Harvard (1866), and after studying in Berlin and Paris taught, at Harvard, German (1868-72) and English (1877-81). In the interval he was for two years editor of the *North American Review*. He afterwards wrote *Life and Letters of Francis Lieber* (1882), *English Literature in the Eighteenth Century* (1882), *A History of Greek Literature* (1883), *From Opitz to Lessing* (1885), and *The Evolution of the Snob* (1887).

PERRY, William Stevens (1832-98). An American clergyman, second Protestant Episcopal Bishop of Iowa. He was born at Providence, R. I., studied at Brown University, but took his degree from Harvard in 1854. He studied theology at Virginia Seminary and continued his studies with the Rev. Alexander Hamilton Vinton. He was ordained priest at St. Paul's, Boston, in 1858, where he spent the first year of his ministry. His succeeding charges were Saint Luke's, Nashua, N. H.; Saint Steven's, Portland, Me.; Saint Michael's, Litchfield, Conn.; and Trinity, Geneva, N. Y. He taught history at Hobart College for several years and served the institution as president from April to September, 1876, when he was consecrated Bishop of Iowa. He did much for the cause of education in his diocese; reopened Griswold College in its academic, theological, and preparatory departments, founded St. Katharine's Hall for girls, Kemper Hall for boys, and Lee Hall for training candidates for orders. He also founded St. Luke's Hospital at Des Moines. Among his writings are *Documentary History of the Protestant Episcopal Church in the United States of America* (with Dr. F. L. Hawks, 1863-64), *Historical Collections of the American Colonial Church* (5 vols., 1871-78), *Historical Notes and Documents Illustrating the Organization of the Protestant Episcopal Church in America* (1874), *Historical Sketch of the Protestant Episcopal Church, 1784-1884* (1884). Consult sketch and bibliography in his *Episcopate in America* (New York, 1895).

PER'RYVILLE, Battle of. A battle fought at Perryville, Ky., about 40 miles south of Frankfort, on October 8, 1862, during the Civil War, between a Federal force of about 22,000 men, actually engaged, under General Buell, and a Confederate force of about 17,000 men under General Bragg. The Confederates opened the engagement at about 2 o'clock in the afternoon by an attack upon the Federal left under McCook, and for a time drove it back, but were finally forced back themselves through the town of Perryville. During the night the Confederates retired from the field. By many the engagement has been considered a drawn battle, though strategically it is generally regarded as a victory for the Federals. General Buell's forces in the vicinity of Perryville numbered about 58,000 men, less than half of whom were actually engaged in the battle. The Confederates lost, in killed, wounded, and missing, 3396; the Federals, 4211. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iii. (New York, 1887).

PER'SÆ (Lat., from Gk. Πέρσαι, Persians). A play of Æschylus, produced at Athens in B.C. 472, with three other dramas, *Phineus*, *Glaucus*, and *Prometheus*. It is notable as being the only extant ancient drama the subject of which is not mythological. Its subject is the defeat of the Persians, with a fine description of the battle of Salamis. The scene is laid at Susa. The actors are Atossa, the mother of Xerxes; Xerxes himself, a messenger, and the Shade of Darius. The chorus consists of aged Persian nobles.

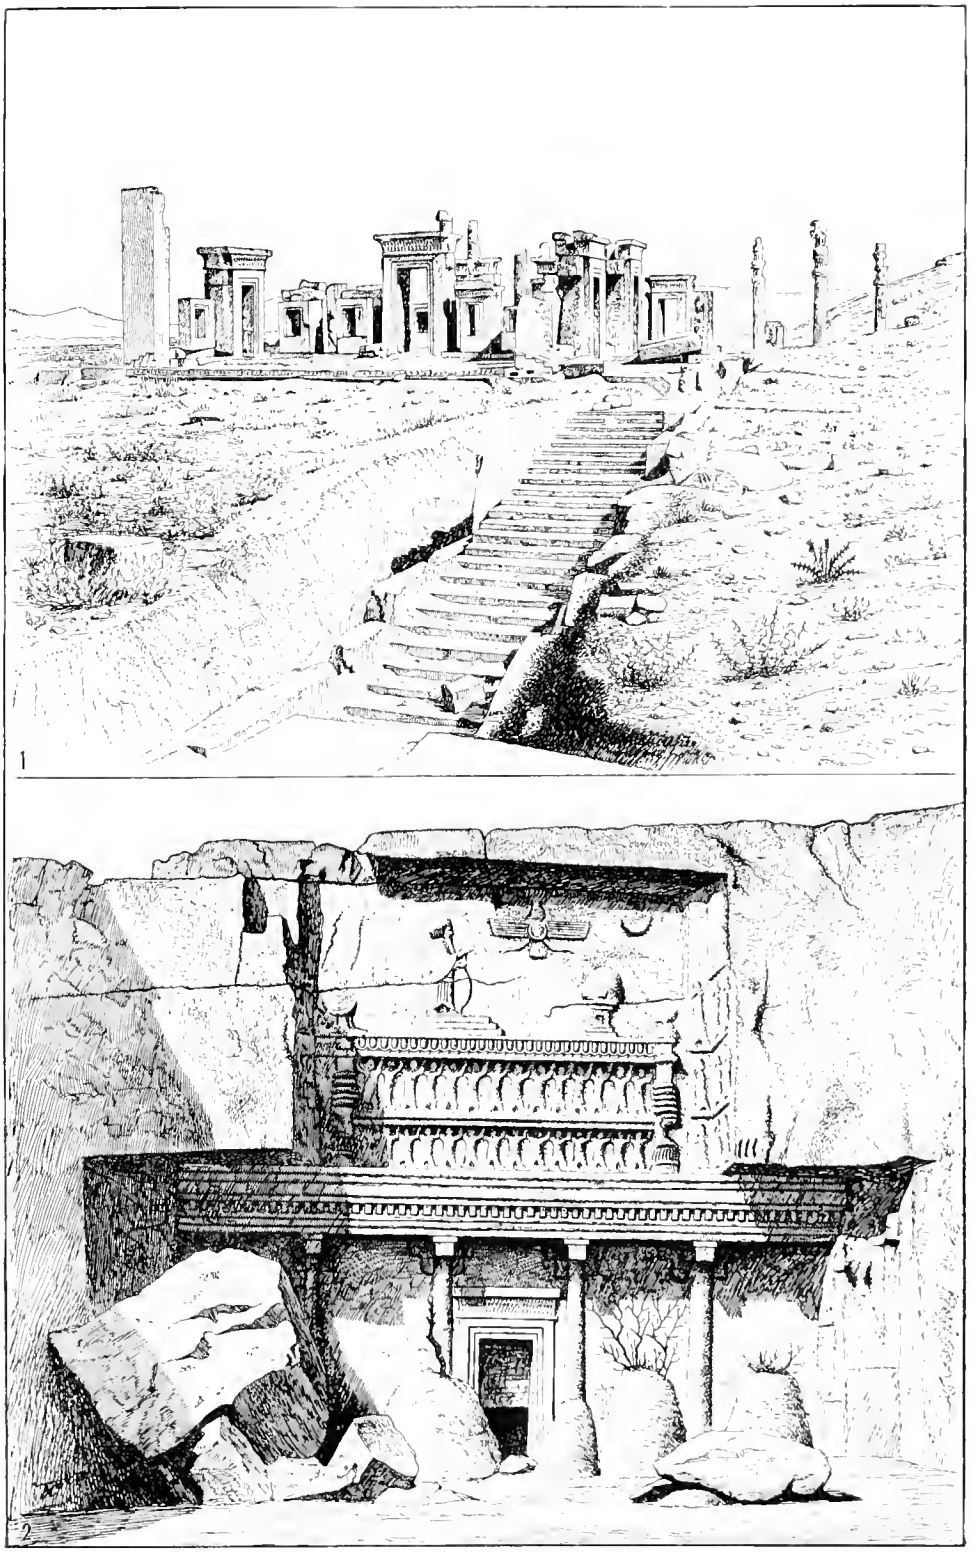
PERSECUTIONS OF THE CHRISTIANS, The Ten. A phrase that has been in very general use since the fifth century. The number, however, has no basis in fact, and was suggested by the ten plagues of Egypt, and the ten horns of the beast in the Book of Revelation (xvii. 3 sqq.), interpreted, in accordance with the allegorizing spirit of the time, as types of ten emperors. There were only two persecutions coterminous with the Roman Empire, and directly prompted by Imperial action, that under Decius in 250, and that under Diocletian and his associates, 303-313. On the other hand, if provincial and local persecutions be taken into account, the number is far too small. So far as known, Claudius (41-51) was the first Roman Emperor to attempt

are a sort of persecution of the Christians. Suetonius states that he expelled the *Jews* from Rome. The reason is not altogether clear, but a very plausible interpretation is that, at this early date Christian converts being mainly Jews, the Government regarded the former merely as a sect of the latter, and the decree was occasioned by disorders arising in the city because of conflicts between non Christian and Christian Jews, leading to the expulsion of both. The date is uncertain; it has been placed in 52, but may have been earlier (cf. Acts xviii. 2). The ten persecutions as commonly given, with the date fixing approximately either the beginning or period of greatest severity, are: That under Nero, 64; under Domitian, 95; under Trajan, 112-113; under Marcus Aurelius, 177; under Septimius Severus, 202; under Maximinus, 235; under Decius, 250; under Valerian, 257; under Aurelian, 274; under Diocletian and his successors, 303-313. Consult, besides the Church histories: Gibbon, *Decline and Fall of the Roman Empire*, chaps. xiii., xiv., and xvi.; Renan, *Les origines du christianisme* (Paris, 1863-82); Allard, *Histoire des persécutions* (Paris, 1884-94); id., *Le christianisme et l'empire romain* (Paris, 1897); Ramsay, *The Church in the Roman Empire Before 170* A.D. (London, 1894); Weis, *Christenverfolgungen* (Marburg, 1901); Hardy, *Christianity and the Roman Government* (London, 1894). For the sources, consult Preuschen, *Analecta* (Freiburg, 1893); *Translations and Reprints published by the Department of History of the University of Pennsylvania*, vol. iv., No. 1 (Philadelphia, 1897). See MARTYR.

PERSEPH'ONE. See PROSERPINA.

PERSEP'OLIS (Lat., from Gk. Περσέπολις, Περσαίπολις, City of the Persians). The Greek name of the capital of the Persian Empire under Darius I. and his successors. The native name is unknown. The locality is identified with the principal group of ruins, the Takhti Jemshed or Throne of Jemshed, the traditional founder of Persepolis, and is called also Tchil Minar or Forty Pillars. The city is supposed to have extended throughout the whole valley of the Medus above its confluence with the Araxes (now the Polvar and the Bendemer respectively), overlooking the beautiful mountain-girt and fertile plain of Murghab, north of Lake Tashk or Nargis. Part of the site was occupied later by the important Sassanian city of Istakhr. The only remains of Persepolis are the ruins of buildings erected by Darius Hystaspis, Xerxes, Artaxerxes, and other Achæmenians, which are scattered throughout the valley of the Polvar, about 30 miles northeast of Shiraz on the road to Ispahan. The ruins comprise three principal groups: (1) Takhti Jemshed, already referred to, situated at the foot of a lofty mountain range, in which, at a considerable elevation, hewn out of the solid rock, are three finely sculptured sepulchres; (2) Nakṣ-i-Rustam—the picture of Rustem, so called from the relief adornments—consisting of four similar rock-hewn sepulchres cut in a perpendicular cliff at a considerable height, about six miles to the northeast on the opposite bank of the Polvar; (3) the remains at Haji Abad on the Polvar, about four miles north of Takhti Jemshed, of an ancient fire temple, which was in a perfect state of preservation in the tenth century A.D., and then served as the mosque of the city of Istakhr. The tombs of Nakshi Rustem are those of Darius I., which bears a long inscription identifying it, and probably of Xerxes I., Artaxerxes I., and Darius II., and those behind Takhti Jemshed once held the bodies of Artaxerxes II., Artaxerxes III., and Darius III.

Takhti Jemshed, the most important of the groups of ruins, is situated on a vast terrace of cyclopean masonry built at the base of and backed by the Mountain of the Tombs. The vast substructure is about 1500 feet north by south, and about 800 feet east by west, and was surrounded, according to Diodorus Siculus, by a triple wall of 16, 32, and 60 cubits respectively. The whole area is further divided into three terraces, the lowest toward the south, the northern about 550 feet long and 35 feet high, the central 800 feet square, and rising 45 feet above the plain. No traces of structures are to be found on the lowest platform; the northern supports the Propylæa of Xerxes; and the central platform was occupied by the foremost structures, distinguished as the Great Hall of Xerxes, the Palace of Xerxes, and the Palace of Darius, towering one above the other in successive elevations from the ground. The stone used for the buildings is dark gray marble, cut into gigantic square blocks, and in many cases exquisitely polished. The ascent from the plain to the great northern platform is formed by two double flights, the steps of which are nearly 22 feet wide, 3½ inches high, and 15 inches in the tread, so that travelers have been able to ascend them on horseback. The Propylæa of Xerxes on this platform are two masses of stonework, which probably formed an entrance gateway for foot passengers, paved with gigantic slabs of polished marble. Portals still standing bear figures of animals 15 feet high, closely resembling the Assyrian bulls of Nineveh. The building, conjectured to have been a hall 82 feet square, is, according to the inscription, the work of Xerxes. An expanse of 162 feet divides this platform from the central one, which still bears many of the columns of the Hall of Xerxes, from which the ruins take their subsidiary name. The staircase leading up to the Tchil Minar or Forty Pillars is, if possible, even more magnificent than the first. The walls are more richly decorated with sculptures, representing colossal warriors with spears, gigantic bulls, combats with wild beasts, and processions; while broken capitals, shafts, pillars, and countless fragments of buildings, with cuneiform inscriptions, cover the whole vast space of this platform. The pillars were arranged in four divisions, consisting of a central group six feet deep every way, and an advanced body of twelve in two ranks, the same number flanking the centre. Only thirteen of the columns now remain. Their form is very beautiful. Their height is 60 feet, the circumference of the shaft 16 feet, the length from the capital to the torus 44 feet. The shaft is finely fluted in 52 divisions; at its lower extremity begin a cincture and a torus, the first two inches in depth, and the latter one foot, whence devolves the pedestal, shaped like the cup and leaves of the pendent lotus, the capitals having been surmounted by the double semi-bull. The Great Hall of Xerxes is computed to have been a rectangle of about 300 to 350 feet, and consequently to have covered 2½ acres. Behind the Hall of Xerxes was the so-called Hall of a Hundred Columns, to the south of which are indications



1. PALACE OF DARIUS

2. FIRST OF THE TOMBS OF THE KINGS

of another structure, termed the central edifice. Next along the west front stood the Palace of Darius, and to the south the Palace of Xerxes, measuring about 86 feet square, similarly decorated.

Persepolis replaced Pasargadæ (q.v.) as the capital of Persia under Darius I., by whom and his successors the city was extended and enlarged. It surrendered to Alexander the Great (B.C. 331) after the defeat of Ariobarzanes at the battle of Gaugamela. Ariobarzanes again offered battle, but was killed, whereupon Alexander ordered a general massacre, sacked the city, and, acting—it is doubtfully chronicled—on the suggestion of Thais the courtesan, fired the palaces of Takhti Jemshed. Although fifteen years later Persepolis was still the capital of Persia, it gradually sank into insignificance, until upon its ruins Istakhr rose into prominence about A.D. 200, and for centuries was a considerable centre of administrative, religious, and commercial activity. It was a formidable opponent of the Moslem invasion, suffered severely, and also passed out of existence, but, unlike its great predecessor, left few traces of its ancient glory.

(London, 1892); Curzon, *Persia and the Persian Question* (ib., 1892).

PER'SEUS (Lat., from Gk. Περσεύς). In Grecian legend, the son of Zeus and Danaë (q.v.), and grandson of Acrisius, King of Argos. As his grandfather had been warned that he would perish by the hand of Danaë's son, he inclosed mother and child in a chest and cast them into the sea. They drifted to the island of Seriphos, where they were cared for by Dictys, brother of the King, Polydectes. The latter fell in love with Danaë, and as Perseus, now grown to manhood, interfered with his plans, he sent him to bring the head of Medusa, the Gorgon. Guided by Athena, he found the Graeæ, old women with but one eye and one tooth between them, who directed him to the nymphs, from whom he received winged sandals, a pouch, and the cap of Hades, which, like the Tarnhelm of Teutonic story, made the wearer invisible. Hermes provided him with a harpe (ἅρπη) or scimitar, and Athena with a bronze shield, in which as a mirror he could see the face of Medusa without encountering her glance, which turned all living things to stone. After a long journey, which the poets gradually filled with adventures, he reached the distant home of the Gorgons, found them asleep, identified Medusa, cut off her head, and escaped by the aid of his magic helmet. On his return he rescued Andromeda (q.v.), daughter of King Cepheus of Ethiopia (variously localized in this story), and took her with him to Seriphos, where he found his mother and Dictys suppliants at the altar, for Polydectes had resorted to violence. Medusa's head turned Polydectes and his followers to stone, and Perseus sent his magic weapons to the nymphs by Hermes, and gave the head to Athena, who placed it on her ægis. Perseus with his wife and mother then returned to Argos, and found that Acrisius had fled to Larissa, in Thessaly. Perseus followed, and accidentally killed his grandfather while throwing the discus during some games. Returning, he exchanged the rule of Argos for that of Tiryns and later founded Midea and Mycenæ. Perseus is originally the local deity of the spring Perseia by Mycenæ, as Danaë is the ancestor of the Danaans of Argolis. The slaying of Medusa and the rescue of Andromeda were favorite subjects of ancient art, and are found on early vases and Pompeian wall-paintings, as well as in sculpture. They are catalogued and discussed by Knatz, *Quomodo Persei Tabulam Artifices Graeci et Romani Tractaverint* (Bonn, 1893). For the study freely told in English, consult William Morris, "The Doom of King Acrisius," in *The Earthly Paradise* (London, 1868).

PERSEUS (c.212 B.C.-?). The last King of Macedonia, the eldest son of Philip V. He was born about B.C. 212. He was from his earliest years trained to a military life, and, having compassed through intrigue the death of his brother Demetrius, who was a favorite both with the Macedonians and with the Romans, and whom he for that reason regarded as a dangerous rival, he ascended the throne on the death of his father in B.C. 179. A struggle with Rome was inevitable, and Perseus was well prepared for it. His treasury and magazines were full, his army amounted to over 40,000 trained men, his alliances were strong, and he was himself popular with his subjects and neighbors. He sought, however, to postpone the inevitable as long as possible, but matters came to an open rupture in 171. In that year the Consul Publius Licinius Crassus was sent against him. The blunder of the Romans saved Perseus. Crassus was defeated at Callicinus in Thessaly. But Perseus failed to follow up his victory, and the war was continued without decisive result for a number of years. Finally, in the month of March, 168, Lucius Æmilius Paulus arrived in Greece to take command of the Roman forces, and on June 22d of the same year the Macedonian army was utterly defeated in the battle of Pydna. Perseus fled, but afterwards fell with all his treasures into the hands of the Romans. After gracing the triumph of the consul at Rome, he was held in captivity several years at Alba Fucens, in Italy, where he at length died. Consult: Droysen, *Geschichte des Hellenismus* (2d ed., Gotha, 1877-78); Freeman, *History of Federal Government* (2d ed., New York, 1893); Mahaffy, *Alexander's Empire* (New York, 1888).

PER'SHORE. A market-town in Worcestershire, England, on the Avon, nine miles southeast of Worcester (Map: England, D 4). It is noted for the Church of the Holy Cross, the only remaining portion of the famous abbey founded in 685. Vegetable gardening is largely carried on, and there are manufactures of stockings, and engineering and machine works. Population, in 1891, 9100; in 1901, 8800. Consult Styles, *History of Pershore Abbey Church* (London, 1839).

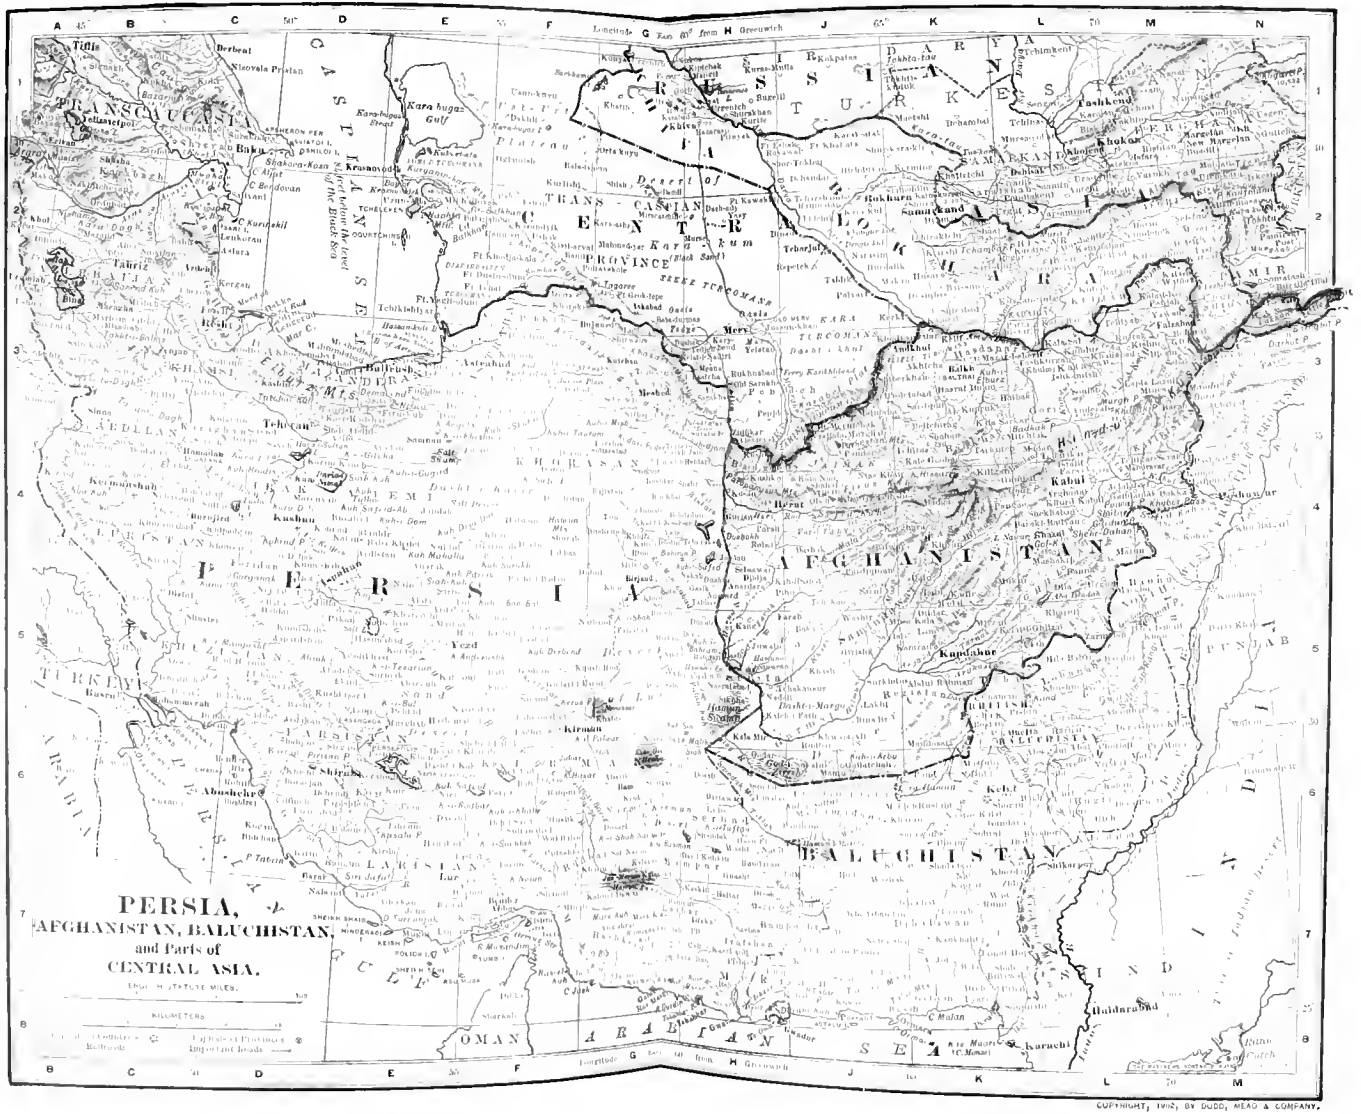
PERSIA, pēr'shȧ *or* pēr'zhȧ (Lat. *Persia, Persis*, from Gk. Περσίς, from OPers. *Parsa*, Pers. *Pārs*, Ar. *Fārs*, Persia). A native State of Southwestern Asia, called by the inhabitants Iran, the

name Persia (Farsistan) being applied only to a small province. It extends from latitude 25° N. (Cape Jask, near the Baluchistan frontier) almost to latitude 40° N. (Aras River on the border of Transcaucasia), and from longitude 44° E. (Armenia) to longitude 63° E. (Baluchistan). A line extending northwest and southeast, nearly bisecting the country, is 1400 miles long. Its greatest north and south extent, from Ras el-Kuh on the Strait of Ormuz to its most northern point on the frontier of Russian Turkestan, is 875 miles. The country is bounded on the north by Transcaucasia, the Caspian Sea, and Russian Turkestan, on the south by the Indian Ocean and Persian Gulf, on the east by Russian Turkestan, Afghanistan, and Baluchistan, and on the west by Asiatic Turkey and the Persian Gulf. It is over one-fifth as large as the United States, excluding Alaska, having an area of about 642,000 square miles.

Topography. Persia is an elevated tableland from 3000 to 5000 feet in general altitude, sinking to the Caspian Sea and the plain of Turkestan in the north and to the Persian Gulf in the south, and embracing the western and larger portion of the great Iranian plateau, which includes Afghanistan and Baluchistan. To reach this plateau great mountain barriers must be crossed on all sides excepting in the east, where the tableland and mountains merge imperceptibly with those of Afghanistan and Baluchistan. On the other three sides great mountain ranges stretch between the interior plateau and the narrow plains which slope to the Caspian Sea on the north, and the Persian Gulf on the south, and merge with the plains of Asiatic Turkey on the west. The plain of the Caspian presents a wonderful contrast to the colorless, waterless, and treeless expanse of the plateau to the south from which it is separated by the Elburz Mountains. It comprises the maritime provinces of Mazanderan and Ghilan, so rich in water that many swamps and lagoons breed miasma, and so abundantly covered with forests and undergrowth that it is often difficult to force a way through the dense vegetation. Furthermore, it possesses a degree of atmospheric humidity that is seldom found outside of the tropics. Most of the towns are among the forests on the lower slopes of the mountains. For purposes of agriculture and fruit-raising this is the most favored part of Persia. Many large and small plantations have been cleared in the forests, and all the cultivated crops of Southern Europe, including the mulberry for silk manufacture, attain high perfection. This luxuriance of vegetable life is due to the vapor-charged clouds of the Caspian, which are brought south by the prevailing winds, and, impinging upon the northern slopes of the Elburz, descend in mist and rain to the lowlands.

Along the southern maritime border the mountains, low in elevation and extending east and west, often closely approach the sea, and the narrow plains between them and the ocean are dry and barren excepting in certain districts where the rainfall, supplemented by irrigation, suffices for agriculture. Nearly all the mountains of Persia are bleakly sterile in aspect. The most imposing of the mountain ranges is the Elburz, which, continued eastward by the Kuren Dagh, Kopet Dagh, Ala Dagh, and Binalud Kuh, stretches like a mighty mountain wall along the entire northern border of Persia. The Elburz, from 10 to 30 miles south of the Caspian, may be crossed by a few passes or defiles, some of them at an elevation of over 8000 feet. Its upland valleys, with an average elevation of about 4000 feet, are dominated by peaks rising from 8000 to 11,000 feet above the sea; and towering above them all is Demavend, a nearly extinct volcano, about 18,500 feet high, the culminating point of Persia. From its ice-filled crater, on a clear day, the eye may survey a panorama spread over 50,000 square miles, embracing the Caspian, the mountain ranges of the north and west, and the dry expanse of the tableland with patches of green oases and the outlines of many towns. The wide mountain lands of Western Persia extend in many parallel ranges throughout the whole of that part of the country overlooking the valley of the Tigris and the Persian Gulf. Their trend is from northwest to southeast. They form the mountain barrier between Persia and Turkey and are known collectively as the Zagros Mountains. Some of the peaks are snow-crowned most of the year, and Mount Alijuk, south of Ispahan, is 14,000 feet in elevation. But the culminating range of these highlands is the Kuh-Dinar, extending north of Shiraz, whose highest summit, the Kuh-i-Dena, is over 17,000 feet in elevation, second only to Demavend. Islands along the east coast of the Persian Gulf are merely the partly submerged fragments of the coast ranges.

The tableland of the interior, thus walled in by mountains, is itself intersected by numerous ranges and detached masses of mountains, excepting in Eastern Persia, where great plains and deserts are the main topographic feature. Between these ranges, also extending northwest and southeast, are wide plains and narrow valleys. These plains and valleys would be utterly sterile were it not for the mountains near them, which collect rain and snow. The valleys are more easily irrigated, and are thus more fertile than the plains, which are here and there brightened by a patch of green oasis, but for the most part are sandy and barren. The general aspect of the plateau is that of a cheerless and monotonous waste stretching to the base of mountains that are equally bleak and uninviting, and reaching the acme of frightful desolation in the two deserts of the east, the Dasht-i-Kavir or Great Salt Desert, extending between latitudes 33° and 36° N., and from longitude 52° to 57° E., and the more southerly Dasht-i-Lut or Great Sand Desert, extending between latitudes 29° and 32° N., and between longitudes 57° and 60° E. Their combined length is over 500 miles from northwest to southeast, but they are separated between the thirty-second and thirty-fourth parallels by a hilly region through which passes one of the main caravan routes between Central Persia and Meshhed. The origin of the Great Salt Desert is not yet clearly determined. One theory is that it is due to the drainage of saline streams from the surrounding higher lands and the consequent deposition of a white crust or efflorescence; the other theory is that it is the bed of an ancient salt lake. Geologists now incline to the latter explanation. In 1891 a solid bed of rock salt estimated at over 600 square miles in area and several feet in thickness was discovered in this remarkable region. Lieutenant Vaughn and Mr. C. E. Biddulph, who brought to light this sea of solid rock salt,



which is probably unrivaled in the world, found it so hard that with iron tent pegs they were able to detach only a few chips.

The Dasht-i-Lut or Great Sand Desert, which separates the Province of Khorasan from that of Kirman, has salt also as one of its chief ingredients, but it is rarely overlaid like the more northern desert with saline incrustations or briny swamps. It gives life to a few poor shrubs, while nothing grows in the other desert. Sand is its prevailing feature. It is much lower in altitude than the Great Salt Desert, its average elevation being less than 2000 feet, while in places it sinks to only 500 feet above sea-level. All these topographic aspects have a marked effect upon the distribution of the population. The lines of villages and cities follow the trend of the mountains from east to west across North Persia and from northwest to southeast across Western and Central Persia, because only in the neighborhood of the mountains can water be obtained to supply the towns and nourish the gardens and fields. Where the ranges spread far apart, and in Eastern Persia, where there are few high elevations, there is only a sprinkling of human inhabitants. Desolation reigns over vast expanses.

Hydrography. The waters of two-thirds of Persia do not reach the sea, but are lost in inland swamps or lakes or disappear in the sands. Few rivers are worthy of special mention. Among them is the Karun, which drains a large part of the mountainous provinces of Luristan and Khuzistan, empties into the Persian Gulf, and is nearly four feet deep throughout the year. A small steamer, subsidized by the British Government, is now making regular trips 150 miles up the river to Ahwaz, where rapids and ledges obstruct navigation. No other river is navigable. The Sefid Rud, Atrek, and Gurgan, draining the northern slopes of the Elburz, and its prolongations, are the only considerable streams entering the Caspian. The streams flowing to the inland basins are much inferior in volume to those emptying into the sea. Only two lakes are of importance. Lake Urumiah lies in the extreme northwest and from its surface the snowy top of Mount Ararat may be seen. It is so heavily charged with salt that swimmers cannot dive in it. Its wooded shores and islets give a pleasing impression, but the average depth is only about 15 feet, and, though it covers an area of about 1600 square miles, its volume is six or seven times inferior to that of Lake Geneva in Switzerland. The great salt lake of Southern Persia is Niriz, much smaller than Urumiah and with a greatly indented and fantastic outline.

Climate. The winter cold is intense on the high tableland. The summers are very warm, but there is little humidity, and the dry, clear heat is temperate compared with that of Northern India. On the other hand, the air is damp and relaxing in the forest-covered lowlands of the Caspian, and the southern maritime tracts are very dry and hot at most seasons. Spring and autumn are the most enjoyable parts of the year. The average annual rainfall perhaps does not exceed 10 inches in any part of the country excepting along the Caspian, where the lowland Caspian provinces have a rainfall about five times greater than that of the highlands. The soils, composed of a mixture of sandstone, limestone, and volcanic débris washed down from the mountain slopes, are very productive.

Flora. As Persia is a land of transition between Eastern Asia and the Western World, its flora partakes of the character of the surrounding lands. The zones of vegetation succeed one another quite abruptly. Polar species, for example, are found on the higher summits of the north, while wheat is cultivated at heights of 9000 feet, and rice and the fruits of Southern Europe thrive on the neighboring lowlands. Except on the Caspian seaboard, the Persian flora is poor in varieties. Over most of the plateau the konar tree, cyprus, dwarf oak, walnut, and mulberry are almost the only timber encountered. But the rich humid valleys of the Caspian belt and the lower slopes of the Elburz produce timbers of great variety, including the oak, ash, beech, elm, alder, birch, sycamore, cherry, and thorn. In the same region the fruits of Europe and of Asia meet and are grown in great variety. Among the medicinal products are gum tragacanth, gum arabic, asafœtida, and several others; indigo, henna, madder root, saffron, gall nuts, and other dyestuffs are also valuable products. The rose is preëminent among flowers and attar of roses is among the famous productions.

Fauna. The animals of Persia differ little from those of the neighboring lands. In the forests of the Caspian plain are the hare, fox, wolf, hyena, jackal, leopard, tiger, lynx, and wild boar. On the mountains are seen the ibex, mountain sheep, wild goat, antelope, and bear. The maneless lion sometimes attacks human beings, but preys chiefly on the wild boar. Although the Persian fauna is poor in number of species, the reptiles, especially lizards, are represented by many varieties. Owing to the general aridity of the land, snails and other land mollusks are nowhere found. The domestic animals include fine horses and mules, single-hump camels, sheep of the fat-tailed species yielding a fine quality of wool, dogs, and several species of falcons that are trained for the chase.

Geology and Mineral Resources. Most of the tableland and mountains are of sedimentary formation, largely sandstone, Tertiary limestone, chalks, and Cretaceous nummulitic rocks. But interspersed among these sedimentary rocks are mountains built up of eruptive rocks and volcanic ash such as mounts Demavend, Savalan, and many others. The deserts are composed mainly of saline and sand accumulations. The mineral resources are enormous, but are largely undeveloped. Roughly speaking, there are six mineral producing zones: (1) the Province of Azerbaijan, in the northwest, where iron, copper, lead, and coal are found; (2) the northern and southern slopes of the main Elburz range, where iron and coal occur near each other, Teheran deriving its coal supply from this region; (3) Khorasan, the rich northeastern province, which contains the famous turquoise mines of Nishapur, and in which are obtained considerable quantities of copper, coal, and salt; (4) the Province of Kirman, with copper, lead, manganese ore, and fine marble; (5) the highly mineralized districts in the central mountains, with iron, antimony, nickel, cobalt, copper, lead, sulphur, and asbestos; and (6) the Persian Gulf littoral, with naphtha, rock salt, iron, ochre, gypsum, nitrates, and sulphur. While Persia abounds in remark-

able mineral resources, their commercial value is chiefly dependent on the cost of transportation to the coast or nearest markets. In the absence of good roads, the minerals of large parts of Persia must long remain almost untouched.

AGRICULTURE. Tillage in Persia depends upon the water supply. The detritus swept down by the streams or torrents deposits a layer of soil upon the sand, which is subsequently fertilized by the same agency that brought it. A large amount of cultivable land is not yet utilized. Cereals, chiefly wheat, barley, and rice, are grown throughout the country. Sugar-cane is sparsely cultivated and coarse sugar is made, but large imports from Russia and France are necessary. Cotton, short in staple, thrives to an elevation of 5000 feet above the sea, and over 100,000 bales are annually exported to the mills of Bombay and Marseilles. Silk is produced in the Caspian provinces to the amount of 500,000 pounds (weight) a year, most of it going to Yazd, Kashan, and Ispahan, the centres of the manufacturing trade; and in 1899 1,171,601 pounds of cocoons were sent to Europe. Persian tobacco is known throughout Western Asia for its superior quality. The home consumption is enormous, and over 5000 tons are exported to other Asiatic countries and Egypt. The production is roughly estimated at over 50,000 tons a year. The poppy has been widely cultivated since 1864, chiefly in the central and southern provinces, with an average production of over 6000 chests of opium. Most of it is sold to China, but the purest quality is sent to London for the extraction of morphine and is in part reëxported to America. Indigo grown in the southwest is used in the dyeing of cotton. Nearly every house has its vegetable and tangled but beautiful flower garden. The fruits include the grape, plum, raspberry, apple, pear, peach, and apricot; and Persia is said to produce the finest melons in the world. Dates are grown along the Persian Gulf and are sold abroad. The implements of tillage are extremely primitive.

Persia has great sources of wealth in its animal products. The sturdy Persian horse, excellent for cavalry or ordinary purposes, is exported to India. The mule, though small, has extraordinary strength and endurance. The best camels of Khorasan carry 600 pounds at the rate of twenty miles a day. Skins and hides are exported in large quantities to Bagdad and Russia. Persian lamb skins are famous. Sheep's wool (about 9,000,000 pounds exported annually) and goats' hair are used in making cloths and shawls. The shores of the Caspian and the rivers emptying into it are richly stocked with fish, and a Russian has the monopoly of preparing caviare from the sturgeon and sterlet.

MANUFACTURES. The chief manufactures are silk, woolen, and cotton tissues, and artistic fabrications. Broadly speaking, there are no factories, the output being the work of private shops or the production of special, localized schools of industry. Almost every large town has its own special manufactures which cannot be procured elsewhere. The most important and best known of the textile fabrics is Persian carpet, of which there are about 30 different kinds, all hand-made and the design varying with each carpet. Each kind has its own characteristics, so that it is easy to distinguish between the products of different districts. Carpets are sent to Europe and America, the exports amounting to over $700,000 a year. The woolen shawls of Kirman made of goats' hair are also famous. Cotton fabrics, chintzes, velvets, silks, and embroideries are produced in considerable quantity, though the cheaper fabrics of European looms have injured all the home textile industries including that of carpets. For illustration, see Colored Plate under the article RUGS.

The earthenware and faïence of Old Persia were its most famous artistic products. The ceramic arts, however, have now largely disappeared. Enameling in gold, silver, and copper is the best surviving relic of the ancient metal work. Native artisans still excel in copper, glass, and filigree work, and carvings. The lack of good means of transportation, the neglect of the Government, the apathy of the people, and the invasion of foreign products are responsible for the undoubted decline of Persia in the manufacturing arts.

COMMERCE. The Russian frontier is within 80 miles of Tabriz, the commercial capital of Persia, and Russian steamers unload cargoes within 160 miles of Teheran. The result is that in North Persia Russia is the predominant commercial factor. In South Persia Great Britain, controlling the Persian Gulf, has been able, since the opening of the Suez Canal, firmly to establish its supremacy in trade. Between these two great spheres of Russian and British trade lies Middle Persia, over which both countries are endeavoring to extend their sway. The great inland centres of commerce are Tabriz, Teheran, Ispahan, and Meshhed, connected by caravan routes to which smaller routes extending to most parts of the country are tributary. Opium leads in the exports, followed by raw silk, rice, carpets, tobacco, dried fruits and nuts, wheat and barley, gum tragacanth, asafœtida, and raisins. The imports are determined by the fact that the country is deficient in many products which constitute the necessaries of civilized life. Iron is worked only in the rudest fashion, little sugar is made, the oil wells are untouched, fabrics are in limited supply, and yet Persia consumes enormous quantities of sugar, kerosene, hardware, textiles, and many other manufactures. Cotton textiles are the largest imports ($3,991,542 in 1901-02). Great Britain supplies most of the bleached and unbleached cottons. Then come silks and woolens, sugar, spices, hardware, glassware, iron, and many other commodities. The value of the imports in the fiscal year 1901-02 was $27,184,536, of which Russia sent $11,071,828; Great Britain, $10,327,900; France, $2,324,927; Turkey, $1,218,100; Austria, $995,729; Afghanistan, $261,671; Germany, $231,913; other countries, $742,465.

The value of the exports in the same period was $11,415,464. The total import and export trade was therefore worth $38,600,000, of which Russia had 56 per cent. and Great Britain 24 per cent. The sales of pearls from the great Bahrein fisheries in the Persian Gulf amounted to $2,895,000.

The principal ports are Bender Abbas, Lingah, and Bushire on the Persian Gulf, and Enzeli and Meshhed-i-Ser (the port of Balfrush) on the Caspian. Trebizond, a port of Asiatic Turkey on the Black Sea, is still an important outlet for the trade of Tabriz. In February, 1903, the new tariff agreement between Russia and Persia,

by which the ad valorem duties of 5 per cent. on both exports and imports were changed to a specific tariff, went into effect. All the other foreign Powers are included in this agreement on the 'most favored nation' basis.

TRANSPORTATION AND COMMUNICATION. The roads are very poor, the caravan routes being merely mule paths. An excellent highway 217 miles long, extending from Resht on the Caspian Sea to Teheran, built by the Russian Government, was completed in 1899. Another improved road built by British capital was completed in 1900 between Ispahan and Ahwaz, the head of navigation on the Karun River. Regular steamship lines connect the ports of the Caspian Sea with Russian ports, and the ports of the Persian Gulf with Great Britain and India. The only railroad extends from Teheran to one of the suburbs—six miles. The telegraph system extends north and south across the country and east and west across Northern Persia, with 4800 miles of line. There are about 100 post offices.

BANKING. The Imperial Bank of Persia, established in 1889 under a concession granted to Baron Reuter, has an authorized capital of £4,000,000 sterling, which, however, owing to the great fall in silver and the rise in exchange, was reduced in 1894 to an actual capital of £650,000. The bank has the exclusive right to issue bank notes, which must not exceed £800,000 unless authorized by the Persian Government. The issue of notes is on the basis of the silver kran, the coin in reserve now being 33 per cent. The head office is at Teheran and there are branches at Tabriz, Resht, Meshhed, Ispahan, Yezd, Shiraz, Bushire, and Bombay. The Russian Banque des Prêts de Perse, which is connected with the Russian State Bank, and a branch of the Russian Banque de Commerce de Moscou are also established in Teheran.

GOVERNMENT. The government is an absolute monarchy in the hands of the Shah, and resembles that of Turkey. The Shah is assisted by a ministry consisting of a Grand Vizier, and of ministers (viziers) of Foreign Affairs, Internal Affairs, Finance, War, Education, Mines and Telegraphs, Post, Justice, etc., to the number of 27. The rule of the Shah, however, is restrained in that it must accord with the "divine law" of the Mohammedan religion. Furthermore, the Imâm-Juma, not the Shah, stands at the head of the Shiah religious system, which prevails in Persia. There are 35 main political divisions, comprising five large provinces or *mamlikats* and 30 smaller provinces termed *vilayets*. The *mamlikats* and their capitals are as follows:

MAMLIKAT.	CAPITAL.
Azerbaijan.	Tabriz.
Farsistan, or Fars.	Shiraz.
Ghilan, or Gilan.	Resht.
Khorasan.	Meshhed.
Kirman.	Kirman.

Azerbaijan is the fief of the heir apparent. The governors of the other provinces are appointed by the Shah and usually hold office for one year. They have almost absolute power in their respective territories. The provinces are divided into sub-provinces, districts, subdistricts, parishes, cities, towns, and villages. These minor divisions are administered by lieutenant-governors, mayors, etc., who are appointed by the governor and are directly responsible to him. Justice is administered both by the Shah and by the clergy, according to the laws of the Koran, and is often satisfied, even in connection with the worst crimes, by payment of money to the Government. The Persians, however, have been renowned through all time for the cruelty of their punishments and their disregard of human life. Teheran is the capital.

FINANCE. The revenues and business of the country suffer from the great fluctuation in value of the silver medium of exchange. Owing to the rise in the price of silver, the value of the revenue rose in 1890-91 to £1,775,000, but the subsequent decline in the price of silver reduced the value of the revenue for 1899-1900 (estimated at less than £1,500,000). About four-fifths of the revenue is derived from assessments upon towns, villages, and districts, the rest coming from the customs, post office, telegraphs, fisheries, mines, and some other concessions. The revenues exceed the expenditures, the balance being paid into the Shah's Treasury. About one-third of the expenditures is for the army, one-tenth for the royal court, one-fifth for pensions, one-sixteenth for allowances to princes, and one-sixtieth for the Foreign Office—the civil service, colleges, and local governments absorbing most of the remainder. The debt is very small. Persia's credit is good and the Government has promptly met its foreign obligations. The only foreign debts now outstanding are a loan of $17,325,000, known as the five per cent. Persian gold loan of 1900, taken by the Russian Banque des Prêts de Perse, the loan running 75 years and guaranteed by Persian customs receipts, and a further loan of $7,700,000, granted in 1902 by the same bank on the same conditions.

ARMY. See under ARMIES.

WEIGHTS, MEASURES, AND MONEY. The kran, a silver coin, is the monetary unit. Its value, subject to great fluctuations, is about 8.2 cents. The copper coinage has been entirely replaced by large quantities of nickel 5 and 10 centimes pieces coined at Brussels and put into circulation in 1900. There are six gold coins, subdivisions or multiplications of the toman, which is nominally worth 10 krans. Very little gold is in circulation. The unit of weight is the miskal (71 grains), but most articles are bought and sold by a weight called batman or man, which varies in avoirdupois, one of the most commonly used being the man-i-Tabriz, which equals 640 miskals or 6.49 pounds. The unit of measure is the zar or gez, of which several standards are in use, the most common measuring 40.95 inches.

POPULATION. The inhabitants number over 9,000,000, the largest part of whom live in the cities and towns. Large areas are uninhabited, and the density of the population is only about 14 to the square mile. The estimated population of the principal cities is: Teheran, 250,000; Tabriz, 180,000; Ispahan, 80,000; Meshhed, 60,000; Kirman, about 40,000; Yazd, 55,000; Balfrush and Shiraz, 50,000 each. The inhabitants are divided into two distinct classes, the dwellers in towns or villages and the dwellers in tents. Many of the richer dwellers in the towns leave for the mountains during the hot summer months. The nomads, including Arabs (260,000), Kurds and Leks (675,000), Turks (720,000), Lurs (234,000), and Baluchis and Gypsies (20,700), move from place to place according as their animals need pasturage or their other interests dictate.

Religion. Nearly all the inhabitants are Mohammedans, besides whom there are about 9,000 Parsis, 35,000 Jews, 15,000 Armenians, and 25,000 Nestorians. Wide tolerance is exercised toward the followers of other religions in places where Europeans reside, but elsewhere they are sometimes oppressed by the lower classes of the population. It is an interesting fact that most of the Mohammedans in Persia belong to the Shiite or "unorthodox" sect of Islam.

Education. All wealthy families employ private tutors for their children, and many colleges supported at public expense instruct students in religion, Persian and Arabic literature, and some scientific branches. There are also many schools for children, but most of the population are taught to read only the Koran. Western languages and science have been introduced to some extent into Persia by the polytechnic school which was opened in Teheran in 1849. It has several European professors. There are military colleges at Teheran and Tabriz, and a number of schools with improved methods of teaching supported by subscription and small tuition fees are in several of the larger towns.

Ethnology. The Persians, ancient and modern, are the most numerous and the most important historically of the Iranian group of Aryan peoples. The great plateau of Iran has been occupied since the earliest historical times by peoples of Aryan stock, Medes, Proto-Medes, and ancient Persians, who played a great rôle in the development of Western Asia, produced monuments of lasting grandeur, imposed a court and a language upon nations from the Mediterranean to the Bay of Bengal, and through their literature profoundly influenced both the Orient and the Occident. They are also said to have had more or less to do with the rise of strict monotheism among the Hebrews after the captivity. The culture of the modern Persians covers a wide range, from the civilization or semi-civilization of the cities and towns to the nomadism and pastoralism of a very primitive sort prevalent in the mountainous districts. The civilization of the Persians is often spoken of as only "skin-deep," the barbarian and the savage sleeping but lightly in the garb of culture. Physically, the mass of the Persians belong to the Aryan type, although much intermixture (as the modern Persian type shows) has taken place. The pure Iranian is to be found among the Farsis about Persepolis, and among the Loris (Luris), or mountaineers, somewhat farther to the west. Of the "ideal Persian type" there are three subvarieties: (1) A darker population toward the southwest, along the line of contact with the Arabs; a Semitic strain pointing toward Africa. (2) The great mass of the Persian population—the Hajemis and Tajiks of the east and northeast—the result of a Turkoman-Tatar cross with the pure Iranian. Here belong also the Azerbaijan Tatars, Turkish in speech, but distinctly Iranian in race. (3) The Susians about the mouth of the Persian Gulf in the southeast, where a strain of Negroid blood is apparent, and relationship with the hill tribes of India is suggested. Some authorities, however, do not attribute so much importance to the 'Negroid' traits of the Susians, since they may be due to slave intermixture. With the Hajemis, whose habitat is chiefly between Teheran and Ispahan, belong the Talych, Mazanderani, and other tribes of the Caspian littoral, to whom are closely related both dialectically and otherwise the Tat and Guran of the extreme west, who are agriculturists. The Tajiks are the settled agricultural population of the greater part of Persia, as well as the stock from which many of its mercantile classes come. The same name is applied to their kindred between the Caspian, China, and India. The Tajiks are brachycephalic and above the average in height, while the Hajemis and in part the Farsis are dolichocephalic and of average stature. The Persians of the Persepolitan country are fair-skinned, slender, finely formed, and blonds by comparison with their darker neighbors. The Loris or Luris are taller, much darker, and dolichocephalic. Besides its Aryan population, Persia contains a considerable number of Turks and some few Arabs. In the extreme west Kurds (Aryans) are also to be found; likewise some Armenians, also Aryans. See Plate of Asia, Yellow Races of.

History. Although the legendary history of Persia begins some thousands of years before the Christian Era, our earliest trustworthy information is derived from the Greek writers. Herodotus, Ctesias, and Xenophon are our chief authorities, but their accounts are very conflicting. The northwestern part of Iran, anciently called Media (q.v.), was at the earliest period known to the Greeks a part of the Assyrian empire, but the Medes revolted and under Deioces established an empire which subdued both Assyria and their own kindred Persis. Herodotus states that the Persians were brought under complete subjection, but Xenophon's account implies that they were entirely independent, or at most that they recognized only a nominal allegiance to the ruling power.

The history of the Persian Empire proper begins with the revolt under Cyrus the Great about the middle of the sixth century B.C. With the defeat of Astyages, King of the Medes, the Persians gained their independence and subdued their former masters, who from this time became amalgamated with them. Cyrus continued his career of conquest, and soon succeeded in establishing a mighty empire, which extended from the Oxus and Indus to the shores of the Mediterranean. (See Cyrus.) His son, Cambyses II., a cruel tyrant (B.C. 529-522), subdued Tyre, Cyprus, and Egypt. After the brief rule of the usurper Smerdis (B.C. 522-521), Darius I., surnamed Hystaspis (B.C. 521-486), mounted the throne. He firmly established his dynasty, added Thrace and Macedonia to his empire, and suppressed a revolt of the Greek cities of Ionia; but his two attempts to subdue Greece were completely foiled, the first by the Thracians, and the second by the Athenians at Marathon (B.C. 490). One important service which he performed for the empire was the organization of the satrap system of administration. The whole empire was divided into provinces, and over each was placed a governor, or satrap, who was directly responsible to the Great King. Some uniformity in the government was thus secured, and the empire, as a whole, was very much strengthened. Darius's son, Xerxes I. (B.C. 486-466), raised the largest army that the world had ever seen for the subjugation of Greece. His military force was seconded by a great fleet. The King himself led the expedition in B.C. 480. He at first advanced successfully, but his fleet was utterly defeated at Salamis, and in B.C. 479 his army was overwhelmed at Platæa, while his

fleet sustained another great defeat at Mycale, on the coast of Asia Minor. He was now forced to act on the defensive, and thereby, despite his energy, exhausted the resources of his kingdom. His son, Artaxerxes I. (B.C. 466-425), surnamed Longimanus, was unable to stay the decadence of Persia, which had now commenced. He, however, crushed a formidable rebellion in Egypt, though his wars with the Greeks and Ionians were unsuccessful. The empire became racked by internal strife, which continued during the reigns of his successors, Xerxes II., Sogdianus, Darius II., Artaxerxes II., and Artaxerxes III. Darius III., Codomannus (B.C. 336-330), the last of the dynasty, was compelled to yield his throne to Alexander the Great, who conquered all the former provinces of Persia and founded a vast empire, which, after his death, in B.C. 323, was divided into four parts, Persia along with Syria passing to the Seleucidæ, and its old dependency, Egypt, to the Ptolemies.

The Seleucidæ soon lost Bactria, which became independent under a series of Greek sovereigns; and about B.C. 246 Parthia also rebelled under Arsaces I., who founded the dynasty of the Arsacidæ, by whom the greater part of Persia was wrested from the Greeks, and defended alike against the Greeks and Romans. The Greek empire of Bactria, which included part of Northern Hindustan, was overthrown by nomads from Turkestan. The Parthians drove these invaders out and added Bactria to their empire. The dynasty of the Arsacidæ was brought to an end about A.D. 226 by a Persian named Ardashir (q.v.), the founder of the dynasty of the Sassanidæ (q.v.).

The Sassanian kings raised Persia to a great height of power and prosperity, and more than once they imperiled the Byzantine Empire. The greatest of these monarchs were Khosru (Chosroes) I. (531-579) and Khosru II. (590-628). Soon after the death of Khosru II. the Persian monarchy was engulfed in the tide of Saracen conquest. The victories of Cadesia (c.635) and of Nehavend (c.642) made the Arabs masters of the kingdom. During the reigns of Omar (the first of the Arab rulers of Persia), Othman, Ali, and the Ommiads (to 750), Persia was ruled by deputy governors; but on the accession of the Abbassides (A.D. 750), Bagdad became their capital, and Khorasan their favorite province, and Persia consequently was regarded as the centre of the caliphate. But their rule soon became a nominal one, and ambitious governors established independent principalities in various parts of the country. Many of these dynasties were short-lived, but others lasted for a considerable period and represented powerful empires. The chief were the Taherites (820-872), in Khorasan; the Soffarides (869-903), in Seistan, Fars, Irak, and Mazanderan; the Samani, in Transoxiana, Khorasan, and Seistan; the Dilemi (933-1056), in Western Persia, and the Ghaznevides (q.v.), in Eastern Persia.

This series of dynasties was ended by the Seljuks (q.v.), whose dominion extended from the Hellespont to Afghanistan. A branch of this dynasty, which ruled in Khwaresm (see KHIVA), gradually acquired the greater part of Persia, driving out the Ghaznevides and their successors, the Ghurides (see GHURI); but, together with the petty dynasties which had established themselves in the southwestern provinces, they were swept away by the Mongols under Genghis Khan (q.v.) and his grandson, Hulagu Khan, the latter the founder of a new dynasty, the Perso-Mongol (1253-1335). This was supplanted by the Il-khans in 1335, but an inroad of the Tatars under Timur (q.v.) again freed Persia from the petty dynasties which misruled it. After the death of Timur's son and successor, Shah Rukh, the Turkomans took possession of the western part of the country, while the eastern portion was divided among Timur's descendants, until, at the close of the fifteenth century, the Uzbeks (q.v.) added all Eastern Persia to their new Khanate of Khiva.

In 1500 a new dynasty arose in Western Persia. Ismail, the first prince of this line, became the leader of a number of Turkish tribes, overthrew the Turkomans, and seized Azerbaijan, which was the seat of their power. He quickly subdued the western provinces, and in 1511 took Khorasan and Balkh from the Uzbeks; but in 1514 he had to encounter a much more formidable enemy in Selim I. (q.v.), the Sultan of Turkey. The Persians were totally defeated in a battle on the frontiers; but after his retreat Ismail attacked and subdued Georgia. His son, Tamasp (1523-76), a prudent and spirited ruler, repeatedly drove out the Uzbeks from Khorasan, defeated the Turks, and assisted Humayun, the son of Baber, to regain the throne of Delhi. After a period of upheaval, during which the Turks and Uzbeks attacked the empire, Shah Abbas I., the Great (1585-1628), ascended the throne, restored tranquillity, and repelled the invaders. In 1605 he inflicted on the Turks a defeat which enabled him to recover the whole of Kurdistan, Mosul, and Diarbekir, which had for a long time been separated from Persia; while in the east Kandahar was taken from the Great Mogul. The government of Abbas was strict but just. He constructed at immense expense roads, bridges, caravansaries, and other conveniences for trade, and, with a tolerance unusual in a Mohammedan, he encouraged the Armenian Christians to settle in the country, knowing that their industry would help to advance the prosperity of his kingdom. His successors, Shah Sufi (1628-41), Shah Abbas II. (1641-66), and Shah Sulaiman (1666-94), were undistinguished by any remarkable talents, although the two former were sensible and judicious rulers, and advanced the prosperity of their subjects. During the reign of Sultan Hussein (1694-1722) priests and slaves were elevated to the most important offices of the empire, and religious persecution ran riot. The consequence was a general discontent, of which the Afghans took advantage by declaring their independence and seizing Kandahar (1709). Their leader, Mir Vais, died in 1715, but one of his successors, Mahmud, invaded Persia (1722), defeated Hussein's armies, and besieged the Sultan in Ispahan. Hussein then abdicated the throne in favor of Mahmud, who, on his accession, immediately devoted his energies to gaining the confidence of his new subjects. He became insane and was deposed in 1725 by his brother Ashraf (1725-29), but the latter's tyranny was ended by Nadir Shah (q.v.), who raised first Tamasp (1729-32), and then his son, Abbas II. (1732-36), of the Sefevid race, to the throne. Not content with the nominal rule, Nadir Shah found a pretext to depose Abbas, and seized the sceptre (1736-47). On his death anarchy reigned; the

country was devastated by the rival claimants for the throne; Afghanistan and Beluchistan finally separated from Persia, and the country was divided into a number of small independent States till 1755, when a Kurd named Kerim-khan (1755-79) reëstablished unity in Western Persia, and by his wisdom, justice, and valor gained the esteem of his subjects and the respect of neighboring States. After a period of anarchy Lutf Ali ascended the throne in 1789, but was attacked by Agha Mohammed, a eunuch of the Kajar race, who had set up an independent principality in Mazanderan. Agha Mohammed triumphed in 1795, becoming the founder of the present dynasty. On his accession he announced his intention of regaining what had been lost since the reign of Kerimkhan, and accordingly invaded Khorasan and Georgia, subduing the former country almost without effort. The Georgians, however, besought the aid of Russia, but Agha Mohammed at once marched his army into the country and devastated it with fire and sword; his conquest was, however, hardly completed when he was assassinated, May 14, 1797. His nephew, Futteh Ali (1797-1834), succeeded him, and after a period of conflict succeeded in fully establishing his authority. He completely subdued the rebellious tribes in Khorasan, but was involved in a war with Russia soon after his accession, and by a treaty concluded in 1797 was forced to surrender Derbend and several districts on the Kur.

In 1801 Georgia was declared to be a Russian province. War with Russia was recommenced by Persia, at the instigation of France, and, after two years of disaster, Futteh Ali by the Treaty of Gulistan (Oct. 12, 1813) ceded to Russia Daghestan, Shirvan, Baku, etc., and granted her the right of navigation in the Caspian Sea. In 1826 a third Russian war broke out, equally unfortunate for Persia, which in the Treaty of Turkmantchai (1828) had to surrender the bulk of Persian Armenia and pay a war indemnity of 18,000,000 rubles. The severe taxation necessary to pay this sum so exasperated the people that they rose in insurrection (Oct. 12, 1829), and murdered the Russian Ambassador, his wife, and almost all the Russian legation. The most humiliating concessions, and the mutilation of 1500 of the rioters, alone averted war. The death of the Crown Prince, Abbas Mirza, in 1833, seemed to give the final blow to the declining fortunes of Persia, for he was the only man who seriously attempted to raise his country from its abasement. By the assistance of Russia and Great Britain, Mohammed Shah (1834-48), the son of Abbas Mirza, obtained the crown. He resolved to extend the Persian dominions to the Afghan, Baluch, and Khivan boundaries, but an attempt which he made to reannex Herat was resisted by England. The war was terminated in 1838 by the landing of a small Sepoy force on the shores of the Persian Gulf.

Nasr-ed-Din succeeded to the throne on his father's death in 1848, and the new Government announced energetic reforms, but failed completely in carrying them out. Following his father's example, the new Shah resolved to reassert his claims in Afghanistan and Baluchistan. The ruler of Herat having recognized the claims of Persia, the English Government remonstrated with the Shah, and he was compelled to sign an agreement on Jan. 25, 1853, by which he bound himself not to interfere further in the internal affairs of Herat. In October, 1856, however, on the pretext that Dost Mohammed, the Ameer of Kabul, was about to invade Herat, the Persians again took the city of Herat. In consequence of this violation of the terms of the treaty with Great Britain, war was declared against Persia, and a British army was landed on the coast of the Persian Gulf, which, under generals Outram and Havelock, repeatedly defeated the Persians and compelled them to restore Herat (July, 1857). In 1868 the Persians occupied Seistan, a province claimed by the Afghans, and extended their jurisdiction over the western third of Baluchistan. To put an end to this incessant strife, the Persians at length agreed with the Ameer of Afghanistan and the Khan of Khelat to refer the questions in dispute to an English commissioner. Sir Frederick Goldsmid accordingly visited the eastern frontier of Persia, and in 1872 delivered his award. It carried the Baluch frontier from 58° to 63° east longitude, so as to include in Persia the inland town of Jalk, and Guadar on the Indian Ocean. In 1870 the Russians granted the extension of the jurisdiction of Persia over the whole basin of the Atrek. In 1873 Nasr-ed-Din visited several of the European courts; in 1878 he visited Russia; and in 1889 he again made a tour of Europe. As a ruler he was energetic and severe. His policy was largely under the influence of the Russian Court, though for a time after the failure of his attempt to restore the Persian dominion over Herat he maintained a somewhat friendly attitude toward Great Britain. He sternly repressed revolts and conspiracies, but, through the sale of the tobacco monopoly to English speculators, he offended many of his subjects, and his unpopularity was increased by the scarcity of food in several of the provinces in subsequent years. In 1896 a *mollah*, an adherent of a seditious sect, who had been banished from Persia in 1891, shot and killed the Shah while the latter was entering a shrine near Teheran. His son, Muzaffer-ed-Din, was proclaimed Shah in the following month.

The new Shah reduced the taxes on food, proclaimed that public office should henceforth be awarded on merit and without consideration of money, and declared that he would rule without a Grand Vizier, assuming himself the presidency of the Cabinet of twelve ministers. In 1900 he made a visit to Europe and was entertained in nearly all of the Continental capitals, although the death of the Duke of Coburg prevented him from going to England. While driving from Paris to Sèvres on the 2d of August he narrowly escaped assassination at the hands of an anarchist by the name of Salson. The chief feature of his reign has been the attempt of Russia to extend her influence over the country. Very much the same tactics have been employed as in Manchuria. Russian consuls have been appointed in nearly all of the larger towns, railroad franchises have been seized, extensive loans have been made to the Government, and the number of Russian troops on the frontier has been increased. In the face of these efforts the British have been playing a losing game. The Russian Government is especially anxious to secure a post on the Persian Gulf. With this end in view, a subsidized line of steamships was established in February, 1901, between Odessa and the Persian Gulf.

PERSIAN ART. The history of Persian art falls into two main divisions: that before and that after the advent of Mohammedanism. In the earliest period the civilization and art bore a great resemblance to the Babylonian and Elamite. The palaces, rock-cut sculptures, and images of gods closely resembled those of neighboring nations. These monuments, however, at Susa and elsewhere, were swept away by the invasion of the Iranian tribes toward the eighth century B.C., in their two divisions of Medes and Persians.

Medes and Persians. Ecbatana and Pasargadæ and the rock-cut altars on several mountain summits show that the new art was quite different from the old. It had no temples, only altars in the open air, with some slight protection. Its palaces, as indicated by Polybius's description of that of Cyaxares at Ecbatana, were built of wood covered with metal, brilliant and light, a great contrast to the heavy brick architecture of the Babylonians. The conquests of Cyrus and his successors led to radical modifications; the architectural features, sculptural and decorative methods, were adopted from Lydia and the rest of Asia Minor and from Egypt: stone replaced wood and metal; sculpture in relief, in stone and glazed tiles, was copied, both in style and subject, from Babylonia and Assyria, and thus we find sporadic resemblances even to archaic Ionian Greek art, due to borrowing from a common source. But the Persians adhered to their open-air architecture, to their large, light palace halls, amid all these transformations.

A most original compound, the keynote to this style, is what is termed the Persepolitan column, found also in great perfection at Susa. It is extremely slender, its height being thirteen times its diameter, and has numerous channelings. It was also far more widely spaced than the Egyptian, as it supported a wood instead of a stone superstructure—a feature Hellenic and not Egyptian. Its capital is the most complicated devised in the history of ancient architecture, being usually in three superposed stories, the lower taken from Egypt, the middle from Assyria, the upper being two bulls back to back. These columns appear to have supported wooden beams, an idea also borrowed, apparently, from the Greeks. The size and magnificence of the monuments increased with the expansion of the empire, but, after culminating under Darius (see Persepolis), had been waning for over a century when Alexander conquered Persia.

The Parthians and Sassanians. In vain the Hellenistic art of the period succeeding Alexander sought under the Seleucidæ to impose its yoke on these provinces. There is almost a blank until national existence was revived under the Parthian dynasty of the Arsacidæ. Even then art did not rise above mediocrity, for the dominant race was not artistic. The palace of Hatra, attributed to them, shows the heavy walls, small chambers and vaults of Assyro-Babylonian art, but the material is stone and the ornamentation shows Greek influence. Under the Sassanians a real artistic renaissance took place, almost thoroughly Oriental, which lasted until the Arab conquest in the seventh century A.D. Earliest of all come the domed palaces of Fars and Sarvistan; then that of Firuzabad, and finally those of Ctesiphon and Mashita, with characteristic Iranian elliptic domes and partial return to Babylo-

nian [illegible]rk in place of Hellenic stone. Finally, as a transition to Byzantine art, already heralded at Mashita, with its wealth of decoration, come the palaces of Rabbath-Ammon and Eivan. This Sassanian art had many forms that are now destroyed. Its hangings and its rugs were doubtless models for mediæval workmen. Of its goldsmith work the silver cup of Khosru in Paris is a magnificent example, with clear lines and crisp details, influenced by the barbaric Greek school of the Black Sea and the Bosporus. Coins and medals, ivories and cut gems, all show this mixture of influences.

Mohammedan Persia. Two centuries after the Mohammedan conquest Persia not only recovered its artistic supremacy, but enlarged its influence by dominating the Caliphate of Bagdad. But of this period almost nothing remains. Persia was then overrun by Tatars and Mongols, whose influence modified the purer native Mohammedanism. Persian art retained the dome and the broad arch—like the old Sassanian ellipse—and threw itself more and more into color and decoration. It was the only Mohammedan school consistently to allow the use of the human figure in design—in wall paintings and illuminations, in metal sculpture and textiles. This school radiated into India, and influenced all other Islamic schools, such as the Syrian, Spanish, and even, though slightly, the Egyptian. The collapse of the caliphate and the hordes of Genghis Khan and Tamerlane wiped out most of the really mediæval work, and we must judge of it from the better-preserved and more gorgeous if less pure works of the Persian renaissance of the fifteenth and sixteenth centuries, its last period of brilliancy. Even in modern times Persian art has retained its character and influence, its beauty of color and design, while other Eastern schools have died out, and it has not been without effect even in raising the standard of taste in Europe and America, especially by its rugs and hangings. (ib., 1890); Gayet, *L'Art persan* (ib., 1895); Coste, *Monuments modernes de la Perse* (ib., 1867); Sarre, *Denkmäler persischer Baukunst* (Berlin, 1901). See Ecbatana; Mohammedan Art; Pasargadæ; Persepolis; Susa.

PERSIAN GULF. An arm of the Arabian Sea, almost land-locked between the southwestern coast of Persia and the Arabian Peninsula (Map: Persia, D 7). It is entered from the Gulf of Oman, a northwestern arm of the Arabian Sea, through the Strait of Ormuz, 30 to 60 miles wide, and stretches from southeast to northwest, with a length of 520 miles and a breadth of 150 to 200 miles. Its area is about 90,000 square miles, including 1400 square miles of islands, which are generally barren and desolate. The most important islands are Ormazd, Kishm, and the Bahrein Islands (qq.v.), the last being noted for their important pearl fisheries. The coasts, which are mostly of limestone formation, are high and steep on the Persian, but low and sandy on the Arabian side. The gulf is, as a whole, shallow, being nowhere more than 300 feet deep, and having shoals and banks in many places. The only considerable river entering the gulf is the Shat-el-Arab—the combined waters of the Euphrates and the Tigris.

PERSIAN LANGUAGE. The modern Iranian language of Persia. The earliest authentic specimens are found in the fragments of Handhala of Badghis in the first half of the ninth century, and of Abbas of Merv (A.D. 809). Closely connected with the Middle Persian or Pahlavi (q.v.) and with Old Persian (q.v.), modern Persian has undergone scarcely any change from the time of Abbas and Firdausi (q.v.) to the present day. In structure the language is analytic, like English. It is indeed possible to trace a certain analogue between the development of the two tongues. As English has become an analytic language as compared with Anglo-Saxon, so Persian is analytic while Old Persian is highly inflected. Again, as English received through the Norman Conquest the Romance and Latin elements, Persian was enriched with a large vocabulary of Arabic loan-words by the Mohammedan invasions. On the other hand, it is considered inelegant in English to overload one's style with Latinisms, while in Persian stylistic charm is in direct proportion to the Arabisms employed. The phonological deviations of modern from ancient Persian are comparatively few. The principal ones are as follows: Old Persian *ai* becomes New Persian *ē*, *ī*, as Old Pers. *Haraiva*, New Pers. *Harē*, *Harī*, 'Herat;' Old Persian *au* becomes New Persian *ō*, *ū*, as Old Pers. *raučah*, New Pers. *rōz*, *rūz*, 'day;' initial Old Persian *y* becomes New Persian *j*, as Old Pers. *yauviyā*, New Pers. *jōi*, *jō*, *jū*, 'canal;' initial Old Persian *v* becomes New Persian *b* before *a*, *ā*, *ē*, *ī*, *iy*, but *g* before *u*, as Old Pers. *vasiy*, New Pers. *bas*, 'much,' but Old Pers. *viyatarayāma*, 'we crossed,' New Pers. *guδaštan*, 'to pass over;' Old Persian *f*, *d*, *θ*, sometimes becomes New Persian *h*, as Old Pers. *kaufa*, New Pers. *kōh*, *kūh*, 'hill,' Old Pers. *dadātuv*, 'let him give,' New Pers. *diham*, 'I give,' Old Pers. *gāθʻu* New Pers. *gāh*, 'place'; but initial Iranian *s*, which sometimes appears as *θ* in Old Persian, is retained as *s* in New Persian, as Old Pers. *θuxra*, Avesta *suxra*, New Pers. *surx*, 'red;' Old Persian surds between vowels and after *r* or *n* become sonants in New Persian, as Old Pers. *xšapan*, New Pers. *šab*, 'night,' Old Pers. *pitar*, New Pers. *pidar*, *piδar*, 'father.' Old Pers. *Varkāna*, 'Hyrcania,' New Pers. *gurg*, 'wolf.' The accent in modern Persian falls in general on the last syllable of the word. The preterite tense of the verb, except in the third person singular, however, keeps the accent of the stem, as *āfarīdam*, 'I created.' In the New Persian noun there is neither gender nor, properly speaking, case. The plural, however, distinguishes to some extent between animate and inanimate, as *gāvān*, 'cattle,' but *jāmahā*, 'clothes.' The plural ending *-ān*, which is now usurped in colloquial speech by *-hā*, is the old genitive plural, as Av. *xšafnąm*, 'of the nights,' New Pers. *šabān*, 'nights.' The genitive and adjective relations are denoted by *i* (called by the Arabic term *izāfat*, 'annexation') placed between the governing word and the following genitive, and between the noun and the following adjective, as *raftan-i laškar*, 'departure of the army,' *āb-i pāk*, 'pure water.' This *i* is derived from the similar use of *hya* in Old Persian and *yaṯ* in Avesta, as Old Persian *kāra hya manā*, 'my army' (literally, 'army that of me'), *kāra hya Bābiruviya*, 'Babylonian army' (literally, 'army that Babylonian'), Avesta *ašahe yaṯ vahištahe*, 'of best

righteousness' (literally, 'of righteousness that the best'). The dative, especially in the older poetry, is frequently expressed by an appended *rā*, as *pidar-rā guftam*, 'I said to the father.' This *rā* is the survival of the same use of *rādiy*, 'for the sake of,' in Old Persian, as *avahya rādiy*, 'on account of this.' Adjectives are compared by adding *-tar* for the comparative, and *-tarīn* for the superlative, as *buzurk*, 'high,' *buzurktar*, *buzurktarīn*. The verb in Persian is extremely simple. It has three persons, two numbers, an indicative, imperative, and (rarely) a precative, an infinitive, a present (active) and past (passive) participle, and a gerundive. The tenses of the indicative are the preterite, corresponding in force to the Greek aorist; imperfect (formed by prefixing *mī* or *hamī* to the preterite), corresponding to the Greek imperfect; aorist, corresponding to the Latin indefinite present; present (formed by prefixing *mī* or *hamī* to the aorist); and future (formed by prefixing *bi* to the aorist). The passive is formed by the past participle with auxiliary *šudan*, 'to be,' as *pursidah šudan*, 'to be asked,' while active periphrastic tenses are formed by the participles and the infinitive with the verbs *ast*, etc., 'he is,' *būdan*, 'to be,' *xᵛ āstan*, 'to wish.'

The dialects of Persian are both numerous and, especially from a linguistic point of view, important. They are divided into three groups, the Pamir, Caspian, and Central. The Pamir dialects are Wakhi, Shighni, Sarikoli, Roshani, Tajiki, Sanglici, Minjani or Mungi, Yidghah, and Yaghnobi. The Caspian group includes Samnani, Mazanderani, Lahijani, Gilaki, Talishi, and Tat or Judæo-Persian. The Central dialects embrace Gabri, Shirazi, Bahbahani, Sivandi, Yazdi, Zafrahi, Kashahi, Vonishuni, Kuhrudi, Nayini, Natanzi, and Kashani. But few of these dialects have as yet received any literary culture.

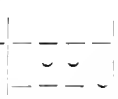
PERSIAN LITERATURE. The literature of Persia is, strictly speaking, divided into three great periods, old, middle, and new. In view, however, of the wide distinctions in chronology, language, and spirit, the Old Iranian literature, including the Avesta (q.v.) and the Old Persian inscriptions (see OLD PERSIAN), as well as the Middle Persian or Pahlavi (q.v.), may best be treated separately. The literature which began shortly after the Mohammedan conquest of Persia is that which is usually implied by the term Persian literature. It is for the most part in verse, although prose is by no means lacking. The genius of the poetry of Persia lies in the ability to say old things in a new way. Perfection of form and euphony of phraseology are the marks of the Persian poet rather than lofty thought and sincere inspiration, while originality of theme is supplanted by fertility of conceits. The poetry is, consequently, so essentially different from that of the Occident that it is somewhat difficult for a Western reader to become interested in Persian verse unless he can habituate himself to the somewhat artificial poetic atmosphere to which he is transported. This artificiality, which to the Occidental mind is a defect, is to the Oriental a proof of genius. Nor is this view unreasonable. The freedom of the West has never existed in Persia. Crushed by a despotism, hampered by Mohammedanism, and circumscribed by social conditions, only a small range of subjects has been left open for the Persian poet. Striving to make the best of his material, he has been driven to elaboration rather than creation. The monotony which wearies the Westerner, whose meagre vocabulary cannot match the luxuriousness of synonyms and rhymes found in Persian, does not exist in the original. There the music of the verse and the dexterity of the turns of thought conceal the poverty of idea, and give a pleasure which is real and justifiable.

The first Persian poetry of which any extensive remains have survived was epic, with the general metrical scheme, read from right to left, ⏑ – | ⏑ – | ⏑ – | ⏑ –. Here belong the fragments of a translation by Rudagi (tenth century) of Bidpai (q.v.). To judge from these fragments, his style was simple and free from trivial conceits. The Persian literary historians term him the Sultan of bards, and regard him as the first classical poet. About this period flourished Kisa'i, Khabbaz, Abu'l Abbas, Khusrawani, and Umara. When the Samanid dynasty fell before the attack of Mahmud of Ghazni, the conqueror gathered at his court the poets and philosophers of the time. Of them the laureate was Unsuri, the author of an epic entitled *Wāmik u 'Adhrā*, of which a few verses are preserved in Asadi's rhyming dictionary, and the composer of a long series of eulogies on his patron. Greater than he, however, was his rival, Farrukhi, a master of description, although artificial and Arabized, who bent his energies, like Anvari, Khakani, and others, to eulogies of Mahmud. To this period also belongs Daqiqi, who began the task of composing an epic on the legends of ancient Iran. The work of Daqiqi, amounting, according to tradition, to about a thousand couplets, was incorporated after his death into the greatest of all Persian epics and one of the masterpieces of world-literature, the

Shāhnāmah, or Book of Kings of Firdausi (q.v.). Of the epic poets who immediately followed Firdausi but two names have survived. The first of these is Ali ibn Ahmad al-Asadi at-Tusi, of the eleventh century (generally, but perhaps erroneously, supposed to be the same as the lexicographer Asadi), the author of the *Garshāspnāmah*, wherein he recounts in between nine and ten thousand couplets the deeds of Garshasp (a mutilation of the Avesta name *Keresāspa*), the grandfather, according to some traditions, of the legendary Iranian hero Rustam. The second is the *Sahriyārnāmah* of Mukhtari (died 1149 or 1159), who wrote of the adventures of Shahryar, the great-uncle of Rustam. Of this poem, the scene of which is in great part laid in India, but a few fragments remain. The other epics of this legendary cycle are anonymous. Of these probably the most important is the *Sāmnāmah*, which almost equals in length the *Shāhnāmah* itself, and contains the adventures of Sam, according to the Avesta the grandfather of Keresaspa; and still longer is the *Barzūnāmah*, which, like the comparatively short *Jahāngīrnāmah*, the *Farāmurznāmah*, and the *Bānū Gushāspnāmah*, also forms a part of the Rustam style. The legendary epic yielded, however, to the historical. Here it was the story of Alexander the Great, augmented by myths, which gave the first impulse. The poets Nizami, Amir Khusru, and Jami, from the twelfth to the fifteenth century, each wrote an *Iskandarnāmah*. This series was followed by a long line of epics, in many instances hardly more than rhymed chronicles, of comparatively little poetic worth. It will be sufficient here to name as the most important Ahmad Tabrizi's *Shāhanshāhnāmah* on Genghis Khan and his successors until 1338, Abdullah Hatifi's (died 1521) *Timūrnāmah* on Tamerlane, and the long *Jārjīnāmah*, or Book of George, by Mulla Firuz ibn Ka'us, celebrating the English conquest of India up to the fall of Poona in 1817. Side by side with the legendary and historical epic the romantic epopee was developed. Firdausi himself had set the example in his *Yūsuf u Zulikhā*, based on the story of Joseph and Potiphar's wife. The type of the romantic epic is conventional. The lovers become enamored of each other through a dream or a description, and the interest then centres about their constancy and their trials. The hero and heroine are either Iranian, as in the twenty-one epics on the loves of the Sassanian Khusru, his wife, the fair Armenian Shirin, and her lover, Ferhad, the sculptor, and the ten versions of Behram Gor's seven (or eight) love-adventures; or they are borrowed from the Arabs, as the fourteen poems on Joseph and Zalikha, the seven on Wamik and Adhra, and the eighteen on Laila and Majnun. After Firdausi the first great poet in this genre whose work survives was Fakh ed-Din of Gurgan (born about 1048). His poem, the *Wīs u Rāmīn*, in about nine thousand couplets, relates the love of Wis, the young wife of the aged King Mobad of Merv, for his brother Ramin. The point of the epic, which has many old Iranian elements, lies in the repeated deception of the doting monarch, and it is marked by a humor which is piquant even if unethical. A far greater romantic epic poet than Fakh ed-Din was Nizami (died c.1203), who wrote poems on three of the favorite themes already noted, the loves of Laila and Majnun, of Khusru and Shirin, and of Behram Gor. These works, together with his historical epic, the *Iskandarnāmah*, and his mystical poem, the *Makhzan-ul-asrār*, or Treasury of Mysteries, made a *khamsah*, or pentade, which was imitated by many poets. (See NIZAMI.) Nizami thus became the model for the romantic epopee in Persia. Of his successors the most important was Jami (1414-92) (q.v.), whose *Yūsuf u Zulikhā* and *Lailā u Majnūn* are not inferior to the corresponding poems of Firdausi and Nizami. Khwaja Kirmani (1281-1352) returned to the legendary epic in his *Humāi u Humāyūn*, which describes the love of Humai, son of the mythical Iranian hero Hushang (the Haoshanha of the Avesta), for Humayun, Princess of China, and a similar story is told in the same poet's *Gul u Nauruz*, on the wooing of Gul, the Princess of Rome (i.e. Byzantium), by Nauruz, Prince of Khorasan. On the other hand, Amir Khusru (1253-1325) wrote a romantic epic of his own time, entitled *Duvalrānī Khidrkhān*, on the tragic loves of the Persian Prince Khidrkhan and Duvalrani, Princess of Gujarat. The multitude of minor poets in this genre may be passed over. A noteworthy modification of the romantic epic, however, deserves mention. This is the mystical romance. Katibi (died about 1434) in his *Majma' al-Bahrain*, or Union of the Two Seas, also called *Nāzir u Manzūr*, or Seer and Seen, set forth in Sufiistic diction (see SUFIISM) the mutual love of God and man, while Jami treated the same theme in his poem on the loves of Salaman and Absal. Here too belong, together with many others, the *Gūi u Caugān*, or Ball and Mallet (also called *Hābnāmah*, or Book of Ecstasy) of Ariti (1438), and the *Shāh u Gadā*, or King and Dervish, of Hilali (died 1532).

From the epic one turns to the lyric poetry. Here the verse-schemes are for the most part borrowed from the Arabs, although the *rubā'ī*, or quatrain, is distinctly Persian in origin. The principal lyric forms are five in number, and are as follows: (1) The kassida (from Arabic *qasada*, 'to break') is employed chiefly in eulogies. It consists of at least twelve and at most ninety-nine couplets (*bait*), the second lines of which must rhyme with the first two lines (*matla'*), thus giving the rhyme-scheme *aa*, *ba*, *ca*, *da*, etc. The thought in each *bait* must be complete in itself, but need not be inseparably connected either with the preceding or following couplet. To employ the Persian figure, the rhyme is the thread on which the pearls of the *baits* are strung. The frequent change of order of distichs which is found in Persian manuscripts of lyric poetry thus becomes easily explicable. (2) The ghazal (from Arabic *ghazala*, 'to be abundant') is identical in form with the kassida, but can have no more than twelve couplets, the last of which must contain the name of the poet. This verse is devoted especially to poems on love and wine. (3) The kit'a (from Arabic *qata'a*, 'to cut off') is the same as the kassida, excepting that the matla is lacking. Its rhyme-scheme is accordingly *ab*, *cb*, *db*, *eb*, etc. (4) The mathnawi (from Arabic *thanaya*, 'to fold') is a long poem of epic, mystic, or didactic content, with each *bait* or couplet rhyming, *aa*, *bb*, *cc*, *dd*, etc. (5) The ruba'i, or quatrain (from Arabic *raba'a*, 'four'), is preëminently the Persian form of epi-

gram. Its metrical scheme, read from right to left, is:



and its rhyme is either *aaaa*, or *aaba*.

In general the Persian lyric differs from the epic only in those restrictions which the external form lays upon it. The spirit is practically the same. It is, of course, natural that the personal element should enter into the lyric far more than into the epic, and that we should find in its briefer compass a sublimation, as it were, of the conceits and mannerisms, which are more scattered in the epic. The lyric poetry of Persia may be divided into the lyric proper, the religious and didactic, and the Court poetry. In the first division love is the predominating *motif*, and the theme of next importance is wine. Into the purely subjective lyric, such as is familiar in modern Occidental poetry, the Persian does not enter. The love which is celebrated is either happy, or, in the great majority of verses, blighted by the cruelty of, or separation from, the beloved. The poet rings countless changes on this single theme. He sighs for the curl and the mole, the sugar lip and the cypress form of the object of his devotion. In nearly every instance the love set forth is, at least superficially and exoterically considered, sensuous. Of romantic devotion there is scarcely a trace in Persian literature, even in the greatest epics of the Joseph and Zalikha cycle. It is furthermore a characteristic of Persian erotic verse that the beloved is represented as a boy, as is shown, for instance, by the constant allusions to the skinker or *saqi*. This usage, strange and easy of misinterpretation to the Western reader, is borrowed from Arabic poetic usage. The explanation seems to lie not in an assumption of low morality, but in the Arabo-Persian view that it is indelicate to refer openly to a woman. As the seclusion of women is universal throughout Mohammedan countries, the sole refuge left to the poet was to change in his verse the sex of his love. The incessant praise of wine was due to the fact that it is a forbidden drink. Strict Mohammedan orthodoxy condemns the wine-bibber to hell on the authority of the Koran. The Persians, however, being Shiites in creed, are opposed on principle to the orthodox Sunnis, and as the old Iranians in pre-Islamitic times were inclined to the use of wine, their descendants sing the praises of the grape in tones too real to be mistaken. Besides this exoteric reading of love and wine, there is, however, an esoteric interpretation. The beloved is God, the curl is the transient charm which partially hides His face, the mole is the centre of His divine unity, and the wine is the ecstasy which fills man, the lover, at the thought of reunion with the Beloved, absent for a time and seemingly cruel. The literal interpretation too common in the West, which disregards or denies the mystic element in this poetry, may with some good reason be regarded as inadequate. It is self-evident, on the other hand, that a solely Sufiistic view of these poems is equally misleading. The truth seems to be that there is no clear line of demarcation between the esoteric and the exoteric. Both were in many cases simultaneously present in the poet's mind.

In the Persian lyric by far the greatest names are those of Hafiz (q.v.) (fourteenth century), whose ghazals are his most famous poems, and of Omar Khayyam (q.v.) (died 1123), whose quatrains are the Persian poems best known to the Occident. Hafiz had been preceded by several poets of whom Kamal ud-din Isfahani (died 1237), Ibn Yamin (died 1344-45), and Salman of Sava (died 1376 or 1377) were the most noteworthy. After him came a long line of imitators of more or less ingenuity. Among them mention may be made of Jami, more famous as a didactic poet, and Amir Shahi (died 1453). Jami also had his lyric imitators, of whom the most noteworthy was Baba Fighani of Shiraz (died 1516 or 1519), who was called 'the minor Hafiz.' With Jami, however, the lyric poetry of Persia reached its climax, even though minor poets wrote, and though Akbar sought to rekindle the dying flame by his royal patronage. Closely connected with the lyric proper is parody. Here belongs especially the name of Abu Ishak (died 1427), who devoted himself in his *Diwan* to the glorification of gastronomy, sparing in his parodies neither Hafiz, Sadi, nor even Firdausi. A half century after Abu Ishak came Mahmud Kari, who sang the praises of clothes instead of food, and modeled a clothes State, which reminds one somewhat of Carlyle's *Sartor Resartus*, with burlesque substituted for philosophy. Beside the parody there is the lower vein of ribald verse, to which Orientals are somewhat inclined. Enough to mention the names of Sozeni (died 1173-74), Azraki (died 1132), and the greatest of them all, Ubaid Zakani (died 1370-71), beside whose verses even Martial loses piquancy. Here, too, is a Persian counterpart of Marguerite of Navarre, Mahisti, the favorite of the Sultan Sanjar (died 1157), who could write extremely spicy poems without forfeiting esteem. As is implied by the renown of Mahisti, Persian poetesses are not unknown. In the harem much fugitive verse was composed, chiefly, of course, of an erotic nature, but comparatively little has been preserved. As other subordinate forms of the lyric in Persia, the riddle and the *tarikh*, or chronogram, must be mentioned. The riddles do not differ essentially from those in other literatures. The chronogram is, however, comparatively rare outside of Arabic and Persian. It is formed by the construction of an appropriate sentence, the sum of the numerical values of whose letters equals the year in which the event alluded to by the sentence occurred. It is stated by Kazwini, for instance, with regard to the entrance of Hassan ibn Sabbah, the notorious leader of the Assassins (q.v.), into the fortress of Alamut, which had anciently been called Alah Amut, that "by a strange chance the sum total of the letters *Ulah Amût* in the Arabic chronogram was the year of his entry into the castle." Adding the numerical values of the letters of this name, $a = 1$, $l = 30$, $h = 5$, $a = 1$, $m = 40$, $\hat{u} = 6$, $t = 400$, we have the date of the event, 483 A.H. (= 1090 A.D.).

Closely connected with the lyric poetry of Persia, especially by the bond of mysticism, is the didactic and religious. So closely are the two related that it is sometimes impossible to decide to which class a poet belongs, because he in reality belongs to both.

The mystic and didactic poetry of Persia is entirely Sufiistic in character. The greatest of all who wrote in this genre was Jalal-ud-Din Rumi

(q.v.) (1207-1273), whose *Diwân* and *Mathnawi* are among our most important sources for the study of Sufiism. The first mystic poets, however, were probably Bayazid Bistâmi (died c.874) and Abu Said ibn Abul Khair (968-1049), of whose works a number of quatrains have survived. In the eleventh century the *Râhnamâ'inâmah* of Nasir-i Khusru deserves mention. The earliest great predecessor of Jalal-ud-Din, however, was Farid-ud Din Attar (q.v.) (died 1299), whose *Mantig ut-Tair*, or Bird-Parliament, is a remarkably beautiful allegory of the struggle of the soul to attain to the infinite. Here belongs also another of the greatest names of all Persian literature, Sadi (q.v.) (c.1190-1291). His *Gulistân*, or Rose Garden, and *Bûstân*, or Garden, are among the greatest didactic productions of the East. The last important mystic poet was Mahmud Shabistari (died 1317), the author of the *Gulshan-i-Râz* or Rose Garden of Mystery, which may serve as a text-book of Sufiistic philosophy.

The Court poetry, the third division of the lyric, is the least interesting of all from a literary point of view. The favor shown to poets from the earliest period of Islamitic rule in Persia naturally encouraged the production of eulogies, which, with the luxuriance of Oriental imagination, are so fulsome as to cloy the Occidental reader. The metrical intricacy keeps pace with the increasing artificiality of the Court poets. Such rhymes as *aaaaaaaaax, bbbbbbbbbx*, and so on, and a series of ghazals, united by *misra's*, or rhyming couplets at regular intervals, are common. Within the poems themselves there are conceits and obscure allusions which in many cases baffle even the ingenuity of an Oriental reader, and give rise to commentary after commentary. From the long series of poets of this type the names of Watwat (1088-1182), Muizzi (died 1147), Khakani (died about 1199), and the greatest of them all, Anvari (q.v.) (died about 1190), may be mentioned.

The drama of Persia, apart from the miracle play of *Hasan and Hosein* (q.v.), is of late development and little importance. The prose literature, as has been intimated, is also of small extent and value as compared with the poetry. While it is true that Sadi in the works already mentioned intermingled prose and verse, and that his example was followed by Nakhshabi (died 1330) in his *Sindbâdnamah*, or Book of Sindbad, it seems, nevertheless, strange that so few of the great Persian writers should have availed themselves of prose. There is, however, a mass of novels, tales, fables, legends, and anecdotes, as well as of history, encyclopædias, and the like. The oldest specimens of Persian prose are Muwaffak's book on pharmacology and Balami's translation of Tabari, both dating from the tenth century. As authors of notes and travel, we may mention Abu Tahir, whose numerous romances are chiefly concerned with old Iranian legends, as in his *Dâstân* or *Iahrumânnâmah* (dealing with the legend of Hushang) and his *Darâbnâmah* (on the story of Darius and Alexander), the anonymous writers of the *Sikandarnâmah* (on the Alexander legend), the *Hssah-i Hatim Tâ'i* (on Hotim Tai, proverbial for his generosity and nobility), and the modern Mohammed Taki (seventeenth century), the author of a huge romance in fifteen volumes, entitled *Bûstân-i Xayâl*. There is besides a multitude of novelettes and of tales in the style of the *Arabian Nights* (q.v.). Here the most important are the *Baxtyârnâmah*, or Book of the Ten Viziers, the *Jissa-i cahâr darwîš*, or Story of the Four Dervishes, perhaps by Amir Khusru (died 1325), the *Iutînâmah*, or Book of the Parrot, based on the Sanskrit *Sukasaptati*, and the *Bahâr-i dânîš*, or Spring Garden of Wisdom, by Inayat-ullah Kanbu (died 1671). The best known of all the prose fiction in Persian is Waiz Kashifi's (died 1504-05) *Anwâr-i Suhailî*, or Lights of Canopus, based on the *Kalila wa Dimmnah*, and so ultimately on the Sanskrit *Pañcatantra* (q.v.), although the *Latâ'if ut-tawâ'if*, or Witty and Amusing Stories, by Sali, the son of Waiz Kashifi, also deserves mention.

PERSIAN MUSIC. See Arabian Music.

PERSIAN MYTHOLOGY. Only scanty traces of the mythology of ancient Persia have survived. The reform supposedly instituted by Zoroaster (q.v.) seems to have swept away the older nature worship which prevailed in Iran as in India. It is evident, however, that this reform was not absolutely thorough, and that under the orthodoxy which was forced on the people by Vishtaspa, the royal patron of Zoroaster, according to the rather doubtful Parsi traditions, there lurked many old beliefs and myths which were heritages of the Indo-Iranian religion. When the first enthusiasm of this Zoroastrian Protestantism died out, the ancient faith revived in some measure, and in the Yashts, a part of the Avesta (q.v.) late in form, but almost certainly old in content, many mythological allusions may be found. In some of the Pahlavi texts (see Pahlavi Literature), especially in the Bundahish, there survive numerous traces of the primitive faith, despite the Zoroastrian orthodoxy to which they theoretically conform. The six Amshaspands, who in Zoroastrianism represent the cardinal virtues of Good Mind, Best Righteousness, Desirable Kingdom, Holy Concord, Health, and Immortality, were originally deities protecting respectively cattle, fire, metals, earth, water, and plants, being therefore nature divinities. Ormazd, who in the Zoroastrian reform became the chief, and really the only god, was originally a sky-deity, whose son was the fire, and who

was also the father of the Good Mind, or, in the early evaluation of this godling, of cattle. His daughter was Holy Concord, the earth, who from many allusions in the Yashts was a goddess of fertility. The demons, who play a subordinate part in the orthodox texts, find a more prominent place in the Yashts. Important here is the serpent Azhi Dahaka, who was probably the sky-serpent, corresponding to the Vedic Vritra slain by Indra (q.v.), especially as the Bundahish describes him as falling from heaven. The Yashts emphasize the nature worship of the pre-Zoroastrian religion in the chapters devoted to the sun, the moon, the planet Tishtrya, who, mounted on a black horse, perhaps the storm-cloud, defeats the demon Apaosha, drought, and to the waters, Anahita, who is the Anaïtis (q.v.) of the classical writers. To all these not only heroes, but even Ormazd himself, offer sacrifices, clearly pointing to an earlier period when one god was dependent on another for aid. Ghost worship also (see GHOSTS) is represented by the cult of the Fravashis, who seem to have originally represented the spirits of the beneficent dead. The cosmogonic mythology (see COSMOGONY) is largely derived from Semitic sources, for the antithesis of Ormazd, the god of the sky and light, to Ahriman (q.v.), the god of darkness, and their conflict at the creation of the world, is precisely analogous to the battle of the Babylonian solar deity Marduk with Tiamat, the demon of chaos. About trees and animals myths clustered. In the white *Hōm* tree, which will give man immortality at the day of resurrection, there is a pre-Zoroastrian reflex of the Semitic tree of life, while the human-headed bulls of Assyrian sculptures are represented by Gopatshah, a being half bull and half man, who pours holy water into the sea. With the downfall of the Iranian religion before Mohammedanism, the old myths vanished almost entirely, so that the mythology of modern Persia is practically Islamitic. However, the *pairika*, a female demon of Iran, is preserved as the beneficent *péri* of modern Persian folk-lore, and the *simurgh*, a bird of magic properties, has become the *roc* of the *Arabian Nights*.

PERSIAN POWDER. See INSECT POWDER.

PERSIGNY, pâr'sē'nyē', JEAN GILBERT VICTOR FIALIN, Duke de (1808-72). A French politician, born at Saint-Germain-Lespinasse, in the Department of Loire. He joined the hussars in 1828, but after the Revolution of July, 1830, owing to doubts as to his loyalty, he was expelled from the army on a charge of insubordination. He now became a journalist in Paris, formed the most intimate relations with Louis Napoleon, and commenced a career of Bonapartist propagandism throughout France and Germany, in which he displayed extraordinary energy, pertinacity, and fertility of resource. Articles from his pen had already appeared in *Le Temps*, and in 1834 he founded *l'Occident français* as a Bonapartist organ. He had the chief hand in the affair of Strassburg (See NAPOLEON III.). He also took part in the expedition to Boulogne, where he was captured and condemned to twenty years' imprisonment. His confinement, however, became almost nominal, and he passed his time in writing a voluminous and singular work on the *Utilité des pyramides d'Egypte* (1844). On the breaking out of the Revolution in 1848 Persigny hurried to Paris, and set himself, with his accustomed vigor and swiftness, to organize the Bonapartists. He was appointed aide-de-camp to the President, Louis Napoleon, and major-general of the Parisian National Guard. In 1849 he was chosen a member of the Legislative Assembly. He was sent to Berlin as Ambassador at the close of the same year. As was to be expected, Persigny took a prominent part in the coup d'état of December 2, 1851. In January, 1852, he succeeded Morny as Minister of the Interior. From 1855 to 1858, and again from 1859 to 1860, Persigny was the French Ambassador to Great Britain. He was recalled to France, however, in 1860, to resume the office of Minister of the Interior. This office he resigned in June, 1863, when the elections of Paris and other large towns showed dissatisfaction with his policy. In the autumn of the same year he was created a duke. He did not long survive the overthrow of the Second Empire, his death occurring at Nice, January 13, 1872. Consult references under NAPOLEON III.; also Delarva, *Le duc de Persigny et les doctrines de l'empire* (Paris, 1865); Delard, *Histoire du Second Empire* (ib., 1868-75).

PERSIMMON (from the Virginia Indian name), or DATE PLUM. A tree and its fruit, including several species growing wild and cultivated to some extent. The Japanese persimmon or kaki (*Diospyros kaki*) is the principal native fruit of Japan. It is found also in Korea, Eastern and Southern China, and parts of the East Indies. It is grown to a limited extent in Southern Europe, and was introduced into the United States about 1875. It finds a congenial climate in California and the Southern States as far north as Virginia. The cultivated trees grow 8 to 12 feet high, and bear a very attractive yellow, thin-skinned globose fruit often attaining the size of a medium orange. When ripe, the fruits contain a soft sweetish pulp. A number of varieties are in cultivation, and these vary much in size, color, the number of seeds they contain, period of ripening, etc. The American persimmon (*Diospyros Virginiana*) is native from Pennsylvania and Indiana south to the Gulf. Wild trees sometimes reach a height of sixty feet in the forest, and are valuable as cabinet woods. In the open the trees seldom exceed 20 to 30 feet in height. Another American species, *Diospyros Texana*, is grown in Texas. The fruits of the American persimmon are much smaller than those of the Japanese varieties, are very soft when ripe, and on this account are seldom marketed.

NATIVE PERSIMMON (*Diospyros Virginiana*).

Persimmons are propagated from seed. Varieties seldom reproduce themselves, and so budding and grafting are resorted to. Seed sown in the fall is allowed to grow the following season. The second spring the seedlings are either budded or crown grafted. Grafting gives the better results. Native trees may be successfully top-grafted with improved varieties. In transplanting to the orchard trees one to two years from the graft are preferred. Persimmons thrive on nearly all soils. Like other orchard fruits, they respond generously to cultivation. Trees come into bearing within four years after setting in the orchard. Top-worked trees produce fruit within three years from the graft. Japanese varieties are inclined to overbear, and should therefore be thinned. The green fruit of all varieties of persimmons is extremely astringent, and maintains this condition until fully ripe. The ripening period of the different varieties varies from August until December. The Japanese sorts should be gathered before frost and stored in a cool, well-ventilated, moist room until fully ripe. Some native persimmons ripen before frost, which greatly improves others. The fruit is usually consumed fresh as a dessert or out of hand. Some varieties may be dried or preserved. Consult: Hadley and Troop, *The American Persimmon;* Indiana Agricultural Experimental Station Bulletin 60; Watts, *Persimmons;* Tennessee Agricultural Experimental Station Bulletin XI., No. 1. In the latter bulletin both native and Japanese persimmons are considered. See Plate of Papaw and Persimmon.

PERSIMMON INSECTS. The persimmon does not suffer greatly from the attacks of insects. Several caterpillars may occasionally defoliate individual trees, especially the larva of *Spilosoma virginica*, *Orgyia leucographa*, *Tolype velleda*, and *Edemasia concinna*. The little leaf-miner (*Aspidisca diospyriella*) forms a minute blotch-mine in the leaves of this tree, and eventually cuts out a case in which it pupates. One of the plant-lice (*Aphis diospyri*) seems to be specifically attached to this tree, but does little damage, and the same may be said of one of the flealice (*Psylla diospyri*). One of the weevils of the family Otiorhynchidæ, namely *Brachystylus acutus*, is found only on the persimmon, but does comparatively little damage.

PERSIO. See Arcuil.

PERSIUS (Aulus Persius Flaccus). One of the most famous Roman satirists. He was born at Volaterræ (now Volterra), in Etruria, A.D. 34. He was of a distinguished equestrian family, was educated under the care of the Stoic philosopher Cornutus, lived on terms of intimacy with the most distinguished personages of his time in Rome, and died November 24, A.D. 62, in the twenty-eighth year of his age. The principal authority for the life of Persius is an abridgment of a 'commentary' by one Probus Valerius. Modest and gentle in his manners, virtuous and pure in his whole conduct and relations, he stands out conspicuously from the mass of corrupt and profligate persons who formed the Roman 'society' of his age, and vindicated for himself the right to be severe by leading a blameless and exemplary life. His six satires were greatly admired, not only in Persius's own day, but all through the Middle Ages; but the estimate which modern critics have formed of his writings from a literary point of view is not so high. He is remarkable for the sternness with which he censures the corruption of morals then prevalent at Rome, contrasting it with the old Roman austerity and with the Stoic ideal of virtue. The language is terse, homely, and sometimes obscure, from the nature of the allusions and the expressions used, but the dialogues are the most dramatic in the Latin tongue. The *editio princeps* appeared at Rome in 1470; later editions are those of Isaac Casaubon (Paris, 1605); Passow (Leipzig, 1809); Jahn (Leipzig, 1843); Hermann (Leipzig, 1881); Conington (with an English translation and commentary, revised by Nettleship, Oxford, 1893); and Bücheler (Berlin, 1893). Persius has been frequently translated; the two best English translations are those by Dryden and Conington. There is a complete bibliography of Persius by Morgan (Cambridge, Mass., 1893).

PERSON (OF. *persone*, Fr. *personne*, from Lat. *persona*, person, actor's mask, from *personare*, to sound through, from *per*, through + *sonare*, to sound, from *sonus*, sound; connected with Skt. *svana*, sound, from *svan*, to sound). In theology, the word person is applied to the distinctions in the divine Trinity in a modified sense. Sabellius applied the Greek word *prosopon* (face) to the Father, Son, and Spirit, on the supposition that they were three separate appearances, or faces, of the one divine nature. In the trinitarian controversy culminating at Constantinople (381), the orthodox party accepted the term, but affirmed that the 'faces' were eternal faces, or were manifestations of eternally existing distinctions. The natural tendency of the word, when the meaning 'person' had become attached to it, was to emphasize the separateness of the trinitarian hypostases, and in that respect it had a bad influence.

PERSONA GRATA (Lat., acceptable person). A term applied to a diplomatic agent, indicating that he is acceptable to the sovereign to whom he is accredited. See Diplomatic Agents.

PERSONAL ACTION. Under the common-law system of pleading and practice, any action available to enforce rights or redress wrongs, including actions to recover possession of personal property, and excluding actions to recover possession of involving rights in real property. See Action; Forms of Action; Pleading.

PERSONAL EQUATION. See Equation, Personal.

PERSONALITY. See Individuality; Mental Constitution; Self.

PERSONAL PROPERTY; PERSONALTY. These terms are applied to all that class of property which is to be distinguished from real property or real estate, and which consists for the most part of property which is either movable or merely temporary in character. The only absolute distinction, however, between real and personal property lies in the legal method of its disposition after the death of its owner. Real property is inheritable or descendible, and passes to the legal heirs of the owner according to the rules of the common law or statutes governing descent. Personal property is not inheritable, but passes to the administrator or executor of the deceased person.

The term 'personal property' is generally used as synonymous with 'goods' or 'goods and chattels.' The term, however, has a broader significance than either of those terms, and includes both chattels and choses in action. Property that is personal in its nature may become real by becoming affixed to real property, and in the same way real property may be converted into personal property by severance from the realty.

Title to personal property may be acquired in three ways: (1) By original acquisition; (2) by transfer by operation of law; (3) by transfer by act of the parties.

(1) Property acquired by original acquisition may be acquired by either: (a) occupancy when one appropriates to his own use a thing which was not then subject to ownership, as in the finding and appropriation of lost property or the capture of wild animals; or (b) accession, which is the right which a person has to all the property which his own property produces, as the young of animals, and the right to all property which is annexed naturally or artificially to his own property; or (c) by confusion, which is the inextricable commingling of other property with one's own property; or (d) by intellectual labor, which is the source of the property right of authors and inventors in their writings and inventions.

(2) The transfer of the title to personal property by operation of law may be by forfeiture; by sale under execution; by operation of bankruptcy or insolvency laws; by exercise of the right of eminent domain; by marriage; by death of the owner; or by escheat.

(3) Transfer of title of personal property may be accomplished by act of the parties. At common law all that is necessary to transfer an interest in personal property from one to another is intent or mutual meeting of the minds of the parties without writing or other formality. (See CONTRACT; SALES; GIFT.) Modern statutes have made formalities requisite under some circumstances in order to protect the rights of the transferee from the claims of third persons.
